ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters

ac., acre(s).
agric., agricultural
ambas., ambassador(s)
Amer., American.
anct., ancient.
ann., annual.
arron., arrondissement.
A.-S., Anglo-Saxon.
A.V., Authorised Version.
h., horn.
Biog. Dic., Biographical Dictionary.
bor., borough
bp., birthplace
Brit., British.
C., Centigrade
c., about.
cap., capital.
cf., compare
co., county.
com., commune.
cub. ft., cubic feet
d., died.
Dan., Danish.
dept., department.
dist., district.
div., division.
E., east; eastern.
eccles., ecclesiastical
ed., edition; edited.
e.g., for example.
Ency. Brit., Encyclopædia Britannica.
Eng., English.
estab., established, establishment.
F., Fahrenheit.
fl., flourished.
fort. tn., fortified town
Fr., French.
ft., feet.
Ger., German.
Gk., Greek.
gov., government
Heb., Hebrew.
hist., history.
horticult., horticultural
h.p., horse-power.
hr., hour.
i.e., that is
in., inch(es).
inhab., inhabitant(s)

is., island(s)
It., Italian.
Jap., Japanese.
jour., journal.
Lat., Latin.
lat., latitude.
lb., pound(s).
l. b., left bank.
long., longitude.
m., mile(s).
manuf., manufacture.
min., minute(s).
mrkt. tn., market town
MS., manuscript.
mt., mount; mountain.
N., north; northern.
N.T., New Testament.
O.E., Old English.
O.F., Old French.
O.T., Old Testament.
oz., ounce(s).
par., parish.
parl., parliamentary.
pop., population.
prin., principal.
prof., professor.
prov., province; provincial
pub., published; publication.
q.v., which see.
R, **riv.**, river.
r. b., right bank.
Rom., Roman.
R.V., Revised Version.
S., south; southern.
sec., second(s).
sev., several.
Sp., Spanish.
sp. gr., specific gravity.
sq. m., square mile(s).
temp., temperature.
ter., territory.
tn., town.
trans., translated; translation
trib., tributary.
univ., university
urb., urban.
vil., village.
vol., volume.
W., west; western.
Wm., William.
yd., yard.

The article ABBREVIATIONS contains a list of those in general use.
See also ABBREVIATION (music) and ELEMENTS (chemical) symbols.

Spitalfields, dist. of E. London, in the metropolitan bor. of Stepney, on the N. side of the Thames, called after the hospital of St. Mary Spital, founded there in 1197 by Walter Brune and his wife. It became a great seat of the silk manuf., which was estab. there by the Fr. emigrants after the revocation of the Edict of Nantes. There is a large market, built in 1928.

Spitfire, single-seat fighter monoplane, made by Vickers-Armstrong from designs by R. J. Mitchell (*q.v.*). The S. is derived from the Vickers Supermarine S.6B, winner of sev. Schneider trophies, was first flown in 1936, and was introduced into the R.A.F. in 1938. With the Hurricane (*q.v.*) it became famous in the battle of Britain, and successive types were used throughout the war, thereafter being replaced by the Spitfire and the Naval Air Arm Seafang. Powered by the Rolls-Royce Merlin engine, the speed of the S. was steadily developed to 369 m.p.h. in 1943. In 1946 the Griffon engine was introduced and a speed of 450 m.p.h. attained. The armament at first consisted of eight 303 Browning machine guns, but four 20 m.m. cannon were later used. The S. was used in many theatres of war, as fighter, fighter-bomber, photographic reconnaissance craft, and in the naval seafire version. The wing span of the sev. varieties remained at 36 ft. 10 in.

Spithead, roadstead in the Eng. Channel, between Portsmouth and the Isle of Wight, often selected for naval manoeuvres. Here was fought in 1646 a battle between the Eng. and Fr. fleets, in which the latter was dispersed.

Spitsbergen, or (with Bear Is.) **Svalbard**, group of is. in the Arctic Ocean, lying between Franz-Josef Land and Greenland. The prin. is. are W. Spitsbergen, Edge Is., N.E. Land, Bear Is., Barents Is., and Prince Charles Foreland, and the land area of the group is about 24,295 sq. m. They are said to have been discovered by Barents in 1596, but it is probable that Sir Hugh Willoughby visited the is. in 1533, and that the Norwegians visited them in 1194. All the is. are mountainous, the highest peak (5580 ft.) being situated near Treurenberg Bay. There is much ice, generally in the form of long glaciers in valleys. S. lies between 76° 30' N. and 80° N. lat. In this lat. there is total daylight for 122 days; for 217 days there is either full sunlight or twilight only; and for a period of 115 days the sun does not rise above the horizon, but there is twilight for part of the day and total darkness during the remainder. Polar bears, foxes, and reindeer are amongst the land animals; musk-oxen have been introduced. The elder-duck and other wild-fowl breed on the is., and seals and walrus are found. Whale-hunting was carried on in the

seventeenth century, and possession of the area was then disputed between the Norwegians, Dutch, and Eng. Whale-hunting ceased in the eighteenth century, but on the discovery of rich beds of coal the question of sovereignty was again raised. Norway's sovereignty of the is. was recognised by treaty in 1920, and in 1925 the archipelago was officially taken possession of by Norway. In 1947 the Soviet Gov. raised the question of revising the treaty of 1920 on the ground that it was signed without the Soviet Gov.'s knowledge, that it included Medveshli Is. (forming part of the Spitsbergen Archipelago—actually a Russian is.), and that it disregarded the interests of security of the U.S.S.R. in the N. as well as Russian economic interests. Agreement was reached with Norway on the necessity of joint defence of Spitsbergen, and Russian camps were estab. The is. are important as a stage in trans-polar air-routes. The chief mineral is coal, some 500,000 tons annually being mined, and asbestos and copper are also found. The wintering pop. is about 2300, and there are sev. permanent mining camps, the largest being at Longyearbyen. A raid on Spitsbergen early in Sept. 1941, largely conducted by Canadian troops, destroyed the coal-mines and power installations there, which might eventually have been seized by the Gers. There was a Ger. naval raid two years later. See R. M. Rudmose Brown, *Spitzbergen*, 1920, and V. Romanovsky, *Le Spitzberg et la Sibirie du nord*, 1943.

Spittal, par. of the bor. of Berwick-upon-Tweed, with fertiliser and chemical works. It has a fine beach and cliffs. Pop. 1600.

Spitteler, **Carl Friedrich Georg** (1845-1924), Swiss poet and novelist, *b.* at Lucerne. After studying law and theology he became a teacher in Finland and Russia, and later in Neuveville. He was an editor in Basle and Zurich, and after 1892 a free-lance journalist. S. first came into prominence with the impressive poetic work *Der Olympische Frühling* (1905), and for this and his later work he received the Nobel prize for literature in 1919. S. set himself against the naturalistic tendencies of his time, approaching them only in his minor works. His collected works were pub. from 1945 onwards, ed. by G. Bohnenblust, W. Altwegg, and R. Faesi. See lives and studies by R. Faesi, 1933; G. Baudouin, 1938; F. Buri, 1945; G. Bohnenblust, 1945; and L. Reiger, 1947.

Spitz, see POMERANIAN DOG.

Spleen, largest of the ductless glands. In man it is an oval body about 5 in. long, situated on the left side of the abdominal cavity towards the rear at the level of the tenth rib. The external surface is bounded by the diaphragm, the pleural cavity, and the lower ribs; the internal

Spleenwort

surface touches the left kidney and the fundus of the stomach. The S. is enclosed by a fibro-elastic coat which allows of considerable extension. The coat sends processes called trabeculae into the S., dividing it into small compartments containing S. pulp, which consists of Malpighian corpuscles, lymph corpuscles, red blood corpuscles, and fat. The S. takes part in breaking up worn-out red corpuscles, and in forming white ones, and by producing uric acid assists nitrogenous metabolism.

Spleenwort, name given to various species of ferns in the genus *Asplenium* (q.v.). Thus *A. trichomanes* is the common S., *A. ruta-muraria*, the wall S.

Splenic Fever, see ANTHRAX.

Splint, bony enlargement, usually on the inside of the foreleg just below the knee, and rarely on the hind shanks, of horses. It is due to an injury setting up inflammation which causes an exostosis or bony tumour.

Splints, structures made of wood, leather, zinc, or other material shaped so as to fit about a fractured limb in order to render it immovable. The same effect can be produced by the use of bandages stiffened with mucilage, or, with still greater effect as regards rigidity, moulds of plaster of Paris.

Split (formerly **Spalato**), seaport of Croatia, Yugoslavia (Dalmatia), on a promontory on the E. side of the Adriatic, 74 m. S.E. of Zara. It has an excellent harbour. S. was one of the great cities of the Rom. world, and is famed for the vast palace built by Diocletian, which was his residence after his abdication. Much of the tn. stands within what were the walls enclosing the subsidiary buildings and grounds. The finest portions of this palace are still extant. The modern tn. carries on trade in wine, oil, grain, and cattle, and is noted for its liqueurs. Pop. 49,800.

Spügen, pass across the Rhaetian Alps, forming part of the boundary between Switzerland and Italy. It has an altitude of 6945 ft., and is 23 m. N. of the head of Lake Como. A roadway over the pass was constructed between 1819 and 1821.

Spode, variety of china ware. In 1770 Josiah S. the elder, an apprentice of Whieldon, having acquired some pottery works at Stoke-upon-Trent, manufactured blue willow-pattern table ware, black-printed china, and vitreous glazed ware of basalt and jasper. About thirty years later his son, Josiah the younger, made a felspar porcelain which has long been the general type of porcelain used in England. The felspar was added to a composition of china-clay, stone, and crushed bone, thus producing a soft paste which gave a translucent body and a smooth transparent glaze. Later he made what he styled 'opaque porcelain' or ironstone china used for table services or other useful articles. S. shapes were good and their pieces decorated with flowers and gilding. The marks used include a floral wreath and the words 'Spode felspar porcelain,' or these words without a wreath, or simply 'Spode' on a cartouche or scroll.

Sponges

Spofforth, Frederick Robert (1853-1926), Australian cricketer, b. at Sydney, N.S.W. He visited England with each of the first five Australian teams that played there, beginning in 1878. Known as 'the Demon Bowler,' for his fastness and ingenuity, in 1878, at Lord's, S. took ten wickets for twenty runs, and during the early eighties frequently performed similar feats. He settled in England, and died at Ditton.

Spofford, Harriet Elizabeth, née Prescott (1835-1921), Amer. story-writer and poet. Her first novel, *Sir Rohan's Ghost* (1860), is in the tradition of Mrs. Radcliffe's *Mysteries of Udolpho* and the tenebrous stories of Poe. She is chiefly known for her numerous romantic short stories, *The Amber Gods* (1863) being the first collection.

Spohr, Ludwig (1784-1859), Ger. violinist, composer, and conductor, b. at Brunswick, studied with Kunisch and Maucourt and Hartung. He was court musician at Gotha (1805), and opera-director at Vienna (1812) and Frankfurt (1817). Finally he settled at Kassel (1822-57) as court choirmaster. S. left nine symphonies, eight overtures, ten operas, four oratorios, and many violin concertos and chamber works of the Itomantic school. He is important in the development of violin playing. His autobiography appeared in 1850-61 (Eng. trans. 1865).

Spokane, city of Washington, U.S.A., cap. of co. of same name, 230 m. E. of Seattle. It was first settled in 1874 and known as 'Spokane Falls,' from the adjacent falls on S. R. There are two univs. S. is an important commercial tn., and its industries are connected with lumbering, the rich mines (gold, silver, copper, etc.) in the neighbourhood, and agric. products. Pop. 122,000.

Spoleto, city of Tuscany, Italy, in the prov. of Perugia, 60 m. N.N.E. of Rome. About 242 B.C. it was a Rom. colony (Spoletum). It was later the cap. of a Lombard duchy, and from 1220 to 1860 a papal tn. The cathedral was begun in the seventh century. There is a Rom. amphitheatre, aqueduct, and other remains. It trades in grain, silk, wine, and oil, and produces truffes. Pop. 36,500.

Spondee, in prosody, a metrical foot consisting of two long syllables, equivalent to a dactyl or anapaest, and thus met with in these metres. Examples: 'arbor,' 'primrose,' etc.

Spondias, tropical genus of Anacardiaceae, which contains about half a dozen species. The fruit is a drupe, and under the name of hog-plum is often eaten.

Sponges, or **Porifera**, simple form of animal life, the structure being cellular, with no differentiation into organs, and only slight tissue formation. Their relation to other forms of simple animal life is obscure. A simple sponge consists of a sac attached at one end to some support, the other having an opening or oscule. The walls are pierced with many pores. It is contained between the ectoderm and endosperm, the whole being strengthened by a minute skeleton of calcareous or siliceous spicules. The flagella of the

collar cells (or choanocytes) in the endoderm, which surround the pores, continuously lash the water so that a flow of water, supplying food and oxygen, is drawn into the sponge through the pores, waste matter being ejected through the oscule. Through this also are disseminated the reproductive elements. The *Ascteta primordialis* and *Grantia compressa* (common in Brit. waters) belong to this type as does the *Homoderna lycandra* where the sac is convoluted and a protective armour of spicules developed; these belong to the *Ascon* type. In the *Sycon* type, such as *S. citiatum*, found in deeper water, there is greater specialisation of cells of the endoderm and a progressive development of convolution into chambers and channels. In another development, the *Rhagon*, the endoderm develops spherical chambers within the paragastric.

SPONGE

The arrows show the direction of currents.

S. are usually classified according to skeleton, but a few, the Myxospongiae, have no skeleton at all. The pigments found in S. are chiefly brown or red, e.g. floridin. The fresh-water sponge, *Spongia*, is the only one possessing green colouring matter, allied to chlorophyll. The four families of S. are the Calcarea, the Hexactinellida (which includes the beautiful *Euplectella* or Venus's Flower Basket), the Tetraxonida, and the Keratosa (which include the bath sponge).

Reproduction is accomplished: (1) by the asexual formation of buds which become detached and float away from the parent on the death of surrounding parts; (2) by fission; (3) by sexual means.

The sponge of commerce, *Euspongia*, is chiefly obtained in the Mediterranean, particularly from the Levant and the Adriatic, the coasts of Barbary, Tunis, and Syria being visited regularly by boats.

See F. M. Duncan, *Animals of the Sea* (Romance of Reality series), 1922; E. G. Boulenger, *The Under-water World*, 1928 (a popular introduction to sponges, worms, molluscs, etc.); and L. H. Hyman, *The Invertebrates (Protozoa through Ctenophora)*, 1940 (which contains a full bibliography).

Sponge, Vegetable, see LOOFAN.

Sponsors, godparents who present a child for baptism and make the baptismal confession and promises to keep the faith, in its name. According to the rule of the Church of England, every male child must have two godfathers and one godmother, while a female child has two godmothers and one godfather. In the Rom. Church one sponsor, or at most two of different sexes, is required.

Spontaneous Combustion, burning which takes place without the application of any igniting agent. Combustion is generally a form of oxidation in which sufficient heat is produced to render the particles of the material incandescent. The mere contact of atmospheric oxygen with a substance is not usually sufficient to produce chemical combination; a certain temp. or the presence of oxygen in a particularly active form is essential. In cotton-waste impregnated with oil, oxidation may proceed slowly until sufficient heat has been generated to cause it to burst into flame. The temp. necessary to produce flame varies with different substances. Thus carbon bi-sulphide vapour is ignited if the temp. rises to 150° C., which is insufficient to produce incandescence in most other bodies. Phosphorus, again, in a finely divided condition, combines with oxygen with the evolution of light and heat at ordinary temps. The conditions necessary for S. C. are the presence of a substance with a low temp. limit for flame, and a source of heat, such as slow oxidation, which eventually reaches that limit. Thus a heap of damp hay may burst into flame through the gradual rise in temp. caused by fermentative processes.

Spontaneous Generation, see ABIO-GENESIS.

Spontoon, see Pike.

Spoonbills, sub-family Plataleinae in the ciconiiform family Ibisidae and closely related to the ibises. They are characterised by their curious bills, which are long and flat, and are dilated at the end into the shape of a spoon. Their feet are adapted for wading, and the birds obtain their food, consisting chiefly of fish, frogs, molluscs, and crustaceans, from shallow water. The spoonbill is found in Europe and Central and S. Asia, and is a visitor to E. England, where it formerly bred.

Spoonerism, accidental transposition of initial letters or syllables of two or more adjacent words. It owes its name to the Rev. W. A. Spooner (1844-1930), warden of New College, Oxford. Instances are 'Kinkering kongs their titles tik', for 'Conquering kings their titles take'; 'Will nobody pat my hiccup' for 'Will nobody pick my hat up'; and 'You are occupying my pie' for 'You are occupying my pew'. While some of the most diverting, including the first cited, may be attributed to Dr. Spooner, most are apocryphal. See J. Huxley, *On Living in a Revolution* (essays), 1914.

Spoons of clay were used in the Neolithic period, and S. of bronze occur in the Early Iron Age, but in all probability these were of ritual and not utilitarian use. There are two chief types of Rom. S.; those for

table use have long tapering points at the end opposite the bowl for the removal of shell-fish from the shell, and others with long tapering bowls are for the removal of ointments from slender glass phials. *S.* were commonly in use in antiquity, and many Rom. and Saxon examples of metal are known; many others of horn or wood must have perished, and the name spoon, from the Saxon *span*, a chip, is a reminder that early *S.* were of wood. Folding *S.* were in use in medieval times when personal sets were customary. There was considerable variety in metal, decoration, and shape. The form of spoon now in use came into fashion about 1750-60. See also APOSTLE SPOONS.

Sporades, group of is. in the Aegean Sea, see GREEK ARCHPELAGO.

Sporadic, in medicine, term applied to diseases which occur in scattered cases, although their usual incidence is epidemic. *S.* cases often differ in a marked manner from epidemic cases.

Spore, minute, one-celled embryoless body, by means of which the flowerless plants or Cryptogams chiefly reproduce themselves, as distinct from the Spermatophytes or Phanerogams, which produce many-celled seeds, each of which contains an embryo plant. The div. between the two groups is more artificial than the older systematists supposed, and the pollen-grains of the Phanerogams are homologous with the microspores (the smaller of the two kinds of *S.*) of the higher Cryptogams, as is the embryo sac with the megaspore (or larger *S.*). A *S.* is in general an asexual reproductive body; the vesting zygotes of algae and fungi are known as zygospores. In large numbers of the fungi the *S.* are formed in huge numbers, as, for instance, in the 'puff balls' which shoot out a cloud of *S.* when compressed. Bacteria produce *S.* when conditions are unfavourable to vegetative reproduction and they can resist high temp. and poison, while they often retain their vitality for many years.

Sporozoa, large and important class of microscopic unicellular parasitic animals (Protozoa, *q.v.*), so called on account of the readiness with which they break themselves up into reproductive spores. The majority of them are minute, but their poisonous products give rise to deadly diseases in man and animals. The prin. groups of *S.* are the gregarines, the coccidians, and the haemosporidia. One of the best-known gregarines is *Monocystis* which is very common in the great white spermatic sacs of the earthworms. In its younger stage, as an oval uncelled body, it penetrates the male spermatic sac. There it comes side by side with another, and when they have adhered they form a glass-like cyst. Gametes are formed inside the cyst; they fuse in pairs and each zygote forms a boat-shaped sporocyst. The latter divides into eight sporozoites, which remain unchanged until swallowed by another earthworm, when their life hist. begins again. Gregarines occur only in invertebrates. Coccidians are found in mice, rabbits, frogs, insects, molluscs, and lower animals. They reproduce by

splitting and by the formation of spores after fertilisation by true spermatozoa. These two distinct processes of multiplication occur also in the haemosporidia, a group of blood parasites, one of which causes malaria. This is known as *plasmodium* (*q.v.*). See MALARIA.

'Sporting Times', sporting and theatrical weekly, known as the 'Pink 'Un', founded in 1865 by Dr. Shorthouse, and ceasing pub. in 1932. Its political tone in its earlier years was avowedly Tory. With it became incorporated 'The Looking Glass' and 'The Man of the World.' A notable feature was its theatrical notes. The paper invented the term 'Ashes' (*q.v.*) in cricket.

Sports, see ATHLETICS; BALL GAMES OF (and separate articles on such games); CYCLES AND CYCLING; ROWING; RUNNING AND HURDLING; TRACK AND FIELD SPORTS, etc.

Sports, or Mutations, see VARIATION, IN BIOLOGY.

Sports, Book of, name given to a proclamation of James I. in 1618, dictating games lawful to be played after church on Sundays. The sports permitted were dancing, archery, vaulting, running, leaping, May-games, etc., and those prohibited were dramatic interludes, bear and bull baiting, and bowling. In 1644 this book was ordered to be publicly burned by decree of the Long Parliament.

Spotsylvania Court House, now generally known as Spotsylvania, post vil., cap. of a co. of the same name, in Virginia, U.S.A., 11 m. S.W. of Fredericksburg, and 55 m. N. by W. of Richmond. In 1861 it was the scene of engagements between the forces of Grant and Lee. Pop. 9900.

Spottiswoode, Alicia Anne (1810-1900), became Lady John Douglas Scott by marriage (1840). She is remembered chiefly as the composer of *Annie Laurie*, pub. anonymously in Paterson and Roy's *Vocal Melodies of Scotland* (1838), and as the composer or transcriber of *The Banks of Loch Lomond*.

Spottiswoode, William (1827-83), Eng. mathematician, the son of Andrew S., partner in the firm of Eyre and Spottiswoode. Wm. S. succeeded his father as queen's printer in 1846. Having graduated at Balliol College, Oxford, he became eminent as a mathematician and physicist. In 1853 he was elected a fellow of the Royal Society, and in 1878 president. Among his works are *Meditationes analyticae* (1847); *The Polarisation of Light* (1874); and *A Lecture on the Electrical Discharge, its Form and Function* (1881).

Spot-welding, see under WELDING.

Sprain, wrenching of a joint, causing stretching or laceration of the ligaments. The most commonly sprained joint is the ankle, owing to the inelasticity of the lateral ligaments. The immediate effects of *S.* are pain and loss of power in the joint. Swelling soon takes place and renders investigation of the extent of the damage difficult. Where fracture is suspected the joint should be treated for that, as treatment for fracture is generally appli-

Sprat

cable to S. also. In ordinary S. swelling may be lessened by the application of cold water immediately after the injury. After the joint has swollen, however, hot water should be employed to ease the pain. The part should be well bandaged and rested.

Sprat, or *Clupea Sprattus*, small member of the herring genus common around the Brit. Isles. It is from 3 to 6 in. long, with smooth scales and prominent lower jaw. It may be distinguished from young herring by the absence of teeth on the vomerine bone and by having only one air vesicle in the ear. The S. is a favourite food-fish in mid autumn. Larger S. are extensively tinned and sold as 'bristling'.

Spray Painting, see under PAINTING AND DECORATING.

Spree, riv. of Germany, rises in E. Saxony on the borders of Bohemia, and winds N.E. through Brandenburg for 226 m., till it falls into the Havel at Spandau. It expands into numerous lakes and is connected by canal with the Oder.

Spremburg, tn. of Brandenburg, Germany, on the Spree, 15 m. S. of Kottbus. Manufs. include textiles and machinery. Pop. 13,300.

Sprengel, Hermann Johann Philipp (1834-1906), Ger. chemist and physicist, b. near Hanover. In 1859 he settled in England, first at Oxford and later in London. His name is connected with the invention of the 'Sprengel pump' (1865) and the 'Sprengel tube' for the accurate testing of sp. gr.

Spring, Howard (b. 1889), Brit. novelist, b. in Cardiff, became a journalist, and in 1931 book critic of the *Evening Standard*. He is now reviewer for *Country Life*. His realistic novels, usually describing a wide selection of people, show good description of setting and background, and a feeling for characterisation, particularly of the working class. They include *The Shabby Tiger* (1935); *Rachel Rosier* (a notable character in the previous novel, 1936); *O Absalom* (1938; republished as *My Son, My Son*; filmed and trans. into sev. languages); *Fame is the Spur* (1940; filmed); *Hard Facts* (1941); and *Dunkirkers* (1946). *Darke & Co.* (1932), *Sampson's Circus* (1936); and *Tumbledown Dick* (1936) are children's books; and S. has pub. the autobiographical *Heaven Lies About Us* (1939); *In the Meantime* (1942); and *And Another Thing* (1946).

Spring, Tom (1795-1851), Eng. pugilist, the champion of England in 1824, in which year he twice defeated Jack Langan.

Spring, first season of the year, which is assumed to begin in the N. hemisphere at the vernal equinox (March 21), when the sun enters the sign of Aries, and to end at the summer solstice (June 22). See SEASONS.

Spring. Where rain falls upon pervious strata, such as chalk or sand, or upon jointed and broken strata, it sinks through until its further progress is arrested by an impervious stratum, e.g. clay. Above this stratum the rain-water then moves underground to the lowest point at which the impervious layer outcrops and there escapes in the form of a S. If the water supply is constant the S. is termed 'peren-

Spruce

nial,' and where the supply is variable it is called 'intermittent.' Deep-seated waters become heated in their underground course and give rise to hot S. like those of Buxton, Bath, Matlock, etc. Underground waters have also a solvent action upon the rocks due to the presence of carbonic acid in solution, and may then issue forth as mineral S. These S. may be classified according to their contained salts, as saline, chalybeate, sulphurous, siliceous, etc. See also ARTESIAN WELLS; GEYSERS; MINERAL WATERS.

Spring Balance, see BALANCE.

Springbok, or *Gazella euchores*, beautiful antelope found in central and S. Africa. It is of a tawny-red general colour with a white under-surface and head, and obtains its name from the long distances it can leap.

Springer, see under SPANIEL.

Springfield: 1. Par. of Essex, England, 1½ m. E.N.E. of Chelmsford, to which, in 1907, part of it was transferred. Pop. 600. 2. Cap. of Illinois, U.S.A., and co. seat of Sangamon co., 185 m. S.W. of Chicago, in the centre of an important farming, horse-breeding, and coal-mining region. Manufs. include soap, flour, watches, lumber products, engines, woollen goods, etc. S. has a fine state capitol and arsenal, and a monument to Abraham Lincoln, who lived and is buried here. Pop. 75,500. 3. Co. seat of Hampden co., Massachusetts, U.S.A., on the Connecticut R., 98 m. W.S.W. of Boston. Here is the Y.M.C.A. college and the Amer. international college. The U.S. armoury (1794) is here, and there are manufs. of firearms, machinery, paper, rubber and celluloid goods, cottons, woollens, and electric and motor cars. Pop. 149,600. 4. Co. seat of Clark co., Ohio, U.S.A., 45 m. W. of Columbus. Here is the Lutheran Wittenburg college. The tn. manufs. agric. implements, motor trucks, and flour. Roses are cultivated, and magazine printing is important. Pop. 70,700. 5. Co. seat of Greene co., Missouri, U.S.A., 200 m. S.E. of Kansas city. There are railway workshops, and farm produce is processed. Pop. 61,200.

Springhill, tn. of Cumberland co., Nova Scotia, Canada, 75 m. N.N.W. of Halifax. It has extensive coal-mines. Pop. 6000.

Springs, tn. of the Transvaal, S. Africa, 20 m. E. of Johannesburg. Gold was discovered in 1933, and ann. production is valued at about £32,000,000, from thirty or more large mines. Coal is also mined, and a variety of industries includes engineering, chemicals, food, glass, lumber, bricks and fertilisers. The production of helical springs and ventilation equipment is noteworthy. Pop. 116,500 (including 25,600 Europeans and 83,400 natives) (See illustration, p. 6.)

Spring-tails, see COLLEMBOLA.

Sprinklers, Automatic, see under FIRE BRIGADES.

Sprinting, see under RUNNING AND HURDLING AND ATHLETICS.

Spruce, term applied to various coniferous trees in the genera *Picea* and *Tsuga*. Both *P. excelsa*, the S.-fir or Norway S., and *T. canadensis*, the hemlock S., are

valued on account of their wood, and their products of resin, turpentine, and pitch. Aircraft construction has provided a new use for the wood and encouraged increased cultivation. Black S. (*P. nigra*) is used in the manuf. of paper pulp.

South African Railways
SPRINGS: THE TOWN HALL

Spruce Beer, alcoholic beverage used in Canada, and prepared by fermenting sugar solutions and essence of spruce with yeast.

Spur, apparatus fastened to the heel of a horseman for goading the horse, the modern variety usually consisting of small sharp-pointed wheels called rowels. In the days of chivalry the use of the S. was limited to knights, and it was among the emblems of knighthood, and still forms part of the Brit. regalia.

Spurge, see EUPHORBIA.

Spurge Laurel, see DAPHNE.

Spurgeon, Charles Haddon (1834-92), Eng. preacher, b. at Kelvedon, Essex, the son of an Independent minister, joined the Baptists in 1850, of which sect he became an active member. He was pastor of Waterbeach, Cambridgeshire, in 1852, but he soon was transferred to Southwark, London. His sermons at Exeter Hall crowded the building, and he became minister of the great Metropolitan Tabernacle when it was opened in 1851. He was the most popular preacher of his day. His autobiography was pub. posthumously (1897-1900). See also W. Williams, *Personal Reminiscences*, 1895; and lives by W. Y. Fullerton, 1921; J. C. Carlile, 1933; A. Hoefs, 1934; and A. Roth, 1934.

Spurn Head, promontory at the S.E. extremity of Yorkshire, England, on the estuary of the Humber. Since the erection of groynes in 1864 the inroads of the sea have been checked. There are two lighthouses.

Spurs, *Battle of the*, see COURTRAÏ (Belgium), GUINEGATE (France).

Sputum, matter ejected from the mouth in spitting. It consists usually of saliva mixed with a mucus from the nasal passages and fauces. In morbid states of the respiratory passages it may contain blood, purulent matter, and the debris of diseased surfaces.

'Spy,' see WARD, SIR LESLIE.

Squadron. In the R.N. the term is applied to administrative groups of battleships, battle-cruisers, cruisers, or aircraft carriers either working separately or attached to fleets and commanded by junior flag officers. Similar groups among smaller vessels are known as flotillas. In the Brit. army the S. is a body of cavalry or armoured troops forming a sub-div. of a regiment. Three or more S. compose a regiment, each under the command of a captain or of a major assisted by a captain. Each S. is divided into three or four troops, each commanded by a subaltern officer. In the U.S. Army a S. is a unit of size corresponding to a battalion, divided into troops each the size of a Brit. S. and again subdivided into platoons. This is the organisation for U.S. cavalry proper and for light armoured troops, but not for tanks. The word is of It. origin and means a 'square' battle formation of companies of infantry or troops of cavalry in close order. The S. is the smallest operational unit of the R.A.F. and consists of a number of aircraft and flying and ground personnel. The number of aircraft employed and the rank of the commanding officer vary according to the role of the S. The commanding officer is usually either a S. leader or a wing commander.

Squall, sudden strong wind usually associated with a change of direction; frequently there is also heavy rain, a sudden rise of pressure and fall in temp. In a line-S. which moves in a line across a large area, the wind shift and fall of temp. may be considerable, and much of the change may be permanent. In an isolated thunderstorm the wind and rise in pressure may only be very temporary, but frequently the fall in temp. remains permanent. A line-S. is usually associated with a cold front (a cold air mass replacing a warm one), and it carries with it its own typical roll cloud. The S. is due to the increase in unstable conditions caused by the warm air being held up by friction at the surface and being overrun by colder air. As the rain from the warmer air higher above the front falls into the cold air, it evaporates and cools the cold air even more by absorbing latent heat from it; if this cold air has trapped some warm air more violent instability is produced, and the down-flowing cold air attains a great velocity; this is the S. wind. The convection may be so violent that sometimes a vortex is set up, when a funnel cloud appears as in the waterspout or tornado.

Square Measure, see under WEIGHTS AND MEASURES.

Square-rig, rig of a ship whose prin. sails are extended on yards suspended horizontally at the middle, and can be set on either side at a greater or less angle with the keel, but not on one side as a fore and aft sail. See SAILS AND RIGGING.

Square Root, see INVOLUTION.

'Square, The,' see NORMA.

Squaring the Circle, see QUADRATURE.

Squash, popular name given to a variety of *Cucurbita Pepo*, the pumpkin. It is closely related to the vegetable marrow, and is edible.

Squash

Squash Racquets, offshoot of racquets (*q.v.*) or rackets, which has outstripped its parent in popularity in the twentieth century, partly because it is less costly. It differs from racquets in the following ways: (1) The court is much smaller, being only 32 ft. long and 21 ft. broad. The height of the 'service' line is 6 ft., and the top of the 'board' (*i.e.* the play line, sometimes also called the 'tin') is 19 in. from the ground. Other measurements are, of course, in ratio. The floor is of wood, and sometimes the side and back walls also. (2) The ball used is of india-rubber and hollow (except in the U.S.A., where a solid rubber ball is used). Its size is a little larger than a racquets ball. (3) The racket is lighter and 3 in. shorter than that used in racquets. Its length may not exceed 27 in. (4) The scoring, in the Brit. game, is up to 9 instead of 15, with the option at 8-all of 'no-set' or 'set-two' (*i.e.* up to 10) on the part of the player who reached 8 first. As at racquets, points can only be scored when 'in hand' (*i.e.* serving); but in the U.S.A. scoring is up to 15, with points scored whether 'in hand' or not.

S. R. originated in England, and was probably first played at Harrow. Until 1890 the game was played almost exclusively at public schools. Since then its popularity has increased quickly, and it is now played (by both men and women) in many different parts of the world. The game was first standardised in Britain in 1922, and the central S. R. Committee was formed, later to become the S.R.A. (Squash Rackets Association), of which women now have their own branch. There are innumerable competitions throughout the country, the greatest being the Open Championship, instituted in 1930. The holders have been C. R. Read (Queen's Club, professional champion) 1930; D. G. Butcher (Conservative Club, professional champion), 1930-31; F. D. Amr Bey (amateur champion), 1931-37; J. Dear (Prince's and later Queen's Club, professional champion), 1938; M. el Karim (Gezira Sports Club, professional), 1946; A. E. Biddle (professional champion of the Brit. Isles), 1948; M. el Karim, 1949.

There is also a doubles form of the game, played in a somewhat larger court, 45 ft. long and 25 ft. wide. The service line is 8 ft. 2 in. high, but the board is lower than that in the singles court, its top being only 17 in. from the ground. S. R. is a game requiring great skill and great stamina. In fact it requires no less skill and considerably more stamina than racquets, but owing to the soft ball it lacks the speed and exhilaration of the older game. See J. T. Hankinson, *Squash Rackets*, 1949.

Squid, see CEPHALOPODA.

Squill, see SCILLA.

Squilla, genus of stomatopod crustaceans. *S. mantis* is common in the Mediterranean, where it is used as food, and is occasionally taken off Brit. coasts. It is about 7 in. long, and the carapace covers only eight of the segments, those uncovered bearing the eyes and antennules.

Squint, or **Hagioscope**, slanting aperture cut through the walls of the chancel, in

Squire

certain medieval churches, so as to make the elevation of the Host visible from a side chapel.

Squinting, or **Strabismus**. In correct vision the axes of both eyes correspond in direction and turn towards the subject looked at. The motor muscles so act that any movement of one eye causes a harmonious movement in the other. Sometimes the axes of the eyes are not parallel and the eyes do not move harmoniously together, this defect being known as S., or strabismus. It may take place upwards, downwards, inwards, or outwards; both eyes may be affected, or it may be confined to one. S. usually occurs in childhood, being caused generally by some defect in the muscles or nerves of the eye. Convulsions, teething, fevers, shock, etc., can be precipitating conditions. Another common cause is either short or long sight, and the squint can then be remedied by spectacles alone. A new branch of ophthalmic optics known as orthoptics is now correcting many forms of squint by exercises designed to stimulate weak muscles or nerve reactions in one or both eyes. In some cases operative treatment is necessary. In adult life there can occur a form of squint arising from paralysis of one or more of the external eye muscles. See Gibson, *Clinical Orthoptics*, and G. H. Giles, *The Practice of Orthoptics*, 1943.

Squire, Sir John Collings (b. 1884), Eng. author and critic, b. at Plymouth, educated at Blundell's School and at St. John's College, Cambridge. In 1913 S. became literary editor of the *New Statesman*, and was its acting editor 1917-18. In 1919 he founded and ed., until it ceased in 1934, the *London Mercury*, a monthly magazine of literature and the arts. S. early took his place among the pre-1914 'Georgian' group of poets, but much of his poetry covers the period of the First World War. The best of many vols. of poetry was collected in 1926 in *Poems in One Volume*. Most of S.'s critical work, which is informative, catholic, and kindly, appeared first in periodicals, and has since been collected under his own name (*Books Reviewed*, 1922; *Sunday Morning*, 1930) and under a pseudonym, Solomon Eagle (*Books in General*, 1918, 1920, and 1921). S. is also a clever parodist (*Collected Parodies*, 1921). As editor he revived the Eng. Men of Letters Series, and ed. Freeman's and Flecker's poems, also *Selections from Modern Poets*, and *A Book of Women's Verse*, and was joint editor of the Eng. Heritage Series. S. has done invaluable work for the preservation of notable buildings (honorary secretary Stonehenge Preservation Society and chairman of Architecture Club, 1922-1928). From 1926 to 1929 he was chairman of the Eng. Association. Other books: *Socialism and Art* (1907); *The Gold Tree* (stories, 1918); *Life and Letters* (1920); *Essays on Poetry* (1923); *The Grub Street Nights Entertainments* (stories, 1924); (ed.) *The Comic Muse* (anthology, 1925); *A Face in Candlelight* (poems, 1933); *Outside Eden* (1933); *Reflections and Memories* (1935); *Weepings and Wailings* (1935); *Water Music* (1939); *Poems of*

Two Wars (1940); and *Selected Poems* (1948). See I. A. Williams, J. C. Squire, *A Bibliography of his Works*, 1922.

Squire, abbreviated form of esquire. Originally a S. was the armour-bearer of a knight, to whom he was next in rank, and had various privileges and exemptions. It later became popularly applied to the chief landowner in an Eng. country dist.

Squirrel, or *Sciurus*, genus of arboreal rodents. *S. vulgaris*, the European S., is widely distributed over Europe and parts of Asia. Of this the Brit. S. is a subspecies, restricted to the Brit. Is. The body is reddish-brown above and white below; the ears are large and tufted. The body is about 8 in. long, and the bushy tail only an inch shorter. It feeds on fruits and shoots, and sometimes eggs and small birds. It has been destroyed in large numbers in Scotland on account of its habit of barking and otherwise damaging forest trees. In the S. of England it is driven away from its haunts by the introduced grey or Canadian S. (*S. carolinensis*) which has adapted itself with remarkable readiness. Males of this species are, however, in great preponderance. Its coat is grey, and its head bears resemblance to that of the rat. The African ground or spiny S. belong to the genus *Xerus*. The Flying S. (*Pteromys*) of the Orient are remarkable for the possession of a membrane stretching from fore to hind limb, whereby they can glide for distances up to 80 yds.

Srinagar, Serinagar, or Cashmere, cap. of the important frontier state of Jammu and Kashmir (q.v.), N. India, on R. Jhelum, 115 m. N.E. of Rawal Pindi. It is beautifully situated in a valley at an elevation of 5276 ft. Formerly the summer cap. of the Moguls, it has many interesting features. In 1947 it was occupied by Indian forces. Pop. 207,800.

Srirangam, or Seringham, tn. in Madras, India, on an is. on the Kaveri R., 2 m. N. of Trichinopoly. It contains a temple of Vishnu. Pop. 27,000.

S.S. Troops, see S.A. and S.S.

Szu-Ma-Ch'ien, see under CHINA, Chinese Literature.

Ssumao, Sumao, Semaio, Ssemiao, or **Esmote**, tn. of S. Yunnan, China, 185 m. S.W. of Yunnanfu. The centre of the trade in Puerh tea.

St. (in the case of geographical names), see SAINT.

Stabat Mater, well-known Lat. hymn on the seven sorrows of Mary, so called from its opening words. In the Rom. Missal it forms the sequence for the feast of the Seven Dolours of the Blessed Virgin Mary. The author was probably Jacopone da Todì. There are many musical settings.

Stabiae, anct. seaport tn. of Campania, Italy. The modern Castellammare is near its site. It was buried by the eruption of Vesuvius, together with Pompeii and Herculaneum, in A.D. 79. Pliny the Elder met his death here.

Stabilisation (exchange rates), financial policy of counteracting wide fluctuations in the relative value of monetary units. The world-wide economic depression of 1930-32 brought the subject under dis-

cussion at the World Economic Conference in London in 1933, but with no practical results. Formerly, monetary units had a known value which was based on the gold standard. S. of exchange rates after the Second World War was the aim of the Bretton Woods Agreement (1948), by which the International Monetary Fund was set up, which began work in 1947. By the agreement, fixed exchange rates of the other currencies (*par values*) are to be estab. with the dollar (and this indirectly with gold since the dollar has still a fixed value in gold); changes in *par values* (with certain exceptions) require the approval of the Fund, which was obtained for the devaluation of Sept. 1949. Real S. requires freedom of exchange restrictions; not much progress has so far been made in this direction. S. of exchange rates, to be effective without exchange restrictions is dependent on internal financial stability, i.e. avoidance of inflation. Much progress towards this goal has been made in W. Europe since the beginning of Marshall Aid.

Stability, property by which a structure tends to maintain its original position, and by which a moving system tends to recover its typical configuration when slightly disturbed. In mechanics *static S.*, or stable equilibrium, is possessed by a body when, if it is slightly displaced from its position, the forces acting on the body tend to make it return to its original position. Thus a book lying on its side is in stable equilibrium, but a thin book standing on end is in unstable equilibrium. When a body tends to remain in the new position without further movement it is said to be in neutral equilibrium; example: a sphere resting on a horizontal plane. The condition of S. is that the centre of gravity shall be as low as possible. In *kinetic S.* motion has to be considered. A system is said to be in equilibrium when the general configuration is maintained in spite of small occasional disturbances; e.g. a spinning top, a rolling wheel.

Staccato (It. detached), special manner of performing musical phrases without slurring the notes together, articulating each separately. The S. actually shortens the value of each note as written by the insertion of a minute pause, so that, for example, crotchets marked S. become something like dotted quavers followed by a semiquaver rest. The notation of S. is a series of dots placed over each chord or note to be so performed.

Stachys, genus of labiate plants, containing over 200 species. These are worldwide in distribution, except for Australasia, and the Brit. species are known as hedge-nettle or woundwort. *S. Betonica* is the Brit. wood betony, *S. sylvatica* the hedge woundwort (with foetid leaves), and *S. palustris* the marsh woundwort. *S. Sieboldi* produces a large number of small white tubers, which, under the name of *crosnes*, are often eaten.

Stade, tn. of Hanover (Lower Saxony), Germany, near the mouth of the R. Schwinne, 22 m. N.W. of Hamburg. Industries include iron-founding, ship-building, and the manuf. of lace, cloth,

and flannel. It was a Hanseatic tn., and belonged to Sweden, 1648-1719. Pop. 15,100.

Stadholder, or **Stadtholder**, corrupt form of the Dutch *stad-houder* (stead-holder), a title formerly applied to a royal lieutenant or viceroy of a prov., who was also a chief magistrate. It became a hereditary title in the House of Orange.

Stadium, Gk. measure of length, equal to 600 kti. ft., and 582.5 ft. Eng. measure. In the time of the Rom. Empire 7½ stadia, or 4732 Eng. ft. went to a mile. The standard was the length of the Olympic stadium, i.e. the oblong course over which foot races were run (see OLYMPIAD).

In modern times the S. has come to mean an athletic ground, and emphasis is laid not on the original distance of the course, but on the accommodation for spectators.

Stael, **Madame de** (1766-1817), or **Anne Louise Germaine Necker, Baronne de Stael-Holstein**, by marriage in 1786, Fr. novelist and essayist, b. at Paris, was the daughter of Necker, the celebrated financier. From the first a precocious child, she pub. her famous *Lettres sur Rousseau* (1789) when scarcely twenty-three years old. In 1792 the revolution forced her to leave France, and for some years she travelled, visiting Switzerland, England, Germany, and Italy, writing her *Recherches sur la paix intérieure* (1795) and *De l'influence des passions* (1796). A quarrel with Napoleon against whom she intrigued constantly led to her exile (1803) and she removed to Weimar, where she met and studied literature with Schiller and Goethe, and later to Berlin, where she met August Schlegel (q.v.), who lived at her home on Lake Geneva after 1804. In Italy she wrote *Corinne*, her masterpiece (1805). After returning to France in 1806 she was again exiled in 1810, and had to seek refuge in Russia, Sweden, and London, where her *De l'Allemagne* (which, when going to press in 1810, was seized by the Russian police) (1813) gained her access to intellectual circles. In 1814 she was welcomed to Paris by Louis XVIII., but her health gradually gave way under the strain of nursing her delicate second husband, whom she had secretly married at Geneva (1811). Before her time Ger. literature was unknown to France. Her complete works were ed. by Mme Necker de Saussure (1820-21). The Fr. attitude towards it was summed up in Voltaire's gibe at the Gers, who 'wanted more wit and less consonants.' Her *De l'Allemagne* overcomes Fr. prejudices and abandons the sensualist point of view of eighteenth-century philosophy. See lives by M. Norris, 1853; A. Stevens, 1881; A. Sorel (Eng. trans.), 1892; also C. A. Sainte-Beuve, *Portrait des femmes*, 1869; A. C. P. Haggard, *Mme de Stael: Her Trials and Triumphs*, 1922; R. McN. Wilson, *Germaine de Stael: the Woman of Affairs*, 1931.

Staffa, small is. of the Inner Hebrides, Argyllshire, Scotland, lying 7 m. W. of Mull and 6 m. N.E. of Iona. Its circumference is about 14 m. Geologically it is composed of volcanic tufa and trap rock,

or basalt, and is remarkable for its numerous caves, where the latter rock appears in beautiful prismatic and columnar forms. The most famous are Fingal's Cave, Clamshell Cave, McKinnon's or Cormorant's Cave, and Boat Cave.

Staff, Air. The present R.A.F. Staff is descended from a combination of the staffs of the R.F.C. and the R.N.A.S. which were amalgamated into the R.A.F. on April 1, 1918. The Air Council is the governing body of the R.A.F. and is charged at Parliament with the administration of the R.A.F. and with defence of the Realm. It consists of the secretary of state for air, the parliamentary under-secretary of state for air, the chief of the air staff, the vice-chief of the air staff, the deputy chief of the air staff, the air member for personnel, the air member for supply and organisation, the air member for technical services, and the permanent under-secretary of state for air. Each member of the Air Council has an appropriate staff working under him at the Air Ministry. The Air Ministry issue instructions and directives to the various air officers commanding-in-chief at home and R.A.F. commanders-in-chief overseas, to whom is delegated a considerable amount of authority. In their turn commanders-in-chief raise matters for decision by the Air Ministry. The air officers commanding-in-chief and commanders-in-chief have at their headquarters their own air, technical, and administrative staffs, and administer smaller headquarters and units (e.g. stations, training establs.). Officers are trained in staff duties at the R.A.F. Staff College, Joint Services Staff College, and Imperial Defence College. They are, however, only employed on staff duties for limited periods—at other times they carry out their normal work of flying, administration, or technical duties.

Staff College, Camberley, in Surrey. The Army S. C., designed to train selected officers for the staff and later for appointments in command. Officers here study the intricacies of the science of warfare and discuss and practice the tactical handling and administration of large formations composed of all branches of the army. Co-operation with the R.N. and the R.A.F. is an essential feature of the instruction. In addition to the purely military studies, emphasis is placed on broadening officers' general knowledge. During the course, which lasts one year, visits are paid to both military establs. and civilian firms and newspapers. Lectures are given throughout the year by senior officers of the services, gov. ministers, and other prominent men. All officers who graduate from the S. C. have the letters 'p.s.c.' placed after their names in the Army List.

Staff College, Joint Services, opened early in 1947 at Latimer House, Chesham, Buckinghamshire, England. It has about 100 students chosen from the R.N., the Army, the R.A.F., the home civil service, and the dominions. Officers normally attend this college at some period after passing through their respective S. Cs.

Each course lasts about six months. The syllabus covers the activities of all three services and of gov. direction in wartime, and is designed to qualify officers for appointments on joint staffs and for higher staff appointments in their own services. The directing staff of the college is drawn from all three services, the commandant being found by each service in rotation. The college develops mutual understanding and a common doctrine between the services, and evolves a standardised system of staff work. Among the subjects studied are the organisation and capabilities of the three services, imperial strategy, the study and analysis of inter-service and joint operations, and the planning and execution of joint operations of all kinds. Such subjects as weapon and equipment development, scientific warfare, military geography, the machinery of war production and modern production methods, and the governmental and central direction of war are also included in the syllabus.

Staff Colleges. military colleges open to officers of all arms, including the Royal Marines, maintained by the gov. for the purpose of affording selected officers instruction in the higher branches of the art of war and in staff duties (see STAFF, MILITARY). A limited number of officers of the permanent staff or permanent forces of Canada, Australia, New Zealand, and S. Africa, and certain other countries selected by the gov. of those countries may be permitted to undergo the course. Twenty-four vacancies are annually filled by competition and eight by nomination. See preceding article.

Staff, Military. The S. of an army formulates the plans and transmits the orders of the commander-in-chief and co-ordinates the operations of subordinate commanders. It is composed of a number of specialised elements, usually all under a chief of S. S. now are of two kinds: (a) those at the War Office (g.v.) (or equivalent depts.), which are in being during peace and war, and (b) those which are formed to accompany a field army during active operations. In the latter case the lower formations such as divs. and brigades maintain S. during peace which accompany these formations on active service.

British Army.—The first example of an organised S., with mainly administrative duties, of which we have detailed knowledge, is that of the new model army, based on the practice of Gustavus Adolfus as perfected by the Prussians. It was controlled by the sergeant-major general under the Capt-Gen. Sir Thomas Fairfax. This S. was capable of transmitting written administrative orders, but its operational plans were not committed to paper and operation orders were given by word of mouth, either direct to commanders or through aides-de-camp.

The greater complexity of military organisation and the multiplicity of arms led to the issuing of written operation orders and to the formation of the 'G' (general) branch of the S. which is now subdivided into operations, intelligence, and S. duties (allocation of officers and

personnel), and takes precedence over the older 'A' (adjutant general) and 'Q' (quartermaster general) branches. Artillery and engineers maintain separate S. at headquarters the commanders of which, in addition to their duties as commanders of their own arms are advisers to the force headquarters commander on all matters affecting their arms. Orders for operations are received from the 'G' branch and for administration and supply from 'A' or 'Q' branches respectively.

In the Brit. Army a system of alternating command and S. employment operates so that all S. officers have regimental experience, and some regimental officers and most generals have S. experience. For practical purposes there is no general S. corps.

French Army.—The Fr. S. system which was widely adopted in E. Europe dates in origin from the reforms of Louvois (g.v.) about 1680. Besides the commander's personal assistant (*chef de cabinet*) there is a *chef d'état-major* controlling the whole S. which consists of *bureaux* as follows: 1^{er} *bureau* (adjutant and judge-advocate); 2^d *bureau* (intelligence); 3^e *bureau* (operations); 4^e *bureau* (quartermaster). Here also the system of alternating command and S. duties operates. Fr. S. are noticeably smaller, and S. appointments carry a lower rank, than in other armies.

United States Army (see also WAR DEPARTMENT, U.S.A.).—Before 1903 no permanent general S. existed in the U.S. Army, and the present S. system, which is uniform from the War Dept. down to regimental level, is essentially that laid down by the Defence Act of 1920. It bears certain resemblances to the Fr. system, largely owing to the experiences of 1917, but perhaps in part dating back to the days of Lafayette. Every formation and unit has a chief of S., and under him assistant chiefs of S., G. 1 (adjutant), G. 2 (intelligence), G. 3 ('executive,' i.e. operations), G. 4 (quartermaster), and latterly G. 5 (civil affairs or military government). Specialist corps for S. duties abound. Amer. S. officers rank relatively high; e.g. the A/C. of S., G. 2, at an Amer. corps is a colonel; at a Brit. corps a major is in charge of intelligence duties. The same system of S. duties obtains in regiments and battalions; but here the respective officers are known as S. 1, S. 2, etc.

German Army. In Prussia and in the Hohenzollern and Third Reichs was developed the general S. corps *par excellence*. Down to the dissolution of the Ger. Army in 1945 only general S. officers were given high command in the field (Rommel was an exception), and the army representatives on the O.K.W. (Combined Services Supreme Command) were almost exclusively drawn from this corps. Ger. S. organisation though smoothly working was elaborate and intricate. It was arranged in echelons rather than branches, each echelon designated by a Rom. figure. Thus the most forward S. echelon consisted of Ia (operations), Ib (adjutant), Ic (intelligence), Id (forward supply of ammunition, rations, etc.). These echelons

extended, with numerous subdivisions, far to the rear (*Rückwärtige Dienst*), and down to VI. The administrative branches of the S. were controlled not by army officers, but by War Office officials (*Wehrmachtsbeamten*) bearing titles such as *Stabsintendant* (major in charge of supplies), *Feldbischof* (senior chaplain), *Assistentenarzt* (medical officer, lieutenant), *Oberstzahlmeister* (lieutenant-colonel, pay corps).

U.S.S.R. (see also RED ARMY).—In general the Russian system conforms to the Ger., since it has been largely influenced by Ger. example, both in Russo-Ger. wars and by the loan of Ger. military advisers from the time of Peter the Great down to the late 1930s. The Russians have a general S. corps, and also some characteristic Ger. military ranks, such as colonel-general.

Staff, Naval, term used for the operational, as opposed to the administrative, S. of the R.N. Unlike the other two services, the administration of the navy is largely run by civilians and, before 1832, it was divorced from the Admiralty in a separate 'Navy Office' in Somerset House. Though, later, construction and material were brought under the Third Sea Lord as controller, and supplies under the Fourth Sea Lord, administration of the R.N. remained predominantly civilian. Only in 1941 was an administrative section under naval officers attached to the Plans Div. In 1882 the Naval Intelligence Div. was set up with a small group of officers, and became the nucleus of the future naval S. But its functions were purely advisory, its object being to collect and disseminate all information leading to operations of war. The organisation into which it developed was inadequate, and the Agadir crisis of 1911 revealed that naval war plans were virtually in the mind of the First Sea Lord, and that no attempt had been made to relate them with those of the army. With Winston Churchill as First Lord a properly constituted war S. was estab. in Jan. 1912. By the end of 1914 it comprised the Operations, Training, Mobilisation, and Intelligence Divs. Two years later the Anti-submarine Div. was created, and the First Sea Lord also became the chief of naval staff (C.N.S.), thus giving executive power to the war S. To-day (1950) the C.N.S. is assisted by the Fifth Sea Lord as deputy chief of naval staff (Air), together with a vice chief of naval staff and an assistant chief of naval staff, while the divs. of the naval S. include Plans, Operations (Sea and Air), Trade, Intelligence, Gunnery, Navigation, Under Water Warfare, Signals, and Training. The S. of commanders-in-chief are set up on a similar principle.

Stafford, Henry, see **NORTHCOTE, BARON**.

Stafford, municipal bor., mkt tn., and co. tn. of Staffordshire, England, on the R. Sow, 23 m. N.W. of Birmingham. Domesday Book mentions a castle, then in ruins, which William I. had built. In 1224 S. was granted an aid for enclosing the tn. with walls. Traces of the old walls are still to be seen, and the name still persists in two of the streets. The

present castle, 1 m. outside the tn., stands on the site of that built by Ralph, Baron S., in 1348, and destroyed in 1643. The earlier castles were inside the tn., i.e. on an entirely different site. Other notable buildings are St. Mary's Church, restored by Sir Gilbert Scott, containing a bust of Izaak Walton, a native of S.; the church of St. Chad; shire, tn., and co. council halls; the Technical School, Edward VI. Grammar School, and the co. school of arts and crafts. The chief industries are electrical engineering and the manuf. of boots and shoes. There are also locomotive engineering and suit works. Until 1918 the bor. sent a member to Parliament. Pop. (1948) 37,500.

Staffordshire, midland co. of England, bounded on the N.E. by Derbyshire, E. by Leicestershire, S.E. by Warwickshire, south by Worcestershire, S.W. by Shropshire, and N.W. by Cheshire. The surface generally is level, rising to hilly regions in the N. and south. The prin. hills in the N. are Axe Edge on the Derbyshire border, and Congleton Edge on the Cheshire border, while in the south lie the Rowley Hills. The chief riv. is the Trent, with its tribs., the Dove and Churnet. The co. includes the great iron and steel manufacturing dist. known as the Black Country, and the Potteries. There are four great coalfields, the Black Country being the most southerly, stretching from Birmingham to Wolverhampton, and including Walsall, Wednesbury, Dudley, and W. Bromwich; the Potteries occupy the N. coalfield, and include Stoke-upon-Trent, Hanley, Burslem, Loughton, Fenton, and Tunstall; while Cheddle is the centre of the third coalfield and Cannock Chase is the fourth. Coal was first mined here in the thirteenth century; potteries were started in the eighteenth. Other industries are the breweries at Burton-on-Trent, chemical works, brick and tile works, paper-mills, and the manuf. of boots and shoes at Stafford, and the metal industries of the Black Country. Agriculture is carried on also, oats, wheat, and barley being grown, and there are dairy farms. Railway communication is good, the prin. centre being Birmingham, and the S. and Worcester, Trent and Mersey, and other canals serve the co. The co. is divided into six parl. divs., each returning one member. Stafford is the co. tn. and S. is in the Lichfield diocese. N. S. Univ. College (q.v.) was planned to serve the heavily populated area around Stoke-upon-Trent. S. was settled by the Romans, then occupied by the Welsh, Wall (*Lletocetum*) was a Rom. station; it is preserved as an anct. monument. Under the Eng. it formed part of the kingdom of Mercia, the Mercian kings having their residence at Tamworth. Besides the cathedral at Lichfield there are many beautiful par. churches, as St. Mary's, Stafford, and St. Peter's, Wolverhampton. There are also remains of castles at Stafford, Tamworth, Tutbury, and Chartley. Samuel Johnson and Izaak Walton were natives of S. Area 1164 sq. m. Pop. (1948) 1,586,700. See S. Shaw, *History of Staffordshire Potteries*, 1829; and *Victoria County*

History: *Staffordshire* (vol. 1.), 1908; W. Beresford, *Memorials of Old Staffordshire*, 1909; C. J. B. Masefield, *Staffordshire*, 1930; and P. Drabble, *Staffordshire*, 1949.

Staffordshire Bull Terrier differs from the modern bull terrier (*q.v.*) in sev. ways, and is a representative of the original fighting breed. Dogs weigh from 28 to 34 lb. The head is short and deep, the neck thick and muscular, the chest wide and deep, and the hindquarters light but strong. The coat may be any shade of red, fawn, black, or brindle, with or without white markings. The breed is unexcelled as a guard.

Staffordshire Regiments, North and South. *North Staffs.*—Formerly the 64th and 98th Regiments. The 64th, raised in 1756 as the 2nd Battalion 11th Foot, was made a separate regiment in 1758, and served in America, the W. Indies, and India. The 98th, raised in 1824, served in the Cape of Good Hope, China, and India. The two regiments were linked in 1881 to form the present regiment, which served in the S. African war, 1900–2. During the First World War it raised seventeen battalions, which served in France, Flanders, Gallipoli, Egypt, Mesopotamia, Persia, and N.W. Frontier of India. In the Second World War the regiment fought with the Eighth Army in Libya and throughout the It. campaign.

South Staffs.—Formerly the 38th and 80th Regiments. The 38th, raised in 1702, served in operations in the W. Indies, America, Cape of Good Hope, Monte Video, Peninsula, Crimea, and Indian Mutiny. The 80th, raised in 1793, served in operations in Flanders (1794), Cape of Good Hope, and the Zulu wars. The two regiments were linked in 1881 to form the present regiment, which served in the Egyptian, Nile, and S. African campaigns. During the First World War it raised eighteen battalions, which served in France, Flanders, Italy, Gallipoli, and Egypt. In the Second World War different battalions served in N.W. Europe, particularly at the battle of Arrhem, Sept. 1944, and as part of the Chindit force in Burma.

Stafford Springs, tn. of Tolland co., Connecticut, U.S.A., 25 m. N.E. of Hartford, on the Central Vermont railway. Manufs. include doekins and cassimere. Pop., including South Springs, 3400.

Stag-beetle, term applied generally to species of lamellicorn coleoptera in the family Lucanidae. The males are remarkable for the enormous development of their mandibles, which are sometimes equal in length to the rest of the beetle. The larvæ are fat white grubs which dwell inside the wood of trees, and do not become perfect insects until the lapse of about five years. Four kinds are found in Britain. The largest Brit. beetle is the common S. (*Lucanus cervus*), which is common around London.

Stage, *see* DRAMA; REPERTORY THEATRE; THEATRE.

'Stage, The.' leading newspaper of the theatrical profession, pub. weekly by Carson & Comerford Ltd., 19–21 Tavistock Street, W.C.2. Founded in 1880, its

present editor is the dramatic critic, S. R. Littlewood. The S. covers every branch of the entertainment industry, including drama, variety, repertory, concert, and music, and cabaret. In addition to reviews of the week's new plays and revivals, it contains articles and news of theatrical interest. The *Stage Year Book and Guide* is pub. annually.

Stage Carriage, defined by the Revenue Act, 1869 (replacing the corresponding provision in the Stage Carriages Act, 1832), as any vehicle, other than a railway carriage, used for the conveyance of passengers who are charged separate and distinct fares, or at the rate of separate and distinct fares for the respective seats. Under the Stage Carriages Act, 1832, a S. C. may not be used without the required numbers of passengers being painted on it. A horse tramcar (Brian v. Aylward) and an electric tramcar (Phesso v. Fisher, 1915) are S. Cs. A bus, privately hired for a journey from one place to another, is not a S. C. (M'Kee v. Weir, 1929). In bors. and other urb. dists., and in those rural dists. invested with the necessary powers under the Public Health Acts, S. Cs. that are hackney carriages within the Town Police Clauses Act, 1889, are seemingly subject to both sets of provisions. Throughout England S. Cs. are subject to the provisions of the Act of 1832 as amended by the London Hackney Carriages Act, 1833, the Railway Passenger Duty Act, 1842, and the Revenue Act, 1869. Within the metropolitan police dist. they are subject to special enactments. S. Cs. are not to carry either in the whole or inside or outside a greater number of passengers than it is constructed to carry as ascertained according to the relevant statutory provisions or than painted numbers specify. There are penalties for breach of these restrictions from £5 to £10 fine. In *Dennis v. Miles* (1924) a motor omnibus licensed in King's Lynn as a hackney carriage was held to be a S. C. outside that dist., and also a S. C. in King's Lynn. The effect of the Road Traffic Act, 1930, is that the above statutory provisions governing S. Cs. relate only to S. Cs. that are not motor vehicles or motor S. Cs., and that other public service vehicles (*q.v.*) are subject to regulations made under section 94 of the Act of 1930. According to the decision on appeal in the divisional court in the case of *Hunt v. Morgan* (Dec. 2, 1948) a disengaged cruising taxicab is not bound to stop and accept the passenger who hails it. There had previously never been a decision on this point, though there existed a widely held belief that a cabman, whether on the rank or not, was bound to accept a fare unless he had a reasonable cause for refusing. If, however, the driver actually solicits custom when cruising, it seems that he is guilty of an offence under the London Hackney Carriages Act, 1843. By the combined operation of the London Carriage Hackney Carriage Act, 1843 (empowering the police commissioners to set up 'standings' or cab-ranks), the London Hackney Carriage Act, 1853 (on the construction of the words 'plying for hire'), and the London

Hackney Carriage Act, 1831 (providing that a cab found standing in any street or place shall, unless actually hired, be deemed to be plying for hire, although not on any standing or place usually appropriated for the purpose of cabs plying for hire) the court in the above case decided that a London taxicab is 'plying for hire' only (1) when it is stationary and disengaged, having just set down a passenger, and (2) when it is on a rank.

Stage Coach, see COACH AND COACHING.

Staggers, Sheep, see LOUPING ILL.

Staghound, foxhound used only for the purpose of hunting either the wild or the 'carted' deer (see FOXHOUND). A deerhound (*q.v.*) is a quite distinct breed.

Stagirus, or **Stagira**, anct. tn. of Macedonia, Greece, in N.E. Chalcidice, on the Strymonic Gulf. It was the bp. of Aristotle, often therefore called the Stagiritic. The present vil. of Stavro occupies the site.

Stahl, Friedrich Julius (1802-61), Ger. legal writer, b. at Munich of Jewish parents, but became a Christian in 1819. He devoted himself to the study of law, taught at Erlangen and Wurzburg (1832-1840), and became prof. of the philosophy of law at Berlin (1840). He wrote *Die Philosophie des Rechts* (1830-37) and *Der Christliche Staat* (1847), etc. See lives and studies by G. Masur, 1930, and P. Drucker, 1933.

Stained Glass is of anct. use. The earliest known mention is of Count Arnold's gift of a S.-G. window to the abbey of Tegernsee in Bavaria in A.D. 999. S.-G. windows of an early date consisted of a mosaic-like arrangement of pieces of brilliantly S. G., the glass being stained the whole way through. Later pictorial subjects were introduced, the roughly cut pieces of glass being set in leads and fastened to an iron tracery. Slight shading and details were painted on the glass in *grisaille*. Some of the finest S. G. belongs to the thirteenth and fourteenth centuries, and even earlier. Beautiful examples are to be found in Sainte-Chapelle, Paris; Chartres Cathedral; York Minster; King's College, Cambridge; Canterbury Cathedral; Cologne Cathedral; and in the church of the mkt. tn. of Gouda in Holland. The workshops of Engrand Leprince at Beauvais produced some of the most beautiful glass of the sixteenth century, and examples are to be found in St. Etienne, Beauvais, and in St. Vincent at Rouen. In the middle of the sixteenth century a new technique was introduced, the painting of glass in enamels. This method produced imitations of oil paintings: the simplicity of design was lost and, worse, the brilliance of the glass was diminished. In the nineteenth century there was, however, a return to the older method of making S. G. Burne-Jones and Wm. Morris designed and carried out many beautiful S.-G. windows. Their designs were always without canopies to the figures, a convention that had been much used in S.-G. design. A society of S.-G. painters has done much to improve and maintain modern standards of work. To make S. G. at the present time metallic

oxides are painted on pieces of glass, which are then fired, the colours becoming fused with the glass surface. Coke kilns were once used for fixing S. G., but open gas kilns have taken their place. The processes necessary in the production of S. G. may be enumerated as follows: (1) Making of small coloured sketch. (2) Taking templates. (3) Full-size cartoon. (4) Outlining. (5) Cutting of glass. (6) Embossing. (7) Working up. (8) Painting. (9) Silverstraining. (10) Firing. (11) Leading up. (12) Cementing.

See W. R. Lethaby, *Stained Glass Work*, 1905; P. Nelson, *Ancient Painted Glass in England*, 1913; H. Read, *English Stained Glass*, 1926; and E. W. Twining, *The Art and Craft of Stained Glass*, 1928. There are valuable regional studies, e.g. C. Woodforde, *Stained Glass in Somerset, 1250-1830*, 1946, and B. Rackham, *The Ancient Glass of Canterbury Cathedral*, 1949.

Stainer, Jacob (1621-83), Austrian violin-maker, b. in Absam in the Tyrol. He learned the craft at Innsbruck, and also perhaps with one of the Amati family or with Vimercati. From 1641 he worked on his own account, with his brother Marcus (*b. c.* 1625), the latter becoming later an independent craftsman.

Stainer, Leslie, see HOWARD.

Staines, mkt. tn. and urb. dist. on the Thames, in S.W. Middlesex, England, 19 m. from London. It has breweries, linoleum factories, and market gardens; it adjoins London Airport. There is a market twice weekly. Runnymede where King John signed Magna Carta, is only 2 m. distant, and the tn. contains the church of St. Mary, with a tower by Inigo Jones (1631). Pop. 39,200.

Staining, see under PAINTING AND DECORATING. *Some Decorative Methods*.

Stanland, tn. in the W. Riding of Yorkshire, 3 m. S.W. of Halifax, England. It has manufs. of woollen goods, worsted, cotton, and paper. Pop. 5,000.

Stainless Steel, see under NICKEL. *Nickel-Chrome Steels*.

Stair, Earl and Viscount, see DALRYMPLE.

Stair, par. and vil. of Ayrshire, Scotland, from which a famous Scottish family derived its title. The Dalrymples of S. held many gov. offices during the seventeenth and eighteenth centuries. The par. includes the coal-mining vil. of Trabnoch. The well-known Water-of-Ayr stone (from which curling stones are made) has been exported very largely from S. Pop. 10,500.

Stakes, see RACE MEETINGS.

Stalactites and Stalagmites are found in limestone caves and under damp arches. They are formed by the deposition of calcium carbonate from solution. Water saturated with limestone held in solution by carbon dioxide drips from the roof. As each drop gathers it partly evaporates and loses carbon dioxide; the excess of carbonate which it can no longer retain is deposited round its edges. With successive drops the deposit grows until a long pendent mass is formed possessing an internal radiating fibrous structure (stalactite). The water from which these lime icicles are derived falls to the floor, and on further evaporation these drops

give rise to pillar-like masses called stalagmites. Curtain-like structures are sometimes formed. White and blue tints may be given by salts dissolved in the water. See CAVER.

Stalbridge (the anct. **Staplebridge**), tn. of Dorsetshire, England, 7 in. from Sherborne. There is a very old church and a market cross. Timber and gloves are produced. Pop. 1500.

Stalin, Iosif Vissarionovich Dzhugashvili (b. 1879), Russian statesman, b. at Gori in Transcaucasia, son of a peasant who became a cobbler, and who died when S.

Soviet Weekly

IOSIF STALIN

was eleven years old. At seven he survived an attack of smallpox, though scars remained. From fourteen to nineteen he was at the Gk. Orthodox Theological Seminary at Tiflis, where he first took to the study of revolutionary doctrines, in 1898 joining the Social Democratic party. In the same year he was expelled. For the next few years he did propaganda work in the industrial lns. of the Caucasus. Between 1902 and 1913 he was arrested seven times, exiled to Siberia six times, and escaped five times. Up to 1917 he was an active but minor figure in the Social Democrat movement. He joined the Bolshevik faction when the party split in 1903, and first met Lenin at the all-Russian Bolshevik conference in Finland in 1905. S. attended the Russian Social Democrat conferences of the next two years, in Stockholm and London; these, apart from two short visits to Cracow and Vienna in 1912, seem to have been his only experience of foreign countries.

In Feb. 1917 the news of the revolution brought him to Petrograd, shortly to become a member of the Bolshevik party's central committee. Helping in the overthrow of the Kerensky gov., S. was one of 'the Five' of the Oct. Revolution and later of 'the Seven,' along with others of the original Bolsheviks, such as Zinoviev and Trotsky, whom he later crushed. He became commissar for nationalities, holding the post until 1923, and also took an active part in the civil war, with Voroshilov, defending Tsaritsyn (now Stalingrad) against the Whites. In March 1919 he became commissar for state control.

The opportunity to create a position of personal power came with his election to the general secretaryship of the central committee of the Communist party in 1922, for he was able to place nominees of his own in many key positions in the party. Moreover, as general secretary he was able to control the Central Control Commission in charge of the 'purges.' On the death of Lenin many others in the party had equal or better claims to leadership, and indeed Trotsky was perhaps the one generally regarded as Lenin's natural successor. Against him S. joined with Zinoviev and Kamenev, and when the Trotsky group was ousted, S. collaborated with Rykov and Kalinin against the Zinoviev group. It was not, in fact, until the final 'purges' of 1936-37 that the last of the old Bolsheviks were destroyed, but S.'s virtual victory was early estab. Thenceforward he put into practice his own policies based always on his idea of what the master, Lenin, would have wanted. He forced, at great cost, the industrialisation or collectivisation of the farms, and ruthlessly pursued Lenin's path towards converting Russia from an exclusively agric. into an industrial and mechanised country. By 1927 S. had achieved entire control of the party.

In 1936 and 1937 S. effected a party purge, marked by the Moscow trials of Radek, Bukharin, and Marshal Tukhachevsky, and many executions of former leading Communists (see RUSSIA, History). The enthusiasm which greeted the five-year plan overwhelmed the 'Right Troika,' as the Rykov, Bukharin, and Trotsky faction was termed, and their downfall marked the end of serious opposition to S. within the upper hierarchy of the Bolshevik party, and one may say that from the beginning of 1930 onwards S.'s authority was supreme.

S. became the core and symbol of the Communist faith, the holder of a mystic inner something known as the Party Line, which is and has from the beginning been the expression and inspiration of Bolshevik policy and belief, and it may be said that the world has known no such combination of spiritual and temporal power in the hands of a single man since the days of the mightiest popes. As has been truly said, S.'s greatest achievement has been to mobilise and direct Bolshevik fanaticism and self-devotion in unison with Russian patriotism and contempt for death. From 1934 to 1938 Com-

munists everywhere exalted S. as the champion of anti-Nazism, and indeed S. had sought collaboration with the W. democracies against Hitler. Yet in 1939, during negotiations for an alliance with Britain and France, he concluded a non-aggression pact with Hitler, giving Germany a free hand in Poland, and, following a fortnight's war between Germany and Poland in Sept., the Red Army marched westward into Poland and jointly with Hitler partitioned it.

S. took over the premiership from his able deputy and friend, Molotov, on the eve of the Ger. invasion of Russia in 1941, thereby uniting the two offices, general secretary of the Politburo and premier. S.'s conduct of Russia's defence in the Second World War belongs to the hist. of the country, and details will be found under *Russia, History*.

S.'s publs. are *Lenin and Leninism* (1924); *Problems of Leninism* (1927-29) and *Stalin Speaks* (speeches, 1945). See lives by I. D. Levine, 1931; S. Graham, 1931; H. Barbuse (Eng. trans.), 1935; V. Holland, 1935; O. Ray, 1939; D. M. Cole, 1942; E. Yaroslavsky, 1942; J. T. Murphy, 1945; L. Trotsky (Eng. trans. and ed. by C. Malachuk), 1947; and I. Deutscher, 1949.

Stalinabad (formerly *Dushambe*): 1. Region of the Tadzhik S.S.R. 2. Cap. of the Tajik S.S.R., 100 m. N. of the Afghan frontier, connected by a new trunk road with Tashkent, and by rail with Termez. There are cotton manufs. Pop. 82,500.

Stalingrad: 1. Region of the R.S.F.S.R., on the lower Volga. There is a steppe-land to the E. of the riv., but to the W. is fruitful agric. land, producing winter wheat and a variety of other crops. Area 82,360 sq. m. Pop. 2,289,000. 2. Formerly *Tsaritayn*, cap. of the above, 25 mi. S.W. of Saratov. It, a junction between N. and S., Europe and Asia, a riv. port, connected by rail and riv. with N. Russia, Moscow, the Urals, the Donbas, N. Caucasus, the Caspian, and Central Asia. It has been described as 'the solar plexus of the Russian grain belt.' Before its destruction by the Gers. in 1942 S. was a large modern industrial city, whose pop. had grown from 20,000 in 1920 to 446,000 in 1939. It was, too, one of the great grain-producing centres. It was the economic and industrial centre of the entire lower Volga region and it owed its importance to its central position in relation to the rich grain lands of European Russia and the coalfields of the Don basin, and its situation as an important railway junction, at the point where the Don and Volga come close to each other. When the new ship canal replaces the older canal and the Volga is deepened for vessels of larger draught, S. will again become a great industrial metropolis. Three of the five main railway lines to the lower Volga converge on S. Before 1942 its new factories and workers' settlements stretched along the Volga for sev. miles. It manufactured high-quality steel and chemicals; but the foremost industry was the mass-production of heavy caterpillar

tractors for agriculture. There were also oil refineries, and saw-mills and wood-working plants, representing the former industries which began with the construction of the first saw-mill in 1880. Large apricot orchards have been planted on the light soils close to the city. In the autumn of 1918 Stalin and Voroshilov conducted a brilliant defence of Tsaritayn (as it then was) against a White Army which had advanced from the Don region with the aim of joining the Whites from Siberia and making a single front from the Urals to the Black Sea. The defence of S. in Aug.-Nov. 1942 is one of the greatest events in the world's military hist. A sword of honour, with blade of hardest tempered steel, was presented to S. in 1943, with inscription: 'To the steel-hearted citizens of Stalingrad, the gift of King George VI., in token of the homage of the British people.' For full details of the battle for S., see *EASTERN FRONT, OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR*.

Stalinir, cap. of the S. Ossetian Autonomous Region of the Georgian S.S.R., 30 m. N. of Stalinsk.

Stalin, Mount (formerly *Garino*), peak of the W. Pamirs, in the Tadzhik S.S.R. Height, 24,585 ft.

Stalino: 1. Region of the Ukrainian S.S.R., in the S.E., bordering on the sea of Azov. It is an agric., lumbering, and industrial area. Area 1060 sq. m. Pop. 2,978,000. 2. Formerly *Yuzovka*, cap. of the above, some 70 m. N. of the sea of Azov, connected by rail with Mariupol. It was formerly called *Hughesovka* (*Yuzovka*), after John Hughes, iron founder and son of a Welsh blacksmith who went out on the invitation of the Russian Gov. to set up iron-works (see *HUGHES, JOHN*). On the Donetz coal-field, it is an important iron and steel centre. Pop. 462,000. 3. Seaport in the Archangel Region of the R.S.F.S.R., on the Dvinskaya Gulf.

Stalinogorsk, formerly *Bobriki*, tn. in the Tula Region of the R.S.F.S.R., 20 m. S.E. of Tula. It has the largest chemical works of the Soviet Union, producing nitrogenous and phosphatic fertilisers. Local deposits of phosphates and brown coal are used. Pop. 76,200.

Stalinsk: 1. Formerly *Kuznetsk* (q.v.) tn. of the Kemerovo Region of the R.S.F.S.R., on the r. b. of the Tom. R. It lies among meadows and marshes in the broad valley formed by the junction of the Tom and Koudoma Rs. It is the chief centre of the Siberian steel industry, and its own industry has been built up on ore from the mines in the Magnitogorsk dist. in the Urals. The ann. output of steel from its mills is over 1,000,000 tons. Iron deposits, mainly magnetite, have been discovered in the hilly, wooded countr. S.E. of S., where there is now a large mining settlement. Precious stones, gold and other minerals are also found. Pop. 169,500. 2. Tn. of the Georgian S.S.R. on the Kur R., 75 m. E.N.E. of Tbilisi, with which it is linked by rail. 3. Tn. of the Evreiska Autonomous Region of the R.S.F.S.R., on the l. b. of the Amur R.,

bordering on Manchuria, 175 m. S.W. of Khabarovsk.

•• **Stall**, in eccles. architecture an elevated seat in the choir or chancel of a cathedral or other church. It is wholly or partially enclosed at the back and sides, high, and has projecting arms separating it from its neighbour, and there is usually a ledge for books. S. are generally of wood, though sometimes of stone, embellished with sculptured foliage and grotesques; while in some cases the S. is covered with a canopy of tabernacle work. Most of the S. in Eng. churches and chapter-houses are of pre-Reformation times and were intended for the use of the clergy, chapter, and monks. In cathedral and collegiate churches they are occupied by the canons and prebends. Sometimes there is a row of Ss. for the choir, because they fulfil part of the duties of the monks, the chanting of the divine office.

Stalybridge, municipal bor. and mrkt. tn. of Cheshire, England, on the Tame, 7 m. N.N.E. of Stockport. In 1776 a cotton mill was estab. here. The tn. is mainly engaged in engineering, iron and brass founding, colour making, and the manuf. of cotton, paper, rubber goods, and electric cables. From 1867 to 1918 it returned one member to Parliament, but now forms part of the S. and Hyde parl. div. Pop. (estimated) 22,200.

Stamboul, or **Stambul**, see **CONSTANTINOPLE**.

Stamens, in botany, form with the carpels the essential floral organs, as they are the producers of seed; the sum of the S. in each flower constitutes the androecium. A typical specimen consists of three parts, the filament, anther, and connective, and it is in the anther that the pollen-grains which fertilise the ovules of the carpels are developed; as a result of fertilisation the ovules develop into seeds. See **FLOWER**.

Stamford: 1. municipal bor. and mrkt. tn. on the R. Welland, partly in Lincolnshire and partly in Northamptonshire, England. It became a royal bor. in 972. Part of the earthworks of a Norman castle may still be seen, and during the Middle Ages a number of monasteries were founded, and seventeen par. churches built. Of the latter six survive, and St. Martin's, St. Mary's, All Saints, and St. John's are highly interesting. The Benedictine priory of St. Leonard retains a Norman arcade and a fine W. front. Among the many noteworthy buildings, Browne's Hospital of the time of Edward IV. possesses a chapel with a good screen and some exquisite glass. Burghley House, S. of the tn. was begun in 1575 by Lord Burghley. The house and grounds are open to the public at certain times. Agriculture, engineering, and timber and stone trades are important. The *Stamford Mercury* is one of the oldest newspapers in the country, and is said to have been estab. in 1695. Pop. (estimated) 10,500. 2. City of Fairfield co., Connecticut, U.S.A., on Long Is. Sound, about 35 m. from New York. It is the commercial centre of an extensive region and an important manufacturing tn., producing

builders' hardware, locks and keys, typewriters, and pianos. Pop. 48,000.

Stamford Bridge, vil. in the E. Riding of Yorkshire, England, on the R. Derwent, 8 m. N.E. of York. It was the scene of the defeat of invading Norwegians under Harold Haarfager by the Saxons under Harold, Sept. 25, 1066. Pop. 630.

Stammering and Stuttering, fairly common form of speech disorder, which is due to the inco-ordinated action of the muscles around the larynx. In stammering there is a hesitation or delay in the pronunciation of a syllable, while in a stutter there is a machine-gun like repetition of the initial letters of a syllable. Stammering may be divided into two types depending on whether it originates in childhood or makes its first appearance later in adolescence or adult life. The former is generally regarded as being mainly physiological in origin, i.e. it is believed to be the result of physiological instability in the organisation of the neuromuscular apparatus concerned in speech. It may, however, be provoked or aggravated by emotional factors, and it may arise as an imitation of other children's speech. There may be a family hist. of stammering or of some other form of speech defect. The relatively frequent association of stammering with a family hist. of left-handedness has given rise to the theory that the condition is basically due to the incomplete dominance of the leading hemisphere. This would appear to be confirmed by electroencephalograph records showing the alpha waves of the two hemispheres to be out of phase. Treatment of the physiological type of stammer usually takes the form of training in breath-control and patient re-education in articulation, coupled with the removal of any aggravating emotional factors and suggestion aimed at increasing self-confidence. Some childhood stammers, however, especially those appearing in the first few years of speech development, may be mainly psychogenic. It has been shown in some cases that stammering may be due to infantile conflicts even as early as the suckling phase. Any threat to the oral region, at the stage when phantasies are apt to centre around it, may lead to the production of a stammer as a psychoneurotic symptom. Stammering of recent origin in the adolescent or the adult is entirely psychogenic. It is, in fact, an hysterical symptom, and is usually of short duration. For its removal treatment of the underlying anxiety state by psychotherapy is called for. See also **PSYCHONEUROSIS**, *Anxiety States*; **HYSTERIA**. See S. T. Orton, *Reading, Writing, and Speech Problems of Children*, 1937; L. Despert in *American Journal of Psychiatry*, 1943; and D. K. Henderson and R. D. Gillespie, *A Text-book of Psychiatry* (6th ed.), 1944.

Stamp, Josiah Charles Stamp, first Baron, of Shortlands (1880-1941). Eng. economist; b. in London. He entered the civil service in 1896, and in his spare time read for an economics degree. In 1916 he became assistant secretary to the Board of Inland Revenue, but three years later

became a director of Nobel's Industries Ltd. Later S. became chairman of the L.M.S. Railway, and, in 1928, a director of the Bank of England. In addition he held sev. univ. posts, and served on various financial committees. He became a peer in 1938. A month after war broke out in 1939 the gov. appointed S. as 'adviser on economic co-ordination,' to assist the Cabinet committee on economic and financial policy; but co-ordination was not the Chamberlain Gov.'s strong suit, and S. and his fellow economists found that they had little scope. But he continued his association with the economic machinery of the war Cabinet until a few months before his death. Of his books the most scholarly was his *British Incomes and Property* (1916), a critical sifting of the statistics which provided a sounder basis than had previously existed for estimates of the national dividend and its distribution. In *The Fundamental Principles of Taxation* (1920) his wide experience as a revenue official was brought to bear on the problems of public finance. His *Wealth and Taxable Capacity* (1922) was a popular exposition of the statistical methods involved in the estimation of the nation's wealth; and *The National Income* (1927), produced in collaboration with Prof. A. L. Bowley, was the most authoritative calculation of the magnitude of that wealth that had theretofore been made. Of still greater value to economists is the series of papers he contributed to the *Economic Journal* and the *Journal of the Royal Statistical Society* of which his *Wealth and Incomes of the Great Powers* (1914), reprinted in *Current Problems in Finance and Government* (1924), is of outstanding importance. In 1929 he pub. *Taxation during the War*, a first-hand account of the taxation methods of 1914-19. Other pub. include *Report on Effect of Reparation Payments on Industry* (1925) and *Financial Aftermath of the War* (1930).

Stamp Act. Act passed in 1765 through the instrumentality of Grenville, and in spite of the protests of six out of the thirteen New England colonies of America, by which the gov. gave itself the right to levy a tax on all manner of documents, such as legacies, cheques, and receipts, as a means of raising revenue. The colonists, already irritated by Grenville's customs duties of 1764, declined to use the stamped paper, and on the principle of no taxation without representation, denied the right of the home gov. to tax them at all. The Rockingham Whigs, represented by Burke and Chatham, who succeeded Grenville in office, reopened the Act (1766), but with a saving clause in the shape of an Act declaring that England had full legislative and fiscal authority over the colonies.

Stamp Collecting. see PHILATELY

Stamp Duties. The law relating to S. D. is to be found in the Stamp Act, 1891, and in various subsequent Finance and Revenue Acts. The effect of the provisions of these Acts is that an unstamped or insufficiently stamped document cannot be used in evidence, except in criminal proceedings. If, however, the document

be one which may be stamped after execution, the Court will allow the party producing it to pay the S. D. and a penalty of £10. Bills of exchange and promissory notes and marine policies executed in the United Kingdom cannot be stamped after they have been issued (except that on payment of £100 penalty an unstamped marine policy may be given in evidence), and, therefore, in such cases the objection to their admissibility is fatal. The judge must take notice of the necessity for or the insufficiency of a stamp. A document should, generally speaking, be stamped previously to or at the time of its execution, unless the first execution took place out of the United Kingdom, in which case, with the exception of a marine policy, it may be stamped within thirty days of its arrival within the United Kingdom. Where more than one document is written on the same paper, each document must be stamped separately, to the extent of its proper duty by impressed stamps. Agreements under hand and receipts may be stamped with an adhesive stamp. The party first signing a document stamped with an adhesive stamp is usually the proper person to cancel the stamp by writing his name or initials and the date across the face of the stamp. Agreements under hand only and liable to a S. D. of 6d. may be presented for stamping any time within fourteen days of first execution; deeds within thirty days of first execution; marine policies executed outside the United Kingdom, but enforceable within the United Kingdom, within ten days after first reception within the United Kingdom. Foreign bills of exchange must be stamped with a specially appropriated adhesive stamp by the first recipient in the United Kingdom before he presents the instrument for payment or in any way negotiates it. The instruments for which the use of postage adhesive stamps is permitted under the Stamp Act, 1891, are agreements liable to the duty of 6d.; bills of exchange (including cheques) for payment on demand; lease or tack of a dwelling-house for a definite term not exceeding a year at a rent not over £10 a year; policies of insurance (not life or marine); and receipts. Adhesive stamps may also be used for a lease or agreement, for a lease for any definite term less than a year of a furnished dwelling-house or apartments. Where the duty payable is 1s. or 2s. postage-stamps may be used, but for duties between 3s. and 10s. special Inland Revenue stamps are provided. In two cases (Contract Notes and Foreign Bills) adhesive stamps must be used, and specially appropriated stamps are provided.

Stamps, Postage. see POSTAGE STAMPS; PHILATELY.

Stand. see WHITEFIELD

Standard. see BIMETALLISM; CURRENCY; FLAG, WEIGHTS AND MEASURES.

'**Standard**,' former leading London daily paper, estab. in 1827 as an evening paper. Originating during the controversy over Rom. Catholic Emancipation as a staunch upholder of the throne, the Brit. Constitution, and especially of the Protestant

religion, it was consistently Conservative throughout its existence.

Standard, or *Verillum*, uppermost and largest of the five petals composing the irregular corolla of papilionaceous flowers. It overlies the lateral wings and the 'keel.' In horticulture a S. tree or shrub is one grown on a single upright stem.

Standard Hill, in the N. Riding of Yorkshire, near Northallerton, was the scene of the battle of the Standard, fought in 1138 between David of Scotland and the N. barons, which resulted in David's defeat. The Eng. fought under the banners of sev. saints, fastened on a pole, with a cross above; hence the name of the battle.

Standardisation. Attempts at standardising tokens of value, weights and measures are to be observed early in the hist. of civilisation. The head of Caesar on a Rom. coin served to establish a fixed value even though in practice traders may have hoarded the heavier coins and passed on the lighter. The Romans also had standardised measures of weight. The lb. (libra) was adopted by the Romans, and was based on the weight of 7680 grains of wheat—the grain of wheat being the first unit of weight adopted; it was specified that the grains used had to be taken from the middle of the ear and dried. In Saxon times Eng. standards were kept at Winchester whence they were moved to Westminster under the Normans. In the thirteenth century it was enacted that three barley-corns = 1 in., 12 in. = 1 ft., 3 ft. = 1 ell. Most of such standards came about through a more or less unconscious evolutionary process based on common use and have survived through the centuries. With the introduction of the craft guilds in the Middle Ages, standards of workmanship and the development of technique were a function of the guilds, and the marking system (or gild marks) then adopted brought great credit to Brit. workmanship and commerce; in some cases these gild marks have continued to the present day. To meet modern needs, standards of measurement have been set up in other fields—units of temp., electric measures, frequencies, atomic weights, etc.

The remarkable expansion of production during the latter half of the nineteenth century, in Great Britain in particular, allied with increasing ease of communication bringing the products of many manufacturers to the consumers, drew attention to the need of simplification and S. in order to reduce an unnecessary multiplicity of sizes and ranges, to permit assessment of fitness for purposes, to provide a uniform basis of comparison, to define in uniform terms the correct applications and to secure accuracy of descriptions. Sir Joseph Whitworth, the inventor of the screw thread bearing his name and of precision machine tools, was the first to advocate S. to secure interchangeability, and Great Britain was the first country to put S. on an organised basis when, in 1901, the Institutions of Electrical, Mechanical, and Civil Engineers, the Iron and Steel

Institute and the Institution of Naval Architects set up a joint committee from which has developed the present Brit. Standards Institution. The institution is now recognized by gov. and by industry as the national organisation for the preparation and promulgation of all standards of national application other than for a few specialised products. Other countries have followed this lead and the Brit. Standards Institution collaborates closely with the national standards bodies of thirty-six other countries, including the Amer. Standards Association which is its counterpart in U.S.A. although the National Bureau of Standards as the gov. organisation and the Amer. Society for Testing Materials and sev. other bodies also issue national standards. The advantages claimed for standards are many, chiefly economy, reduction in selling costs, greater facilities for mass production, and greater consumer choice.

Standard of Living. This is the term used to indicate the results of inquiries or measurements concerning the kinds of and expenditure on food, housing, clothing, and other necessities or amenities enjoyed by any section of a community at any given moment. The results of such inquiries may be measured against certain 'desirable' or 'minimum' standards in order to assess the adequacy of an existing S. of L., or the results of successive inquiries may be compared in order to assess the changes in the S. of L. over a period of time. The results may also be used for the purpose of comparing the S. of L. of different countries. Owing to the economic upheavals which resulted from two world wars in the last half-century, and the rapid and, in some cases, violent changes which took place in the supplies and prices of commodities, the S. of L. is a much more controversial matter now than formerly. In the United Kingdom during this period, two inquiries have been made into the pattern of household expenditure in a large number of industrial and other workers' families. In 1904 the Board of Trade collected nearly 2000 urb. working-class family budgets giving particulars of family incomes and of expenditure on food and rent. The particulars derived from this inquiry, supplemented by other information, and adjusted to the price levels of July 1914, were used as a basis for the official 'Cost of Living Index' which was started early in the First World War. For some years before the Second World War, however, it was generally recognised that this index needed revision, in view of the fact that after 1914 the working-class S. of L. had obviously undergone very considerable changes. Accordingly, a second inquiry into household budgets was made in 1937-38; this inquiry covered about 10,000 working-class households. The results were summarised in the *Ministry of Labour Gazette* for Dec. 1940 and Jan. and Feb. 1941. By that time the war had broken out and the revision of the basis of the index had to be left in abeyance for a time. In 1947, however, the gov. decided that the basis of the old

cost of living index had become so out of date that the index should be terminated and that a new 'Interim Index of Retail Prices' should be substituted until it might be possible to make a further collection of household budgets and arrive at a fresh starting-point for a permanent index. The 'Interim Index of Retail Prices' measures the changes, since June 1947, in the retail prices of the goods and services which entered into working-class expenditure in 1937-38, as shown by the family budgets collected during that period.

Some idea of the changes which occurred in the S. of L. in the United Kingdom between 1914 and 1937-38 is given by a comparison of the results of the 1937-38 family budget inquiry with the expenditure basis used for the 1914-17 cost of living index. For example, in 1914 it was estimated that food accounted for about 60 per cent of the expenditure on all the items covered by the 1914-17 index, but in 1937-38 food expenditure of urb. households accounted for only about 40 per cent of total family expenditure, although the actual expenditure on food was very much higher in 1937-38 than in 1914. This higher expenditure was due not only to higher prices in the later period but also to the fact that expenditure of the present generation covers many articles of food which were not available or were seldom purchased by working-class households in 1914. The smaller proportion of total expenditure devoted to food in 1937-38 was accompanied by a much greater proportion of expenditure devoted to items outside the group of basic necessities. To this extent it can be argued that comparison of the 1937-38 standard with that of 1914 shows substantial changes in the ways of living and habits of expenditure of the classes of the pop. covered by the inquiries. When a further collection of budgets is found desirable and practicable, the results may again throw some light on further changes in the S. of L. In the meantime, though the number of workers whose wage-rates are subject to variation on a sliding scale based on the official index has fallen in recent years, the Interim Index of Retail Prices is still a factor in many negotiations between organised employers and workers about wages. In Jan. 1950 the index of retail prices stood at 113 (June 17, 1947 = 100), while the index of rates of wages in the prin. industries and services in the United Kingdom was 110 (June 10, 1947 = 100).

See also **COST OF LIVING**. For fuller information about the new Index of Retail Prices see *Interim Report of the Cost of Living Advisory Committee* (Cmd. 7077), and *Interim Index of Retail Prices—Method of Construction and Calculation*, pub. by H.M. Stationery Office.

Standard Oil Company, international oil combine, possessing a virtual monopoly, developed out of a company founded in Ohio in 1870. After a long-drawn-out political and legal struggle the combine was declared illegal by the U.S. Supreme Court under the Sherman anti-trust law in 1911, and was separated into its con-

stituent parts, the largest being the S. O. C. of New Jersey. See also **ROCKEFELLER**.

Standard, Royal, popular name of the king's banner of arms. It bears the full blazonry of his majesty's royal arms. In Richard I.'s time the royal banner bore only the three lions passant. In 1340 these arms were quartered with those of France on account of Edward III.'s claim to the Fr. crown. These were afterwards removed and those of Ireland were introduced in 1603. The lion rampant within a tressure represents Scotland. From the time of George I. until the accession of Victoria, the R. S. also bore the arms of Hanover. Since that time it has remained in its present form.

Standards Institution, British, see under **STANDARDISATION**.

Standards, National Bureau of (U.S.A.), see under **STANDARDISATION**.

Standard Solutions, solutions the concentration of which is known. *Normal*, *semi-normal*, *deci-normal*, etc., solutions are a common variety of S. S., such that 1 litre of the solution contains 1 gram-equivalent, half a gram-equivalent, one-tenth of a gram-equivalent, etc., respectively, of the dissolved substance.

Standard (or Normal) Temperature and Pressure are 0° C. and 760 mm. respectively.

Standards Department (Board of Trade), gov. dept., is not to be confused with the Brit. Standards Institution. It was created by the Standards of Weights, Measures, and Coinage Act of 1866 and came into existence in 1867, taking over the functions of regulating weights and measures previously exercised by the exchequer. It is responsible for the central administration of the Weights and Measures Acts and Regulations, the day to day enforcement being in the hands of Inspectors of Weights and Measures who are appointed by the Local Authorities. Its duties include the custody of the Imperial Standards of length and mass, of the Board of Trade Standards derived therefrom and of the Standard coin weights and Trial Plates of the Realm; the periodical re-verification of the Local Standards and weighing equipment provided by the local authorities; the certification of new patterns of weighing and measuring appliances for use in trade; the examination of candidates for certificates of qualification as Inspectors of Weights and Measures; the promulgation of regulations relating to weighing and measuring apparatus in use for trade and to the sale of food; the verification of flash point apparatus under the Petroleum Acts and the general direction of the work of the Inspectors of Weights and Measures.

Standard Time, see under **TIME AND TIME MEASUREMENT**.

Standerton, tn. of the E. Transvaal, S. Africa, on the banks of the Vaal R. Great numbers of sheep, horses, and cattle are bred, and large quantities of oats, mealies, and manna raised in the dist. Pop. 10,800.

Standing Stones, term used of stones erected by man. They may be found singly or in groups, and some are the

remaining stones of burial chambers once set in long barrows. Other stones have inscriptions in poor Lat. or in Ogham characters. Notable S. S. are the Devil's Arrows, Boroughbridge, E. Riding of Yorkshire; the Five Kinks, in Upper Coquetdale, Northumberland; and Harold's Stones, Trolleck, Monmouth. *See also* CIRCLES OF STONES; MENHIRS.

Standish, Myles (c. 1584-1656), Eng. colonist, *b.* at Duxbury, in Lancashire. He served under the Veres in the Netherlands before 1603, and took an active part in the war against the Spaniards, but in 1609 settled at Leyden, from which place he embarked in 1620 for New Plymouth on the *Mayflower*. He was chosen military captain of the colony, 1621, and defended it against the attacks of the Indians, notably at Weymouth, 1622, when he defeated the Indians and broke up their hostile league. His exploits are celebrated by Longfellow in the *Courtship of Miles Standish*, and by Lowell in an *Interlude with Miles Standish*. *See* lives by J. Abbott, 1898, and T. Jenks, 1905.

Stanhive, *see* STONEHAVEN.

Stanford, Sir Charles Villiers (1852-1924), Irish composer, *b.* in Dublin, educated at Cambridge, and studied music at Leipzig and Berlin. Organist of Trinity College, Cambridge, and conductor of Cambridge Univ. Musical Society (1872-1893) and of the Leeds Festival (1901-10). He was appointed prof. of music at Cambridge Univ. 1887, and was knighted 1901. His work followed in the true Handel tradition, and he is most famous for his choral works: some religious, such as his setting of the *Stabat Mater*, and many songs and anthems; some secular, such as *Songs of the Sea* and *Songs of the Fleet*. He also wrote a number of symphonies and operas and other large-scale works such as the clarinet concerto, violin concerto, etc., and numerous works for the organ. *See* lives by J. F. Porte, 1921, and H. P. Greene, 1935.

Stanford University, non-sectarian co-educational univ. at Stanford, in W. California. It was founded in 1885 by an Amer. capitalist, Leland S., governor of California, in memory of his son. Its grounds cover 9000 ac. There are about 10,000 students and 800 teachers.

Stanger, tn. of Natal, 50 m. N.E. of Durban. It is the centre of an important agric. dist., producing tea, sugar, mealies, beans, and wattle. Chaka, whose memory is still venerated among the Zulus as 'The Old Lion,' lies buried here, a monument being erected to him in 1932. Pop. 2500.

Stanhope, Charles, third Earl Stanhope (1753-1816), Eng. politician and scientist, *b.* in London. He entered Parliament in 1780 as member for Wycombe, and advocated the cessation of the Amer. war and parl. reform. He also opposed the coalition of Fox and North, and attacked Pitt's proposals for a sinking fund. He succeeded to the peerage in 1786, and became chairman of the 'Revolution Society' in 1788, openly avowing his republican sentiments. He was a remarkable public character in his time,

and his thin ungainly figure was caricatured by Gillray and other cartoonists. His *Principles of Electricity* (1779) sets out his theory on the 'return stroke' resulting from the contact with earth of lightning, which theory he worked out in fuller detail in the *Philosophical Transactions* for 1787. Among his many inventions were printing instruments and processes.

Stanhope, Lady Hester Lucy (1776-1839), Eng. traveller, daughter of Charles S. (third earl). She was housekeeper and trusted confidante of her uncle, Wm. Pitt (1803-6), but after his death and that of her brother and Sir John Moore, with whom she was in love, she left England and went on a pilgrimage to Jerusalem. She lived in a villa near Sidon, among the Druse tribe, from 1813 until her death. *See* her memoirs (ed. C. L. Meryon), 1845; life and correspondence (ed. duchess of Cleveland), 1913; and life by J. Haslip, 1934.

Stanhope, James Stanhope, first Earl (1673-1721), eldest son of the Hon. Alexander S., second son of Philip S., first earl of Chesterfield, *b.* in Paris. Educated at Eton and Trinity College, Oxford, he served first under the duke of Savoy, and then under King William III., in Flanders, in the war against France. He was returned to Parliament for the bor. of Cokeremouth in 1702, and he continued to be a member of the House of Commons from this time till his elevation to the peerage. He distinguished himself in the campaign in Spain, and in 1707 was made major-general, and in 1708 appointed commander-in-chief of the Brit. forces in Spain. He captured Port Mahon, but was defeated and captured by the Fr. in 1710 at Brihuega. In 1714 he was appointed one of the two prin. secretaries of state. In July 1717 S. was created Baron S. of Elvaston, and Viscount S. of Mahon in the is. of Minorca, and a few weeks later Earl S.

Stanhope, Philip Dormer, *see* CHESTERFIELD, EARL OF.

Stanhope, Philip Henry Stanhope, fifth Earl (1805-75), Eng. historian, styled Viscount Mahon from 1816 until his succession to the earldom. He took a degree at Christ Church, Oxford, entered Parliament in 1830, and four years later was under-secretary for foreign affairs. In 1832 he pub. his *History of the War of Succession in Spain, 1702-13*, and followed this (1836-54) with a *History of England from the Peace of Utrecht to the Peace of Versailles*. Among his other valuable works was a *Life of William Pitt* (1861-62).

Stanhope, tn. of Durham, England, on the R. Wear, 6 m. from Wolsingham. Lead, ironstone, and limestone are extensively worked. Pop. 1750.

Stanhope Medal, gold medal, instituted in 1873, which is awarded annually by the general court of the Royal Humane Society (*q.v.*), on the recommendation of its committee, for the highest example of gallantry during the year. The award originated in a memorial fund raised to commemorate the services of Capt. Chandos Scudamore Stanhope, R.N.

Stanislas Leszozynski, see under POLAND, *History*.

Stanislas Xavier, see LOUIS XVIII.

Stanislav (Polish *Stanislawow*): 1. Region of the Ukrainian S.S.R. The slopes of the Carpathians in the S.W. are thickly wooded, and in the plains at the foot of the mts., watered by the tribs. of the Dniester, maize, melons, and sun-flowers are grown and livestock reared. Salt, potash, and oil are found. The area was a Polish co. until taken by Russia in 1939, and ceded to Russia in 1945. Area 6520 sq. m. Pop. 1,477,000 (69 per cent Ruthenian and 25 per cent Polish). 2. Cap. of the above, 75 m. S.E. of Lvov. Machinery and textiles are produced, and there are oil-refineries and railway workshops. It lay in Poland until occupied by Russia in 1939, and was in Ger. hands from 1941 to 1944. Pop. 60,000.

Stanko, see KOS.

Stanley, see DERRY, EARLS OF.

Stanley, Arthur Penrhyn (1815-81), Eng. churchman and theologian, b. at Alderley, Cheshire. He was educated at Rugby, under Arnold, and at Balliol College, Oxford, and in 1839 was elected a fellow of Univ. College and took orders. In 1856 he was prof. of eccles. hist. and canon of Christ Church, and in 1863 dean of Westminster. He travelled in Palestine and Egypt (1852-53), in Russia (1857 and 1874), accompanied the Prince of Wales on an E. tour (1862), and visited America (1878). S. was well known for his broad church views. He wrote *Life of Arnold* (1844); *Sermons on the Apostolical Age* (1847); *Bishop Stanley* (1851); *Memorials of Canterbury* (1854); *Sinai and Palestine* (1856); *Lectures on the Jewish Church* (1863-76); *Memorials of Westminster Abbey* (1868); and *Essays on Church and State* (1870). See R. E. Prothero and G. G. Bradley, *Life and Correspondence*, 1893, and H. Bolitho (ed.), *A Victorian Dean*, 1930.

Stanley, Sir Henry Morton (1841-1904), Brit. explorer and author, b. at Denbigh. At the age of fifteen he went to New Orleans, and in 1861 entered the service of the Confederate States. The years 1863 and 1864 were spent in voyages to the W. Indies, Italy, and Spain, and in 1867, having already estab. a connection with the press, he was appointed correspondent for the *New York Herald*, and accompanied Lord Napier's Abyssinian expedition. He next visited Spain, the Suez Canal, Palestine, Turkey, Persia, and India, and then set out to find Livingstone, reaching Zanzibar in 1871. He came upon him at Ujiji, and together they explored the N. end of Lake Tanganyika. In 1872 he pub. *How I found Livingstone*, and in 1874 set off on another expedition, circumnavigated Lake Victoria Nyanza, passed down the Lualaba to its confluence with the Congo, and then traced the course of that riv. to the sea. Having pub. *Through the Dark Continent* (1878), he in 1879 again set out and founded the Congo Free State. He took part in the expedition for the relief of Emin Pasha, and after much disaster met Emin on the shores of Albert Nyanza. Among other works of his are *The Congo* (1885); *In*

Darkest Africa, or The Rescue of Emin (1890); and *My Early Travels in America, and Asia* (1895). His autobiography was ed. by his widow (1909). See lives by J. Wassermann (Eng. trans. 1932) and F. Hird, 1935; and Glivia Stanley, *The Remarkable Expedition*, 1947.

Stanley, Oliver Frederick George (b. 1896), Brit. statesman, a younger son of the seventeenth earl of Derby, educated at Eton and Oxford. After military service in the First World War he was called to the bar (1919), practising for a short time, and then became a stockbroker. He was Conservative M.P. for Westmorland from 1924 to 1945; parl. under-secretary to the Home Office, 1931-33; minister of transport, 1933-34; and minister of labour, 1934-35. Here his political prospects suffered a setback on account of the regulations issued under his Unemployment Assistance Act passed to deal with the problem of 2,000,000 unemployed. He was then transferred to the presidency of the Board of Education, 1935-37. His next post was that of president of the Board of Trade, 1937-40. In 1940 Chamberlain appointed him secretary of state for war in succession to Horne-Bechsha. The first two years of the Churchill Gov. he spent in the army, but in 1942 was recalled to be secretary of state for the colonies, following a swift succession of colonial ministers. He occupied this post until Aug. 1945, and during his tenure were appointed the Colonial Medical Research Committee, the Colonial Animal Health and Forestry Research Committee, the Colonial Social Welfare Advisory Committee, and the Tsetse Fly and Trypanosomiasis Committee.

Stanley: 1. Urb. dist. of Durham, England, 7 m. S.W. of Newcastle. It has coal-mines and women's and children's clothing factories. Pop. 50,000. 2. Par. and vil. of Derbyshire, 5 m. N.N.E. of Derby. It has coal-mines. Pop. 1900. 3. Urb. dist. in the W. Riding of Yorkshire, 2 m. N.N.E. of Wakefield. There are coal-mines and brickfields, and rurburb is extensively grown. Pop. 15,700. 4. Vil. of E. Perthshire, Scotland, on the W. bank of the Tay, 7 m. N. of Perth. It has a cotton factory. Pop. 1500. 5. Cap. of the Falkland Is., about 8100 m. distant from Liverpool or twenty-six days' sail. It has a memorial commemorating the victory of Adm. Sturdee over von Spee's squadron on Dec. 8, 1914. S. is the only important settlement of the colony and is situated on the coast of E. Falkland. There is a good harbour and a wireless station.

Stanley Pool, enlargement of the Congo R., Africa, discovered by H. M. Stanley in 1877, about 25 m. long, 15 m. broad, and about 350 m. from the riv.'s mouth.

Stanleyville, tn. on the Congo R., Belgian Congo, cap. of E. Prov. It is a trading centre, and is connected by rail with Pontherville. The Congo is navigable as far as the tn., from Leopoldville, from which it lies 800 m. N.E. Pop. 13,600.

Stanmore, Arthur Hamilton Gordon, first Baron (1829-1912), Eng. administrator. Having graduated at Cambridge

(1851), he became private secretary to the Prime Minister (1852-55), and acted as secretary to the special mission to Corfu (1858-59). He was governor of Trinidad (1866-70), Mauritius (1871-74), Fiji (1875-1880), New Zealand (1880-82), and Ceylon (1883-90). His pubs. include *Story of a Little War* (1879); *Life of Lord Aberdeen* (1893); and *Memoir of Sidney Herbert* (1906).

Stanmore, part of the Harrow urb. dist., Middlesex, England, and a residential area. Fighter command of the R.A.F. has had its headquarters here since the Second World War.

Stannaries (Lat. *stannum*, tin). Court of the S. of Cornwall and Devon is a court of record (*q.v.*), with a special jurisdiction for the administration of justice among the tinners of those cos. The judge of the court is called the vice-warden. The jurisdiction rests on an anct. privilege confirmed by royal charter in 1305, granted to the tin miners to sue and be sued in their own court so as to avoid being drawn from their business to the public detriment.

Stannic Acid, *see* TIN.

Stansfield, Grace, *see* FIELDS, GRACIE.

Stanton Drew, par. of Somerset, England, 6 m. S. of Bristol, with numerous Druidical antiquities and a Norman bridge. There are coal-mines near by, and trout-fishing in the R. Chew.

Stanza, word of lt. origin, signifying a number of verses, connected by metre and rhyme to form a regular div. of a poem. The word is specially used in Italy to denote the *ottava rima* (*q.v.*), a particular form of S.

Staphyloma, bulging outward of part of the globe of the eye. Anterior S., a bulging forward of the cornea and sclerotic (probably caused by a perforating conical ulcer). Posterior S., protrusion backward of the sclerotic at the posterior pole caused by high myopia, usually accompanied by choroiditis.

Staple (O.F. *estape*, mart or marketplace for wines), once written *estaple*. Used to denote those tns. called 'S. tns.', both in England and on the Continent, where the prin. products or 'S. commodities' of a country were sold. Instances of important S. tns. were London, Calais, Antwerp, Bruges, Canterbury, Newcastle, Bristol, Norwich, Chester, Carmarthen, Cork, and York. All merchandise sold for the purpose of exportation was compelled either to be sold at the S. or afterwards brought there for exportation. Afterwards the word S. came to be applied to the merchandise itself which was sold at the S. tn. The merchants of the south of England traded chiefly with Flanders in wool, woolfells, or sheepskins, leather, lead, and tin. The merchants of the south reached the pitch of their power under Edward II. They had their own court, called the 'court of the mayor of the S.', a court of considerable antiquity. Most of the enactments relative to the S. were passed during the reigns of Edward I. and II. The object of the Statute of Acton Burnell (1283) was to remove the S. previously

held at Calais to various tns. in England, Wales, and Ireland. In 1328 the S. was abolished, though reimposed very shortly afterwards. In 1353 by the *Ordinance of the Staple* (*see* CUSTOMS DUTIES) the S. was regulated and the privileges of the S. merchants confirmed.

Staplebridge, *see* STALBRIDGE.

Staples, The, *see* FARNE ISLES.

Stapulensis, Jacob, *see* FABER, JACQUES.

Star, *see* STARS.

'Star', penny evening daily (London), estab. in 1888 by T. P. O'Connor. Its next editor was the equally well-known Liberal journalist, H. W. Massingham, who continued O'Connor's support of Gladstone's policy. In 1941 A. L. Cranfield became editor. The S. was long associated with the old *Morning Leader*, later the *Daily News and Leader*. The S. makes special appeal to women through its 'Star Man's Diary' and 'human' features. Sales exceed 1,200,000 daily. The S. is owned chiefly by the Cadbury family, as also is the *News Chronicle* (*q.v.*).

Star, 1914-15: 1. '1914 Star'.—This Brit. decoration is a bronze S., with no clasp, pendent from a riband red, white, and blue, shaded and watered, and was granted under an Army Order dated Nov. 24, 1917, as a distinctive decoration for services rendered by the military forces under the command of F.-M. Sir J. D. P. French in France and Belgium during the earlier phase of the First World War in 1914. All military personnel who actually served in France or Belgium on the estab. of a unit of the Brit. Expeditionary Forces between Aug. 5, 1914, and midnight of Nov. 22, 1914, were eligible for the decoration. This decoration is popularly known as the 'Mons Star.' 2. **'1914-15 Star'**.—This decoration was granted under an Army Order dated Dec. 28, 1918, in recognition of services rendered by the Forces in theatres of war between Aug. 5, 1914, and Dec. 31, 1915 (inclusive). The S. and riband are similar in appearance to the 1914 decoration. Qualifying service was in certain scheduled theatres of war, and between certain scheduled dates. Individuals in possession of the '1914 Star' were not eligible for the '1914-15 Star.'

The 1939 45 *Star* has a dark blue, red, and light blue ribbon in three equal vertical stripes. *See also* ATLANTIC STAR; BURMA STAR; FRANCE AND GERMANY STAR; ITALY STAR; PACIFIC STAR.

Star Apple, *see* CHRYSOPLYLLUM CAINITO.

Staraya Russa, tn. in the Leningrad Region of the R.S.F.S.R., 36 m. S. of Novgorod, on the Valdai Hills. It is a health resort. The tn. saw fierce fighting during 1942. Pop. 21,500.

Starazagora (Turkish *Eski-Zagra*), tn. of Bulgaria in E. Roumelia, S. of the Balkans, cap. of a co. of the same name. It is situated in a fertile dist., which produces cereals, wine, and fruit. Trade is carried on, and there are some industries, including the production of attar of roses, and there are mineral baths. Area of co. 6002 sq. m. Pop. 812,700. Pop. of tn. 29,900.

Starch, or *Amylum* ($C_6H_{10}O_5$)_n, carbohydrate, widely disseminated throughout

the vegetable world. It occurs in rice and all kinds of grain in quantities up to 75 per cent, and also occurs in tubers, such as potatoes and arrowroot. From these substances it is prepared by macerating (potatoes) or fermenting (grain) and then washing with water. The S. settles from the water as a paste, which is washed by decantation. It forms a white powder which is made up of striated granules, is insoluble in cold water, but swells and gelatinises in hot water, and is coloured blue with iodine. Boiled with dilute acids it is converted to dextrin and glucose, and heated with diastase it forms dextrin and maltose, which substances are also formed by the action of saliva and pancreatic juice on S. In green plants S. is formed from water and atmospheric carbon dioxide by the agency of the green colouring-matter chlorophyll; the necessary energy is derived from sunlight. There are probably sev. different kinds of S., which name is really a generic term like 'sugar.'

Star Chamber, Eng. high court of justice going back at least as far as Edward III.'s reign, when jurisdiction was exercised in the *chambre des estoiles*, Westminster, the name being derived, perhaps, from a starry decoration on the ceiling. It originated in the civil and criminal jurisdiction of the privy council and was in fact identical with the king's council acting in its judicial capacity. After the estab. of the court of chancery this jurisdiction declined but was revived on account of the lawlessness and corruption of juries which followed the Wars of the Roses. In 1487 the Statute 3 Henry VII., c. 1 constituted a committee of the council, a court with considerable judicial powers, for the purpose of suppressing the evils arising from seditious assemblies and from livery and maintenance. The members of the court were the lord chancellor, lord treasurer, keeper of the privy seal, a bishop, a lord of the council, and the two chief justices. Under Edward VI. the S. C. was still a committee of the council, but by the end of Elizabeth's reign it had become a judicial body distinct from the latter, but it had ceased to remedy the uncertainties and inadequacy of the common law and under the Stuarts it became merely an instrument for enforcing the claims of the prerogative. The procedure of the court was entirely unregulated by law, and consisted in summoning the accused to appear and then examining him on oath. The punishments, which were usually excessive, and often illegal, included mutilation, whipping, and torture to extract evidence or confessions. The abolition of the court in 1641 (16 Car. I, c. 10) deprived the crown of a formidable weapon for the suppression of free speech and writing and for the enforcement of proclamations which the king had no right to make.

Starch, *Animal*, see GLYCOPEN.

Staré-Benátky, former com. of Czechoslovakia, merged with Nové-Benátky to form the tn. of Bená and Jizerou. This tn. is in the dist. of Mladá Boleslav, and the former Ger. name Jungbunzlau applies to the chief tn. of the dist., also Mladá

Boleslav (*q.v.*), 30 m. N.E. of Prague. Pop. of Bená and Jizerou 4300.

Starfish, or *Asteroida*, class of the echinoderms, with a body of starlike shape, the rays of which usually number five; these are movable arms with skeletal structures, consisting of calcareous plates transversely arranged and articulated with one another like vertebrae. Into the arms the chief organs are prolonged. A series of tube feet or suckers is developed along each ray, and is supplied by a system of water vessels. The mouth and the anus are at the centre of the disk. S. live on oysters and other molluscs and dead fishes, and cause considerable loss in some fisheries. The sexes are distinct, and the free-swimming larva, into which the eggs hatch, pass through a series of remarkable stages.

Stargard, see STAROGRAĐ.

Stark, Freya Madeline, Eng. explorer and travel writer, educated in Italy, at Bedford College, and at the School of Oriental Studies. She worked on the *Baghdad Times* and pub. *Baghdad Sketches* in 1933 (new ed. 1937). *The Valleys of the Assassins* (1934) describes journeys in Persia and Kurdistan, for which she received the Burton Medal of the Royal Central Asian Society. She wrote *The Southern Gates of Arabia* (1936) after explorations in the Hadhrumant. During the Second World War she worked for the Ministry of Information in the Middle E. and N. America. Her other publs. are *Seen in the Hadhrumant* (1938); *A Winter in Arabia* (1940); *Letters from Syria* (1942); *East is West* (1945); and *Perseus in the Wind* (1948).

Stark, James (1791-1859), Eng. painter, b. at Norwich. He was a pupil of John Crome for three years, exhibited at the Royal Academy in 1811, and became a member of the Norwich Society of Artists in 1812. He moved to London in 1814, and three years later attended the Royal Academy schools. Ill health caused his return to Norwich, but he came back to London in 1830, and removed to Windsor in 1840. S. painted landscapes and riv. and coast scenery. 'The Valley of the Yare, near Thorpe, Norwich' and 'Woodv Landscape' are in the Tate Gallery, London.

Stark Effect. Atoms that emit light while in a powerful electric field have their spectra changed (see SPECTRUM) by the field, and each line of the ordinary spectrum is split into a number of components which may be polarised in various ways. The phenomenon was discovered in 1913 by the Ger. physicist, Johannes Stark (*b.* 1871, awarded the Nobel prize for physics, 1919), and investigated in detail by him in the following years.

Starley, James (1831-81), Eng. inventor, b. at Albourne, Sussex. He invented a type of sewing-machine in 1857. Afterwards he made bicycles at Coventry. His nephew, John Kemp S., introduced the safety bicycle.

Starling, Ernest Henry (1866-1927), Eng. physiologist, b. in Bombay, was prof. of physiology at Univ. College, London, from 1899 to 1923. He studied the

secretions of the body, and discovered the substance secretin. He wrote *Principles of Human Physiology* (5th ed., 1930).

Starling (*Sturnus vulgaris*), passerine bird, common in Europe, and of recent years in Britain. It is about 8½ in. long, and the head, neck, back, and under-parts are a metallic glossy black. The feathers on the upper parts are tipped with buff, and the wings are greyish-black, with a

Starnose, see SHREW-MOLE.

Star of Bethlehem, see ORNITHOGALUM
Star of India, see INDIAN ORDERS OF KNIGHTHOOD.

Starograd (Ger. *Stargrad*), tn. in Poland, formerly in Germany, on the Ihna, 22 m. S.E. of Szczecin (Stettin). St. Mary's Church was built in 1292 as a hall, and converted in the fifteenth century, and the Rathaus is a sixteenth-century structure.

THE NORTHERN SKY EXTENDED TO ABOUT 25° SOUTH OF THE EQUATOR

Constellations are printed in square capitals and stars in Greek letters or in italic capitals, with the exception of the important group known as the Pleiades in the constellation of Taurus.

reddish-brown fringe. The female is less glossy and lustrous than the male. Nests are made almost anywhere, about five pale blue eggs being laid. The food consists principally of worms, snails, and insects, and the birds are, therefore, of great benefit, though they often devour orchard fruit, and are sometimes destructive to seed wheat. A number of closely related foreign birds are known as *S.* For the rose-coloured *S.* see PASTOR.

S. was part of the Hausentia League. There are manufs. of machinery and tobacco, mills, and breweries. Pop. 40,300.

Stars. Until the time of Halley the *S.* were supposed to be fixed because they did not appear to change their positions relative to each other or to the planets in the solar system. It is now known that the apparent motions of the *S.* are small only because they are at enormous distances from the earth. Thus, excluding the sun

itself, the nearest star is Proxima Centauri, some 25 billion m. away, so that light, travelling at 186,000 m. per sec., takes over four years on its journey from the star to the earth. The most distant bodies at present known are over 500 million light-years: these are the extra-galactic nebulae, but the S. visible with the naked eye are in our galaxy, and none exceeds about 100,000 light-years in

titudes and the nature of the light they emit (see below), and the positions of the S. at any epoch can be deduced from the information included in the catalogue.

Stellar Magnitudes.—Since the time of Hipparchus (*q.v.*) the classification of S. according to their apparent brightness has engaged the attention of astronomers. Hipparchus called the brightest S. he could see S. of the first magnitude, while

THE SOUTHERN SKY EXTENDED TO ABOUT 25° NORTH OF THE EQUATOR
The Roman numerals in both maps refer to the Right Ascension of the stars, and the equator and declination circles 30° and 60° are shown

distance. It is therefore not surprising to find that the well-known constellations maintain the same configurations with respect to the earth for thousands of years, although the S. are travelling with great velocities relative to us.

Star catalogues have been compiled by astronomers during the past 300 years, one of the most important to-day being the Henry Draper catalogue of Harvard. Such a catalogue classifies the individual S. according to their magni-

tudes just visible to the naked eye were called S. of the sixth magnitude. The determination of stellar magnitudes has since been made a scientific measurement. Following Herschel (*q.v.*) the mean apparent brightness of the sixth magnitude S. of the older classification has been adopted as the standard for the sixth magnitude of the modern classification. A star of the fifth magnitude is one whose apparent brightness is 2.5 times that of the sixth magnitude; one of the fourth 2.5 times as

bright as that of a star of the fifth magnitude, and so on. S. of the first magnitude are apparently 100 times as bright as S. of the sixth magnitude. Modern methods of measuring the apparent brightness of a star enable the astronomer to subdivide each of the different magnitudes. Thus Sirius, the brightest star, is of magnitude -1.4, i.e. 2.4 magnitudes below a star of the first magnitude. Stellar magnitudes are determined either directly by means of a telescope or by a photographic or photo-electric method. The total number of S. of magnitude visible to the naked eye is about 6000, of which number about 2000 may be seen on a clear night. The Yerkes telescope will show S. of the seventeenth magnitude. Recent estimates give 50,000,000,000 as the order of the number of S. in our galactic system, and each of the many millions of other galactic systems probably contains a number of the same order.

Proper Motion of Stars.—The proper motion of a star is defined as the component of its motion at right angles to the line of sight that causes an apparent displacement of the star relative to the other S. (see further PROPER MOTION). The proper motion of α -Centauri, for example, is 3.68" per annum, i.e. if S_1 and S_2 are the respective positions of this star relative to the earth E at the beginning and end of a year, then the angle S_1ES_2 is 3.68". Comparatively few S. have a proper motion greater than 1" a year; such a proper motion would cause an angular displacement of 1' to an observer on the earth in 3600 years.

The motion of a star in the line of sight can be detected and measured by means of the Doppler effect (*q.v.*), that causes a shift of the spectral lines towards the violet end of the spectrum if the star is approaching, towards the red end if it is receding (see also SPECTRUM; SPECTROSCOPY).

Stellar Spectra.—The Draper catalogue classifies the S. according to the type of spectrum obtained from them. Stellar spectra consist of a continuous spectrum crossed by absorption lines or bright lines or both. According to the type of spectrum the star is classified as a star of one of the following groups: O, B, A, F, G, K, M, R, N, S, N, the significance of which is described below under *Stellar Evolution*. The groups are further subdivided to differentiate between the S. whose spectra differ in degree but not in type. The sun's spectrum is characteristic of the type G.

Temperature of Stars.—The colour of the light emitted by a star is connected with its surface temp., and the estimate of this temp. is based on the distribution of the energy radiated from the star among the various wave-lengths in its spectrum (see RADIATION). The surface temp. of the sun is about 5900 C., while that of some of the hottest S. of type O is about 50,000° C.

Distances of the Stars.—The semi-diameter of the earth's orbit is taken as the base line for the measurement of the distances of the S. Distances are expressed in terms of the ann. parallax of

the star, i.e. the angle subtended by the semi-diameter of the earth's orbit at the star. For the nearest star, Proxima Centauri, this parallax is only 0.78". The linear distance can be determined by elementary trigonometry from the stellar parallax; it may be expressed in miles or in light-years, the distance light travels in one year, but for astronomical purposes the unit adopted is the *parsec*, a distance corresponding to a stellar parallax of 1", which is about 19.1 billion m. The standard method for determining stellar parallaxes of the nearer S. is to take photographs of the star at intervals of six months. A comparison of the shifts of the star relative to the background of the very distant S. enables the parallax to be determined. In recent years another method has been evolved for the measurement of the distances of more remote S., a method that also gives the size of the star (see below).

The reader should refer to the articles on MULTIPLE STARS, NOVAE, for further information regarding those types of S. Variable S. possess characteristics that have contributed much towards the rapid progress that has been made in astronomical science during the present century.

Cepheid Variables.—The star δ -Cephei is a single star that pulsates, i.e. it expands and contracts, in a regular period of 5.37 days. The pulsations cause a corresponding periodic variation in the intensity of the light emitted by the star. The distance of δ -Cephei has been determined, and also its intrinsic luminosity. There are scattered through the universe an enormous number of S. that are seen to be similar to δ -Cephei; they are known as Cepheid variables. In 1912 Miss Henrietta S. Leavitt, of the Harvard Observatory, made a very important discovery about these S. She found that their periods, which vary from a few hours to about fifty days, depend on their luminosities, the more luminous the S. the longer the periods, and the less luminous the S. the shorter the periods. The luminosity of a star is not the same thing as its magnitude; a star might appear to be very bright merely because it is comparatively close to us and yet it might be much less luminous, if only it could be seen at the same distance, than many faint S. Astronomers have agreed to give the name *absolute magnitude* to the apparent magnitude of a star if it were placed at a distance of 10 parsecs or 32.6 light-years. Hence, knowing the distance of a star and also its apparent magnitude, its absolute magnitude is easily calculated, and a catalogue of absolute magnitudes of S. immediately gives an insight into their intrinsic brightness or luminosities. Suppose a Cepheid variable is observed and its distance in light-years and its apparent magnitude known, its absolute magnitude and hence its luminosity can then be calculated, and its period, ascertained by observation, enables the astronomer to establish a relation between its luminosity and period. This star can then be used as a standard for any number of Cepheid variables.

Another Cepheid is observed with the same period, and it is certain that its luminosity is the same as the previous one; but its magnitude is probably very different because it is not at the same distance and it is easy to calculate how far away it is, knowing its apparent magnitude and luminosity. This simplifies the problem because not all Cepheids have the same period of the hypothetical one taken as a standard, but this is not a serious difficulty. Actually the relationship between the periods and the luminosities is well established, and knowing the former by observation, the latter is computed. Then, when the apparent magnitude has been ascertained and compared with the luminosity, the distance is known. A good illustration is found in the case of two street lamps. If their apparent brightness is compared by a photometric method it is possible to determine the distance of the second lamp if that of the first is known. Even if one lamp differs from the other in luminosity, so long as this difference is known, the distance of the second lamp can be found. This simple method has been applied in recent years to determine the distances of the remote parts of the universe. Wherever a Cepheid variable is found, the distance of that region can be calculated.

Stellar Evolution.—The birth of the S. from nebulae is discussed under NEBULAR THEORY. The spectral types of the S. classified as O, B, A, F, G, K, M, R, N, S possess the following characteristics. The O and B types are characterised by hydrogen and helium lines. S. in the A to F classes are white or blue S. whose spectra are chiefly characterised by strong hydrogen absorption lines. F, G, and K types contain the absorption lines due to the metallic elements (e.g. the solar spectrum of type G). The remaining types are orange and red S. and their spectra are crossed by absorption bands due to hydrocarbons. Betelgeuse, in the constellation Orion, is a red star of type M. The present theory of stellar evolution suggests that a star begins as a red giant of type M. As an example Betelgeuse may be quoted. Its diameter is of the order of 300,000,000 m., i.e. if it occupied the position of our sun, the earth's orbit would lie within the star. It is so diffuse that its density is about $\frac{1}{1000}$ of the density of air, while its surface temp. is about 3000° C. The red giant contracts, its density and its temp. increasing, so that it passes through succeeding spectral types M, K, G, F, A, B. The 'degeneration' then begins, and the star is now termed a dwarf. Its surface temp. decreases while its size decreases and its density continues to increase. Our sun is a red dwarf of type G. There are a few white dwarfs whose density is so great that, as Eddington says, a ton of the star would occupy the volume of a match-box. The companion of Sirius is a notable example of this class of white dwarf. It should be pointed out that theories of stellar evolution are highly speculative and there is still much uncertainty on the subject.

The Interior of the Stars.—From the point of view of the scientist the conditions inside a star are physically simple, i.e. it consists of atoms, electrons, and ether waves, and the laws of a perfect gas hold for these conditions. Knowing the mass of the star, and its magnitude, it is possible to compute by the method of trial and error what the temp. at any point inside a star must be in order that equilibrium may be obtained between the gravitational attraction of the inner layers on those above, and the bombardment of the outer layers by the atoms and electrons below. In this way it has been found that the temp. at the centre of the sun must be 20,000,000° C. in order that this equilibrium may be maintained. Further considerations lead to the conclusion that the age of the sun is probably 3,000,000,000 years or more.

Stellar Distribution.—It is obvious to a casual observer that the S. are not uniformly distributed throughout the heavens. On a clear night the belt of S. that is known as the Milky Way or Galaxy may be seen quite distinctly with the naked eye. This belt encircles the heavens. Shapley, who has done brilliant work in this phase of astronomy since 1920, explains that the phenomenon of the Milky Way is largely an optical one. The apparent belt is really a depth effect. S., groups of S., and star clusters being concentrated in the plane of the Milky Way. The sun is far removed from the centre of the stellar system, that must now be regarded as a thin, disk-like system extending far in the direction of the galactic plane.

Star Clusters.—(1) Globular clusters consist of an enormous number of S. grouped together to form a spherical cluster. At the centre of the sphere the S. are packed together relatively closely; the density of packing decreases fairly rapidly at first from the centre outwards, but the decrease becomes more gradual towards the boundary, which is not sharply defined. There are about 100 such clusters known at present, one of the most famous being the Hercules cluster. Globular clusters are fairly symmetrically distributed with respect to the plane of the Milky Way, about 7° or 8° from that plane. The brightest S. in such clusters have been shown to be giants. Since globular clusters generally contain Cepheid variables, the distances of the clusters have been computed. The nearest galactic clusters are more than 20,000 light-years away, while some are nearly 200,000 light-years distant. The diameters of these clusters are of the order of sev. hundred light-years. The clusters are approaching the galactic system, and Shapley states that a close approach leads to the break-up of a globular cluster under the gravitational attraction of the galactic system. It is suggested that this break-up creates the open clusters and the moving star-groups found in the Milky Way. (2) Open clusters contain far fewer stars than their suspected parents, the globular clusters. Their shape too is less regular than that of the globular

cluster. They are found in the regions close to the galactic plane. The best known are the Pleiades and the Hyades in Taurus, Praesepe in Cancer, the double cluster in Perseus, and the cluster in Coma Berenices, all visible to the naked eye.

Stars and Stripes, see under FLAG.

Starshine Camera or Night-sky Recorder is exposed at night pointing towards the pole, about which the stars describe circles once every twenty-four hours. The stars are observed when cloud passes over so that the length of trace gives a rough measure of the amount of clear sky during the night just as does the sunshine recorder (q.v.) during the day. The traces of sev. stars appear on the negative but only those of α -Ursæ Minoris (the pole star) and δ -Ursæ Minoris are measured because they are the only ones not obliterated by bright moonlight. See N. K. Johnson, A. J. Lander, and W. A. Toms, 'Night-sky Recorder,' *Meteorological Magazine* (vol. lxxvii.), 1948.

Starwort, or **Stitchwort**, see STELLARIA.

Stassfurt, tn. of Saxony-Anhalt, Germany, on the Rode, 19½ m. S.S.W. of Magdeburg. There are rich deposits of kalinite and rock salt mines. The tn. has chemical works, and produces lin and asbestos products. Pop. 15,800 (with Leopoldshall 23,200).

State. Theories of the nature of the S. divide broadly into three types. Of these the individualist theory, widely held in the seventeenth to the nineteenth centuries, regarded the S. fundamentally as an enemy of liberty, even in those areas where its necessity was conceded, and, significantly, was inclined to equate the S. with its gov., rather than to recognise the latter merely as an agency of the former. In total opposition stands the organic or idealist school, which, represented in Plato, received a new support from Hegel. Supporters of this doctrine have claimed Rousseau as one of themselves. In this view the S. is the complete, final, and all-embracing form of human society, and only in the S. can the individual find his fullest expression. His will is to be merged in that of the S., and his greatest freedom lies in its service. This theory rests upon a fatal confusion of S. and society, and leads inevitably to the totalitarian scheme.

The group theories would appear to

answer more correctly to the facts of society. To fulfil their economic, spiritual, and cultural needs individuals join themselves voluntarily into groups of many different kinds, which derive their existence from the persons who compose them. The sense of the common aim overrides the differences within the group, but it does not abolish them, and the basic unity is the consensus about values cherished in common. Society, therefore, besides containing the 'countless unformulated relations of man to man' comprises the complex of groups. The function of the S. is to represent the general public good of the people taken as a whole. For this purpose it is given a coercive power, its distinguishing mark. In a conflict between itself and any group the S. will win only provided it commands the greater loyalty and is backed by the ultimate sovereign, general public opinion. The S. has achieved since about the time of the Reformation its normal modern supremacy because it alone has given the best prospects of social order, peace, and satisfaction of general needs. The 'machine' theories, that the S. is simply and solely a mechanism set up by man in society to further his needs, result practically in a similar view of the purpose of S.

The problem of its organisation is that of the relationship between the subjects and the law; to the extent that they share in its making, the S. is a democracy, and to the extent that law is imposed upon them, the S. is an autocracy. A mixed form generally occurs in practice, and the precise forms of any actual S. are determined by its historical traditions.

Nearly all the known definitions of a S. assume that the S.-force prevails only within prescribed territorial limits. But in this connection a distinction is to be drawn between 'sovereignty' *simpliciter* and territorial sovereignty, which latter is at the basis of modern international law. On its negative side S. sovereignty (q.v.) connotes the right of the S. to exclude every other S. or power from sovereignty in or interference with its ter., and hence no modern S. permits any foreign power to exercise any jurisdiction or police powers within its ter. (See also CAPITULATIONS and FOREIGN JURISDICTION.) This rigid insistence on exclusiveness is the primary condition of such a status among the family of nations as alone makes it possible for any given S. to deal on equal terms with another sovereign S. But from the point of view of the subjects of a S. absolute sovereignty of their immediate ruler with respect to all other S. is not essential, e.g. in protectorates the external part of sovereignty resides or may to a large extent reside in another S.—the suzerain S. (see SUZERAIN). Egypt, until recent years, was a S. occupying the somewhat paradoxical position of what has been called a *mi-souverain* S. It formed part of a combination of S. on unequal terms, the titular head of which was the khedive, nominally under the control of Turkey but actually directed by Great Britain through its commissioner.

Composite Forms of State.—In contradistinction to *simple* and *unitary* Ss., Ss. which consist of component parts organised like Ss. are called *composite* Ss. In these there is a distinction between the power of the collective or chief S. and the independence of the separate Ss. or dependencies. Composite Ss. are commonly classified into: (1) Federations or federal empires, e.g. the U.S.A. and pre-republican Germany. Both the collective and the particular Ss. have a complete organisation and polity, but their constitutions are generally limited by the overriding power of the organised nation, the constitution of which is generally written and 'rigid,' and appropriates to the national legislature and executive exclusive power in regard to certain well-defined spheres of action, more especially in foreign affairs and taxation. *See further under* FEDERATION and FEDERAL STATES. (2) Confederations, e.g. the Ger. Confederation of 1815, 'a conglomeration of states, each having its own organisation,' and severally independent in all or most matters except external or foreign relations. A confederation insists on the individual independence of each component, while federation insists on the supremacy of the common gov. (*See further under* CONFEDERATION.) (3) Suzerainties and protectorates. The Holy Rom. Empire exercised a general dominion over a number of vassal Ss., while modern examples are furnished by many African protectorates. These may be regarded as nothing less than inchoate colonial dependencies of the protecting power. (*See further under* PROTECTORATE.) (4) Ss. and colonial dependencies in absolute subjection to a mother country.

Relation of the State to Individuals.—Membership of a S. is usually acquired by birth, marriage, or naturalisation. Most nations recognise nationality as a personal relation, not wholly dependent on place of birth or domicile of origin, but also partly on descent from members of the nation. A person ceases to belong to a S. by marriage (i.e. a wife who acquires the nationality of an alien loses her former nationality), and free renunciation, e.g. by emigration with *no animus revertendi*. Nationality is chiefly of importance in regard to conscription or compulsory service, and restriction on the exercise of certain handicrafts and retail trades. In England no alien can own any share in a Brit. ship (*see* MERCHANT SHIPPING). Political rights and the right to own land are for the most part granted in most modern S. to aliens. *See also* ANARCHISM; GOVERNMENT; POLITICS; SOVEREIGNTY.

Wheare, *Federal Government* 1946.

State, Acts of, term used in law, but of somewhat vague import. It would appear to signify (1) an act done or adopted by the prince or rulers of a foreign independent state in their political and sovereign capacity, and within the limits of their *de facto* (actual) political sovereignty (q.v.); (2) more particularly, 'an act injurious to the person or to the property of some person who is not at the time of that act a subject of his (or her) majesty; which act is done by any representative of his majesty's authority, civil or military, and is either previously sanctioned, or subsequently ratified by his majesty' (Sir James Stephen), such sanction or ratification being expressed in the proper manner through responsible ministers. It is settled law that no action of tort lies in respect of an act of state. Eng. courts do not discuss acts of these kinds, because the transactions of independent states between each other (and with subjects of other states) are governed by other laws than those which municipal courts administer. In short, as between the sovereign and his subjects there can be no such thing as an act of state, and there is a long line of estab. decisions in the Eng. courts to show that if one Brit. subject puts another to death or damages his property, the king's express command is no protection unless the act is in itself lawful. There is, however, a distinct point of jurisdiction in connection with which the term act of state is used. A sovereign prince or other person representing a foreign power is not liable to be sued in the courts of this country for acts done in a sovereign capacity. The result of decisions in our courts seems to be that an act done by the authority of the gov. of a sovereign state is not examinable at all in the courts of any other state. So far as an act of state affects persons not subject to the gov. in question, it is not examinable in the ordinary courts of that state itself. If and so far as it affects a subject of the same state, it may be, and in England it is, examinable by the courts in their ordinary jurisdiction. In most continental countries, however, if not in all, the remedy for such acts must be sought before a special tribunal (in France the Conseil d'État). *See further* DROIT ADMINISTRATIF.

State or District Attorney of the U.S.A. is an officer appointed in each judicial dist., whose duty it is to prosecute in such dist. all delinquents for crimes and offences cognisable under the authority of the U.S.A.,

and all civil actions in which the U.S.A. are concerned, except in the Supreme Court. The officer who represents the state in criminal proceedings within a particular co. is also, in some of the states, called state or dist. attorney. As a prosecuting attorney, the S. A. is a quasi judicial officer and stands indifferent between the accused and any private interest (51 *Michigan Reports*, 422). In a prosecution for a crime in which there is no question of vindicating the public wrong, the proceedings are always initiated by a S. A., who thus takes the place of the private prosecutor in England.

State Church, or Established Church, one estab. by custom or legislation as the official church of the country. Its services are made use of on those occasions when the need of a religious ceremony is felt by the State. In return the Church always recognises the head of the State in some way (see CONCORDAT). In England and Scotland there are estab. churches, both under the authority of Parliament. The Eng. Church was disestablished in Ireland in 1869 and in Wales in 1919. In Eire Rom. Catholicism is the religion made use of by the State on suitable occasions, but it enjoys no special emoluments.

State Department, executive dept. of the U.S.A. The Dept. of Foreign Affairs, created on July 27, 1789, was renamed S. D. on Sept. 15. Under the President the S. D. conducts foreign affairs, relations with foreign representatives, and correspondence with U.S. public ministers and consuls. The staff numbers some 7600.

Staten Island, is. of New York, U.S.A., co-extensive with the bor. of Richmond. It is some 14 m. long and has an area of over 65 sq. m. It is cut off from Long Is. on the E. by the Narrows, which S. I. commands by Forts Tompkins and Wadsworth, and from New Jersey on the W. by Arthur Kill, and on the N. by Kill van Kull. The chief tns. are New Brighton, Port Richmond, and W. New Brighton. There are shipyards, oil refineries, smelting, and metal works, and market gardens. Pop. 174,100.

Stater (lit. 'a standard coin'), largest gold piece in common use in anc. Greece. Many of them reached W. Europe as spoil of war. The victory of Athenobarbus over the Arverni, A.D. 121, brought them to Gaul, and the coinage of Britain in the Early Iron Age was copied from that of the tribes of N. Gaul, itself in turn copied from Gk. S.

States-General: 1. Name given to the various legislative assemblies of France prior to the revolution: (1) The *Aus-général* of 1313, which estab. at least in principle, 'that the free consent of the three orders of the realm is necessary to the levying of taxation.' (2) The *États de la langue d'oc*, which assembled at Toulouse, and that of *la langue d'oïl*, which met at Paris (1356). (3) *États de 1357*, an extreme radical assembly which demanded the abolition of the inalienability of crown demesne lands, the extirpation of corruption in the distribution of judicial posts, and the right to create a commission of thirty-six members to ad-

minister the affairs of the whole kingdom. (4) *États de Paris* (1413), convoked by Charles VI. ostensibly to reform abuses but in reality to exact subsidies. (5) *États d'Orléans* (1439), which estab. an ann. tallage of £1,200,000 for the maintenance of a permanent army. (6) *États de Tours* (1484), notable for the declaration in a remarkable speech by Philippe Pot, a Burgundian deputy, of the principle of popular sovereignty. (7) The *États de Paris* (1614) did not meet again till 1785. These were strictly the last S.-G. held in France, for in 1789 they were transformed into the National Assembly. 2. Legislative body of the Netherlands (*q.v.*) which in 1814 superseded the National Assembly estab. in 1795 in place of the old S.-G. of the United Provs.

States of the Church, see CHURCH, STATES OF THE.

State Trading, term applied to trading functions (buying and selling either at home or abroad) being carried out by the state. It should be distinguished from state control (where the gov. lays down conditions as to price, quantities, etc., under which trade may be carried out) and from nationalisation of industry and transport, where the existing enterprises (*e.g.* the coal-mines, the electricity and gas undertakings, and the transport undertakings) are taken over by the state with compensation. S. T. naturally plays a great part in Soviet Russia's economy and as far as foreign trade is concerned, this is directed less on economic principles and, more to suit Russia's political aims of the moment; thus at the time of the depression of the 1930s sudden Russian sales of grain and timber aggravated the price fall in the markets of the W. world.

In Britain S. T. received a great impetus during the First World War, and a still greater during the Second World War, when the buying and selling of most industrial raw materials and foodstuffs were undertaken by the state in the interest of the national war effort, but it has not yet been shown to be an efficient instrument for solving peace-time economic problems. In the First World War S. T. was gradually extended to most foodstuffs and practically all imports. These and other extensions of state interference were, on the whole, welcomed by the public since it was felt that no private inconvenience should stand in the way of military efficiency. After the First World War it was realised that in the event of another emergency an even greater degree of state interference with economic activities would be required. However, the general opinion was that the war experience had not proved that S. T. possessed any permanent advantage over the existing private capitalistic system under normal conditions. In spite of some striking successes which S. T. achieved during the First World War, there can be no doubt that the new function the state assumed would have miscarried but for the assistance secured from experts in private organisations.

During the Second World War S. T. assumed even larger proportions than

during the First World War. Trade in all foodstuffs was concentrated in the hands of the Ministry of Food, and industrial materials were bought and sold by the Ministry of Supply and the Board of Trade. All these depts. used the existing private firms as agents, and there is again no doubt that the success the ministries achieved during the war was due to the advice they received from traders with long experience.

There are sev. ways of carrying out S. T. The dept. concerned may make a contract for an individual lot of a commodity (e.g. oranges) or it may buy in advance at a fixed price the production of a period ahead (e.g. six-month contracts for metals produced in the empire), or definite quantities of certain goods at prices determined in advance for sev. years ahead, the so-called long-term contracts, the commonly used expression bulk-buying includes all forms of state-buying except the buying of occasional lots.

The Labour party stated before the end of the Second World War that it intended to continue S. T. in times of peace. The Ministry of Food therefore continued to buy most foodstuffs, the Ministry of Supply non-ferrous metals, and the Board of Trade raw materials such as timber and hides. In addition the gov. estab. in 1916 the Raw Cotton Commission to replace permanently the Liverpool Cotton Exchange. During the shortages of the immediate post-war period long-term contracts permitted Britain to buy more cheaply than she would have otherwise done in a period of rising prices. When, however, goods became more plentiful and world prices began to fall, this advantage had gone. Since 1949, and even more since the general election of 1950, there has been a gradual diminution of S. T., though, in addition to cotton and softwood, metals (except tin) and the rationed basic foodstuffs were still subject to S. T. in June 1950.

Statico, *see under* EVERLASTING FLOWERS.

Statics, branch of dynamics which deals with the action of forces in compelling a body to remain at rest or not alter its motion. The basis of the science is contained in Newton's *Laws of Motion* (q.v.), from which are deduced the following axioms. (1) matter possesses inertia, and requires force to move it or change its motion; (2) each force is independent, and can be used as a means of finding the effects of sev. forces; (3) force is transmissible, that is, it may be regarded as applied at any point in its line of action. When forces act in the same straight line, the necessary condition of equilibrium is that the algebraical sum of the forces is equal to zero. When two forces acting on a particle do not act in the same straight line the resultant of the forces may be measured by the diagonal of the parallelogram whose sides are parallel to the directions of and proportional to the forces. This leads to the condition of equilibrium illustrated by the important proposition known as the *triangle of forces*, that is, if

three forces acting at a point can be represented in magnitude and direction by the sides of a triangle taken in order, the forces are in equilibrium. This proposition may be extended to include any number of forces as the *polygon of forces*. It should be noticed that the forces need not be in one plane. When the lines of action of the forces acting in one plane upon a rigid body are parallel, the conditions of equilibrium are that the algebraical sum of the forces is zero, and the sum of their moments about any point in their plane is zero. If the forces are not coplanar, their algebraical sum must be zero, and the sum of their moments about any line in a plane perpendicular to the forces must be zero. The most general principle, applying to any number of given forces, is that the sum of the components along each of three non-coplanar directions must be zero, and the moments of the forces about each of the three directions must be zero in order to produce equilibrium. *See also* GRAPHIC STATICS.

Stationers' Hall and Company, institution for the registration of copyright. The Stationers' Company, of which the hall is an outcome, was incorporated in the middle of the sixteenth century for censorship purposes, for the better attainment of which object no printing presses were allowed to be set up without notice to the company. *See* COPYRIGHT.

Stationery Office, His Majesty's, Brit. Gov.'s central organisation, estab. 1786, for the supply of printing, binding, office supplies and machinery, pub. books and periodicals for the public service at home and abroad; it also undertakes duplicating and distributing services for gov. depts. and advises them on production and storage of films. The S. O. is the publisher for the gov. and has offices for the sale of gov. pubs. in London, Edinburgh, Cardiff, Manchester, Bristol, and Birmingham; leading booksellers in the larger towns act as agents. The controller is under letters patent the king's printer of Acts of Parliament and in him is vested the copyright in all Brit. Gov. documents. In general, supplies are obtained from commercial sources by competitive tender or long-term contracts. About one-third of printing requirements are, however, obtained from the S. O. printing factories whose output includes telephone directories, rationing documents, and insurance and savings stamps. The wide and varied range of gov. pubs. includes the *London Gazette* which has been issued twice weekly since 1665, and *Hansard*, the verbatim report of both Houses of Parliament.

Stations (in liturgy) (Lat. *stationes*), name originally referred to the lengthy services held in the early Church on fast days, viz. Wednesday and Friday, and during which the faithful had to stand (*stare*); these came to be known as 'station days.' By a natural development the name was transferred to the church in which the liturgy was held. In the fifth century at Rome and elsewhere, whenever the liturgy was to be celebrated a special church was appointed, and came to be known as the 'station church.' A

procession usually preceded the liturgy, and gave rise to the phrase 'statio ad . . .', meaning 'procession to . . .', the church in question. In this form the direction for Sundays and the older liturgical days have survived in the Roman missal.

Stations, or Way, of the Cross, late medieval devotion, originating in the pilgrimages to the Holy Land. In the fifteenth and sixteenth centuries in certain cities of Europe an exact topographical reproduction of the points of devotional interest seen by pilgrims in Jerusalem was attempted by means of shrines in various parts of the city. Reproductions subsequently lost all attempt at topographical meaning and, shrinking in size, came to consist of images or pictures showing various scenes from Christ's journey to Calvary. As such they eventually found permanent form, and are found as pictures on the walls inside Roman Catholic churches. They are fourteen in number, and the devotion consists in going from one to another and saying appropriate prayers at each. Sometimes fourteen crosses are erected without pictures, but the devotion is made in the same way. See H. Thurston, *The Stations of the Cross*, 1906.

Statistics, method of demonstrating facts concerning the social life of man based upon the quantitative observation of aggregates. The term is derived from *status*, in the sense of state or area of government, and was originally applied to any inquiry concerning the social or political conditions of the people without any particular regard to quantity. A nation or community naturally changes from minute to minute as regards the individuals composing it, but a careful study of aggregates shows that it possesses certain permanent features, or at any rate features that change gradually in a typical manner. The usefulness of figures may be admitted, since in a large community no observer or group of observers can apprehend any great social fact without their aid, yet their use is accompanied with certain dangers, usually in connection with the ignorant application of various aggregates, so that it is said that 'figures can prove anything.' Nearly every important country has now a statistical bureau engaged in preparing figures likely to be of use in connection with administration, trade, etc. In the United Kingdom the Central Statistical Office in conjunction with the statistical divs. of gov. depts. prepares two regular statistical pubs.—the *Monthly Digest of Statistics* and the *Annual Abstract of Statistics*, covering all the main statistical fields. In addition, many of the prin. depts., notably the Board of Trade, Ministry of Labour and National Service, and General Register Offices, publish detailed S. in their own particular fields of interest. See R. A. Fisher, *Statistical Methods for Research Workers*, 1925; H. M. Walker, *History of Statistical Method*, 1929; L. H. C. Tippett, *Statistics*, 1943; G. U. Yule and M. G. Kendall, *Introduction to the Theory of Statistics*, 1945; F. E. Croxton and D. J. Cowden, *Applied*

General Statistics; and M. G. Kendall, *The Advanced Theory of Statistics*, vol. i, 1945, and vol. ii, 1946.

Statuary, see SCULPTURE.

Statute, see ACT.

Statute Law Revision. It is a commonplace of Eng. jurisprudence that no Act of Parliament can become inoperative by mere desuetude, however inapplicable its provisions might be to modern conditions. Prior to the Statute Law Revision Acts, an Act was only inoperative either directly by express repeal, or, indirectly, by the existence of some subsequent Act containing provisions inconsistent with the tenor of the earlier Act. There was a Commons petition in 1610 demanding revision of the statutes, and both Bacon and Coke were engaged for some time on a commission for revision. Earlier statutes, however, are generally simple in character and language, and the most important step was not taken until late in the nineteenth century, by which time the enormous growth in the number of statutes passed every session made periodical revision essential. This resulted in the appointment of the Statute Law Revision Committee of 1868 by Lord Chancellor Cairns for the purpose of overhauling the Statute Rolls, and eliminating therefrom any Acts which time and altered circumstances had rendered obsolete or unnecessary. The outcome, the revised ed. of the statutes is generally known as the *Statutes Revised* (1878). But this ed. necessarily becomes less accurate every year with the appearance of fresh legislation, whence the necessity of frequent Statute Law Revision Acts and of periodical eds. of the *Revised Statutes*. Altogether there have been thirty-two Statute Law Revision Acts. It is to be borne in mind that a Statute Law Revision Act does not alter the law; it simply strikes out certain enactments which have become unnecessary (Robins v. Robins, 1907, 2 K. B.). This is made clearer by the declaratory words in the proviso to section 1 of the Act of 1927 which are to the effect that the repeal of any words or expressions of enactments described in the schedule to the Act will not affect the binding force or construction of any other statute as respects the past or the future; and again, that 'when any Act not in the schedule has been repealed, confirmed, etc., by any Act repealed in the schedule such earlier repeal, confirmation, etc., will not be affected by the repeal effected by the Act of 1927.' Nor does the Act affect the validity, invalidity, effect, consequences, etc., of anything done or suffered or any existing status or equity; nor does it repeal any Act so far as the latter may be in force in the overseas dominions unless otherwise expressly stated. The Statute Law Revision Act of 1948 covers the period 1235 to 1800, while the Act of 1950 extends the process of expurgation up to 1948, thus completing the necessary preliminary to the third ed. Owing to the decision of the N. Ireland Gov. to publish a revised ed. of the statutes affecting N. Ireland, the 1950 Act provides for the omission from the third ed. of *Statutes Revised* of the

statutes relating to matters within the powers of the Parliament of N. Ireland, and a large proportion of the Acts or sections of Acts scheduled in the 1950 Act for repeal relate to N. Ireland. The Act also deals with the revision of the Church Assembly Measures.

Statute Merchant, in O.E. law, a bond of record pursuant to an Act of 1285 acknowledged before one of the clerks of the statutes merchant and the mayor or chief warden of London or before certain persons appointed for the purpose; on which, if not paid at the day, an execution might have been awarded against the body, lands, and goods of the obligor. So stringent were the laws against debtors in and after the reign of Edward I., especially in that of Edward III. (see 'capias ad satisfaciendum' under ARREST), that such severe laws as the S. M. were rendered unnecessary.

Statute of Frauds, see FRAUDS, STATUTE OF, 1677.

Stanton: 1. Co. seat of Augusta co., Virginia, U.S.A., 135 m. by rail W.N.W. of Richmond. * The Virginia school for the deaf and blind is here, and it is the bp. of Woodrow Wilson. The tn. was the first to use the commission form of gov. under a city manager. Agric. implements, flour, and bricks are produced. Pop. 13,300. 2. Coal-mining centre in Macoupin co., Illinois, U.S.A., 30 m. N.W. of St. Louis. Pop. 5000.

Stavanger, fort. city in the prov. of Rogaland, Norway, on Boknufjord, 100 m. S. of Bergen, founded in the eighth or ninth century. The battle which united Norway under one ruler (Harald Haarfagr) for the first time occurred at Hafsford in 872. It has a splendid Gothic cathedral built by Bishop Remald from Winchester in the twelfth century. It was rebuilt after a fire in 1272 and restored in 1886. S. is the centre of a sheep-farming area, exports large quantities of fish, and has the world's largest fish-canning industry, with more than 100 factories. S. is also a centre of the fish-curing trade, and has iron foundries, and shipyards, and Hille contains important mineral deposits, including calcium phosphates (*apatite*). S. possesses a modern airport, Sola, nearest to Britain, which the Gers. used as a base for bombing raids on allied shipping. It was the bp. of the great novelist Alexander Kielland (1849-1906) and the philosopher Henrik Steffens (1773-1845).

Stave, or **Staff**, see MUSIC.

Stavesacre, or **Delphinium Staphisagria**, see DELPHINIUM.

Stavisky, Serge (1866-1934), naturalised Frenchman, of Russian birth, responsible for a financial scandal in France in 1934. He floated a very large sum in bogus bonds, in the name of the municipal credit estab. of Bayonne. S. committed suicide after a warrant for his arrest had been issued. The scandal caused the fall of two govts., and a general strike and riots in Paris.

Stavropol: 1. Ter. of the R.S.F.S.R., to the N. of the Caucasus, watered by the Egoriyk, Kalaus, and Kuma Rs. It is part of the pre-Caucasus upland, and includes a plateau some 2000 ft. in height.

2. Cap. of the above, now called Voroshilovsk (q.v.).

Stawell, tn. in Borung co., Victoria, Australia, 150 m. W.N.W. of Melbourne. It lies in an agric. area with wheat, oats, and merino sheep, and there are gold mines and freestone quarries. The tn. has woollen, cotton, timber, and flour mills, and brickworks. Pop. 4900.

Stead, William Thomas (1849-1912), Eng. journalist, b. at Embleton, Northumberland, the son of a Congregational minister. In 1871 he became editor of the *Darlington Northern Echo*, and, coming to London, was appointed assistant editor of the *Pall Mall Gazette* in 1880, and succeeded John Morley in the editorial chair in 1883. His series of articles on the *Maiden Tribute to Modern Babylon* on the white slave traffic, though it secured the passing of the Criminal Law Amendment Act, 1885 (raising from thirteen the 'age of consent' to seduction), resulted in his spending three months in Holloway Jail. He did much to bring about the dispatch of Gordon to the Sudan. He left the *Pall Mall* in 1889, and subsequently founded the *Review of Reviews* (1890), the magazine being a new feature in Brit. journalism; *Borderland*, a spiritualistic organ (1893-97); the *Daily Paper* (1904); *Books for the Bazaar*; *Penny Poets*; and *Penny Classics*. S. was at first an imperialist (and a co-heir of Rhodes), but became a firm opponent of the South African war. He wished to see a strong Brit. Navy, was a strong advocate of peace, and in later years a spiritualist. He wrote fluently and vigorously on all manner of subjects, his works including *The Truth about Russia* (1888); *The Pope and the New Era* (1889); *If Christ came to Chicago* (1893); and *Mrs. Booth* (1900). He was one of those drowned in the *Titanic*. See lives by Estelle Stead, 1913, and F. Whyte, 1925.

Stealing, see LARCENY.

Steam, dry, colourless, and transparent gaseous substance, formed when water is vaporised. (Note that the wet white cloud that is often wrongly called S. consists of small drops of water, condensed from S. by a surrounding cold atmosphere.) S. is given off from the surface of water at all temps., as long as the space above it is unsaturated. Saturation is reached at a given temp., when a slight cooling causes the formation of water again. At every temp. water has a corresponding vapour pressure; if this is less than the external pressure, S. will evaporate quietly from the surface of the water. If it reaches the same value as the external pressure, the water will change into S., not only at the surface, but throughout its mass, and we get the phenomenon of 'ebullition.' Hence for any given external pressure, there is a definite temp. at which ebullition occurs. At atmospheric pressure (14.7 lb. per sq. in.) the temp. required is 100°C.; at a pressure of 227 lb. per sq. in. the temp. required is 200°C. At the 'critical' pressure (3650 lb. per sq. in.), where S. is so compressed that it has the same density as water, and therefore cannot be distinguished from it,

the corresponding temp. is 380.5° C. S. in the presence of water is called 'saturated' (this is a technical term, and does not imply that the S. is wet). If S. is taken away from the presence of water and heated, it becomes 'superheated,' and approximately obeys the laws governing the expansion of gases. To convert unit weight of water at the point of ebullition (or boiling-point) into S. at the same temp. requires a definite amount of heat energy, called the 'latent heat of evaporation'; this is dependent only on the temp. being 595 C.Th.U. per lb. at 0° C., 539 C.Th.U. per lb. at 100° C., 466 C.Th.U. per lb. at 200° C., and zero at the critical point. (C.Th.U. = Centigrade Thermal Unit = the amount of heat required to raise the temp. of 1 lb. of water through 1° C. at normal temps.) Thus the latent heat falls as the temp. rises. But to convert cold water into steam at any pressure heat must be applied to raise the water to the boiling-point, in addition to the latent heat; and this increases as the temp. rises. The heat required to raise unit weight of water from freezing-point (0° C.) to boiling-point is called the 'total heat of water' at the boiling-point temp., and this, added to the corresponding latent heat, gives the 'total heat of S.' at the same temp. This increases from 595 C.Th.U. per lb. at 0° C., and 539 C.Th.U. per lb. at 100° C., to a maximum of 673.5 C.Th.U. per lb. at 241° C. (corresponding to a pressure of 500 lb. per sq. m.), and then falls to 470 C.Th.U. per lb. at the critical point. The 'specific volume' of S. at ordinary temps. is much greater than that of water, being 26.8 cub. ft. per lb. at 100° C., as compared with water 0.017 cub. ft. per lb.—or 1600 times as great. It falls rapidly as the temp. and pressure increase, being 2.02 cub. ft. per lb. at 200° C.; and at the critical point the specific volumes of S. and water become equal at 0.041 cub. ft. per lb. A further property of S. is its 'entropy,' an abstract mathematical function much used in S.-engine design, which remains constant when S. expands under ideal conditions. All the properties of S. mentioned above are tabulated at great length in 'Steam Tables.' S. is used for heating purposes, because of its large latent heat of vaporisation, which is given up on condensation. It is also used as a disinfectant and a fire-extinguisher, but one of its principal uses is in S. engines, S. hammers, etc. (q.v.) See H. L. Callendar, *Properties of Steam and Thermodynamic Theory of Turbines*, 1920, and J. A. Ewing, *Thermodynamics for Engineers*, 1920.

Steam and Power Hammers. Among the many ideas of James Watt in connection with his study of steam engines was one resulting in a patent (1784) for a steam hammer. Wm. Deverell of Surrey, also took out a patent in 1806. The first machine in actual use (1842) was constructed by Bourdon, mechanical engineer of the Creusot works in France, after designs sketched by James Nasmyth. The sketch showed an inverted cylinder, mounted in a heavy frame, with a heavy block of iron on the end of the piston-rod. The block was raised by admitting steam

under the piston and released by an attendant who allowed the steam to escape. The mass fell under the action of gravity on to the anvil below. Nasmyth's own first steam hammer was soon constructed; the block, weighing 30 cwt., had a clear fall of 4 ft. In 1843 steam was admitted above the piston to aid gravitation, and automatic gear was tried but abandoned. The next hammer had a weight of 5 tons and a fall of 5 ft. The invention made possible the forging of very much larger masses of iron as a whole—for instance, large, reliable anchors could be made. The next application

was for pile-driving, the hammer of 4 tons weight giving eighty blows to the minute. It also gave rise to the 'Infant Hercules' or 'steam hammer engine,' the crank being placed in the position of the anvil. In 1845 the V anvil was produced. A more modern development is the self-acting Massey steam hammer, made in weights ranging from 10 to 25 cwt. A curved lever is moved automatically by a roller on the hammer during the up and down movement of the tup or hammer, admitting steam alternately above and below the hammer piston. A hand-lever, which can be set in any of a range of notches, varies the movement of the valve-rod, and consequently alters the stroke of the hammer. A stop-valve controlled by a hand- or foot-lever regulates the amount of steam admitted and therefore the force of the blows. In place

FIG. 1. MECHANISM OF SIMPLE DOUBLE-ACTING STEAM ENGINE

For explanation of the crank positions (A, BDC, etc.) see text.

of steam hammers, pneumatic hammers are increasingly employed. Very large hammers, pneumatic or steam, are often now replaced by hydraulic presses.

Pneumatic Power Hammers.—The invention of compressed-air motors (*q.v.*) has resulted in the development of pneumatic power hammers. A hammer of this kind is the Massey, the working parts of which are shown in the diagram opposite. The hand- or foot-lever controls the vertical movement of the valve. In the 'not-working' position air flows freely from one side of the pump piston to the other as the piston reciprocates, without affecting the ram. In the 'full-work' position air passes from above the pump piston to the top of the hammer cylinder and from below the pump piston to the bottom of the hammer cylinder, so that the ram is alternately lifted and thrown down with maximum force in time with the reciprocation of the pump. Intermediate positions of the valve partially close the connecting passages to give a wide variation in the force and nature of the blow. In addition, lower positions of the valve allow air to be transferred from a reservoir to hold the ram up or down with a constant pressure below or above the ram piston. An air buffer space at the top of the cylinder prevents the piston striking the cylinder cover. Hammers of this type are made up to 2-tons falling weight. A light hand-hammer operated by compressed air is used in riveting. See RIVETS AND RIVETING.

Steam Engines are divided into reciprocating engines and turbines. A reciprocating steam engine consists essentially of a cylinder in which a piston is moved to and fro by steam under pressure; the steam is alternately admitted to and released from the cylinder by means of valves, operated by suitable valve gear from the piston mechanism. In this article we shall deal only with such engines (for steam turbines, see TURBINES, STEAM).

MECHANISM OF THE STEAM ENGINE. General.—The mechanism of a simple double-acting steam engine consists of a piston, piston rod, crosshead, connecting rod, and crank, in that order (Fig. 1). The steam pressure in the cylinder acts on the piston, which moves the crosshead by means of the piston rod; this passes through the cylinder cover in a steam-tight stuffing box or gland. The connecting rod converts the reciprocating motion of the crosshead into rotary motion at the crank. The crosshead runs in rigid guides, called slide bars, which take up the side thrust due to the connecting rod. When the piston is at either end of the cylinder the engine is said to be on dead centre. Considering the back end of the cylinder first, steam is admitted slightly before back dead centre (BDC) when the crank is at the point of admission (A) (Fig. 1). This pre-admission allows time for the steam to traverse the ports and exert its full pressure before the engine reaches dead centre; pre-admission is thus greater in high-speed engines. Admission of steam continues until the point of

FIG. 2. VALVES

A, single slide-valve; B, slide-valve with steam lap; C, cut-off; D, balanced slide-valve.

cut-off (CO), when the valve closes, and the steam begins to expand. When the steam pressure has fallen sufficiently, due to expansion, the exhaust valve opens, at the point of release (R); pre-release is necessary, to give the steam time to leave the cylinder before front dead centre (FDC) is reached, and the return stroke begun. Exhaust steam is much more sluggish than live steam, and pre-release is therefore always considerably greater than pre-admission. The exhaust-valve stays open on the return stroke until the point of compression (C). From here till the point of admission (A) the residual exhaust steam is compressed in this way: (1) the clearance volume at the end of the cylinder does not need to be filled with live steam at the beginning of each stroke; (2) the

overlaps the inside edge is called the exhaust lap—the negative exhaust lap is called exhaust clearance. The first slide-valves had no lap (as in Fig. 2 A), and therefore steam could not be used extensively. A large steam lap gives an early cut-off, and also makes the points of release and compression earlier. Exhaust lap makes the point of release later and the point of compression earlier; exhaust clearance has the opposite effect. Slide-valves are still sometimes used in locomotives. The slide-valve has two main disadvantages: (1) the steam and exhaust events are interdependent; this is unimportant at cut-offs later than 25 per cent of the stroke, but becomes troublesome at early cut-offs. One solution, now obsolete, is the cut-off valve, a flat valve

FIG. 4. POPPET-, LIFT-, OR DROP-VALVES
A, single-beat; B, double-beat

FIG. 3 (left). PISTON SLIDE-VALVES
Comparison of A slide-valve with Cap, and B piston-valve; C, piston slide-valve with spaced-pistons.

moving parts are slowed down by increasing resistance to motion due to compression prior to the reversal of direction of movement at back dead centre, thus promoting smooth running. A similar cycle of operations takes place at the front end of the cylinder.

Valves.—In the earliest engines, steam was controlled by two cocks at each end of the cylinder, one for admission and one for exhaust, which were opened and closed in turn to admit and release the steam. The four cocks were soon replaced by a single slide-valve (Fig. 2 (A)), consisting of an open box of cast iron, brass, or gunmetal, sliding face down on a flat surface, in which are two steam ports leading to the two ends of the cylinder, and between them an exhaust port leading to the atmosphere or to a condenser. The valve is kept seated on the port face by the pressure of steam outside it. When it is moved to one side (the position shown in Fig. 1), one steam port is opened to live steam, and the other to the exhaust port, via the hollow inside of the valve. When it is in its central position, the amount that it overlaps the outside edge of the steam port is called the steam lap (Fig. 2 (B)), while the amount that it

working on the back of an ordinary slide-valve (Fig. 2 (C)) to shut off steam from the main valve before the latter has reached its real point of cut-off on the port face, without affecting the points of admission, release, and compression. To obtain early cut-offs satisfactorily, poppet-valves and some form of drop gear are necessary (see below). (2) The pressure of steam on the back of the slide-valve is more than enough to keep it steam-tight, and the resulting friction causes wear of valve and port face, and absorbs much power; to avoid this, the balanced slide-valve, in which part of the back of the valve is relieved of steam pressure, was invented (Fig. 2 (D)). It is very complicated and liable to leakage; it was formerly used on Amer. locomotives. A more modern solution is the piston-valve, consisting of two small pistons on the same spindle, working in a cylindrical steam chest, in which steam and exhaust ports are cut, exactly as in the flat port face on which the slide-valve works. Fig 3 (A and B) shows the essential resemblance between the slide-valve and the piston-valve. The latter is perfectly balanced, and comparatively frictionless, but depends on piston rings for steam-tightness, and so is liable

to leak. In the piston-valve the pistons can be well spaced out, and the steam ports correspondingly shortened (Fig. 3 (c)) to reduce steam losses; this is impossible with the slide-valve, owing to the large area thereby exposed to live steam pressure, and consequent friction. Piston-valves are standard practice on modern locomotives and marine engines using superheated steam. Unlike wet steam, this has no lubricating properties, and slide-valves are liable to score the port face if oiling is not carefully watched. The Corliss engine was a reversion to the original idea of four independent valves per cylinder; it used cylindrical valves, with a rotary motion like plug cocks, but having passages specially shaped to give large port openings. Corliss engines are no longer made, but independent steam and exhaust-valves are standard practice nowadays on high-efficiency stationary engines; poppet-valves or lift- or drop-valves, which come down on to a seat, as in internal-combustion engine practice, are used instead of valves with a sliding or rotating action. Such valves require very little force to move them, give a large valve opening with a small lift, are easy to make and maintain steam-tight, and by means of cams can be made to open and close exactly as the designer wishes. Single-beat valves (Fig. 1 (A)) are used in steam lorries, but balanced double-beat valves (Fig. 4 (B)) are the general rule in the stationary practice. Double-beat valves are also used on locomotives.

Valve Gears.—On the very earliest engines the steam and exhaust cocks were turned on and off by a boy; but a linkage from the engine mechanism, which knocked the cocks on and off in correct sequence, was soon found more efficient. The early slide-valves were worked by an eccentric (a specialised form of crank) placed at right angles to the main crank, so that, at dead centre, the valve was in its mid position, closing both steam ports. To give pre-admission, however, the valve should be open at dead centre by a small amount called the lead, which means that it should be displaced from its mid position by an amount = (steam lap + lead); this is done by shifting the eccentric on the shaft relatively to the crank, so that the angle between them is greater than a right angle; this extra angle is called the angle of advance. A single eccentric, set in this manner, gives only one direction of rotation, and to make the engine reversible a large number of different valve gears have been invented. It is seen (Fig. 1) that the eccentric always leads the crank; to run backwards there must be a second eccentric similarly set on the other side of the crank and means for driving the valve from it. In the first reversing gear, the gib gear, the two eccentric rods terminated in hooks, either of which could be made to engage with a pin on the valve rod. In the Stephenson gear (Fig. 5 (A)), the ends of the two eccentric rods were connected by a curved link, in which worked a slide block and pin attached to the valve rod. The link and eccentric

rods were lifted up or down so that the drive to the valve came from either eccentric. It was soon found that, at intermediate positions, the valve gear still functioned, but at an earlier cut-off. Thus the engine could be adjusted for varying loads by 'notching up,' and changing the point of cut-off. Other link gears are the Gooch and the Allan straight link gear. This last was invented when machining methods were crude, and it was difficult to get a curved link made of the correct radius. The next gears were the radial gears, which depend on the geometrical fact that the motion of the two eccentrics

FIG. 5. VALVE GEARS

A, Stephenson (link-motion); B, Walschaerts (radial)

can be represented by: (1) a constant motion in phase with the crosshead or crank - 2(lap + lead) of the valve; (2) a variable and reversible motion at right angles to the crank. This is clearly shown in the Walschaerts gear (Fig. 5 (B)), where the pendulum lever, worked from the crosshead, provides the 'lap and lead' component, while an eccentric at right angles to the crank provides the variable 'travel' component, through a radius rod and reversing link. This is the standard valve gear for nearly all modern locomotives. Other gears based on the Walschaerts are the Baker and the Helmholz; also the Young and Deeley lever gears for two-cylinder engines. Other radial gears are the Hackworth, Bremme, and Marshall, where one eccentric in line with the crank provides both components of the motion, through an eccentric rod perpendicular to the line of action of the cylinder, and an inclined slide, whose angle of inclination is varied

to alter the cut-off, and to reverse. These gears were used for marine engines, but are unsuitable for locomotives, as the action of the springs disturbs the valve setting. A special radial gear is the Joy, where the motion is taken from a point on the connecting rod, thus avoiding eccentrics altogether. At one time it was used on locomotives, although it is affected by the springs, imposes harmful stresses on the connecting rod, and requires a special correcting linkage to make up for its inherent irregularities of motion. All these valve gears can be used for slide-valves or piston-valves of all sorts. Corliss valves are operated by a special Corliss gear, worked by an eccentric, and regulated by a governor. Poppet-valves on stationary engines are operated by cams on a geared camshaft running alongside the cylinder. The inlet valves usually

flywheel's kinetic energy by a small drop in speed, thus giving an almost uniform motion. The size of the flywheel depends on: (1) the percentage variation in speed allowable throughout the stroke; where this is small, as in engines driving electrical alternators, large flywheels are necessary; (2) the variation in engine torque throughout the stroke; this is large in single-cylinder engines, where the flywheel has to help the engine over dead centre, but small in multi-cylinder engines; (3) the speed of the engine: kinetic energy varies as the square of the speed, so high-speed engines need only small flywheels.

Governor.—The governor plays a similar part to the flywheel, but over a longer period of time. Cyclical variations in power are evened out by the flywheel; but if the mean power developed by the engine is greater than the power absorbed by

FIG. 6. PRINCIPLE OF GOVERNORS

A, Watt's conical pendulum governor; B, Porter's or loaded governor; C, governor with arms crossed.

W = weight of each ball in poundals.

W/g = mass of each ball in pounds;

n = speed of rotation of spindle, n revolutions per sec.

r = radius of path in which balls revolve.

h = vertical distance of path below point of suspension of rods on spindle axis.

P = centrifugal force on each ball = $4\pi^2 n^2 r W/g$

Condition of equilibrium $Wr = Ph$

$$\therefore Wr = 4\pi^2 n^2 r h W/g$$

$$\therefore n^2 h = g/4\pi^2$$

have a drop mechanism; i.e. the valve is opened by the cam, against a spring, at the point of admission; at the point of cut-off, the connection between the valve rod and the valve is abruptly broken, and the valve comes sharply on to its seat under the action of the spring, giving a clear-cut point of cut-off without throttling. The valve rod connects with the valve again at its leisure, and opens it at the point of admission on the next stroke. The drop mechanism, and hence the point of cut-off, is controlled by the governor. Poppet-valves for locomotives are controlled by special cam gears, such as the Caprotti and Lentz, both of which are models of ingenuity and compactness.

Flywheel.—The pressure of steam acting on the piston of an engine varies continuously throughout the stroke, and would produce a very irregular motion of the engine were it not for the flywheel, a heavy wheel with its mass concentrated at the rim. Any excess of power above the mean is stored in the flywheel as kinetic energy by a small increase in speed, while any defect of power is made up from the

the load, the speed gradually increases; the governor has to detect this and reduce the power of the engine until normal speed is regained, and vice versa. Most governors depend on the action of centrifugal force. A simple Watt governor is shown at Fig. 6 (A). The vertical shaft, carrying two heavy balls at the end of arms, is rotated by some portion of the engine mechanism. Centrifugal force tends to move the balls outward, while the controlling force of gravity tends to move them inward. At any speed an equilibrium is reached; if the speed is increased, or falls short of its normal value, the balls move out as in (r) and so take up a new equilibrium position, thus raising or lowering a collar connected to the throttle-valve through a lever and so controlling the power output of the engine. A governor must be very sensitive to small variations in speed; to increase the sensitivity, a static load may be added to the Watt governor, giving a larger controlling force without altering the centrifugal force (Porter's governor, Fig. 6 (B)), or the arms of the governor may be crossed,

so reducing the variation in height h (Fig. 6 (c)) and consequently the speed range of the governor, which means increasing its sensitivity. Modern stationary engines employ a spring as controlling force (Fig. 7), as the governor can then be mounted on a horizontal shaft, such as the end of the crank axle; the controlling force also varies with the position of the governor balls, and allows the sensitivity to be arranged to suit the design of engine. An engine may be controlled either by the throttle or by the cut-off. With the former the governor opens or closes a valve in the steam pipe.

FIG. 7.

GOVERNOR CONTROLLED BY SPRING

This is very simple and requires little power at the governor, but is uneconomical, as the full pressure of steam is rarely used. In cut-off governing the valve gear is adjusted to give a later or earlier cut-off; with drop-valves the governor controls the point at which the valve is disconnected from the operating gear (see *Valve Gears*). This method is the more economical but is generally more complicated. If a governor is made very sensitive (i.e. a very small change of speed will move it from full open to full closed), hunting, or rhythmic speed variation of the engine, may be set up. This is an objectionable phenomenon, caused by the governor instantly responding to speed variations and over-shooting the mark each time; in such a case the governor must be made less rapid acting, without reducing the sensitivity, by means of an oil dash-pot or other damping device. Then, if the speed rises slightly, the governor tends to shut off steam completely, but must do so slowly because of the dash-pot. Speed then falls to its proper value, but the governor has not

had time to overshoot the mark, and a constant speed is thus maintained.

THEORY OF THE STEAM ENGINE.—*Thermodynamics* deals with the relation of heat to mechanical work and gives us a standard with which to compare actual heat engines. There are two fundamental laws: (1) In any heat engine, the amount of mechanical work obtained is strictly equivalent to the amount of heat lost, since heat and work are both forms of energy. 1400 ft.-lb. of work = 1 C.Th.U. (see STEAM), and this is called the Mechanical Equivalent of Heat or Joule's Equivalent, after the man who first determined it. (2) It is impossible for a self-acting machine, unaided by any external energy, to convey heat from a body at lower temp. to a body at higher temp. From these laws it can be deduced that a perfect heat engine, taking in heat at a high temp. T_1 , and rejecting heat at a low temp. T_2 , cannot have a greater

efficiency than $\frac{T_1 - T_2}{T_1}$ (Carnot's principle). Temps. for this expression are to be measured from the absolute zero, or temp. below which it is impossible to go (-273°C.): e.g. a locomotive, taking in heat in a boiler working at 227 lb./sq. in. steam pressure (corresponding temp. 200°C. or 173°Abs.), and rejecting heat up the chimney at atmospheric pressure (corresponding temp. 100°C. or 373°Abs.), has a maximum possible thermal efficiency of $\frac{473 - 373}{473}$, or 21.2 per cent. That is,

for every 100 units of heat put into the boiler, at least 78.8 must be thrown away in the steam going up the chimney. As no locomotive is a perfect heat engine, considerably less than 21.2 units are actually made use of; a recent locomotive trial gave an overall thermal efficiency of 8.2 per cent at the drawbar. Thus to increase the efficiency of a steam engine we must raise the temp. at which heat is taken in (e.g. increase the boiler pressure) and lower the temp. at which heat is rejected, by using a condenser, to give an exhaust temp. nearly approaching the atmospheric. It is impossible to exhaust at a temp. below that of the surroundings, as that is contrary to the second law of thermodynamics. By using high-pressure steam in large steam turbines (see TURBINES, STEAM), and exhausting to a high-vacuum condenser, overall thermal efficiencies of 30 per cent have been attained in practice.

Sources of Loss in a Steam Engine.—(1) Cylinder condensation. When the valve opens to admission, hot live steam comes in contact with a cylinder piston, and steam port that have been previously cooled by exhaust steam and condensation takes place; more steam is therefore needed to fill the cylinder than calculation from its dimensions would indicate. The difference between the steam actually used and that theoretically necessary is called the missing quantity, and is 20–60 per cent in engines using saturated steam. Further, as the steam in the cylinder expands after cut-off, more condensation

takes place at first; but, as the pressure and temp. both fall, the steam soon becomes cooler than the cylinder walls and condensed water; the latter therefore re-evaporates at the end of the stroke when it is no longer wanted, and congests the exhaust ports, and overloads the condenser (where fitted). Re-evaporation cools the cylinder walls again and prepares them for condensing more steam next stroke, so that a vicious circle is set up. Cylinder condensation is less in a high-speed engine, as the steam has less time to condense and re-evaporate. By superheating the steam (see BOILERS) before it is admitted to the engine, initial condensation is avoided, as contact with cold cylinder walls merely reduces the degree of

exhaust-valves of the Corliss or poppet-valve type avoid this, as they are less liable to leakage, and, in any case, steam can only leak into the cylinder and not direct to exhaust. (3) 'Wire-drawing.' With small valves, and long, narrow steam ports, the steam is considerably throttled, both at entering and at leaving the cylinder; this reduces the power of the engine, as a large amount of the steam's energy is employed in getting itself through the ports. The remedy lies with long-travel piston-valves with short, straight ports, or, better, with large-diameter poppet-valves. (4) Incomplete expansion. This is an inherent fault in all condensing S. E. (other than steam turbines). Complete expansion down to

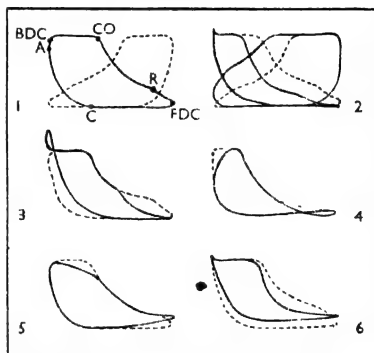

FIG. 9. INDICATOR DIAGRAMS
For explanation, see text

superheat; but condensation occurs during expansion, particularly with large expansions in one cylinder. A very high degree of superheat will prevent condensation entirely, so that slightly superheated steam is exhausted (*cf.* modern locomotives when worked hard); but as the temp. of rejection is thereby increased, the thermal efficiency is reduced. (See also *Compound Engines and Uniflow Engines* below). (2) Leakage of steam past the valves. Where slide- or piston-valves are used with saturated steam, the movement of the valve uncovers portions of the port face that have previously been exposed to exhaust steam; live steam therefore condenses, and the resultant film of water is blown underneath the valve by the difference in pressure between the steam and exhaust sides; once on the exhaust side, it re-evaporates, due to the low pressure, and congests the exhaust passages. This leakage contributes to the missing quantity. Independent steam and

condenser pressure (which may be as low as $\frac{1}{2}$ lb./sq. in.) is impracticable, owing to the enormous cylinder necessary to accommodate the large volume of expanded steam; apart from limitations of space, the friction of the very large piston and valves required would more than absorb the extra power given by complete expansion; cylinder condensation would also be increased, and 'wire-drawing' would be unavoidable. Condensing engines therefore exhaust at a pressure of 3 to 8 lb. per sq. in. and do not make full use of their steam. (5) Incomplete compression. This is due to faulty valve setting. Where it occurs, the clearance volume at the end of the cylinder must be filled with live steam at the beginning of each stroke, and this steam is included in the missing quantity. (6) Loss of heat by radiation and leakage from steam pipe, cylinder, valve chest, etc. This can be reduced by careful lagging of all parts, and attention to joints. (7) Mechanical friction between piston and cylinder.

valve and port face, and at all sliding surfaces and joints in the mechanism and valve gear. These sources of loss, of which 1 and 4 are the most serious, reduce the indicated thermal efficiency to 50 to 70 per cent of the ideal thermal efficiency; the brake thermal efficiency is, of course, less still

the crank shaft is less than the I.H.P., owing to friction in the engine mechanism; this is called shaft horse power (S.H.P.) or brake horse power (B.H.P.)—the latter because. In a test, the power delivered by the engine is absorbed and measured by a brake acting on the engine shaft. The ratio B.H.P./I.H.P. is called the

FIG. 10

means of the curves.

Indicators and Testing of Engines—The indicator is a piece of apparatus used for testing engines. It draws a diagram showing how the pressure in the cylinder varies with the position of the piston throughout the stroke. From the dimensions of an engine, and the indicator diagram, we can calculate the power developed by the steam inside the cylinder; this is called the indicated horse

power (I.H.P.), and generally lies between 60 and 90 per cent. In testing locomotives a dynamometer car is used, placed between the locomotive and its train, to measure the tractive force at the tender coupling, or 'drawbar'; this gives the drawbar horse power (D.H.P.), which is less than the B.H.P. owing to the frictional and wind resistance of the locomotive and tender, considered as vehicles.

power (I.H.P.) of the engine (1 h.p. = 33,000 ft.-lb. per min., a figure adopted by Watt as being 50 per cent more than could be done by a good cart-horse, so that his customers should have no cause to complain of the power of their engines). In a condensing engine, the steam used can be weighed in the form of condensate, and the steam consumption calculated. This is expressed as 'lb. steam per I.H.P.-hour.' The power actually delivered at

The indicator diagram is also used to test the setting of the valves and valve gear, as the smallest irregularity makes itself apparent on the diagram. Watt designed the first indicator, from which have developed many different types. In the Crosby indicator (Fig. 8) the drum, carrying a piece of paper held by the paper clips, is rotated from the cross-head of the engine by a reducing lever and pulley. The body of the indicator is screwed into

the cylinder of the engine, which is thus put in steam communication with the indicator piston. This is controlled by a graduated spiral spring SS, and connected to a pencil point by means of a multiplying mechanism. Thus the pencil moving vertically records variations in steam pressure, while the drum in rotating follows the motion of the piston, resulting in an indicator diagram (Fig. 9). (The letters have the same meanings as in Fig. 1.) Two diagrams are usually taken on the same paper, corresponding to the two ends of the cylinder. The area of the diagram represents the work done per stroke to a suitable scale. Indicator diagrams (Fig. 9) show in (2) more work is done at one end of the cylinder than at the other, (3) the points of release and compression are both too early, (4) the point

the other diagrams are used, as they consist solely of straight lines and circles. In the Zeuner diagram, the position of the valve is set off along the crank for each crank position; it can be shown geometrically for an ideal valve gear that the resultant figure is a pair of circles, of diameter equal to half the valve travel, and with centres on an axis inclined to the vertical by an angle equal to the angle of advance of the equivalent eccentric. The Reuleaux diagram consists of one circle of diameter equal to the valve travel; the position of the valve, at any crank position, is the distance from the circumference of the circle to an axis inclined to the horizontal by an angle equal to the distance of advance. In all diagrams, the port openings to steam and exhaust are shown shaded. The points

FIG. 12

ZEUNER VALVE DIAGRAM

FIG. 13

REULEAUX VALVE DIAGRAM

of admission is too late (lead is negative), and the point of release is too late. In (5) the ports are too small, causing throttling at admission and exhaust; in (6) there is condensation of steam in the cylinder, as shown by the rapid falling away of the expansion line, and excessive back pressure (the correct diagrams are shown by dotted lines).

Valve Diagrams.—To determine the movements of the valve under all conditions of working, various valve diagrams are used; some, like the oval and harmonic diagrams (Figs. 10 and 11), give the exact position of the valve for every position of the crank; others, like the Zeuner and Reuleaux diagrams (Figs. 12 and 13), give, as an approximation, the position the valve would occupy if actuated by an ideal valve gear. In the oval diagram, the position of the valve is plotted vertically, against the position of the piston or crosshead on a horizontal axis. In the harmonic diagram, the positions both of the valve and of the piston are plotted vertically, against the position of the crank (in degrees) on a horizontal axis. Both these diagrams take time to draw out accurately. For more rapid calculations

M and N indicate corresponding positions on the four diagrams, the port openings being shown by thick lines. Each diagram represents one setting of a valve gear; for other settings, with later or earlier cut-offs, or when reversed, separate diagrams must be drawn. These can be superposed on the oval diagram, but must be drawn separately, to avoid confusion, for the other three diagrams. These four diagrams are applicable to slide-valves and piston-valves; for Corliss valves and poppet-valves only harmonic and oval diagrams can be drawn, and they are of very different appearance to Figs. 10 and 11.

FORMS OF THE STEAM ENGINE.—The simple steam engine is a single cylinder slow-speed horizontal machine with a slide-valve, using saturated steam and exhausting to the atmosphere. Two or three cylinders give better balance, thus requiring less solid foundations, and a better torque, thus needing a smaller flywheel. Piston- or poppet-valves enable an early cut-off to be used, without throttling, while super-heated steam reduces cylinder condensation. Another type is the vertical high-speed engine with

forced lubrication, and a totally enclosed crank-case to keep out dust and to stop oil being thrown about.

(b) *Condensing Engines.*—A steam engine exhausting to the atmosphere has a high steam consumption on account of the high back pressure (14.7 lb. per sq. in.) (see THERMODYNAMICS). By exhausting into a closed air-tight vessel called a condenser, in which steam is condensed to water almost instantaneously, very low back pressures, down to $\frac{1}{2}$ lb. per sq. in., can be attained. Condensers are of two types, surface condensers and jet condensers. The former consists of a chamber traversed by a large number of small tubes, through which passes cold water, called circulating water. The exhaust steam is condensed on the outside of these tubes; the condensate thus formed is

FIG. 11. JET CONDENSER

(V, check valve; W.P.G., water-pressure gauge).

extracted from the bottom of the condenser by an 'air pump' (falsely so called, as its prin. object is to extract water, though it also deals with any air that may leak in), and, after being freed from oil, is returned to a hot well in the boiler-house to feed the boilers. Being warm, it saves coal; and as it contains no impurities, it does not cause scaling of the boilers as fresh water would; so the condensing engine also reduces boiler troubles. (For further details of surface condensers see TURBINES, STEAM.) In the jet condenser (Fig. 11) the exhaust steam is condensed in a small chamber by direct contact with a jet of cold water; the mixture of condensate and jet water is extracted by means of an 'air pump' and led to the hot well. Jet condensers are more efficient and smaller than surface condensers; but the jet water must be very pure, as any impurities in it are conveyed to the boilers, and deposited as scale; they cannot therefore be used on sea-going ships. Condensers are used on nearly all stationary and marine engines. A good condensing engine (compound), indicating 200 h.p., may require 2200 lb. steam per hr. (or 11 lb. steam per I.H.P.-hr.), whereas an equally good machine exhausting to the atmosphere will need

3800 lb. steam or 19 lb. steam per I.H.P.-hr.).

Compound Engines.—The simple steam engine has a high steam consumption due to cylinder condensation (see *Sources of Loss*); this can be overcome either by the use of superheated steam or by reducing the temp. drop in the cylinder during expansion. This is possible without loss due to incomplete expansion by using compound engines; steam is partially expanded in a small high-pressure cylinder, and then passed to a receiver; from here it is admitted to a larger low-pressure cylinder, where the rest of the expansion takes place, finally exhausting to the atmosphere, or a condenser. The range of expansion in each cylinder is thus halved. Engines in which steam is used in three or four stages are called triple or quadruple expansion engines. Typical cylinder ratios (H.P./I.P. or I.P./L.P.) are: compound, 1:2 $\frac{1}{2}$ (non-condensing), or 1:3 $\frac{1}{2}$ (condensing); triple expansion, 1:2 $\frac{1}{2}$:6 $\frac{1}{2}$ (condensing); quadruple expansion, 1:2:1:8 $\frac{1}{2}$. Further advantages of the compound system are: (1) later cut-off in each cylinder, thus simplifying the valve gear (see *Valves*); (2) the pressure difference between steam and exhaust in each cylinder being halved, leakage past valve and piston is reduced, (3) the 'missing quantity' in the H.P. cylinder is available for work in the L.P. cylinder before escaping to exhaust. A simple condensing engine, using saturated steam at 180 lb. sq. in. may require 19 lb. steam per I.H.P.-hr., whereas a similar compound will require only 13 lb., and a triple expansion engine 11 lb. This is an extreme case, but even with superheated steam a compound exhausting to the atmosphere will show a saving of 5 to 10 per cent.

Uniflow Engines.—In a uniflow engine steam is admitted by valves as usual, but exhaust takes place through ports cut in the cylinder wall; when uncovered by the piston on the outward stroke, release takes place, and when closed again on the return stroke, compression occurs. As these events are inter-dependent, release must be early to avoid excessive compression. In the uniflow engine steam flows only one way—in at the ends via the valves, and out at the middle via the exhaust ports. Live steam does not have to enter through ports that have been cooled by exhaust steam, thus reducing the 'missing quantity,' and wet exhaust steam escapes directly to a cold exhaust port, so that re-evaporation is reduced, giving a free exhaust. Uniflow engines are a comparatively recent development; they are generally fitted with cam-operated drop valves, and are used in mills and collieries where a simple high-efficiency steam engine is required.

USES OF THE STEAM ENGINE. Stationary.—The first stationary S. E. were designed for pumping water from mines, to enable them to be sunk much deeper than was possible with hand pumps. The first practical pumping engine was built by Savery in 1698 (Fig. 15); on the down stroke the surface of the water in the

receiver was used as a piston, the water being forced out by the pressure of steam from the boiler, when the steam cock was opened; on the return stroke the steam in the receiver was condensed by pouring water over the outside from the water cock; the resultant vacuum was filled by water from the mine ready for the next down stroke. This engine was very inefficient, as the steam had to heat the receiver at each stroke before it could fill it, resulting in an enormous missing quantity. Further, the height to which water could be pumped was dependent on the boiler pressure, which in those days was very low. Its successor, Newcomen's engine, 1711, used a piston, piston rod, and beam to actuate a separate pump, so that mine water could be forced

FIG. 13

SAVERY'S STATIONARY PUMPING ENGINE

to heights depending on the relative sizes of the steam and water cylinders, without requiring a high steam pressure. The cylinder, however, was still used as a condenser (a jet of water being injected each stroke), which meant a very large steam consumption. The idea of keeping the cylinder hot continuously, by using a separate condenser, was due to Watt, who patented a single-acting engine on this system in 1769, and brought out his first double-acting engine in 1782. Watt made a scientific study of the steam engine, and invented the separate condenser, the 'air-pump,' expansive working of steam, lagging of the cylinder and steam pipes, the stuffing-box, the governor, the indicator, and the parallel motion (of which the modern equivalent is the crosshead and slide bar); the crank was also his invention, but the patent was stolen. The success of his low-pressure condensing engine delayed the coming of the high-pressure non-condensing engine and the compound engine (invented by Hornblower, 1781) for many years. And, as his machines were beam engines, the

direct-acting engine was a rarity until after 1825. With the invention of the crank in 1781, the steam engine came into extensive use for power purposes, and was the only power used during the industrial revolution and until the end of the nineteenth century. S. E. worked the first electric power stations, where the need for high speeds was met by vertical engines (of Bellis & Morcom, and Willans types), and the later demand for large powers by enormous vertical triple and quadruple expansion engines. When alternating-current electric power stations were erected, difficulty was experienced in keeping the alternators 'paralleled,' due to the fluctuation in torque of the steam engine; and a solution was found in the large steam turbine, with its even torque, perfect balance, and great power, overload capacity, speed, and steam economy (see TURBINES, STEAM). S. E. are no longer installed in power stations, and their use has diminished elsewhere, being replaced by: (1) steam turbines where large powers are required for large mill drives or blowing engines for large furnaces; (2) heavy oil or gas engines (which are very economical in small sizes and require no boiler) for small power stations, workshops, and country houses; but chiefly (3) electric motors, supplied with current from a central or local power station. S. E. are still used (1) where steam is needed for process work, as in paper mills, and boilers would have to be installed in any case; (2) for absolute reliability, which the steam engine, with 150 years of development, almost alone can give, as in colliery winding and haulage (though even here electric motors are often used); (3) where the engine is liable to severe abuse, as in steel rolling mills (though electric motors are nowadays designed for this service), in forging (see STEAM AND POWER HAMMERS), and abroad, for use with native labour; (4) small S. E., direct coupled to pumps without connecting rods and cranks, are used for feeding boilers and for pumping chemicals.

Marine Engines.—The first practical steamboat was the *Charlotte Dundas*, a tug built by Symington in 1801, and fitted with one of Watt's double-acting condensing engines, driving a stern paddle wheel. The first naval steamship was the *Lightning*, built at Deptford in 1823. All early steamships were fitted with paddle wheels, so that the main shaft was transverse, at a considerable height above the ship's bottom, and rotated at a slow speed. The first marine engine proper (as distinct from a land engine fitted into a ship) was the side lever engine, a variation of the beam engine that was proving so successful on land. The beam or 'lever' was placed at the side of a vertical cylinder, in the bottom of the boat, and was driven by return rods from the crosshead. It was used on merchant ships almost until the advent of the screw propeller in 1840; in the navy, however, direct-acting engines were tried, both of the orthodox type, and with oscillating cylinders placed vertically under the crankshaft, working upwards to

save space, for until 1869 steam in the navy was used only as an auxiliary to sails. Successful experiments with the screw propeller were carried out by Ericsson in 1837, and the first ship so fitted was Brunel's enormous passenger steam *Great Eastern*, 1840; but propellers did not become standard practice in the mercantile marine till about 1860. The propeller did not interfere with the sailing qualities of a ship, and was much less vulnerable than the paddle wheel, so it found great favour in the navy. Marine engine design was thereby completely changed, as the main shaft was now fore-and-aft, low down in the ship, and rotated at a high speed. The first naval vessel with a propeller, the *Rattler* (1843), had oscillating cylinders working downwards, geared to the propeller shaft. This expedient was only temporary, as higher-speed engines, direct coupled to the main shaft, were soon developed. Some difficulty was experienced with them, as they had to be entirely below the water line to avoid damage in action; the vertical marine engine working downwards on to the shaft, as used in merchant ships, could not be employed, and there was very little room in the width of the ship for horizontal engines. The Tennant direct-acting engine, the Maudslay return connecting-rod engine, and the Penn trunk engine were the most successful. With the introduction of armoured ships in 1872 the vertical marine engine was adopted, and this proved the final type both for the navy and the mercantile marine. With the low boiler pressures at first used (10–20 lb. per sq. in.), single expansion engines were adequate, but as pressures rose to 60 and 120 lb. per sq. in., compound engines came into use (1870); with a still further rise in pressure to 150 lb. per sq. in. (1885), and to 300 lb. per sq. in. with water-tube boilers in the navy (1895), triple expansion engines became general. In the merchant service quadruple expansion engines were also developed (1900). The early engines had jet condensers, which introduced salt water into the boilers, causing rapid scaling and corrosion; surface condensers had previously been tried and found unsatisfactory, but in 1860 they were re-introduced and improved boiler conditions considerably. To-day the use of the steam engine for marine work is declining. For large powers it has been replaced by the steam turbine (see *TURBINES, STEAM*), as in land practice; since 1905 all war vessels for the R.N. have been so equipped, and so have most of the larger liners and many smaller passenger boats; for medium and small powers it is being replaced by the Diesel engine (see *OIL ENGINES*). Marine S. E. are still built, however, for the larger cargo boats, owing to their low initial cost and great reliability; while recent designs with high-pressures, superheated steam, and poppet-valves have reduced the difference in running cost between Diesel and steam. Sev. medium-power vessels also are fitted with compound engines and exhaust steam turbines, thus getting the advantage of the very low condenser pressures

that the steam engine alone cannot utilise properly.

Locomotive Engines.—The first locomotives were built to replace horses on colliery tramways and enable a greater output of coal to be handled. The first practical locomotive, built by Trevithick in 1804, performed its work successfully, but was soon abandoned, as its weight broke the iron plates on which it ran. The first adhesion locomotive, running on 'edge' rails, was built by Blackett in 1813 for Wylam colliery, Northumberland, and was soon followed by others in the neighbourhood. (For the hist. of the steam locomotive see *RAILWAYS*.) The modern locomotive is founded on a pair of longitudinal frame plates, braced together by cross stretchers. It is supported (1) on the coupled wheels by springs bearing on the axle boxes in which the coupled axles run, and (2) on the carrying wheels by means of a sub-frame (bogies or pony) which is free to move in order to guide the engine round curves at speed. The boiler (see *BOILERS*) is supported at its ends, being riveted to the smoke-box in front and resting on expansion brackets at the back. Behind it is the footplate, from which the locomotive is operated, covered by a weatherproof cab. The smoke-box is bolted to the frames at the front of the engine, and contains the superheater and steam pipes leading to the cylinders; also the blast pipe through which the exhaust steam escapes up the chimney, creating a powerful draught on the fire. The cylinders are bolted to the frames beneath the smoke-box and drive one pair of coupled wheels (driving wheels) by connecting rods. The drive is taken to the other wheels by coupling rods, and converted into tractive force by friction between the wheels and the rails (approximately $\frac{1}{4}$ to $\frac{1}{2}$ of the adhesion or weight carried on the coupled wheels). Steam is admitted to the cylinders by a regulator valve in the boiler, operated from the cab, distribution is by piston-valves and Walschaerts gear, controlled by a reversing screw in the cab. For stopping cast-iron brake blocks are pressed against the treads of the wheels by a steam, air, or vacuum cylinder (according to the braking system employed) operated by a driver's brake-valve in the cab. Water is fed to the boiler by two injectors, one of which is frequently worked by exhaust steam. Coal and water supplies are carried in a six- or eight-wheeled tender attached behind the locomotive. Condensing is not used on locomotives, the theoretical increase in output not being obtained in practice, because a substitute for the blast pipe would have to be found; and, owing to space restrictions, a separate condenser vehicle would have to be provided and hauled; and both these would absorb power. S. E. were used in motor cars from about 1890 to 1914, but are now obsolete on account of their weight and the time required to light up the boiler at starting. S. E. however, are still in use on road rollers (where weight is an advantage), on traction engines, and on heavy road lorries, where simplicity and the use

of cheap coal give them an advantage over petrol lorries. Modern steam wagons are mounted on pneumatic tyres, and are fitted with a high-speed engine embodying poppet-valves and using highly superheated steam.

Darling, *Exhaust Steam Engineering*, 1928; W. E. Dalby, *The Balancing of Engines*, 1929; G. O. McLearn, *Steam Power Stations*, 1932; and R. H. Grundy, *Theory and Practice of Heat Engines*, 1942.

Steam Navy, see EXCAVATION.

Steam Turbine, see TURBINES.

Stearic Acid ($C_{17}H_{35}COOH$), fatty acid occurring in fats and oils. It is, when pure, a colourless waxy substance, insoluble in water, but soluble in alcohol and ether (melting point $69^{\circ}C.$). All its salts, except those of the alkalis, are insoluble in water. On the commercial scale, tallow and other fats and oils are decomposed with water, dilute sulphuric acid, or milk of lime under pressure. The product is distilled in a current of superheated steam and a pasty mixture of fatty acids is obtained, from which all glycerol and liquid oleic acid is removed by pressure. The remaining hard mass is a mixture of palmitic and stearic acids (stearin, *q.v.*), which is mixed with paraffin to make it less brittle and employed in the manufacture of candles. S. A. is also utilised for polishes and rubber compounds, and in ointments as a substitute for wax. Sodium stearate, $C_{17}H_{35}COONa$, is the chief constituent of soap (*q.v.*).

Stearin, Tristearin, or Glycerine Tristearate, $(C_{17}H_{35}COO)_3C_3H_5$, is a component of the solid fats, and when pure is a colourless, tasteless substance, soluble in ether but insoluble in water. It is decomposed by water and dilute mineral acids at moderately high temps. ($200^{\circ}C.$), forming glycerol and stearic acid (*q.v.*).

Steatite, or Soapstone, see TALC.

Steatornis, see GUACUATIRO.

Stedman, Edmund Clarence (1833–1908), Amer. poet and critic, b. at Hartford, Connecticut, and graduated at Yale. He began life as a journalist, was a banker in Wall Street, New York, from 1861 to 1889, and was for over twenty years on the New York stock exchange. His *Victorian Poets* (1875), *Poets of America* (1885), and *Elements of Poetry* (1892) show great clearness of vision and judgment, and gave him a great reputation. Among his poems, the last collection of which was issued in 1897, the more ambitious are *The blameless Prince* (1869) and an *Ode on Hawthorne* (1877).

Steel, Henry Wickham (b. 1871), Eng. journalist, b. at Long Melford, Suffolk, educated at Sudbury Grammar School and at Jena, Berlin, and Paris Univs. In 1896 he became foreign correspondent to *The Times* in Berlin, and from Jan. 1914 and throughout the First World War was foreign editor. From 1918 to 1922 he was editor of *The Times*, and from 1923 to 1931 was proprietor and editor of the *Review of Reviews* (*q.v.*). From 1925 to 1938 he

lectured on European hist. at London Univ. Pubs. include *The Hapsburg Monarchy* (1913, 1918); *Through Thirty Years, 1892–1922* (1924); *The Antecedents of Post-war Europe* (1932); *Hitler: Whence and Whither?* (1934); *The Press* (1938); *The Fifth Arm* (1940); and *Words on the Air* (broadcast talks, 1946).

Steel, see IRON AND STEEL; ROLLING MILLS. See also under METALLURGY.

Steel-bow Lease, in old Scots law, S. goods comprised corn, straw, cattle, or instruments of tillage delivered by a landlord to the tenant at entry on the condition that at the end of the tenancy a like quantity of such goods would be re-delivered by the tenant. In addition the tenant paid a S. rent of 5 per cent on the value of the stock.

Steele, Sir Richard (1672–1729), Irish man of letters, b. in Dublin, and educated at the Charterhouse, London, where Addison was a fellow pupil. He entered the Horse Guards in 1694, and in his early years led a care-free and dissipated life. He pub. *The Christian Hero* in 1701, and in 1703 his *Lying Lover* was performed at Drury Lane. In 1709 he founded the *Tatler*, and over the signature of 'Isaac Bickerstaff' contributed two-thirds of the essays, Addison writing sev. of the remainder. In 1711 he started the *Spectator*, and contributed to this many papers, inventing the 'Spectator Club.' He entered Parliament in 1713, and in the following year issued *The Crisis*, in favour of the Hanoverian succession. After the accession of George I. he was rewarded for his support with various offices. His last comedy, *The Conscious Lovers*, was produced at Drury Lane in 1722. It is, however, rather as the essayist of the *Spectator* and the *Tatler* that he is famous. S., unlike Addison, is not completely a man of his time, some traits recalling the Restoration, others foreshadowing the later eighteenth century; a classicist only by opportunity and accident. With clear thought, and a gift of delicate treatment, he seeks in fact the ideal of a pleasant negligence, and his form is more spontaneous than painstaking. In the *Tatler*, S.'s individual work, he soon turns to a favourite task, the reform of manners, and the victory of culture over excess individualism, in the same way as did the fr. salons of the seventeenth century. Both S. and Addison were able to establish a compromise between the moral freedom leading to licentiousness of the Restoration, and the puritanism which the Commonwealth had brought to disfavour. S.'s sentimental comedies have a great charm and finesse, expressing his own beliefs in homely virtues and moralising principles, and adding a gift for comedy and lively dialogue. *The Funeral* is the most amusing; *The Conscious Lovers* appeals to sensibility. See lives and studies by H. R. Montgomery, 1865; A. Dobson, 1888; G. A. Aitken, 1889; and W. Connely, 1934.

Steel Engraving, see ENGRAVING.

Steel, Harveyised, is steel which has been 'face-hardened' by a process invented by H. A. Harvey, which is chiefly applied

to armour plates. When the plate has been rolled out to the desired size and shape, in steel containing from .10 to .35 per cent of carbon, it is laid flat in a bed of finely powdered clay or sand, upon the bottom of a compartment erected within a furnace. The compartment is then fitted with granular carbonaceous material which is covered with a layer of sand and pressed down on the plate by rows of heavy fire bricks. The furnace is raised to an intense heat, the temp. being kept up for about 120 hrs., by which time the face of the steel has absorbed sufficient carbon to harden it, sometimes as much as 1 per cent being thus taken up. When the surface of the plate has cooled down to a dull cherry-red colour, the superincumbent material is removed and the plate chilled by spraying with torrents of cold water. A plate of steel 10½ in. thick, when treated in the above manner, is found to be supercarbonsated to a depth of about 3 in. Nickel steel when treated by the above process yields a material which is even harder than H. S.

Steel Yard, see BALAN E.

Steen, Jan Havick (1626-79), Dutch painter, b. at Leyden, studied under Knupfer, Adrian van Ostade, and Jan van Goyen. In 1648 he joined the painters' guild in Haarlem, and later in life kept a tavern at Delft. S. was a painter of great diversity, producing compact scenes of human life with much ingenuity of colouring. His chief pictures are the 'Music Master,' 'Tavern Company,' 'Oyster Girl,' and 'St. Nicholas.' See study by A. Bredius, 1927.

Steen, Karl, see DAUDET, JULIA ALLARD.

Steenbok, see STEINBOK.

Steeplechasing, see HORSE-RACING; POINT TO POINT STEEPLCHASES.

Steer, Philip Wilson (1860-1942), Eng. painter, b. at Birkenhead, studied painting at the Gloucester School of Art, in Paris at Julian's under Bouguereau and at the Beaux Arts under Cabanel. His 'Chesham Castle' and 'Mrs. Raynes' both in the Tate Gallery, are perhaps his finest achievements in landscape and portraiture respectively. He first exhibited at the Royal Academy in 1883. In 1885 he was rejected and remained aloof until 1940. He will rank primarily as a landscape artist in the tradition of Constable, with some leaning towards Turner and Gainsborough, with his comparative indifference to the forms of objects and preoccupation with light and atmospheric colour. In 1934 S. was accorded the rare honour, for a living artist, of having an exhibition of his works at the National Gallery. Some critics regard him as the greatest landscape painter since Turner. His Chinese picture, 'The Drunken Sage,' was left to the Brit. Museum. S. was awarded the Order of Merit in 1937. See lives and studies by R. Ironside and J. Rothenstein, 1944, and D. S. MacColl, 1945.

Stefano, Tommaso di, see GIOTTINO.

Stefan's Law, named from Joseph Stefan, Austrian physicist (1835-93), states that the amount of energy radiated per second from a heated body is propor-

tional to the fourth power of its absolute temp. Thus, if R is the amount of energy radiated from a body at an absolute temp. T, then $R = ET^4$, where E is a constant. Strictly the law only applies to 'black bodies' (see RADIATION), but it is frequently a good approximation to the radiation of other objects also.

Stefansson, Vilhjalmur (b. 1879), Canadian explorer, b. at Arnes, Manitoba, of Scandinavian ancestry. Graduated at the State Univ. of Iowa, and was also a student at Harvard. S. was one of the leaders of the Anglo-Amer. expedition to the Arctic seas (1905-12), claiming to have discovered a lost European tribe in the neighbourhood of Coronation Gulf, an Eskimo of a very light colour, with blue eyes and red hair. He commanded the Canadian Arctic Expedition, 1913-18, discovering Prince Patrick Land, and journeyed to the centre of Australia (1924). He wrote *My Life with the Eskimo* (1913); *Anthropological Report* (1914); *The Friendly Arctic* (1921); *The Northward Course of Empire* (1922); *The Adventure of Wrangel Island* (1925); *The Standardisation of Error* (1927); *Adventures in Error* (1937); *Three Voyagers of Martin Frobisher* (1938); *Unsolved Mysteries of the Arctic* (1938); *Iceland: the First American Republic* (1939); *Ultima Thule: Further Mysteries of the Arctic* (1940); and *Greenland* (1942).

Steffens, Henrik (1773-1815), Norwegian philosopher, b. at Stavanger. He studied under Schelling at Jena, and occupied a chair of philosophy and mineralogy at the Univ. of Halle. For some years he was rector of the Univ. of Berlin. His pubs. include *Anthropology* (1821); *False Theology and True Faith* (1823); and *Christian Philosophy* (1839). See life by V. Waschnitzus, 1939.

Stegosaurus, species of dinosaur found in the upper Jurassic beds of N. America. It was about 30 ft. long, had a remarkably small head relatively to its unwieldy body and heavy tail, and its back was armoured with heavy bony plates. Like the Brontosaurus, it was herbivorous.

Steiermark, see STYRIA.

Stein, Charlotte von (1742-1827). Ger. authoress, b. at Eisenach. After the death of the Baron von S., she became an intimate friend of Goethe. His letters to her have been pub. (1848-51, 1923). She wrote a tragedy called *Dido*. See lives by H. Duntzer, 1874; W. von Bode, 1912; and L. Voss, 1921; and E. Adler, *Goethe und Frau von Stein*, 1887.

Stein, Gertrude (1874-1946). Amer. author, b. at Alleghany, Pennsylvania, and educated at Radcliffe College and John Hopkins medical school, where she made a study of brain anatomy. From 1904 she lived in Paris for some years, and in the First World War was decorated for work for the Fr. wounded. In her works, influenced by Picasso and Matisse, she developed an abstract, experimental type of prose which had some influence on later writers. Some of the mannerisms of a conscious innovator were abandoned, with profit to intelligibility, in the later vols. She described her books as fiction

or autobiography or children's literature, but neither her own descriptions nor the oddity of her titles give any real clue to their contents, which, however, show much observation and profundity. Her writings include *Three Lives* (1908); *Making of Americans* (1925); *Autobiography of Alice B. Toklas* (1933), continued in *Everybody's Diary* (1937); a study on Picasso (1938); *Paris France* (1940); and *Wars I have Seen* (1946).

Stein, Heinrich Friedrich Karl, Freiherr vom und zum (1757-1831), Ger. statesman, b. near Nassau. He entered the service of Frederick the Great in 1780, and was appointed president of the Westphalian Chambers in 1796. From 1804 to 1807 he acted as minister of state for trade. He was out of office for a time, but after Tilsit was recalled and given a free hand. His reforms included the abolition of serfdom and class distinctions with regard to callings and occupations, the introduction of free trade in land, a reorganisation of the Cabinet system, and the estab. of local self-government in tus. His work was aimed at arousing resistance to the Fr., and Napoleon on this account secured his dismissal. As a political refugee from 1812 to 1815 he was an advisor to the Tsar Alexander I., and later administrated the liberated ters. At the Congress of Vienna S. pressed for a united Germany with a constitution excluding the princes, but was successfully opposed by Metternich. He then retired, studied hist., and founded (1819) an historical research society, which pub. *Monumenta Germaniae historica*. See lives and studies by J. R. Seeley, 1879; M. Lehmann, 1902-5, 1928; K. Thiede, 1927; G. Ritter, 1927-31; Ricarda Huch (2nd ed.), 1932; C. de Grünwald, 1936; and G. Siegrist, 1940.

Stein, Sir Marc Aurel (1862-1943), Brit. archaeologist and Asiatic scholar, b. in Budapest. He travelled widely in Kashmir, central Asia (conducting excavations in Khotan), W. China (see CAVES OF A THOUSAND BUDDHAS), Persia, Iraq, and Transjordan. His pubs. include *Chronicle of Kings of Kashmir* (1900); *Ancient Khotan* (1907); *Ruins of Desert Cathay* (1912); *Serindia* (1921); *The Thousand Buddhas* (1921); *On Alexander's Track to the Indus* (1929); *The Archaeological Tour in Waziristan and N. Baluchistan* (1931); *Archaeological Reconnaissances in S.E. Iran* (1937); and *On Old Routes of Western Iran* (1940).

Steinamangar, see SZOMBATHELY.

Steinbeck, John Ernst (b. 1902), Amer. novelist and short-story writer, b. at Salinas, California, and educated at Stanford Univ. He first won attention with the appearance in 1935 of the ironically humorous *Tortilla Flat*, a novel of life among the paisanos of Monterey, California. His reputation grew steadily with the pub. of the novels *Of Mice and Men* (1937; dramatised 1939, and filmed 1940) and, especially, *The Grapes of Wrath* (1939; filmed in 1940). This latter novel, which won the Pulitzer prize for 1940, is the story of a refugee family from the dust-bowl of America, and is considered to be among the foremost works

of modern realistic fiction. Mostly his books are a blend of realism and romance, and their background and atmosphere are generally rural. Other books: *Cup of Gold* (1929); *Pastures of Heaven* (1932); *To a God Unknown* (1933); *The Moon is Down* (1942); *Cannery Row* (1945); *The Wayward Bus* (1947); and *The Pearl* (1947, Mexican folk-legends). See studies by H. T. Moore, 1939, and J. H. Jackson, 1940.

Steinbok, or Steenbok, S. African antelope of the genus *Nanotragus*. *N. tragulus*, the common S., is reddish-brown above, white below, while *N. melanotis* is of a greyish colour; *N. pygmaeus*, which stands 10 in. high, is the smallest living ruminant.

Steiner, Rudolf (1861-1925), Austrian founder of anthroposophy, b. in Kraljevic in Croatia, studied mathematics and natural science, and later worked in the Goethe archives at Weimar. From 1902 he evolved a new study of the higher worlds opposed to traditional occultism. He worked in many spheres of learning and his theories of education, using the arts therapeutically in the treatment of mental deficiency, had much influence, his pioneer school at Stuttgart (estab. 1919) inspiring similar experiments in many countries, including Britain. His works include *Welt- und Lebensanschauungen des neunzehnten Jahrhunderts* (1900-1); *Theosophie* (1904); *Wie erlangt man Erkenntnisse der höheren Welten* (1909); and an autobiography, *Mein Lebensgang* (1925). See lives and studies by F. Rittelmeyer (2nd ed.), 1928; F. Poeppig, 1938; and G. Wachsmuth, 1941.

Steinmetz, Charles Proteus (1865-1923), Ger.-Amer. electrical engineer, b. at Breslau, and educated at the univs. of Breslau, Berlin, and Zürich, where he specialised in chem. and electrical engineering. In 1889 he emigrated to the U.S.A., and eventually became consulting engineer to the great General Electric Company at Schenectady, New York. He devoted much time to the study of the phenomena of lighting and alternating electric current, and made studies of the loss of power in electric currents of all kinds. He held many patents for improvements, and new devices in electric generators and motors.

Steir, see STEYER.

Stekene, tu. in the prov. of W. Flanders, Belgium, 15 m. W. of Antwerp. It has manufs. of pottery, hats, carpets, sabots, and has brick-kilns. Pop. 8700.

Stella, see SIDNEY, SIR PHILIP; RICH, PENELOPE; and SWIFT, JONATHAN.

Stellaland, one of two republics (the other being Goshen or Goosen), which the Boers from the Transvaal set up in 1882 on land which had been given them by native chiefs in return for help rendered in inter-tribal wars, especially those in which Chaka was involved. It was so named on account of the fact that the great comet of 1882 was visible at the time of its formation. It had its cap. at Vryburg. The estab. of these states did not, however, end inter-tribal disturbances, with the result that these and other neighbouring ters. were declared a Brit. protectorate in

1884. The two republics were dissolved without bloodshed following Sir Charles Warren's arrival in Bechuanaland. See W. Williams, *Life of Sir C. Warren*, 1941, and S. Cloete, *African Portraits*, 1946.

Stellaria, or **Stichwort**, genus of Alismacæ (a sub-order of clovewort), named S. because the corona is stellate or radiated. There are upwards of seventy known species of these herbs from temperate to cold climates. Brit. species are *S. aquatica*, water; *S. nemorum*, wood; *S. media*, the common, also called common chickweed; *S. Holostea*, the Greater; *S. glauca*, the glaucous marsh; *S. graminea*, the Lesser; and *S. uliginosa*, the bog stitchwort. *S. Holostea* is from 1 to 2 ft. high, and has large white flowers; it is common in copses and hedgerows, and is often planted in gardens as a border flower.

Stellar Magnitudes, see under STARS.

Stellar Parallax, see under PARALLAX.

Stellenbosch, tn. of Cape Prov., S. Africa, 31 m. E. of Cape Town, situated in a vine-growing valley, W. of the Drakenstein Mts. The second oldest tn. in South Africa, the site of S. was selected by Simon van der Stell, one of the earliest and most progressive governors of the cape. Oak-trees are a feature of the streets. S. has a picturesque Rhemish church, which stands in the *brak* or vil. square, with a fine pulpit carved by Anton Anreith. There is a granite memorial to Johannes du Plessis, the famous mission secretary of the Dutch Reformed Church, who became prof. at the theological seminary at S. At S. is a noted univ., with some 2000 students, until 1918 Victoria College; here were educated James Barry Hertzog and Jan Christian Smuts, both Prime Ministers of South Africa. In the dist. are fruit farms and vineyards, and tin deposits in the streams. Pop. 11,500 (European 7500; coloured, etc., 4000).

Stelvio Pass (Ger. *Stilfserjoch*), It. Alpine pass, leads from Bormio, in the Valtellina, to Vintschgau, in Tyrol (30 m.), and is the highest carriage road in the Alps (9055 ft.).

Stem, usually ascending leaf-bearing portion of a plant, though many S. extend underground, but their apex is never covered by a sheath as are the roots, but by rudimentary leaves. S. act as support for the leaves and flowers and for the conveyance of food materials. In their early growth they are usually green, soft, and herbaceous, but later they may become dark coloured and hard and woody, persisting from year to year. Herbaceous perennials which die down each autumn have persistent underground S. or branches, which differ from roots by their small scale leaves, e.g. the rhizomes of the Iris, Solomon's seal; the scabers of the lily-of-the-valley and couch-grass; other underground S. are the tuber, bulb, corm. Above ground S. may be erect, ascending, prostrate, creeping, climbing, or twining. The zone of the S. from which the leaves spring is the node.

Stemonaceæ, see ROXBURGHACEÆ.

Sten Carbine, see under SUB-MACHINE GUNS.

Stendal, tn. of Saxony-Anhalt, Germany, on the Uchte, 33 m. N.N.E. of Magdeburg. Among its buildings are the cathedral, begun in 1188 and reconstructed in the fourteenth century, and the Gothic church of St. Mary. It is the bp. of Winckelmann (1717-68), and was the cap. of the old Brandenburg mark. There are metal industries, breweries, and manufs. of preserves. Pop. 30,000.

Stendhal, see BYLLE, MARIE HENRI.

Sten Gun, see under SUB-MACHINE GUNS.

Stenness, Orkney mainland, Scotland, is the site of well-known prehistoric field antiquities. The ring of Brodgar, a stone circle 340 ft. in diameter, is the largest in Scotland. Maes Howe, a fine chambered tomb with dry stone walling, is allied to the Boyne megalithic culture of Ireland. Both are protected as anct. monuments.

Stenography and **Stenophonography**, see SHORTHAND.

Stentor, Gk. herald, who, according to Homer, shouted before the walls of Troy with the voice of fifty men, whence the adjective *stentorian* is derived.

Stenvall, Alexis, see KIVI.

Stepanakert, cap. of the Nagorno-Karabakh Autonomous Region of the Azerbaijan S.S.R., 60 m. S.S.E. of Kirovabad.

Stephanome, instrument for measuring haloes and allied atmospheric phenomena. A graduated bar, the divs. of which are arranged to give at once angular measure, carries a slide with fixed points. A sight being taken from the end of the bar, the slide is moved till its points coincide with the points of the halo to be measured, and the diameter is read off. It was devised by Prof. P. G. Tait for use in the observatory on Ben Nevis, Scotland.

Stephanotis, climbing evergreen house plant with white waxy fragrant flowers, also known as Madagascar jasmine and clustered wax flower. *S. floribunda* is cultivated in Brit. greenhouses. The variety *Elstanoni* is a dwarf herb and more free-flowering.

Stephen (d. A.D. 33), first Christian martyr, a Jew of Gk. culture, one of the seven deacons set apart to minister to the Christian community in Jerusalem. He was charged with preaching 'against the Temple and the Law,' and made a defence of his belief and conduct before the Sanhedrin, but was stoned by the angry crowd. St. Paul, who had taken part, was converted by S.'s dying prayer. Aug. 3 is commemorated as the discovery of the reputed relics of St. S. at Kafr Gamala in 415, and May 7 as the date of their translation to Rome. His festival is celebrated on Dec. 26. See Acts vi. and vii.

Stephen (c. 1097-1154), king of England, son of S., count of Blois, and Adela, daughter of William I. He promised to recognise the claims of Matilda, daughter of Henry I., to the Eng. throne but on Henry's death usurped the crown (1155), his brother Henry, bishop of Winchester, being one of his leading supporters. Though a man of some culture, and a good soldier, S. entirely lacked diplomatic tact: as a result of this his reign was marked by civil war of an intermittent character.

In spite of early concessions he made to the church S. lost eccles. support by his ill-judged attack on the Salisbury family (see under ROGER OF SALISBURY). When his son Eustace predeceased him S. abandoned his attempt to found a new dynasty in England: at the treaty of Wallingford (1153) he agreed that Henry, Matilda's son, should succeed him. His reign illustrates the immense power exercised by the church, which, between 1135 and 1153, virtually played the role of king-maker. See W. Stubbs, *Select Charters from the beginning to 1307*, 1870; J. H. Round, *Geoffrey de Mandeville: a Study of the Anarchy*, 1892; and F. M. Stenton, *English Feudalism, 1066-1166*, 1932.

Stephen, name of ten (including one unconsecrated) popes of the Rom. Catholic Church, the chief being:

Stephen I. (Saint) (254-57), who engaged in a prolonged controversy with Cyprian bishops on the question of rebaptising heretics. In 257 an edict of the Emperor Valerian attacked the church organisation and ordered official adherence to the gods of Rome. S. was driven into exile.

Stephen III. (752-57), who sought the aid of Pippin against Aistulf, king of Lombardy, and by so doing secured for Rome the exarchate of Ravenna. He was a man of weak character, the instrument of every party in turn.

Stephen X., Friedrich von Lothringen (1057-58), who was a staunch supporter of clerical celibacy and much under the influence of Hildebrand.

Stephen (kings of Hungary):

Stephen I., or St. Stephen (c. 966-1038), b. of Christian parents and brought up on the Scriptures. Soon after the death of his father (997) Geza, duke of Hungary, he defeated some pagan rebels on his ter. at Veszprem (998), and henceforth assumed the title of king, which was confirmed by Pope Sylvester II. in 1001. Throughout his reign he endeavoured to establish Christianity in his kingdom by force of arms. He defeated the invading army of the Emperor Conrad in 1030. S. was canonised in 1083, and is regarded as the greatest Magyar hero and national saint. See B. Homan, *König Stephan I., Die Gründung des ungarischen Staates*, 1941.

Stephen I. (1262-72), son of Béla IV., was born in 1239. In 1262 he obtained the rule of half Hungary from his father, and extended his dominions into Bulgaria. In 1271 he defeated Ottakar II. of Bohemia near Mosony.

Stephen Bathori (king of Poland), see BATHORI, and POLAND, *History*.

Stephen, George, see MOUNTSTEPHEN, BARON.

Stephen Harding, Saint (d. 1137), Eng. monk of Sherborne. He became abbot of Cîteaux in 1109, and drew up the original constitutions of the Cistercians, and the charter of charity presented to the general chapter of Cîteaux in 1119.

Stephen, Sir Leslie (1832-1904), Eng. man of letters, b. in London, educated at King's College, London, and Trinity Hall, Cambridge. At the univ. he distinguished himself at the Union and also as an athlete. He was a devoted Alpinist and

wrote on mt.-climbing, and collected his papers as *The Playground of Europe* (1871, 1895). He took orders in 1855, but seven years later found himself unable to accept Christianity, and resigned his tutorship at Cambridge. He worked in London for the *Saturday Review* and the *Pall Mall Gazette*, and in 1866 began to contribute to the *Cornhill Magazine* (of which from 1871 to 1882 he was editor) the essays known as *Hours in a Library* (1874-79). Of his writings on religion his best book is *An Agnostic's Apology* (1893). Among his other works are a *History of English Thought in the Eighteenth Century* (1876), and lives of Johnson, Pope, Swift, George Eliot, and Hobbes. He was editor of the *Dictionary of National Biography* (1886-91). He was knighted in 1902. Virginia Woolf (*q.v.*) was a daughter of S. See life and letters by F. W. Maitland, 1886, and study by D. MacCarthy, 1937.

Stephen of Grandmont, Saint (1046-1184), b. at Thiers in Auvergne. Though not himself a monk, he founded the Grandmontine branch of the Benedictine order. He was canonised in 1189 at the request of Henry II. of England.

Stephens (Fr. *Estienne, Etienne*; Lat. *Stephanus*), Fr. family of scholars, printers, and publishers, the founder being Henry S. (c. 1465-1520), who started a business in Paris about 1500. For a time his foreman, Simon de Colines, who married Henry's widow, took over the estab., which was afterwards managed by Henry's second son Robert (1503-59). Robert came under the influence of the Reformation, and aroused the anger of the univ. of Paris by his pub. of the *Novum Testamentum* (1522) and of the Lat. Bible (1540). He himself wrote a *Dictionarium seu Latinæ Linguae Thesaurus* (1532), and was printer to the king for Lat. and Heb. works. In all Robert printed eleven eds. of the Bible, in Lat., Heb., and Fr., and twelve of the N.T. in Gk., Lat., and Fr. The opposition of the theologians forced him to leave Paris for Geneva, where his son Henry (1531-98) joined him in 1551. The latter was one of the greatest scholars of his time and pub. first eds. of some twenty Gk. authors and compiled *Thesaurus Graecæ Linguae* (5 vols., 1572). Robert's brothers, Francis (1502-50) and Charles (1504-64), were also engaged in the business. See M. Mattaire, *Stephanorum Historia*, 1709; W. P. Creswell, *A View of the Early Parisian Greek Press*, 1833; and V. A. Renouard, *Annales de l'imprimerie des Estienne*, 1837.

Stephens, James (b. 1882), Irish poet and novelist, b. in Dublin. Irish nationalist in sympathy, his work combines realism with Celtic myth and legend. His original fairy stories, *The Crock of Gold*, were pub. in 1912, and his collection of *Irish Fairy Tales* in 1923. Collected eds. of his poems were pub. in 1926 and 1931. Among his other works are *The Charwoman's Daughter* (1912); *The Hill of Vision* (1912); *Deirdre* (1923); *In the Land of Youth* (1924); *Pitched in Moonlight* (1928); and *Kings and the Moon* (1938).

Stephens, James Brunton (1835-1902), Australian poet, b. at Borrowstounness,

W. Lothian, Scotland, went to Queensland in 1866. His one long poem, *Convict Once* (1871), with its dignified language and imaginative quality, occupies a high place in scholarly verse of Australia; he achieved popularity by purely farcical verse, but his best work is in the Children's Hospital poems, and in two patriotic poems on Australia written in 1877 and 1900, the first being specially notable in this type of verse. His collected work was pub. in 1885 and 1902, and selections in 1925.

Stephenson, George (1781-1848), *b.* at Newcastle-upon-Tyne, for many years worked in various mines as an engineer. In 1815 he, simultaneously with Sir Humphry Davy, invented a safety-lamp. He designed a locomotive (which he called 'My Lord'), which was successfully tried on the tramroads of the Killingworth Colliery, in 1814. The projectors of the Stockton and Darlington Railway appointed him their engineer (1822), and the Stockton and Darlington, the first railway on which passengers and goods were carried by a locomotive, was opened on Sept. 27, 1825. The success of this venture led to the employment of S. in the construction of the Liverpool and Manchester Railway, which he carried successfully through Chat Moss. It was on this line that his improved invention, the 'Rocket,' made its trial trip at 29 m.p.h. Henceforth until his death he was employed as a designer of railways, and during these years greatly improved upon his early locomotive. His work was of the greatest importance in railway development. See life by S. Smiles. 1864.

Stephenson, Robert (1803-59), Eng. engineer, *b.* near Newcastle-upon-Tyne, son of the above. He travelled in S. America, and returning to England in 1827 took part in the construction of his father's 'Rocket,' and in the laying of the first railways in the country. In 1837 he became chief engineer on the Birmingham Railway. He was one of the greatest railway engineering experts of his time, and specialised in the construction of railway bridges. He was M.P. for Whitby (1847-48).

Stepney, metropolitan bor. in the E. of London, England, 2 m. from St. Paul's. It is a suffragan bishopric, and includes Spitalfields, Mile End, Whitechapel, Ratcliff, Wapping, Limehouse, Shadwell, and St. George's in the E. It returns one member to Parliament. Pop. 100,000.

Stepniak, Sergei Mikhailovich, whose real name was **Kravchinski** (1852-95), Russian revolutionary, and writer, *b.* in S. Russia of aristocratic descent. In the early seventies he became connected with a group of Nihilists in St. Petersburg, and was arrested for revolutionary propaganda in 1874. He lived later in Switzerland and England. His pubs. include *Underground Russia* (1882); *The Russian Storm Cloud* (1886); and *The Career of a Nihilist* (1889).

Stepnoi, Elista, or Yelista, tn. in the Rostov Region of the R.S.F.S.R., near the R. Sal, 150 m. S.S.W. of Stalingrad.

Steppe (from Russian *stepi*, a waste),

term applied particularly to the grasslands of S. Russia, and generally to any similar areas in temperate zones, where light rainfall, confined to spring and early summer, produces grassland with few trees, usually in continental interiors. The soil is deep and often rich in humus content, as in the 'black earth' areas of the Ukraine (*a.v.*), though the S. of Siberia (*a.v.*) is less fertile. Grain is a prin. crop, and wild flowers, usually bulbs, abound. See also PAMPAS and PRAIRIE.

Stereochemistry (*i.e.* space-chemistry), concerned with the spatial relations of the atoms in the molecule. Pasteur (1850) obtained crystals of sodium ammonium racemate, and found two classes of crystals, the one containing dextro-hemihedral faces and the other levo-hemihedral faces, *i.e.* the one class of crystals was related to the other as an object to its mirror-image. Solutions of the crystals rotated polarised light to the right and left respectively, *i.e.* dextro- and levo-rotatory. Pasteur's theory regarding these substances was developed independently by Le Bel and van't Hoff (1871). They concluded that a substance is optically active only when its molecule is asymmetric, the most common form of asymmetry being shown by a molecule that contains at least one carbon atom which is directly united with four different groups. One of the simplest of such optically active compounds is lactic acid, which contains an asymmetric carbon atom:

Van't Hoff suggested that the carbon atom was situated at the centre of a regular tetrahedron and the four groups in combination at the four solid angles. The conclusions to be drawn are: (1) A compound of the type CR_4X (where R and X represent any group) can exist in only one form. (2) A compound of the type CR_3XY can exist in only one form (two groups are identical). (3) Compounds of the type CRXYZ (carbon atom asymmetric) exist in two different forms, *i.e.* there are two optical or stereochemical isomers or enantiomorphs. More generally, any substance the molecules of which are asymmetric (whether they contain carbon or not) can exist in three forms, *viz.* a dextro-rotatory form, a levo-rotatory to the same extent, and an optically inactive form, consisting of a mixture or loose compound of equal weights of the dextro- and levo-enantiomorphs. This inactive form is said to be 'externally compensated' or 'racemic.' Unless very special methods are followed, synthesis of a substance with asymmetric molecules always yields the externally compensated mixture, and the process of separating this into the two optical enantiomorphs is called 'resolution.' Resolution is difficult since the *d* and *l* forms have identical chemical properties, solubilities, boiling- and melting-points, etc., but can be

effected by forming derivatives with an optically active substance yielding two products no longer identical in solubility, etc.; these can be separated by fractional crystallisation, etc. Thus to resolve an externally compensated acid, salts may be formed with the *laevo*-rotary base brucine. Then the *d*-acid salt with *l*-brucine is not the optical isomer of the *l*-acid salt with *l*-brucine (for that isomer would be *l*-acid salt with *dextro*-brucine), and hence the two salts may be separated by taking advantage of their different solubilities in a suitable solvent.

Other forms of stereoisomerism may not involve optical activity, which, as we have seen, is dependent on asymmetry of the molecule. Thus fumaric acid and maleic acid are stereoisomers, but are not optically active since their molecules are symmetrical. The spatial arrangements of these two acids are:

See A. W. Stewart, *Stereochemistry*, 1907; A. Hantzsch, *Elements of Stereochemistry*, 1908; J. Read, *Textbook of Organic Chemistry*, 1926; and P. Karrer, *Organic Chemistry*, 1947.

Stereo-comparator, instrument specially devised by Dr. Max Wolf (1901) for detecting any stellar change in a particular portion of the heavens. It depends on the principles of stereoscopic vision. A photograph of the stellar region is taken, and another of a different epoch. When viewed stereoscopically any displacement of a star, any new or missing star, or any difference in brightness is betrayed by the attempt of the muscles of the eye to adjust vision to the normal expected.

Stereographic Projection, see under PROJECTION.

Stereoisomerism, see STEREOCHEMISTRY.

Stereophotogrammetry, science of mapping and surveying by means of stereoscopic pairs of photographs. The science owes its inception to Aimé Laussedat, who constructed a measuring camera fitted with level and compass. This had horizontal and vertical reference marks for locating a point where the optical axis of the lens met the sensitized plate. An advance of the greatest importance was made in 1898 by Theodore Scheimpfing. Two cameras were fixed to a table to photograph a relief model of a landscape. The developed negatives were replaced in the cameras, each being illuminated from behind so that the rays of light followed the same paths out of the cameras as they had followed on entering. With the aid of an intercepting screen two projected pictures could be viewed, which overlay and cut through one another, only those points coinciding which represented the section of the object formed by the plane of the screen. Sections were thus easily drawn corresponding with the sev-

positions of the screen, allowing the preparation of plans showing contour lines. This experiment forms the basis of modern S. The idea was advanced another stage by the introduction of a binocular system containing a fixed reference mark which appeared to float in the relief model of the landscape as viewed through the binoculars, and could be brought into coincidence with the point of the object to be measured. In modern apparatus pairs of air photographs are set up in the precise positions they occupy at the moment of photography. These are observed stereoscopically through a binocular system, and a three-dimensional view of the landscape is obtained from which maps may be constructed on scales up to 1:1000 with contours at 5 ft. vertical intervals.

Stereoscope, optical instrument invented by Wheatstone, which has the effect of giving to ordinary photographic pictures the appearance of solidity. In the instrument now in use two photographs of the same object are taken in the positions in which the person's two eyes would be if he were observing the object from the position in which the camera is placed. These photographs are mounted on a card side by side and viewed through separate acute-angled prisms. The diagram shows an ordinary S. A_1 and A_2 are

PRINCIPLE OF STEREOSCOPE

the two photographs mounted side by side, P_1 and P_2 the two prisms, their angles facing inwards. O_1 and O_2 are the two corresponding parts of the picture. The rays from O_1 fall on the prism P_1 and are refracted, and hence appear to come from O_1 , similarly those from O_2 appear through P_2 to come from O_2 and thus at O a vertical image is formed; the two vertical images formed by P_2 and P_1 coinciding. Similarly the vertical images of other parts will coincide, and thus instead of two pictures only one is seen and the impression produced on the observer is exactly the same as if he viewed the object itself directly; the front parts of the object appearing to stand out and the back parts to fall back. Stereoscopic photographs are of great value in aerial reconnaissance to counteract camouflage.

Stereoscopic films are the latest development in cinematography, a leading worker in the field being Semen Ivanov, who used a grille of copper wires to split the images thrown by two projectors; later he intro-

duced a screen of optical lenses to split the rays of light. An alternative method, used in America, depends upon the wearing of special spectacles by the audience. Stereoscopy is also applicable to television.

Stereotyping (Gk. στερεός = solid), process in printing for making metal plates when long runs or frequent reprints are required. The plate is made from a papier mâché mould or facsimile of the type or printing blocks. The mould is made up of sev. sheets of tissue paper pasted together and kept under a weight, to retain the moisture, until required for use. The product is called a flog and is laid on the face of the type and beaten in with a brush to obtain a deep impression. The hollows on the back of the mould are filled in with pieces of straw-board or other material, and the type, with the flog attached, placed on a steam chest, under pressure, to dry. The dried flog is then inserted in the casting-box with gauges of the required thickness for the plate to be used. The Eng. practice is to make the plates 12 point thick. The Amer. plates are 10 point. The metal is then poured into the casting box. The plate when set is taken out, planed, and finished ready for the printing machine. The flog can be preserved for further castings. A moulding press, electrically heated, is a modern substitute for hand beating. 'dry' prefabricated flogs are used. For newspaper work the flog is inserted in a curved casting box to produce a curved plate for the rotary press. By the use of a facing paste on the flog, stereotype plates can be made from half-tone illustrations and then the plates nickel faced after casting.

Sterilisation, destruction of bacteria, is important in medicine, since bacteria are the cause of sepsis and many diseases; it is also used in the preservation of food, whose decomposition is due to the activity of saprophytic bacteria and mould fungi. In medicine S. of dressings is effected by superheated steam in an autoclave (an apparatus similar to a pressure cooker); instruments are sterilised by the same means or by the use of antiseptic solutions. The destruction of bacteria inside the body is more difficult, since the available agents are liable to cause the death of the patient as well as the germs; salvarsan, an organic arsenic compound, was introduced by Ehrlich in 1907 in the treatment of syphilis, whose causative organism is a spirochaete closely related to bacteria; the sulphonamides (q.v.) followed in 1935, and the antibiotics such as penicillin (q.v.), chloromycetin (chloramphenicol), and aureomycin, during and following the Second World War. The methods of preserving (q.v.) food include the use of heat with subsequent canning or bottling; antiseptic chemicals such as sulphur dioxide, boracic acid, and formalin (the two latter prohibited by law); pickling in brine, vinegar, or syrup. Refrigeration of food retards the activity of bacteria, but does not destroy them.

Sterility, condition of not being capable of reproduction. There are many cases of S. in women: sexual intercourse may be

difficult or unsatisfactory (dyspareunia) from physical or psychological causes; the Fallopian (egg) tubes may be blocked; abnormal growths in the uterus, failure of ovulation, deficiency of sex hormones, and general ill health may also cause S. The investigation of S. calls for a complete pelvic examination of the woman, and a microscopic examination of her husband's seminal fluid (which may be deficient in up to 50 per cent of cases of S.). S. can be artificially induced for medical reasons by ligation of the Fallopian tubes in women, or of the vasa deferentia (sperm tubes) in men. In law S. does not affect the marriage bond, although impotence (q.v.) renders a marriage void. *See also* INSEMINATION, ARTIFICIAL.

Sterling, Antoinette (Mrs. J. Mackinlay) (1850-1904), Amer. contralto ballad singer, studied singing under the Garcias and Mme Marchesi.

Sterling (O.E. *steorra*, star, some of the early Norman coins being marked with a small star; the derivation from East-sterling is no longer accepted), term applied to all lawful coins of the realm. Weight and fineness determine the *standard* of coins, and only coin of the true standard is called S. Formerly all coin had, by the provisions of an Act of 1352, to be of S. metal, but the crown varied the standard even before that Act was repealed. By the Coinage Act, 1870, the standard weight and fineness was fixed as follows: (1) for gold coin, $\frac{1}{19}$ fine gold, $\frac{1}{19}$ alloy, or millimal fineness 916.66; (2) for silver, $\frac{1}{12}$ fine silver, $\frac{1}{12}$ alloy, or millimal fineness, 925; (3) for bronze, mixed metal, copper, tin, and zinc. 240 troy oz. of standard gold are coined into 934 sovereigns and one half-sovereign; one troy oz. is therefore worth £3 17s. 10d., one oz. of pure gold on the same basis being worth £1 4s. 11½d. At the outbreak of the First World War, the gold standard was suspended (i.e. no new gold coins were issued and the Bank of England was no longer obliged to redeem its banknotes in gold). In 1925 the pound S. was brought back to its old parity and the Bank of England was obliged by the Gold Standard Act, 1925, to sell gold at the old fixed price (corresponding to the standard weight of coin, see above) in the form of bars, but banknotes remained unredemable into gold. The obligation to sell gold in bars was suspended on Sept. 21, 1931, and has not been restored since.

Sterling Area.—From the confusion that attended the collapse of the international gold standard between the world wars, there emerged a wide area of exchange stability known as the S. area. Its boundaries were not formally defined, but there were two main characteristics by which countries belonging to it might be identified (i.e. these countries maintained their currencies in a fixed relationship with the pound S., and they tended to keep their exchange reserves largely if not wholly in the form of S. balances and other liquid assets in London. The system was not new, for in fact many countries nominally on gold had long been in practice 'on sterling' in the sense above

indicated. When the pound depreciated in Sept. 1931 a group of countries decided from the outset to keep their exchanges stable in terms of S. rather than of gold. This group comprised in the first instance the Brit. Commonwealth, with the important exception of Canada, whose currency took a middle course between the pound and the U.S. dollar. A few non-Brit. countries, such as Portugal, also joined the S. group immediately. Others joined it later, e.g. the Scandinavian countries in 1933, Persia and Latvia in 1936. In addition there were sev. countries, including the Argentine and Japan, which for many years kept their official exchange rates fixed in S., but which were not generally recognised as members of the S. bloc.

In the autumn of 1939, most of the non-Brit. member countries gave up their link with the pound and the S. area became largely co-extensive with the Brit. Commonwealth, again with the exception of Canada. All members applied similar methods of exchange control, which transformed the S. area into a more coherent organisation though its mechanism remained informal. The other main change brought about by the war was that all members of the S. area 'pooled' their dollar resources with the Bank of England, and drew from this common 'pool' their vital dollar requirements. A number of members increased their S. balances during the war (as did non-member countries) and for some countries, e.g., India, these balances were immobilised and releases were fixed annually by mutual agreement in recent years.

The dollar 'pool' was continued after the war, though some members (especially Africa for its gold production) do not pay all their dollar receipts into the pool. The uniformity of the principles of exchange control permits complete freedom of restrictions for payments on current account between its members; capital payments are also permitted in most instances without restrictions. The cohesion of the S. area was demonstrated again in Sept. 1949, when all members followed Britain's lead in devaluation by 30.5 per cent. Pakistan alone maintained the old parity for its rupee, which shows that there is complete freedom for the members of the S. area whether to conform or go their own way.

The present members (1950) of the S. area are all the member-countries of the commonwealth, with the exception of Canada, and, outside the commonwealth, Burma, Iceland, Iraq, and the Irish Republic. The S. area is the world's largest single area of multilateral trade. It comprises about one-fourth of the world's pop. and in 1948 did roughly 27 per cent of world trade.

Sterling, of Illinois, U.S.A., 109 m. W. of Chicago. It has iron works. Pop. 11,300.

Sterkfontein, Transvaal, S. Africa, site of the discovery in 1949 of a fossil creature who is thought by some authorities to stand in the direct line of descent between ape and man, and very close to man. See *under* MAN.

Stern, Daniel, see AGOULT.

Sterne, Laurence (1713-68), Brit. humorist, b. at Clonmel, Tipperary, and educated at Jesus College, Cambridge, took holy orders and became vicar of Sutton-in-the-Forest in 1736, and prebendary of York in 1738. In 1760 he was appointed also perpetual curate of Coxwold, and he called his house there 'Shandy Hall'. He wrote sev. miscellaneous pieces from 1741 onwards. *Tristram Shandy* was pub. between 1760 and 1767. He made tours in France and Italy (1762-64), being delicate in health. A second novel, *A Sentimental Journey* (1768) was pub. shortly before his death. He collected and issued his sermons in sev. vols. He had a love affair with Mrs. 'Eliza' Draper, and his *Letters from*

LAURENCE STERNE

York to Eliza were pub. in 1773. With S. is reached the extreme limit of the sentimental novel, but he possesses a mastery of emotion, his humour implying great self-possession and detachment. S. did not possess any outstanding gifts for characterisation, and there is an interrelation between all the types he creates. The animality in human nature is almost an obsession with him, so that all his work is coloured with intellectual cynicism and a refined brutality. His art developed with time into a perfect sureness of touch; the *Sentimental Journey* is much more concentrated than the tangled mass of narrative and reflection and digression which constitutes *Tristram Shandy*, and in fine shades and finished polish the former remains unsurpassed. He shows that the novel is to be an autonomous form of art, and the dominant branch of literature.

The *Complete Works* were first pub. in 1773 and 1774; subsequent eds. are those of G. Saintsbury (1894); W. L. Cross (1906); and the Shakespeare Head ed. (1926-27). There are eds. of the *Letters* by R. B. Johnson (1927) and L. P. Curtis (1934). See lives and studies by H. D. Traill, 1882; P. Stapfer, 1870; W. L. Cross,

1909, 1929; W. Sichel, 1910; L. Melville, 1911; A. de Froe, 1925; T. Yoseloff, 1948.

Sterol, see under ERGOSTEROL.

Stethoscope, instrument used in medical practice for ascertaining the condition of the respiratory and circulatory organs by observing the sounds made by them. The simplest form consists of a hollow tube terminated at one end by an ivory plate which is placed on the chest or other surface, and at the other end by a cup to fit the ear of the observer. The binaural S. consists of a Y-shaped tube, one arm being fitted with a small plate, and the other two with flexible tubing carrying metal or bone ear pieces.

Stettin (Polish *Szczecin*), tn. of Pomorze, Poland (Ger. before 1945), on the Oder, 30 m. from the Baltic and 37 m. S.S.E. of its outer port Swinemunde. From 1278 a member of the Hanseatic League, it was held by Sweden from 1648 to 1720, when it became Prussian. There are sev. fourteenth- and fifteenth-century buildings, and a Renaissance castle begun in 1503. Two gateways, the Berliner Tor and the Königsbor, are the remnants of the fortifications which stood till 1871. The squares, called the Königsplatz and the Kaiser Wilhelmplatz contain statues of Frederick the Great and Frederick William III. S. is the centre of the Baltic trade, owing to its central position, and to its rich hinterland, served by canal, rail, and the navigable Oder. There are extensive shipbuilding yards and dock accommodation, besides boiler and engine works, and soap, cement, and sugar factories, in the suburbs of Bredow, Grabow, and Zullehow, and many other manufs. Pop. 73,000.

Stettinius, Edward Riley (1900-49). Amer. business executive and administrator, b. at Harrison, New Jersey, and educated at Pomfret school, Connecticut and Virginia Univ. In 1926 he joined General Motors and in 1931 became a vice-president. In 1931 he joined the U.S. Steel Corporation, and subsequently became chairman of its board of directors. In 1939 he became also chairman of the War Resources Board, but resigned his positions in the Steel Corporation when President Roosevelt appointed him to the Advisory Commission to the Council of National Defence. S. will be chiefly remembered, however, for his work as Lease-Lend administrator, in which capacity he achieved great success, and, equally, as the representative of the U.S.A. in the early days of the United Nations, when he was under-secretary of state, playing a major role in the organisation of victory. He succeeded Sumner Welles in 1943 as under-secretary of state, and a year later succeeded Cordell Hull as secretary of state. His work at the Inter-Amier. conference at Mexico City confirmed his abilities as a negotiator, and was followed by President Truman appointing him as the first U.S. delegate to the United Nations Conference at San Francisco. In 1946, having suffered considerable strain in his war work, he resigned as Amer. representative on the Security Council and returned to business. He wrote

Lease-Lend: Weapon for Victory (1944), and *Roosevelt and the Russians: the Yalta Conference* (1949).

Steuart, House of, see STEWART.

Steubenville, co. seat of Jefferson co., Ohio, U.S.A., on the Ohio, 44 m. W.S.W. of Pittsburgh. It occupies the site of Fort Steuben, built in 1786. There are coal-mines, building-stone quarries, iron and steel works, and manufs. of glass, paper, and flour. Natural gas is found nearby. Pop. 37,600.

Stevenage, small mkt. tn. in Hertfordshire, 28 m. from London. The church, dedicated to St. Nicholas, is mainly Early Eng. At the southernmost end of the tn. the Six Hills (tumuli) stand on a narrow strip of land alongside the Great N. Road, and many antiquarians incline to the belief that they are of Rom. origin. It has an ann. fair dating back to 1280. The grammar school was founded by Thomas Alleyn in 1558. Under the New Towns Act, 1946, a satellite tn. is being built adjoining the existing tn. and a Development Corporation has been set up for this purpose. Pop. 6,500.

Stevens, Alfred (1818-75), Brit. sculptor and decorative artist, b. at Blandford, Dorset, spent nine years of study in Italy (1833-42) including one year under Thorwaldsen at Rome. His greatest work was the bronze monument to Wellington in St. Paul's cathedral, which was left unfinished at his death, and was not completed till 1912. See study by W. Armstrong, 1881.

Stevens, Alfred (1828-1906), Belgian painter, b. in Brussels, studied under Ingres at the Ecole des Beaux-Arts, Paris. He settled in that city, and became a constant exhibitor in the salons. In the Brussels gallery are 'Lady in Pink' and 'The Lady Bird.' 'At Home,' 'Consolation,' 'Ophelia,' and 'The Four Seasons' are other of his works, which were mostly interior scenes of middle-class life, influenced by Courbet. See studies by C. Lemonnier, 1906, and P. Lambotte, 1907.

Stevens, John (1749-1838), Amer. ship-builder and inventor, b. in New York, educated at Columbia Univ. He worked for the development of steamships, producing propellers in 1804, the first ironclad steamship in 1813, as well as other inventions, and helped to establish the modern Amer. law of patents.

Stevenson, Robert (1772-1850), Scottish engineer, b. in Glasgow, educated there and at Edinburgh Univ. He supervised the construction of a lighthouse on the is. of Little Cumbrae when he was nineteen, and, as engineer to the N. Lighthouses Commissioners, constructed the lighthouse on the Bell Rock off Arbroath Forfarshire (1807-11). He advised the use of malleable iron for railway lines, and designed bridges and roads.

Stevenson, Robert Louis Balfour (real name *Lewis*; he adopted *Louis*) (1850-94), Scottish writer, b. in Edinburgh, studied at the univ. there, was brought up to his father's profession of engineer. He abandoned this for law, and became an advocate in 1875, but never practised. Writing was always his delight; at the

age of fifteen he pub. a pamphlet on *The Pentland Rising of 1666*. His delicate constitution necessitated some visits abroad, but in spite of ill health he continued to write. He began in 1876 to contribute his brilliant essays to the *Cornhill Magazine*, and these laid the foundations of his fame, which extended rapidly in literary circles. These essays were collected in *Virginibus Puerisque* (1881) and *Familiar Studies of Men and Books* (1882). *An Inland Voyage* (1878) was his first book and later he pub. other records of his travels, such as *Travels with a Donkey in*

Brodie (1880, revised 1888). Thereafter his plays were written in collaboration with W. E. Henley. They include *Beau Austin* (1884); *Admiral Guineo* (1884), and *Robert Macaire* (1885). In 1888 he sailed for the South Seas, settled in Samoa during the following year, and wrote the *Tailima Letters* to Sidney Colvin (1895). Among the Samoans, who have always cherished his memory, he was their friend Tusitala, 'teller of tales.' He died there, and was buried on Mt. Vaea.

S. gave a very attentive care to the art of writing, and his clear, exact, smooth style shows Fr. influence of the period of the symbolist revival. He imparted a high artistic quality to the adventure story. His novels serve the thirst for dramatic adventure, the poems reveal the unsophisticated emotions of youth, and the essays and studies analyse authors and their work with simplicity and directness. The classic, *Treasure Island*, besides its intensity and vividness, shows imaginative appeal, dramatic progress, and moral originality. His Scottish novels in sev. respects bear comparison with those of Scott, and the unfinished *Weir of Hermission* promised to be a masterpiece. In his writings on the South Seas are shown his keen sensibility to landscape, and a penetrating understanding of primitive souls. The essays, combining irony and clear-sightedness, somewhat resemble those of Charles Lamb in their essential subjectivity.

The Tusitala ed. of his works by Lloyd Osbourne (1923) contains five vols. of letters. See lives and studies by G. Balfour, 1901, 1915; H. B. Baildon, 1901; A. H. Japp, 1905; F. Swinnerton, 1914; Sir W. Raleigh, 1915; R. Masson, 1923; J. A. Stewart, 1924; G. S. Hellman, 1925; G. K. Chesterton, 1927; J. M. Carré, 1929; D. L. Dalglish, 1937; D. Dalchos, 1948; and Lettice Cooper, 1948.

Stevenson, Thomas (1818-87), Scottish engineer, b. in Edinburgh. He joined with his father, Robert S. (q.v.), and his brother David, in lighthouse construction, making a particular study of lighting methods. He invented the thermometer screen, known by his name. There is a character sketch by his son, Robert Louis S. (q.v.) in *Memories and Portraits* (1887).

Stevens Point, tn. in Portage co., Wisconsin, U.S.A., on the Wisconsin, 150 m. N.W. of Milwaukee. Pop. 16,000.

Stevenson, tn. in Ayrshire, Scotland, on the frith of Clyde, 28 m. N.W. of Glasgow. There is an explosives factory of Imperial Chemical Industries estab. by Nobel at Ardeer. Pop. 12,000.

Steward, Lord High, see HIGH STEWARD OF ENGLAND.

Steward of the Household, Lord, in England, is the chief officer of the anct. court of the Board of Green Cloth, and was originally called the Lord Great Master of the Household. He has power over the finances of the royal household, and controls and selects all officers and servants except those of the chapel, chamber, and stable. He receives his charge from the sovereign and holds it during pleasure.

ROBERT LOUIS STEVENSON

A sketch by Sir William Blake Richmond.

the Cerenns (1879). S. went to California in 1879 and married an Amer., Mrs. Osbourne. The great success of the adventure story, *Treasure Island* (1882), finally decided his profession. Other stories include *Kidnapped* (1886); *The Black Arrow*, (1888); *The Master of Ballantrae* (1889); and *Catriona* (1893). In a very different vein was *Prince Otto* (1885), in which year he also pub. *The Dynamiter*, a sequel to *The New Arabian Nights* (1882), and written in collaboration with his wife. Another collaborator was his stepson, Lloyd Osbourne, who was responsible for much of *The Wrong Box* (1888); *The Wrecker* (1892); and *The Ebb Tide* (1894). Other pubs. are *A Child's Garden of Verses* (1885), *The Strange Case of Dr. Jekyll and Mr. Hyde* (1886); *The Merry Men* (1887); *Across the Plains* (1892); *Island Nights' Entertainments* (1893). At his death S. left unfinished *St. Ives*, the last six chapters of which were supplied by Sir A. Quiller-Couch (1899). S.'s earliest dramatic work was *Deacon*

Stewart, Steuart, or Stuart, House of, Scottish family tracing its descent from a Breton immigrant, Alan Fitzhald, in the eleventh century. His son Walter (d. 1177) was made steward of Scotland by David I., and founded Paisley Abbey in 1163. The stewardship remained in the family, the various branches of which are descended from the seven sons of John (killed at Falkirk, 1298).

The first royal Stewart was the son of Walter, sixth steward, and Marjory, daughter of Robert the Bruce, and came to the Scottish throne as Robert II. in 1371. The direct royal male line ended at the death of James V. in 1542. His daughter Mary, who adopted the spelling 'Stuart,' claimed the throne of England on account of descent from Margaret Tudor, queen of James IV., and her son, James VI., became James I. of England and progenitor of the royal line of Great Britain. The Stuarts were excluded from the throne during the Commonwealth (1645-60), and after the flight of James II. of England the elder male line was permanently debarred. James II. was succeeded by his eldest daughter Mary and her husband, William of Orange, son of Mary, the daughter of Charles I., and they were succeeded by Anne, younger daughter of James II. The male line of James II. ended with the death of his grandson, Charles Edward (the Young Pretender) and Henry, known as Cardinal York.

Stewart, Balfour (1828-87), Scottish physicist, b. at Edinburgh. He was director at Kew Observatory and, later, prof. of natural philosophy at Owens College, Manchester. He made discoveries in radiant heat, and was one of the founders of spectrum analysis.

Stewart, David, see ROTHESAY, DAVID STEWART, DUKE OF.

Stewart, Dugald (1753-1828), Scottish philosopher, b. in Edinburgh, educated at the high school and univ. there. He was appointed in 1785 prof. of moral philosophy in Edinburgh, but, though he retained the chair until within eight years of his death, he did not lecture after 1809. He was one of the Scottish 'common-sense' school. His works include *Elements of the Philosophy of the Human Mind* (1792-1827); *Outlines of Moral Philosophy* (1793); and *The Philosophy of the Active and Moral Powers* (1828). His works were collected by Sir Wm. Hamilton (1854-58). See life by J. Veitch, 1858, and F. Harrison, *The Philosophy of Common Sense*, 1907.

Stewart, Sir John, see LENNOX.

Stewart, Robert, see CASTLEREAGH.

Stewartby, tn. of Bedfordshire, England. The world's largest brickworks are here, producing over 9,000,000 bricks weekly, using the fine clay of the blue Oxford clay belt. The model vil. was built in 1927.

Stewart Island, or Rakiura, is. off the S. coast of South Is., New Zealand, crossed by 47° S. The coast is deeply indented and Paterson Inlet and Port Pegasus are good harbours. It is mountainous, and thickly forested, and is a holiday resort. Area 662 sq. m.

Stewarton, burgh and nrkt. tn. of Ayrshire, Scotland, on R. Annock, 5 m. N.W. of Kilmarnock and 19 m. S.W. of Glasgow, with both of which it is connected by rail. It has manufs. of carpets, caps, and hosiery. Pop. 3000.

Stewarts & Lloyds, Ltd., formed in 1903 by the amalgamation of A. and J. Stewart & Menzies Ltd. of Glasgow, and Lloyd & Lloyd Ltd. of Birmingham. These firms had both been in existence for over forty years and were, at the time of their amalgamation, the two largest makers of iron and steel tubes in Great Britain. To-day S. & L. Ltd., with its subsidiary and associated companies, employs more than 30,000 people, produces nearly three-quarters of the steel tubes made in the country, and at Corby, the biggest of the company's twenty-seven works in Great Britain, has constructed one of the most modern and completely integrated steel and tube works in Europe. In addition the company has important tube manufacturing interests in the countries of the Brit. Commonwealth.

Stewing (food), see under COOKERY.

Steyer, Steyr, or Steir, tn. of Upper Austria, at the confluence of the R. Enns and Steyr, 20 m. S.E. of Linz. There is a medieval old tn. with renaissance and baroque buildings. The centre of the Austrian iron industry. S. has manufs. of motor cars, bicycles, rifles, cutlery, paper, and woollens. Pop. 44,800.

Steyning, tn. of Sussex, England, situated at the foot of the S. Downs, 12 m. from Brighton. It was formerly a seaport, the anc. Portus Cathmanni. It contains a Benedictine house, a shrine, and a Norman church and a grammar school, founded in 1614. Bramber Castle, close to S., was bought by the National Trust in 1945. Weekly markets are held and cattle fairs during the year. Pop. 2500.

Stibnite, chief ore of antimony; chemically antimony trisulphide, Sb₂S₃.

Stick Insects, family of orthopterous or straight-winged insects (Phasmodae), called also walking-sticks, most of them being mimetic insects resembling sticks, brown withered branches, or green growing twigs. Like other mimetic insects they are often able to escape detection when at rest in foliage. In the tropics some species attain a length of 13 in. Some four or five of six hundred known species are found in Europe.

Stickleback, popular name given to a genus of small fishes (*Gasterosteus*) of the family Gasterosteidae. They are small, and have elongated, compressed slender bodies, always without scales, but often protected by means of bony scutes. The anterior dorsal fin is represented by isolated spines, and the ventral fin is formed of a strong spine and one or two soft rays. The S. are noted for their nest-building habit, the males constructing them of leaves, twigs, and grass, and binding them together by a mucus which they secrete. They subsequently guard their young with great care. Nearly all the species are found in fresh water in Europe, Asia, and America, are very pugnacious,

and feed on spawn of other fishes. *Gastros-leus aculeatus* (the three-spined S.) and *G. pungitius* (the ten-spined S.) can live in either fresh or salt water; *G. spinachia* (or Sea S.) is a much larger and more slender species than those already mentioned; it is entirely marine and attains a length of 7 in., and is armed with fifteen short spines on the back. The flute-mouths or pipe-fishes which form the family *Fistulariidae* have been described as 'gigantic marine sticklebacks' and closely resemble species of *Gastrosleus*.

STICKLEBACKS

Stiff-neck, rheumatic affection of the muscles of one side of the neck, causing the head to be drawn to one side. S., as the term is ordinarily applied, is usually brought on by exposure to cold or wet, and especially affects individuals with a rheumatic diathesis. Movement gives rise to pain, and occasionally there may be spasm, causing the head to be immovable for the time being. Hot fomentations and general rheumatic treatment are indicated. Torticollis, or congenital S., is due to a defect of the sterno-mastoid muscle, usually through injury at birth.

Stigand (d. 1072), Eng. prelate. In 1047 he became bishop of Winchester, and undertook negotiations between Edward the Confessor and Godwin (1051-52). When the latter re-established his position in England, Robert of Jumièges (q.v.) fled, and S. was uncanonically appointed archbishop of Canterbury in his place. In 1052, and was accordingly excommunicated (by five popes successively), but received the pallium from the antipope Benedict X. in 1058. In 1070 he was charged with various eccles. offences by the papal legate, deprived of his see, and imprisoned.

Stigma, in botany, the summit of the ovary or of the style in flowering plants. Usually it is swollen and covered with glandular papillae and specially adapted to retain the pollen grains brought by the wind, insects, or other agencies in the process of pollination. In shape S. may be round or square, and also either feathery or petaloid.

Stigmatisation (Medieval Lat., *stigmatizare*, from Gk. *stigma*, a mark, puncture), impression on certain individuals of the 'stigmata' or five wounds in the hands, feet, and side which Jesus received in His Passion, generally held to be given miraculously as a mark of signal favour to those specially devoted to meditation on the Passion. St. Paul's words in Gal. vi. 17 should not be taken as an assertion that he bore the stigmata. The earliest and the most striking instance is therefore that of St. Francis of Assisi, of which full accounts are given in his life. Since that time over 300 instances have been collected, of which twenty-nine occurred during the nineteenth century, and Therese Neumann (q.v.) is still living. The cases of Catherine Emmerich (1774-1824) and Louise Lateau (1850-53) attracted considerable attention. Explanations of the admitted physical facts vary, some believing that the phenomena can be naturally explained without recourse to special divine intervention. The Rom. Church does not treat S. as an incontestable miracle. See A. Imbert-Gourbeyre, *La Stigmatisation*, 1894, and I. Dannemarie, *Le Mystère des stigmatisés*, 1933.

Stiftersjoch, see STERILIO PASS.

Still, Andrew Taylor (1828-1917), Amer. osteopath, b. in Jonesboro, Virginia. He is said to have attended Holston College, Newmarket, Tennessee, and he founded osteopathy as it is known to-day in 1874. He met with a great measure of opposition, but he and those who followed his teaching gradually won recognition. In 1892 he founded the Amer. School of Osteopathy at Kirksville, Missouri. His books include *Philosophy of Osteopathy* (1899) and *Osteopathy, Research and Practice* (1910).

Still, John (1543-1608), Eng. prelate. He was rector of Hadleigh (1571), canon of Westminster (1573), master of St. John's College, Cambridge (1574), and of Trinity (1577), bishop of Bath and Wells (1593). The authorship of *Gammer Gurton's Needle* has been ascribed to him.

Still, see DISTILLATION.

Stillborn, see OBSTETRICS, FETUS, ABORTION, etc.

Still Life. The grouping of objects on a plane near the spectator as a subject for painting is hardly known till the fifteenth century. With Rubens groups of weapons, fruit, and flowers assist understanding of mythology and give decorative magnificence. Jan Brueghel earlier had excelled as a flower painter (see FLOWER PAINTING). Beautiful groups are found in the foregrounds of Titian, Tintoretto, Veronese. The seventeenth-century Dutch school showed special aptitude through pride in home and furnishings. Furthermore, their love of light effects led to artistic treatment of tone, colour, texture, for their own sake (Ter Borch, Metsu, Brouwer, Steen, de Hooch, Ostade, Teniers, Vermeer). Rembrandt lifts the genre to the highest plane in his 'Flayed Ox', a repulsive subject dignified by his vision, invested with drama and interpreted in lovely paint. The pots and pans of

Velazquez reflect Sp. gravity, while Chardin's works interpret Fr. homeliness, 'the poetry of the real,' and are a vehicle for ravishing colour schemes. Hogarth's narrative paintings contain fine passages of S. L. painting.

In the nineteenth century a change comes through Impressionism. Renoir, delighting in fruit and flowers, bathes them in rosy sunlight. Gauguin brings decorative interpretation by emphasis on contour, arabesque, and silhouette in deep exotic colour. Van Gogh, powerfully affected by 'things,' and their life-hist., paints with forthright flat colour, enlivened by pointillism and violently rhythmical line. The absence of shadow shows Jap. influence. Cézanne's painting reveals the disciplining of a romantic temperament; powerful forces seem held in tension. His pictures have the power to compel an equal attention to a design on the picture-plane (second dimension), and the idea of a composition in depth (third dimension). His geometrical simplifications foreshadow Cubism, in whose early phases there is much intersecting of crystalline forms (in monochrome). In mature Cubism there is reliance on flat colour areas, pattern, and line which reinforcing edges and crossing spaces, binds the design together. Though near abstract there is feeling of depth, weight, solidity. The effect of the Cubist movement has been invigorating to the *genre* and S. L. remains, with landscape, a much-practised art. See M. Friedländer, *Landscape, Portrait, Still Life*, 1949.

Stillman, William James (1828-1901), Amer. painter and journalist, *b.* at Schenectady, New York. In 1850 he went to England, where he met Ruskin and Turner and came under the influence of Rossetti and Millais. In 1852 he went on an unsuccessful mission for Kossuth (*q.v.*) to dig up the buried Hungarian crown jewels. On returning to America he devoted himself to landscape painting and founded the *Crayon*. He lived for some time at Cambridge, Massachusetts, then went to London, visited Switzerland with Ruskin, lived in France, became U.S. consul at Rome (1861) and at Crete (1865), and settled in Athens in 1868. He was *The Times* correspondent in Herzegovina (1875), at Athens (1877-83), and at Rome (1886-98).

Stillwater, co. seat of Washington co., Minnesota, U.S.A., on St. Croix Riv., 16 m. N.E. of St. Paul. At the head of navigation on the riv., it has a lumber trade and sev. manufs. Pop. 8000.

Stilt, term applied to any species of *Himantopus*, a genus of Charadriidae, which has a very wide distribution. The name is given to these birds by reason of their thin, long legs, which extend far behind the body of the bird. Some half-dozen or more species of S. are known, and they inhabit both the E. and W. hemispheres, though they do not range N. of the temperate regions. *H. himantopus* is a rare visitor to the Brit. Isles, most frequently, in summer, to the E. and S. counties. *H. melas*, *H. novaezeelandiae*, *H. leucocephalus*, and other species belong

to the Australasian region; *H. brasiliensis* to South America; and *H. knudseni* the Sandwich Is.

Stilton, vil. of Huntingdonshire, England, 7 m. S.W. of Peterborough and situated on the Great North Road. It gives its name to a slow maturing, semi-hard, blue cheese made in Leicestershire, Huntingdonshire, and Rutland, and originally sold at S. Pop. 800.

Stilts, poles provided with stirrup-like projections for the feet at a certain distance from the ground, and used for walking over rough or marshy places. Stilt-walking has been for long a form of amusement. S. are used regularly in Landes, a dist. of Gascony, and the Marquesas and other Pacific is., and stilt-races are a favourite feature of festivities in the former locality. They also figure in Il. masquerades.

Stilwell, Joseph W. (1883-1946), Amer. soldier, *b.* in Florida, trained at W. Point Academy, graduating in 1904. He served in the Philippines (1904-6), and became an instructor at W. Point (1906-10). Thereafter service in China and study of the language made him one of the foremost authorities on Chinese life in the U.S.A. In the First World War he served in France. When Japan attacked the U.S.A., S. was at once chosen as U.S. military representative in China. Gen. Chiang Kai-shek appointed him chief of staff and commander of the Fifth and Sixth Chinese armies, co-operating with the Brit. forces in the defence of Burma. Cut off with his meagre forces from supplies after the Jap. had captured Mandalay and Lashio (1942) he led the remnants of his troops in a remarkable retreat across the mts. to India, and returned to Chungking by air to resume the struggle from there. From Oct. 1943 S. conducted an advance of over 200 m., pushing the Jap. 18th Div. back to their main base, Myitkyna, supported in this by the Fourteenth Army and other allied forces. S. was not by temperament suitable for his position as second-in-command in S.E. Asia and chief of staff to Chiang Kai-shek, lacking in tact and political insight, and having little liking for the Brit. He was primarily, and most successfully, a fighting soldier. After an open breach with Chiang Kai-shek S. was given a home command in the U.S.A. He was appointed to command the Amer. Tenth Army at Okinawa, where he played his part in the final act of Japan's defeat. See further under BURMA, SECOND WORLD WAR CAMPAIGNS IN. See T. H. White (ed.) *The Stilwell Papers* (selection of notes from his war journal, papers, and letters), 1949.

Stimson, Henry Lewis (b. 1867) Amer. statesman, *b.* in New York city, educated at Yale and Harvard Univ., and began practice at the Bar of New York city in 1891. He was appointed U.S. Attorney for the S. dist. of New York state, serving from 1906 to 1909, and successfully attacking sev. trusts and combines. In 1910 the Republicans nominated him for governor of New York state, but he was defeated. President Taft made him

secretary of war (1911-13), and he did good work for the efficiency of the army. During the First World War he served in the army, ending as colonel of the 31st Amer. Field Artillery. He was governor-general of the Philippine Is. (1927-29). In March 1929 President Hoover appointed him secretary of state, a post he held until 1933. He headed the Amer. delegation to the London Naval Conference (1930); was a delegate to the Seven Power Conference in London (1931), and a member of the Permanent Court of Arbitration, The Hague (1938). In 1940 S. was appointed secretary of war, a position in which he did work of the greatest importance for the strength of the Amer. war effort. His pubs. include *Democracy and Nationalism in Europe* (1934); *The Far Eastern Crisis* (1936); and his memoirs, *On Active Service in Peace and War* (with M. Bundy, 1949).

Stimulants, agents that increase functional activity. They may be general, exciting the body as a whole to greater activity, or may affect particular organs, as cardiac, renal, hepatic, gastric, cerebral, and others. They are distinguished from tonics by their more immediate and transient action. It often happens that while a small dose of a stimulant causes greater intensity of vital processes, a larger dose or repeated small doses tend to cause depression. Thus, alcohol is an effective stimulant in moderate doses, but if its use be continued, the vital processes become much depressed, so that collapse is an important symptom of alcoholic poisoning. The most common S. are alcohol, ether, ammonia, tea, coffee, various essential oils, strychnine, amphetamine ('benzedrine'), electricity, heat and cold under certain conditions, etc.

Stinging Animals and Plants. Though commonly used as a means of defence both in animals and plants, the power of inflicting a wound and introducing a poisonous fluid is employed by many animals as a means of securing their prey. One of the lowest stinging animals is the hydra, which has a number of cells in the tentacles (see **THREAD CELLS**). The poison glands of spiders are in appendages near the mouth. The Black Widow spider of N. America is the only species likely to be dangerous to man. A number of fishes, notably the sting rays (*q.v.*) and the weeviers, have also stinging powers. Stinging plants (*e.g.* nettle) are usually furnished with sharp stiff hairs which secrete an acrid fluid, which in the nettle contains the irritating substance histamine. Some (*e.g.* the poison ivy of N. America) are capable of causing serious results. See also **INSECT BITES AND STINGS**.

Stinging Cells, see **THREAD CELLS**.

Sting Ray, any individual of the family *Trygonidae*, but specifically *Trygon pastinaca*, a fish of the tropical seas, and found also around the S. shores of England, in which a serrated spine is present on the whip-like tail. This spine projects upwards and backwards and may inflict a severe wound. Species of *Pteroplatea*, in the same family *Trygonidae*, are also able to cause deep and poisoned wounds.

Stinking Camomile, see **MAYWEED**.

Stinkwood, term applied to the wood of numerous plants, is used especially in reference to *Gustaria augusta*, a species of *Lecythidaceae*. The wood has a foetid smell, and the tree occurs in tropical America.

Stinnes, Hugo (1870-1924). Ger. industrial magnate, b. at Mulheim, youngest son of Mathias S., proprietor of coal-ships. At twenty-three he founded 'Hugo S.', capital 50,000 marks. S. became a proprietor of mines, and estab. depots on the North, Baltic, Mediterranean, and Black Seas. He was the chief figure in Deutsch-Luxemburgische Bergwerks-und-Hutten A.-G., estab. in Bochum in 1901, and Rheinisch-Westfälische Elektrizitätswerk A.-G., which supplied numerous tns. with gas and electricity. During the First World War he acquired large holdings in iron-mines, steamship lines, newspapers, and hotels, and achieved immense power in Ger. economic life, his largest concern being the Siemens-Rhinefeld-Schuckert Union. This was rescued from difficulties after his death by his sons, with Amer. support, and under Hitler was a prin. component of the armament and engineering industries. See *lives and studies* by G. Raphael, 1924, and K. Albach, 1925.

Stipa pennata, or **Feather Grass**, hardy perennial grasses of the family *Gramineae*. They grow about 2 ft. high, and flower in summer.

Stipend, originally the pay of soldiers; but now means the ann. allowance or income of an eccles. benefice, though in a wider sense it denotes any settled pay for services whether daily, monthly, or ann. In Scotland the term applied specifically to the provision made for the support of the parochial ministers of the old Established Church, consisting of payments made in money or (formerly) grain, or both, varying in amount according to the extent of the par. and the state of the free tithes (see **TITHES**), or of any other fund specially set apart for the purpose. In the Rom. Catholic Church S. also denotes the fee which a priest is entitled to demand for saying mass. 'Stipendiary' in a wide sense means one who performs services for a settled compensation, but has come specifically to denote a paid police magistrate acting in the metropolis or large prov. tns. See **POLICE**.

Stipple Engraving, see **under ENGRAVING**.

Stippling, in interior decorating, the production of a finely granulated surface on paintwork, achieved by beating the wet surface with a flat-faced bristle brush. Use is made of stipplers with rubber plates or cylinders on surfaces of coarse texture. S. is used on oil-bound, quick setting flatting paint. An even change from one colour to another can be obtained by this method.

Stirling-Maxwell, Lady, see **NORTON, CAROLINE ELIZABETH SARAH**.

Stirling, William Alexander, Earl of, see **ALEXANDER**.

Stirling, royal burgh since the twelfth century, occasional riv. port, and co. tn. of Stirlingshire, Scotland, situated on the R. Forth, 21 m. N.E. of Glasgow, and

37 m. N.W. of Edinburgh by rail. Its strong strategical position has made it the key to the Highlands. In and around the town have been enacted some of the most thrilling episodes in the hist. of Britain. Through the centuries, from Saxon and Rom. times, can be traced its influence on the monarchs and fortunes of Scotland. The castle dates from a Rom. station about A.D. 81, and was the bp. and residence of sev. Scottish kings. The view from the castle walls is unique for interest and beauty, including the field of Bannockburn (1314), S. Old Bridge, the Abbey Craig with the Wallace Monument, Cambuskenneth Abbey, and the sinuous reaches of the Forth. The prin. industries are agric. implements, bacon curing, brush-making, carpet weaving, floorcloth, and woollen goods. The S. and Falkirk Dist. of Parl. Burghs (S., Falkirk, and Grangemouth) return one member. Pop. 28,500.

Stirling, Brit. aircraft made by Short Brothers, the first of the four-engined heavy bombers used by the R.A.F. from 1939 to 1945. From its first going into service in 1941, carrying what was for those days an unusually heavy bomb load, it was employed on operations throughout the war years and was used on a diversity of duties. The S. was powered with Bristol Hercules engines; it was well armed, having power-driven gun turrets in the nose, tail, and upper portion of the fuselage.

Stirlingshire, W. midland co. of Scotland, bounded on the N. by Perthshire, N.E. by Clackmannanshire, E. by the firth of Forth and W. Lothian, Lanarkshire, and part of Dunbartonshire, and W. by Dunbartonshire. S. is one of the most picturesque cos. of Scotland, situated midway between the Highlands and the Lowlands. There are two large plains, known as the carse of Falkirk and Stirling, containing some of the most fertile land in the country. A range of ridges traverses the co., comprising the Campsie Fells, Pintry, Gargunock, and Kilsyth or Lennox Hills. Ben Lomond (3192 ft.), part of the Grampian Range, is situated on the N. bank of Loch Lomond, famous in song and story. The prin. rvs. are the Forth, Allan, Avon, and Carron. There are angling facilities on the rvs. and also on various lochs and reservoirs. S. is rich in minerals, with large seams of good quality coal, while fire-clay, ironstone, limestone, and sandstone, are also available. Agriculture flourishes throughout the co., and particularly along the valley of the Forth, where large crops of barley, beans, corn, potatoes, turnips, and wheat are raised. There are fine grazing lands on the slopes of the central and southern hills for cattle, and large flocks of sheep, chiefly Scotch Blackface and Cheviot breeds. The prin. industrial area is centred on Falkirk. The chief industry is the manuf. of iron goods, notably by the Carron Company. Bookbinding, brewing, timber, and the making of bricks, carpets, dyes, paper, soap, tweeds, and woollen goods is also carried on. Stirling (q.v.) is the co. tn.

and Grangemouth, where shipbuilding is engaged in, is the prin. port. These two towns, with Falkirk, send one member to Parliament; East S. with Clackmannanshire, and West S., each send one. Area 288,560 ac. Pop. 187,200.

There are evidences of Rom. occupation, and sections of the Antonine Wall near Falkirk are preserved as anct. monuments. Numerous battles have been fought in this co., viz.: Stirling Bridge (1297), Falkirk (1298 and 1746), Bannockburn (1314), and Sauchieburn (1488), where James III. was defeated and murdered in the nearby vil. of Milton. See K. M. Randall, *History of Stirling*, 1817; W. Nimmo, *History of Stirlingshire*, 1880; J. W. Small, *Old Stirling*, 1897; J. C. Gibson, *Larbert and Dunipace Parishes*, 1908; E. Stair-Kerr, *Stirling Castle*, 1928; W. D. Simpson, *Stirlingshire*, 1928; and J. Stewart, *Falkirk, a History*, 1940.

Stitch, sharp pain in the side. It may be caused by pleurisy, by spasm of the respiratory muscles during violent exercise, or by intercostal neuralgia.

Stitchwort, see STELLARIA.

Stoat, or **Ermine** (*Mustela erminea*), carnivorous mammal, native of Britain, with a much elongated body covered with short fur which generally retains its reddish-brown colour in Britain, but in colder lat. (including N. Scotland) becomes partially or wholly white and much denser, and is then highly valued by furriers. The S. is about 10 in long, with a black-tipped tail about 5 in long. It destroys enormous numbers of rats and mice, and this service is probably worth the loss the S. causes by destruction of game. It is closely related to the weasel (q.v.)

Stock, term usually associated in the public mind with shares and dealings on a S. Exchange, though negotiability on a S. Exchange is not an essential incident of S. **British Government Stock**.—The gov. invites the public to share in a loan. Each subscriber is allotted S. for his accepted contribution, e.g., War S., Funding S., Consolidated S. (Consols). Also S. has recently been issued in exchange for proprietary interests in nationalised industries, e.g. Brit. Transport S. Thereafter the S. may be bought or sold through the medium of a S. Exchange, the price at which it is transferred varying according to credit conditions prevailing at the time. Interest at an agreed rate is paid, usually half yearly. The terms of issue provide whether the S. shall be redeemed within a certain time or at the option of the gov. Most gov. S. can be transferred from one holder to another in multiples of one penny.

Dominion Government Stocks are similar to Brit., except that the revenues of the dominion concerned are alone liable for the service of the loan. These S. are freely negotiable on the London and other S. Exchanges.

Stock of Public Authorities such as the *Port of London Authority* and *Metropolitan Water Board*.—Such authorities borrow funds to build and equip their docks and other structures, and their revenues

provide periodical interest and ultimate repayment of the funds borrowed in accordance with the contract made when the S. is first offered for subscription. See further under COMPANY AND COMPANY LAW.

Stock (botanical), abbreviation of S. gillyflower, *Matthiola incana*. The wild Brit. species is included in the genus *Matthiola*. All the garden varieties of the simple-stemmed S. and of queen's S. have been derived from *M. incana*; those of ten weeks' S. from *M. annua*; while the smooth-leaved ann. S. are derived from *M. graeca*. The wallflower-leaved S., *M. tristis*, is a small plant, with narrow hoary leaves and dull brown flowers; it grows in S. European countries, and is the night-scented S., which is grown in greenhouses for its fragrance by night. Similar fragrant species are *M. lrida* and *M. odoratissima*. *M. fenestralis* is the window-S. See also GILLYFLOWER; MATTHIOLA; VIRGINIA STOCK.

Stockbridge: 1. Mktt. tn. of Hampshire, England, 8 m. W.N.W. of Winchester. It is an angling centre and has racing stables. Pop. 820. 2. Tn. in Berkshire co., Massachusetts, U.S.A., 17 m. S. of Pittsfield. Ice Glen, Prospect Hill, and Lake Mahkeenac, the latter being near the house where Nathaniel Hawthorne wrote his works, are all places of interest. Pop. 1800.

Stock Exchange. The function of the S. E. is to provide a market in which stocks and shares of all descriptions can be freely bought and sold, and in which the provision of new finance for governmental or industrial purposes can be facilitated through the flotation of new issues of capital. The S. E., London, colloquially termed the 'House,' occupies an area of about 1 ac. and is situated in the triangle formed by Throgmorton Street, Old Broad Street, and Bartholomew Lane, in the city of London. There are nearly 4000 members and over 900 clerks who are admitted to the dealing floor. A recent authoritative statement on the function of the London S. E. is quoted here. 'The Stock Exchange in 1949 transacted business in a total of £4000 millions of British Government stocks alone, an average of some £16 millions each working day. It provides as free a market as possible for the purchase and sale of some 10,000 different securities with a total value exceeding £26,000 millions, covering the entire field of governmental, municipal, and commercial finance. The Stock Exchange market is used not only by countless small investors, but by governments, nationalised boards, trade unions, co-operative societies, the public trustee, banks, insurance companies, public and private companies, and by innumerable pension funds and charitable trusts. Through the machinery of the Stock Exchange a large proportion of the nation's assets and income is made liquid for collection by the government in the form of death duties or as income or surtax. The Stock Exchange is not an isolated organisation that can be considered by itself. It is an essential and

inseparable part of the financial machinery of the country without which neither the government nor the commerce and industry of the nation could function efficiently. This indispensable machinery stands behind every life insurance policy, every pension, every salary and every pay-packet.'

Finance.—The capital was originally £720,000 in 20,000 shares, £36 paid, but was altered in March 1948 by reducing each share to 1s. fully paid, 40,000 redeemable annuities of £4 per annum being issued *pro rata* to shareholders as compensation. These annuities may be held by non-members and a considerable proportion of these is now so held. The properties were valued in the balance sheet for the year ending March 24, 1949, at £1,721,263, against which there are debenture issues of £500,000.

Constitution.—The constitution of the S. E., which was founded before the close of the eighteenth century, is laid down by a Deed of Settlement of Dec. 31, 1875, which superseded the original Deed of Settlement of March 27, 1802. Control is vested in a council which is elected by members and consists of an executive body of not less than thirty and not more than thirty-six members. No one can be elected to the council unless he is, and has been for the previous five years, a member of the S. E. The council is responsible for the rules and regulations which are enforced by strict disciplinary powers, and, supplemented by a traditional integrity among the members based upon the motto 'Dictum meum pactum,' maintain a high standard of honesty and fairness in dealings by members for the public. The disciplinary powers of the council include the power to censure, to suspend a member from entry to the House, and to expel a member from the S. E. In general the business of the council is concerned both with the internal management of the S. E. for the members and with external matters relating to the public interest. The granting of quotations to new issues of capital under further safeguards is also an important part of the council's work. Routine business is mainly delegated to standing committees who are responsible to the council, though all major questions of policy are decided by the council itself.

Membership.—A candidate for membership must be not less than twenty-one years of age and must be recommended by three members of four years standing, each of whom must engage to pay £500 to the creditors of the candidate in case the latter shall be declared a defaulter within four years from his date of admission. He must also be nominated by a retiring member. For such a candidate the entrance fee is £1050 and ann. subscription £105. If, however, the candidate has served as a clerk in the House for four years two recommenders only are required for £300 each, and the entrance fee and ann. subscription are £525 and £52 10s. respectively. These benefits are a strong inducement and the result is that nearly two-thirds of the members have taken up

membership after having served their apprenticeship for four years. Clerks are employed in three categories. 'Authorised' clerks are allowed to carry out dealings. 'Unauthorised' clerks have the right of entry to the House but may not deal, and 'Settling Room' clerks may only enter that part of the House set aside for the daily routine of checking the bargains effected on the previous day. The entrance fee for an Authorised clerk is £52 10s. and the ann. subscription is £105. for an Unauthorised clerk £15 15s. and £31 10s. respectively, and for a Settling Room clerk there is an ann. subscription only of £10 10s. An Authorised clerk must be at least twenty-one years of age and Unauthorised and Settling Room clerks sixteen years.

Brokers and Jobbers.—The members are divided into two categories, namely brokers and jobbers, and carry on their business either as individuals or in partnership. A broker may not enter into partnership with a jobber. Brokers act as agents in buying and selling for members of the public, receiving a commission on the business done; they carry out orders in any class of security which the client desires to buy or sell. It is also their business to advise clients on questions of realisation and investment; to make and certify valuations for probate; and from time to time to advise and assist companies in the raising of capital; and in this connection to effect placings or to procure underwriting for new issues. Members of the S. E. are not allowed to advertise or to approach persons other than their own principals.

Jobbers are principals, dealing on their own account. They may not deal with the public, but only with other members of the S. E. They do not deal in all securities indiscriminately, but specialise in one or more groups of securities, or 'markets' as they are called; e.g. gilt-edged stocks (consisting mainly of Brit. Gov. securities); insurance shares; bank shares, foreign gov. bonds; the shares of mining, or brewery, or investment trust companies; or in one or more of the many sub-divs. of the great mass of commercial and industrial companies. Other 'markets' are those for oil, rubber, tea, and nitrate shares. The trading floor of the House is divided by custom into these various markets, where the jobbers specialising in those particular securities have their stands, i.e. places where they stand and may always be found. The brokers move all over the floor contacting those jobbers whom they need for the particular business in hand. The jobbing system is peculiar to the London S. E. and its existence tends to eliminate violent fluctuations in prices.

Dealing on the Stock Exchange.—A broker on receiving an order from a client approaches a jobber who specialises in the particular type of security, and if the price made by the jobber is acceptable he deals with that jobber. By the custom of the S. E. a jobber may not ask the broker whether he is a buyer or a seller and therefore, when asked for a quotation, he

always names both his buying and his selling price; this is called 'making a price.' He makes his price as far as he can judge by the law of supply and demand: the idea that the jobbers fix or control the prices of securities is a misconception. A jobber may, but is not likely to, refuse to make a price in active securities. The difference between the buying and selling price varies according to the volume of dealings. Where dealings are frequent and the jobber can 'undo' his bargain without difficulty, he makes a 'close' price, but where dealings are less frequent he has to make a wider price, because he carries the greater risk of being unable to do the reverse bargain and make his profit or cut his loss.

A jobber who has made a price is bound by custom to deal at that price in a reasonable amount of stock or shares. If the transaction is larger or smaller than normal, the amount in which the price is made is decided by discussion between the two parties. For instance, in answer to a broker wanting to deal in a certain gov. stock, a jobber might make a price of 96½ to 96¼ in a £100,000 stock, indicating that he is willing to buy £100,000 at 96½ per cent or sell a like amount at 96¼ per cent. If the broker's order is for £500,000 stock, he would ask the price in that amount and the jobber might either be willing to deal at that price or, because of the greater risk, feel obliged to widen the difference between the buying and selling prices. Further bargaining may then take place before the deal is concluded. A broker after executing an order for a client must send him a contract note duly stamped which, *inter alia*, gives the title of the security, the amount purchased or sold, the relative price and value, and the date by which payment has to be made. It is the broker's duty to see that all bargains are made at the best possible prices for his client and that share or stock transfers are duly registered with the company and the relative document of title obtained for them.

Settlement of Bargains.—Brit. funds, etc., corporation and co. stocks (Great Britain and N. Ireland), public boards, dominion, prov., and colonial gov. securities are dealt in 'for cash', and the buying broker is liable to pay on the following day in return for delivery of the stock. Other securities, unless dealt in by special arrangement, are bought or sold for 'the account' and bargains are settled on the account days which are fixed annually by the council and normally recur at fortnightly intervals.

Continuation Facilities.—A continuation (or *contango*) is an arrangement for carrying forward the settlement of a transaction from one account to the next. The normal arrangement is for the buyer who does not wish to take up his stock to pay a rate of interest to a seller who is willing not to deliver, and who in effect therefore lends to the buyer the money value of the transaction. Continuations form a useful part of the machinery for maintaining free markets. They provide a means of bridging delays in delivery

between London and overseas exchanges, or delays arising from other causes. They also enlarge the scope of the jobbing technique and enable jobbers to be more free and more flexible in their price making, since they can, by means of continuations when they are available, carry over an uncovered position from one account to another instead of being compelled to level their books at the end of each account—a process which may be disadvantageous not only to themselves but to the market in which they operate. Continuations can also be used as a medium for speculation, and were largely so used in the past. Many brokers now will not entertain speculative continuations, and, where they are entertained, substantial margins are usually required as a protection against loss. Continuations, for whatever purpose they are entered into, are transactions in real values which must ultimately be settled.

Option dealing has also a useful function in the maintenance of free markets, but, like continuations, it can also be used for purely speculative purposes. Option dealing ceased on the outbreak of war in 1939 and has not yet been reintroduced.

Dealing Ex & Cum Dividend or Ex & Cum Rights.—‘Ex-div’ or ‘x.d.’ means that if a buyer has bought a security so marked, the current dividend belongs to the seller and the price then no longer includes the value of the dividend. ‘Cum div.’ means that the buyer has the right to the dividend due to be paid, and should it be sent by the company to the seller the amount must be paid over by him to the buyer. Similarly ‘cum rights’ means that in a transaction any advantage, perhaps in the form of an offer of new securities on favourable terms or a free issue of shares by means of capitalising reserves (sometimes called bonus shares), passes to the buyer, while ‘ex rights’ means that such advantage remains with the seller. Gov. and other securities dealt in in the gilt-edged market are quoted ‘ex dividend’ on and after the day on which the books close or the balance is struck for the payment of dividend; registered securities of industrial, etc., companies are quoted ‘ex dividend’ on the making-up day (five days before the account day) preceding the first day on which the transfer books are closed for the payment of the dividend. Bearer securities are quoted ‘ex dividend’ on the day the dividend is payable.

Arbitrage Dealing.—The term ‘arbitrage’ refers to professional dealings between London and overseas exchanges, and consists in buying in one exchange and selling in another. Either brokers or jobbers can obtain from the council authority to do this type of business.

Securities which may be dealt in.—Brokers and jobbers may deal only in securities which have been granted quotation by the council, and certain other securities which fall within a narrow classification. To obtain quotation the company or other issuer of the security must comply with stringent regulations imposed by the council in addition to the

requirements of the law. Companies are willing to co-operate in fulfilling the regulations in order to obtain a market for their securities. The council, in granting a quotation, express no opinion as to whether or not a company will achieve the success to which it looks forward, but every effort is made to see that the proposition is put fully and fairly before the public, and that no known rogues or undesirable persons are connected with it. On the grant of quotation a company must pay a fee calculated on the money value of the security issued.

The Stock Exchange Daily Official List.—This list is compiled from securities quoted and the bargains marked. The official ‘marking’ is made up from the marking slips signed by the broker or jobber recording transactions effected before 2.15 p.m. Transactions after that hour on the same day may be marked on the following morning and will then bear a distinguishing sign to show that they were done on the previous day. Except for the few transactions, which owing to special circumstances are effected outside the market price and bear a distinguishing mark, all recorded transactions represent bargains done at the market price, at the time of dealing. Fluctuations in prices are sent out by the Exchange Telegraph Company on automatic machines (‘tape prices’). On April 4, 1949, the value of all securities officially quoted was £26,163,000,000 of which £14,613,000,000 consisted of Brit. Gov. securities; these and others of nearly equal status are colloquially called ‘gilt-edged.’ The volume of dealings in the gilt-edged market alone is very large and the turnover in this market during 1949 amounted to £1,000,000,000.

Other official pubs. of the council are the *Stock Exchange Weekly Official Intelligence* and the *Stock Exchange Official Year Book* which gives details of some 8500 companies.

Scale of Commissions.—The minimum scale of commissions varies according to the type and price of the security. The detailed scale may be obtained on application to the secretary of the S. E. Brokers are allowed to share their commissions with agents who are approved by the council and whose names appear in one or other of the registers of agents kept by the council pursuant to the agency rules.

Provincial and Overseas Exchanges.—In addition to the London S. E. there are exchanges in twenty-two cities and tns. of the United Kingdom and the republic of Ireland. The prin. of these are Belfast, Birmingham, Bristol, Cardiff, Dublin, Edinburgh, Glasgow, Leeds, Liverpool, Manchester, Newcastle, Nottingham, and Sheffield. The membership of these twenty-two exchanges is approximately 1000 and together they constitute a body called the Associated S. Es. Stockbroking firms exist also in a large number of smaller tns. scattered all over the United Kingdom and the republic of Ireland. These firms constitute the Prov. Brokers S. E., the membership of

which is approximately 400. Both of these bodies work in co-operation with the London S. E. and have adopted substantially the same rules. Throughout the empire and the U.S.A., and in many foreign countries, there are S. Es. having business relations with the London S. E.

Stockholm, cap. of Sweden, lies where Lake Mälaren joins Saltsjön, an inlet of the Baltic thickly dotted with is. The oldest part of the city is built on the is. that separates the two stretches of water. Here it grew up in the middle of the thirteenth century round the fortress that had been erected to guard the vital entrance to the trading centres of Lake Mälaren. On the foundations of this old fortress there now stands the imposing

holmen, immediately to the W. of Gamla stan, is the Franciscans' old church, once the centre of their monastic buildings, and later Sweden's Pantheon, where her kings are buried. Formerly the municipal as well as the national govt. was concentrated round this part, but now both the law courts and the city hall are on the is. of Kungsholmen. The Stadshuset (city hall), which is S.'s best-known building from modern times, was designed by Ragnar Östberg and opened in 1923. It combines southern influences with N. brick architecture, and has an extremely beautiful situation on the very shore of Mälaren.

S. extends N. and south of the Old Tn. across the so-called 'malm' areas - Norrmalm, Östermalm, and Södermalm -

STOCKHOLM, FROM THE TOWN HALL

D. McLesch

royal palace, built to the design of Nicodemus Tessin the younger (1697-1754). Its exterior bears the stamp of the Rom. Renaissance style, while inside there are many exquisite examples of eighteenth-century art from home and abroad. Close to the palace is Storkyrkan S.'s episcopal church, the oldest parts of which date from the thirteenth century. Among other things it contains a famous group, representing St. George and the Dragon, executed by the Lübeck sculptor Bernt Notke at the end of the fifteenth century. To the south of these predominant buildings extends an area of dwelling-houses dating from medieval times, with narrow twisting streets and lanes.

There are a number of official and administrative buildings in Gamla stan, the Old Tn., including Riddarhuset (the House of the Nobility), Hogsta domstolen (the supreme court), and Kanslihuset (gov. offices). Others, such as Riksdagshuset (House of Parliament), Riksbank (National Bank of Sweden), and Utrikesdepartementet (Foreign Office), are not far away. On the little is. of Riddar-

holm, which were first built on to any extent during the seventeenth century, and which are now completely covered by the many blocks of flats and offices that were built here after the coming of nineteenth-century industrialism. The turn of the century saw the development of garden suburbs like Djursholm and Saltsjöbaden, and somewhat later the municipal garden suburbs of Bromma and Brännkyrka, W. and S.W. of S., were estab. By the 1930s the inner part of the city had been completely built over, and the building of houses is now expanding rapidly in areas which only a few years ago were open country. In these new outer dists., mainly south of the city, a whole row of modern suburban communities has been estab., planned in line with up-to-date principles in units of about 20,000 to 30,000 inhab. Also outside the city are large residential areas consisting of villas and small cottages with gardens and allotments. Most of those who live in these areas have their work in the centre of the city, which has given rise to big traffic problems. Numerous large bridges and

traffic installations have therefore been built during the last decade, such as Västerbron, Tranebergbron, and Slussen. From the Old Tn. a fine old bridge leads northwards past the House of Parliament to Gustaf Adolfs Torg and the Royal Opera House. This is the beginning of Norrmalm, where most of the office buildings and banks are concentrated. Here, too, there are numerous theatres, cinemas, and restaurants. The other parts of the city have more the stamp of residential areas. This is particularly the case with Östermalm, which is bordered to the south by the cap.'s most fashionable thoroughfares, Strandvägen and Birger Jarlsgratan. The former especially is very popular with its lime-trees and proximity to the water, and leading as it does out to S.'s classical amusement centre, Djurgården, a kind of insular Bois de Boulogne. This is also where Skansen is, the world-famous open-air museum, which not only reflects the old Swedish cultural life from the country estates and farms, but is also a zoo. At Djurgården and the adjacent is. of Skeppsholmen the navy has one of its bases. Otherwise all the military cantonments have been moved out from the city, and the big training-ground N. of Östermalm known as Gärdet has been partly built over during the 1930s. Besides the ordinary elementary and secondary schools S. has numerous higher educational institutions, such as the univ., embracing all faculties except theology. S.'s inner harbour, which gives the city many of its aesthetic values, is both large and deep and is kept open all the year round, sometimes with the help of ice-breakers in the winter. In the N. part of Djurgården is Frihamnen, the Free Harbour. There is passenger traffic from S. not only to most of the Swedish coastal tns. but also to Russia, Finland, etc. Commercial traffic is world wide. The airport of S. is at Bromma, from which there are regular connections by air to nearly all the European countries, the U.S.A., Africa, and the far E. The city has many big industries such as shipbuilding, engineering, iron-founding, sugar refining, brewing, tanning, and the manuf. of silk, cotton, soap, tobacco, cork, and leather. Sev. of the world-famous names among the industries of S. are Bolinder, De Laval, Atlas-Diesel, Separator, Elektrolux, Primus, and J. M. Ericsson. Pop. (1949) 733,600.

Stockholm Conference, see under WORLD WAR, FIRST (1917).

Stockholm, Treaty of, between Sweden and Great Britain (1719), by which George I. obtained Stettin for Prussia, his ally, and Bremen and Verden for Hanover. Other treaties of Stockholm were between Sweden and Russia (1724), Sweden and Great Britain (1813), Sweden, Great Britain, and France (1855).

Stockings, see under Hosiery.

Stockmar, Christian Friedrich, Baron von (1787-1863), Ger. politician, b. at Coburg, educated at the univ. of Jena, where he devoted himself particularly to the study of medicine. In 1814 he accompanied a Saxon regiment as chief physi-

cian, and soon afterwards became one of the doctors of the hospital at Worms. S. about this time met Stein, and began to turn his attention towards politics and diplomacy. He became the confidential adviser of Leopold I. of the Belgians. In 1836 he came to England to act as adviser to the young Princess Victoria, who succeeded to the throne in the following year. S. had for a while a good deal of influence at the Eng. court. See P. Colson, *Private Portraits*, 1948.

Stockport, municipal and co. bor., situated on the R. Mersey, 6 m. from Manchester, England, lies partly in Lancashire and partly in Cheshire. Its position on the R. Mersey at the confluence of the Rts. Tame and Goyt gave it considerable importance in early times; it is believed to have been a Rom. and later a Saxon fortress, and in 1172 was the site of a Norman stronghold. Through S. passed the Young Pretender on his advance south and again on his retreat from Derby. S. is built on the steep sides of the Mersey valley, and in the older parts of the tn. the streets climb sharply to the more level outskirts. 'Underbank Hall,' a fine half-timbered building of the late fifteenth and early sixteenth centuries, is notable. The churches are mainly of the nineteenth century, but that of St. Mary the Virgin, which has many aniet. features, dates back to the twelfth century. The right to hold the market was granted in 1260 by Edward, the first royal earl of Chester. In St. Peter's Square stands the statue of Richard Cobden, advocate of Free Trade, who was M.P. for the tn. S. is primarily industrial, employing 40,000 workers in the many factories. Industries include cotton mills, textile, hat, glove, chemical, food, and confectionary manufs., and aircraft, automobile, electrical, and heavy engineering. Pop. 141,000.

Stocks (fruit). Many varieties of the larger kinds of fruit are found to be more productive when budded or grafted upon the roots of other trees, e.g. the quince stock for pears, the crab apple for standard apples. Similarly, some varieties of roses make stronger growth and live longer when grown on the briar and other S.

Stocks, device for the punishment of certain criminal offenders, consisted of two balks of timber so padlocked together as to imprison the feet, sometimes also the hands and even the neck, in holes made for the purpose. Stow's *Survey of London* (1598) describes them as erected in every ward of London for vagabonds and other petty offenders, while set up in the prison in Cornhill, called the cage, was a pair of S. for the punishment of night walkers. They were last used in England in the middle of the nineteenth century. In the U.S.A. they survived until before the Civil war as a punishment for slaves, but were in more general use in the eighteenth century. See PILORY.

Stocksbridge, tn. in the W. Riding of Yorkshire, 9½ m. N.W. of Sheffield. It manufs. alloy, stainless and other special steels, also vehicle springs and umbrella frames. It is situated close to the proposed Peak Dist. National Park. Pop. 10,300.

Stockton, co. seat of San Joaquin co., California, U.S.A., 70 m. E.N.E. of San Francisco, on an arm of the San Joaquin R. Its chief industries are the manuf. of agric. and mining implements, leather, lumber products, flour, soap, and iron goods, and there is trade in the fruit, cattle, and grain of the rich San Joaquin valley, loaded from an 18 m. long waterfront. Pop. 54,700.

Stockton-on-Tees, municipal bor. mrkt. tn. and port of co. Durham, England, 5 m. from the mouth of the R. Tees, and 19 m. S.S.E. of Durham. The tn. is believed to have received its charter of incorporation as a bor. between the years 1201 and 1208, and its first market charter was granted in 1310. The chief buildings of interest are the par. church, the tn. hall (1735), the first railway ticket office, and sites connected with the first passenger railway from S. to Darlington (see STEPHENSON, GEORGE). In the High Street, one of the widest in England, are held the bi-weekly markets. John Walker, inventor of the first friction match, and Thomas Sheraton, the famous designer and maker of furniture, were born here. In addition to the old estab. heavy industries of iron, steel, chemicals, and engineering, many new industries have been attracted to the bor. These include light engineering, dressmaking, shirtmaking, hollow-ware, telephone equipment, light castings, woollen spinning, bicycles, plywood products, and distributive trades. The quay is being extended and a new warehouse erected to extend the use of the tn. as a distributive centre. S. is a parl. bor. returning one member. Area of bor. 5561 ac. Pop. (estimated) 73,400.

Stockton, South, see THORNABY-ON-TEES.

Stockwell, dist. situated in the bor. of Lambeth, S. London, the site of Spurgeon's orphanage, founded in 1867.

Stoics, name for the sect of anc. moralists opposed to the Epicureans in their views of human life. The founder of the system was Zeno (c. 310-270 B.C.) of Citium in Cyprus and probably of Semitic origin who derived his first impulse from Crates the Cynic. He opened his school in a building or porch, called the Stoa Poecile (Painted Porch), at Athens, whence the name of the sect. Zeno and his successors, *Cleanthus* and *Chrysippus*, represent the first period of the system. The second period (200-50 B.C.) embraces its general promulgation and its introduction to the Romans.

The third period of Stoicism is Roman. In this period we have Cato the younger, who invited to his house the philosopher Athenodorus, and, under the empire, the three Stoic philosophers whose writings have come down to us—Seneca, Epictetus, who began life as a slave, and the Emperor Marcus Aurelius Antoninus. Stoicism prevailed widely in the Roman world, although not to the exclusion of Epicurean views; indeed, both these main philosophical currents of the period have directly in view the same practical end, namely, that if there were any good

attainable at all, it must be found by each man within himself, and whatever of theoretical interest was implied in either philosophy was subordinate to that end; and, again, although they might be reached by widely divergent roads, there was, superficially at least, a close resemblance between the characteristic *arabēta* (freedom from emotion) of the S. and the *ἀραρήσια* (imperturbability) of the Epicureans. The Moral system is best considered under four heads: the Theology, the Psychology or theory of mind, the theory of the Good or human happiness, and the scheme of Virtue or Duty. (1) The S. held that the universe is governed by one good and wise God, together with inferior or subordinate deities. God exercises a moral government; under it the good are happy, while misfortunes happen to the wicked. They did not admit that the Deity intermeddled in the smaller minutiae; they allowed that omens and oracles might be accepted as signs of the foreordained arrangement of God. Like most other anc. schools, the S. held God to be corporeal like man; body is the only substance; nothing incorporeal could act on what is corporeal; the First Cause of all, God or Zeus, is the primeval fire, emanating from which is the soul of man in the form of a warm ether. (2) Next, as to the constitution of the mind. We have bodies like animals, but reason or intelligence like the gods. Animals have instinctive principles of action; man alone has a rational, intelligent soul. According to Antoninus we come into contact with Deity by our intellectual part, and our highest life is thus the divine life. But the most important Stoic doctrine respecting the nature of man is the recognition of Reason as a superior power or faculty that subordinates all the rest, the governing intelligence. (3) The Stoic Theory of Happiness, or rather of the Good, was not identified with happiness. The S. began by asserting that happiness is not necessary, and may be dispensed with, and that pain is no evil, a doctrine which, if followed consistently, would dispense with all morality and human endeavour. They disallowed the direct and ostensible pursuit of pleasure as an end (the point of view of Epicurus), but allured their followers partly by promising them the victory over pain, and partly by certain enjoyments of an elevated cast that grew out of their plan of life. Next to the discipline of endurance we must rank the complacent sentiment of Pride, which the Stoic might justly feel in his conquest of himself, and in his lofty independence and superiority to the casualties of life. The last and most elevated form of Stoic happiness was the satisfaction of contemplating the Universe and God. (4) The Stoic theory of Virtue is implicated in the ideas of the Good now described. The S. were the first to preach what is called 'Cosmopolitanism'. They said: 'There is no difference between Greeks and barbarians; the world is our city.' Seneca urges kindness to slaves, for 'are they not men like ourselves, breathing the same air, living and dying like ourselves?' The

Epicureans declined, as much as possible, interference in public affairs, but the Stoic philosophers all urged men to the duties of active citizenship and were the first who pronounced positive beneficence a virtue. They adopted the 'four Cardinal Virtues (Wisdom, or the Knowledge of Good and Evil; Justice; Fortitude; Temperance) as part of their plan of the virtuous life, the life according to nature. Justice, as the social virtue, was placed above all the rest. But most interesting to us are the indications of the idea of Beneficence. Epictetus is earnest in his exhortations to forgiveness of injuries. Antoninus often enforces the same virtue, and suggests considerations in aid of the practice of it; he contends as strongly as Butler and Hume for the existence of a principle of pure, that is, unselfish, benevolence in the mind, in other words, that we are made to advance each other's happiness. There is also in the Stoic system a recognition of duties to God, and of morality as based on piety. Not only are we all brethren, but also the 'children of one Father.' The extraordinary stress put upon human nature by the full Stoic ideal of submerging self in the larger interests of being led to various compromises. The rigid following out of the ideal issued in one of the Paradoxes, namely that all the actions of the Wise Man are equally perfect, and that, short of the standard of perfection, all faults and vices are equal. This has a meaning only when we draw a line between spirituality and morality, and treat the last as worthless in comparison with the first. The later S., however, in their exhortations to special branches of duty, gave a positive value to practical virtue, irrespective of the ideal. The idea of duty was of Stoic origin, fostered and developed by the Rom. spirit and legislation. The early S. had two different words for the 'suitable' (*καθικον*) and the 'right' (*καρπορα*). It was a point with the S. to be conscious of 'advance,' or improvement. By self-examination he kept himself constantly acquainted with his moral state, and it was both his duty and his satisfaction to be approaching to the ideal of the perfect man. When renouncing the position of 'wise,' he yet claimed to be advancing. This idea, familiar to the modern world, was unknown to the ancients before the S. It is illustrative of the unguarded points and contradictions of Stoicism, that contentment and apathy were not to permit grief even for the loss of friends. Seneca, on one occasion, admits that he was betrayed by human weakness on this point. The chief ancient authorities on the S. are the writings of Epictetus, Marcus Antoninus, and Seneca, themselves Stoic philosophers, together with notices occurring in Cicero, Plutarch, Sextus Empiricus, Diogenes Laertius, and Stobaeus. See also R. D. Hicks, *Stoic and Epicurean*, 1910; E. V. Arnold, *Roman Stoicism*, 1911; R. M. Wenley, *Stoicism and its Influence*, 1925; besides works on philosophy in general which provide a summary on Stoicism, such as W. Durant, *The Story of Philosophy*, 1946.

Stoke Newington, metropolitan bor. of

N. London, with reservoirs and water-works. With Hackney it returns one member to Parliament. Pop. 49,500.

Stoke Poges, vil. of Buckinghamshire, England, 2 m. N. of Slough. The church of St. Giles is part Norman and part Early Eng. It is the burial place of Gray, the churchyard being identified with the scene of his *Elegy*. A field adjoining the churchyard, and a monument to the poet, were acquired by the National Trust in 1922 and 1925. Pop. 1700.

Stokes, Sir George Gabriel (1819-1903), Brit. mathematician and physicist, b. in Skreen, co. Sligo, Ireland, and educated at Bristol and Pembroke College, Cambridge, where he was appointed Lucasian prof. of mathematics in 1849. He was secretary (1854-85), and president (1885-90) of the Royal Society, and fellow (1841-1857), and master (1902) of his college. He represented Cambridge in Parliament from 1886. He discovered the nature of fluorescence, made important discoveries in the theory of light-absorption, the ultra-violet spectrum, and the ether theory of light; did fundamental work in hydrodynamics, and made important contributions in mathematics. His works include *Mathematical and Physical Papers* (ed. Sir J. Larmor, 1880-1903); *On Light* (1881-87) and *Memoirs and Scientific Correspondence* (ed. Sir J. Larmor, 1907).

Stokesay, vil. of Shropshire, England, 6½ m. N.W. of Ludlow. There is a seventeenth-century church with a roofed manorial pew, and a thirteenth-century moated castle, an excellent example of its kind. Pop. 1100. See Horse.

Stokesley, mkt. tn. of the N. Riding of Yorkshire, England, 16 m. S.E. of Stockton-on-Tees. There is an endowed school. Ironstone mines are near by. Pop. 1700.

Stoke-upon-Trent, municipal, co., and parl. bor. and city of Staffordshire, England, 14½ m. N. of Stafford on the Trent and Mersey Canal. It includes the six tns. of Burslem, Hanley, Longton, Fenton, Tunstall, and S.-upon-T., which were incorporated in the co. bor. of S.-upon-T. in 1910. City status was granted in 1925. Educational institutions include the N. Staffordshire Technical College (world famous for its pottery classes), and the city has taken a leading part in establishing the new univ. college of Staffordshire. The chief hospital is the N. Staffordshire Royal Infirmary. S.-upon-T. is famous for the manuf. of pottery and porcelain, often being referred to as 'The Potteries.' Other major industries are coal-mining, iron and steel production, and rubber tyre manuf. A considerable number of light engineering works are allied to these major industries. During the Second World War bombs fell in the city area on some thirty occasions, but the damage sustained was relatively small. Three members are returned to Parliament. Pop. 274,300.

Stokowski, Leopold Antoni Stanislaw Boleslawowicz (b. 1882), Amer. conductor, b. in London, of Polish parentage. In 1912 he was appointed to Philadelphia

Symphony Orchestra, which under his leadership became unexcelled for ensemble playing and beauty of tone.

Stolberg, Christian, Count (1748-1821) and **Stolberg, Friedrich Leopold, Count** (1750-1819), Ger. poets. Christian was b. at Hamburg and his brother at Bramstedt in Holstein. Both were members of the famous Göttingen Hainbund, of which Bürger (*q.v.*) and Voss were also members. They collaborated in *Gedichte* (a vol. of poems ed. by H. C. Boie in 1779); *Schauspielen mit Chören* (1787), designed to reawaken interest in Gk. drama; and some patriotic poems, *Vaterländische Gedichte* (pub. posthumously, 1825). Christian also wrote *Gedichte aus den Griechischen* (1782), *Die Weisse Frau* (a ballad, 1814), and a trans. of Sophocles (1782); and Leopold, who was the better poet of the two, *Timoleon* (a tragedy, 1784); translations of the *Iliad* (1778), of Plato (1796-97), Æschylus (1802), and *Ossian* (1806); a novel, *Die Insel* (1788); *Geschichte der Religion Jesu Christi* (1806-1818); and a life of Alfred the Great (1815). Their works were pub. collectively (1820-1825). See study by J. Jansen, 1877-82, 1910.

Stolberg, tn. in Rhineland (N. Rhine-Westphalia), Germany, 5½ m. S.E. of Aachen, on the railway line to Cologne. It manufs. zinc, lead, brass, soap, needles, and press-studs. Pop. 31,500.

Stolen Goods. Possession of S. G. recently after their loss is *prima facie* evidence that the person in possession stole the goods or received them knowing them to have been stolen; but if many months have elapsed between the loss and the discovery the possessor cannot in the absence of any other circumstances implicating him with the theft be called upon to account for the manner in which he came by the goods. This is the doctrine of *Recent Possession*.

Conviction on indictment for theft entails restitution of the S. G. to the rightful owner. But if the S. consist of some valuable security or negotiable instrument (*q.v.*) which after the theft has been *bona fide* paid by some person who has rendered himself liable to discharge such security or instrument, the court will not order restitution (see also *UNDER MARKET OVERT*). Goods obtained by fraud or other unlawful means not amounting to larceny (*q.v.*) and transferred to some bona fide purchaser will not be restored to the defrauded owner (Sale of Goods Act, 1893). Where S. G. have been sold by the thief to a bona fide purchaser the court has power to make an order, on the restitution of the goods to the owner, that out of any money found on the thief on his arrest a sum not exceeding the amount of the proceeds of the sale be paid over to the purchaser. Magistrates in the exercise of their summary jurisdiction also have power to order restitution. If S. G. have been pawned, they will, generally speaking, only be ordered to be restored to the true owner if the amount lent by the pawnbroker was not over £10. See also RECEIVING STOLEN GOODS; SEARCH WARRANT.

Stolp, see SLUPSK.

Stomach, pear-shaped digestive sac which in man is situated in the upper part of the abdomen, the wider end to the left, the narrower to the right, but with its centre somewhat to the left of the median line. It is entered by the oesophagus at the *cardiac orifice*, where the circular muscle is thickened to form a sphincter. The opening of the S. into the intestine is called the *pylorus*. The innermost coat of the S. consists of mucous membrane made up of a layer of epithelial cells resting on connective tissue. When the organ is not fully distended, the mucous membrane is thrown into folds called *rugæ*; when the S. is distended the rugæ disappear. Outside the submucous coat of connective tissue are the submucous coat of connective tissue and three coats of unstriated muscle, of which the inner is oblique, the next circular, and the outer longitudinal. The whole of the organ is embraced by the two layers of the *peritoneum*, the serous membrane which lines the interior of the abdominal cavity. The mucous coat contains gastric glands which secrete gastric juice and mucus. Entering the S. by the cardiac orifice, the food is acted upon by the gastric juice, which contains hydrochloric acid and enzymes called pepsin and rennin. The juice is effectively mixed with the salivated food by the movements of the muscular walls of the S., the degree of distension of the sac being just sufficient to accommodate the contents. When the food is rendered acid by the action of the gastric juice and has been propelled by peristalsis to the pyloric canal, the pylorus opens to admit the food to the small intestine. The effect of digestion in the S. is to convert proteins into peptones. The gastric juice has also some bactericidal influence.

Gastritis is inflammation of the coats of the S. *Acute gastritis* may be set up by a corrosive poison, by the effects of acute fevers as typhus and diphtheria, or by unsuitable food. The flow of gastric juice is arrested, digestion is stopped, and anti-peristalsis may occur, leading to vomiting. The attack tends to subside when the exciting cause is removed, and treatment should be directed to this end. In the case of poisoning emetics should be used, but the administration of a purgative is less distressing when the irritating substance is indigested food material. Bismuth and restriction to a light diet are of help in soothing the irritated membrane. *Chronic gastritis* or *gastric catarrh* may follow from repeated acute attacks, and is especially associated with the alcoholic habit. The coats of the S. are in a state of chronic congestion, the mucous membrane and in some cases the muscular coat become thickened. The activity of the glands is lessened and the patient becomes a chronic dyspeptic. Treatment requires patience and perseverance in the subject. If alcohol is the predisposing cause, it should be abandoned, and the diet should be carefully restricted for a protracted period. Bismuth and arsenic are useful in allaying

irritation, and peptonised foods help to supply the deficiency in the glands.

Gastric ulcer is commonest in females of an anæmic tendency. It is caused by the S. digesting a part of its own tissue in which the blood supply is deficient. The ulcer or ulcers usually occur toward the pyloric end, are small and circumscribed, but may tend to eat right through the S. wall, when a fatal ending can hardly be averted. The most characteristic symptoms are severe pain and vomiting immediately after food. The best treatment is absolute rest combined with a milk diet, when the condition may cure itself. Copious hæmorrhage, indicating the danger of perforation at an early period, should be met by prompt surgical measures. If perforation has taken place, immediate suturing of the opening and cleansing of the abdominal cavity may lead to recovery.

Cancer (Carcinoma) of the stomach may follow chronic gastric ulcer and usually occurs at the pyloric end. Unfortunately the condition is generally not recognised till too late for surgical measures to be of any avail, though partial or complete excision of the S. (gastrectomy, *q.v.*) can be performed if the disease is not too far advanced. The concentration of hydrochloric acid in the gastric juice is lowered, whereas in gastric ulcer it is raised.

Pyloric stenosis is a stricture of the pyloric sphincter muscle. In infants it is caused by a congenital thickening of the muscle; in adults it may be due to the scars left by ulcers.

Stone, Nicholas (1586-1647). Eng. sculptor, b. at Woolsbury, near Exeter. He lived three years in London, and then went to Holland, where he worked for Peter de Keyser. In 1619 he was appointed master-mason for building the new banqueting-house of Whitehall, and in 1626 was appointed master-mason of Windsor Castle. He made sev. monuments for Westminster Abbey; among them one to Spenser. S. had three sons: Henry, Nicholas, and John. **Henry S.** (d. 1653) was a statuary and painter. He studied in Italy and the Netherlands, and made many excellent copies of celebrated It. and Flem. pictures. There is a large copy at Hampton Court of the celebrated picture, by Titian, of the Cornaro family. **Nicholas S.** (d. 1647), the second son, who was a statuary, also studied abroad, and modelled many excellent copies of celebrated works.

Stone: 1. Urb. dist. and mkt. tn of Staffordshire, England, on the Trent, 7 m. N. of Stafford. There is a priory, and a grammar school estab. in 1558. Brewing, ceramics, and the manuf. of glass and footwear are carried on. Pop. 8500. 2. Vil. of Kent, England, 4 m. W. of Gravesend, on the Thames. Cement manuf. is the chief industry. The historic church of St. Mary overlooks the riv. Pop. 7000.

Stone (for the chief types of S. used in architecture see BUILDING STONES; for dressing S. see MASONRY). **Preservation**: The durability of S. depends on good selec-

tion of the S. at the quarry, weathered (or inclined) top surfaces, correct fixing, and efficient damp-proof courses. External paints and chemicals are not usually very effective in preventing decay. Where the S. has decayed it can be cut out and replaced by a cement mixture, though it is usually better to use pieces of new S. of the same kind. Artificial S. and terra-cotta are often used as a substitute for natural S. Terra-cotta is a special form of burnt clay, whereas artificial S. is a precast concrete. Cast S. is a superior kind of artificial S. which has a face of crushed natural stone and Portland cement over a core of ordinary concrete.

Stone, riv. of Tennessee, U.S.A., joining the R. Cumberland above Nashville, after a north-westerly course. It was the scene of a Federal victory in the Amer. Civil war (Dec. 31, 1862 Jan. 2, 1863), the battle being sometimes called Murfreesboro.

Stone, in medicine, see CALCULUS. GALLSTONES; LITHOTOMY.

Stone, standard Brit. weight, called the Imperial S., is 14 lb. Other Ss. in use are 8 lb. for meat, 24 lb. for wool, 16 lb. for cheese, 5 lb. for glass, and 32 lb. for hemp.

Stone Age. The hist. of man's gradual advancement is best understood by its relation to the three technological stages in his development, in the first of which he used stone tools and weapons (see also IRON AGE). The S. A. has been divided into the Old S. A., when stone implements were merely flipped into shape, and the New S. A. when implements of stone were ground and polished. Lord Avebury suggested the terms Palæolithic and Neolithic for these divs., and a Mesolithic phase has been added to bridge the period between the S. A. and the Metal Age. It should be noted that the S. A. can be considered from a chronological and cultural point of view; the three technological stages, however, and in particular the S. A., were not everywhere contemporary. Recent research has been largely directed towards the relationship of the Palæolithic S. A. to geochronology and to the elucidation of an absolute chronology based upon geology; while the functional-economic stages of the Neolithic have attracted as much attention as the typology of its implements and pottery, and the study of megalithic graves.

Palæolithic men were hunters, and their remains have been found in the caves in which they lived, and in the sedimentary deposits of riv. gravels. The *Early Palæolithic* is divided into the cultures of Chelles and St. Acheul. (The various cultures are known by continental names as Fr. and Belgian workers were the first in this systematised study.) Its prim. deposits belong to the Riss-Wurm interglacial period, when the warm fauna included *Elephas antiquus*, a rhinoceros, and *Hippopotamus major*. Probably the Sussex Piltdown Man belongs to this period. The Middle Palæolithic is characterised by the Mousterian flake industry, and in geological time its spread is in the period of the Wurm advance. Neanderthal man lived in a cold fauna which

included the mammoth, horse, ox, and reindeer. The Upper Palaeolithic has the cultures named Aurignacian, Solutrean, and Magdalenian, and in geological time it covered the retreat of the Wurm glaciation and a dry and rather cold subsequent period. There was a steppe fauna which with the onset of colder conditions became a tundra fauna. Sev. varieties of *homo sapiens* appear.

The walls of certain caves lived in by Palaeolithic man were decorated with sketches and paintings of magic and religious significance. This remarkable practice is often found in the Magdalenian culture of S.W. France and N.W. Spain, and its association with the reindeer hunt is unmistakable. In 1940 were found a series of paintings in a cave at Lascaux (q.v.), near Montignac on the Vézère, a trib. of the Dordogne, which belong to the Aurignacian. No cave art has been recorded in Britain.

There are sev. distinct cultures in the Mesolithic period, all of them based on a food-gathering economy. The climate had much improved, and hunting and fishing are well represented by the presence of microliths and fish-spear barbs. In Britain there seem to be four elements, one of which has affinities with the Baltic.

The New S. A. (Neolithic) saw a higher civilisation based upon agriculture and stock-raising; there was a wide trade in flint, which was mined; and the period is also marked by the spread of megalithic tombs (see MEGALITH CULTURE), and the construction of earthwork camps with causeways or interrupted ditches. There is a distinctive kind of domestic pottery which is ultimately based upon vessels of leather and skin, and plants both cereal and textile. Sheep, oxen, goats, and swine were domesticated. It should be noted that sev. varieties of polished stone implements (axes, knives, daggers, and tanged and barbed arrow-heads) really belong to the succeeding Metal Age.

The Stone Age in Britain.—The interdependence of the various palaeolithic cultures and the glaciations has been well studied, and the correlation between the cultures and glacial deposits has been demonstrated in the lower and upper Thames, in the Cromer dist., and at Hoxne and elsewhere in Suffolk. In E. Anglia deposits of late Tertiary age have yielded colthts, the first tools of man or some manlike creature; the best examples are in Ipswich Museum. Upper Palaeolithic cave-dwellings have been recorded at Creswell Crags, Kent's Cavern, Torquay; Cheddar Cave, Somersetshire; and at Paviland in S. Wales. The Mesolithic period is well represented by discoveries of pygmy flints in the Lower Greensand area of the weald of Kent and Sussex; in the Lincolnshire fens; and in the Pennines. Characteristic pottery of the Neolithic period has been recovered from Windmill Hill near Avebury, Wiltshire, and from Peterborough, and these two places give their name to two important varieties, the study of which has done much to throw light on the cultural groups in Britain. Examples of Neolithic

fortified earthwork camps which have been scientifically examined in recent years include Abingdon, Berkshire; the Trundle, and Whitehawk Hill, Sussex; Knap Hill and Windmill Hill, Wiltshire. In each, except Abingdon, the fort is on a hill top, and it always consists of a complex of concentric, flat-bottomed ditches interrupted at frequent intervals by causeways, and within the ditch a small earthen rampart. For megalithic monuments see MEGALITH CULTURE.

See H. Peake and H. J. Fleure, *Apes and Men*, 1927, and *Hunters and Artists*, 1927; M. C. Burkitt, *Our Early Ancestors*, 1929, and *The Old Stone Age*, 1933; and V. G. Childe, *Man Makes Himself*, 1936.

Stone Carving. Sculpture in hard material, stone or wood, differs from sculpture in plastic material, clay. The former is a paring down of material, the latter a building up. Both, however, are drawing in material and both depend on a realisation of form. The greatest S. C. is that in which the sculptor worked direct, sensing the form in the block of stone and making it grow out of the material as he carved it. S. C. in the hist. of art preceded painting. Primitive man carved the bones of animals on the rock walls of caves, usually in relief. For sculpture in the round see more particularly SCULPTURE. In Egypt gigantic figures were carved from stones placed together for the purpose. In Assyria, Babylonia, and Mesopotamia walls were carved with sculpture. The animal reliefs in stone of the Assyrians show the influence of early Babylonian seal cutting. Wonderful examples of S. C. are to be found in India. Elephant forms were carved out of great rocks, and grottoes and temples were hewn out of rock faces. Flower and leaf forms were carved in and about the supporting pillars. The use the Gks. made of S. C. is well known, and the beauty of the Parthenon frieze has never been surpassed. In central America Maya S. C. shows that blocks of stone elaborately carved were placed one upon the other to form temples and buildings. These carvings, as in most decorative carvings, were in relief. Gigantic stone pillars, carved in relief, called *stelae* after Gk. examples of this kind of work, are the characteristic forms of Mayan S. C. S. C. of elaborate and formal design is to be found in the great cathedrals of the Middle Ages. Columns were intricately carved and the stone supporting pillars were shaped and carved at base and capital. Images of saints, to fill the niches, effigies and heraldic beasts on tombs, gargoyles, screens, and altarpieces all supplied work for the medieval stone carver, who was the craftsman, but not always the designer. There has been a decline of the medieval tradition of architectural S. C. since the industrial revolution, and outstanding examples of S. C. on modern buildings and churches are becoming increasingly rare. It was Eric Gill (q.v.) above all modern artists who led the way to revival of architectural and especially religious S. C., executed as well as designed by the sculptor. A large number of modern sculptors, including

Jacob Epstein and Henry Moore, have since devoted themselves to 'direct' S. C. For stones used in carving see SCULPTURE. Concrete is a medium which may be used plastically in a mould, or it may be carved like stone. See J. C. Rich, *The Methods and Materials of Sculpture*, 1948.

Stonechat (*Saxicola torquata*), small bird of the thrush tribe. The male bird has a black head and throat, dark back, and tawny breast, and the female differs from it in that its head is brown. It is frequently seen in Britain, and occurs in Europe and Asia.

Stone Circles, see CIRCLES OF STONE.

Stone Coal, see ANTHRACITE.

Stonecrop, see SEDUM.

Stone-fly, name given to any of the orthopterous insects of the order Plecoptera. The species are of wide distribution

and it has in this sense been compared with the architectural development of a cathedral.

The monument is enclosed within a low earthwork circle having a bank inside the shallow ditch, and a single entrance fronted by the Avenue, an earthwork of parallel banks and ditches about 70 ft. apart. Part of the course of the Avenue has been recovered by aerial photography, thus confirming statements made by Wm. Stukeley; after leaving S. it continues in its straight course for 600 yds. and then divides, one branch curving N., and the other E. to the Avon at W. Amesbury. Within the earthwork circle is a circle of holes, probably for wooden posts, about 288 ft. in diameter; they were first discovered by John Aubrey in 1666, and are known as the Aubrey Holes. The Aubrey

Valentine & Sons Ltd., Dundee

STONEHENGE

and are frequently found near running streams. The larva are deposited in water, and are usually found under stones.

Stoneham, tn. in Middlesex co., Massachusetts, U.S.A., 9 m. N. of Boston. Its chief monu. are boats, automobiles, and chemicals. Pop. 10,800.

Stonehaven, Stanhive, or Kilwhane, burgh, seaport, seaside resort, and co. tn. of Kincardineshire, Scotland, on Stonehaven Bay, 15 m. S. of Aberdeen and 23 m. N.N.E. of Montrose. The ruins of Dunnottar Castle are in the vicinity. It has a secure harbour, a small fishery, distilleries, and tanneries. Nets and toys are also made. Pop. 4,500.

Stonehenge (from the O.E. *hengen*, that which is hung up, the reference being to the horizontal lintel stones), perhaps the most famous prehistoric monument in Britain, is a great circle of standing stones on Salisbury Plain, 2 m. W. of Amesbury, Wiltshire. It has attracted the attention of antiquaries for many centuries, and in spite of scientific excavation in recent years, it still remains a major archaeological mystery. It is obviously a sacred site and devoted to worship; its structure has been proved to be not all of one date,

Circle, which dates from the Beaker period of the Bronze Age, was the earliest structure at S. After its decay there was erected a ring of standing sarsen stones connected by continuous lintels, the largest stone in the circle being 29 ft. 8 in. in height. Within it was built a horseshoe structure of five trilithons of sarsen stone. All the sarsen stones are carefully dressed, and the vertical stones have tenons made to fit mortice holes on the under sides of the lintels, which are curved to meet the circumference of the circle and the whole corrected for perspective. Of this period seems to be the Altar Stone, a prostrate slab of micaceous sandstone, and both this and the Heel Stone in the Avenue are on the axis of the Avenue. There is also an inner horseshoe of trilithons made from spotted dolerite, a stone which has been transported from the Prescelly Mts. in Pembrokeshire. One of these 'bluestones' at least has been used before in another henge structure, and there is good evidence at S. that the 'bluestones' were put up in their present positions after the sarsens. The structural story of the monument is completed by the Y and Z Holes, two irregular

incomplete circles, in the square socket holes of which has been found pottery of the Early Iron Age. These rings of socket holes lie between the sarsen circle and the Aubrey Circle. S. Down, which contains many barrows and other prehistoric remains, including the Avenue and the Cursus, was purchased by public subscription in 1927 and 1929, and vested in the National Trust in order to preserve the view from S., which itself was a gift to the nation, and is in the custody of the Ministry of Works.

Woodhenge, 2 m. north-east of S., was a timber monument, the post holes of which were first noticed on an air photograph. Its excavation suggested that it may have been a timber prototype of S. There were six concentric rings of posts with a bank and ditch, interrupted by a causeway, and on the central axis, which, as at S., pointed towards the mid-summer sunrise, was the dedication sacrifice of a child whose skull had been cleft. At *Archbury* (q.v.) east of S. is a remarkably imposing monument which in its development is perhaps more interesting than S. At its first period it consisted of three circles of large sarsens with an Avenue, the stones of which are curved with male and female symbols. At a later period it was surrounded by a huge ditch as much as 30 ft. deep, and an upcast bank. The monument is in the custody of the Ministry of Works, and the National Trust owns surrounding property. See *Excavation Reports in Antiquaries Journal*, vols. I-VII, 1921-27; R. S. Newall, *Antiquity*, 1929, 75-88; F. Stevens, *Stonehenge To-day and Yesterday* (H.M.S.O.), 1938. For a bibliography of more than 1000 items, see *Wiltshire Archaeological Magazine*, special part of vol. xxxii.

Stonehouse: 1. Or **East Stonehouse**, since 1914 a part of Plymouth, in Devonshire, England, situated between Devonport and Plymouth, with which it formed the 'Three Towns.' 2. Par. of Gloucestershire, England, 3 m. W. of Stroud. S. was once a centre of the cloth-making industry, but this has largely died out. The manuf. of bricks is carried on. Wycliffe College, the public school, is situated here. Pop. (estimated) 3000. 3. Par. and tn. of Lanarkshire, Scotland, 7 m. S.E. of Hamilton, on Avon Water. Coal-mining and textile manuf. are carried on. The countryside around S. is noted for its charm. The Reformation martyr Patrick Hamilton was b. in S. Pop. 3900.

Stone Loach (*Nemachilus barbatulus*), small Brit. fish, frequents clear shallow streams, living entirely on animal diet. Its length never exceeds 5 in., but the flesh is very delicate. It has six sensitive barbules hanging from the upper lip.

Stones, Precious, see GEM; and separate articles DIAMOND; EMERALD; etc.

Stones, Standing, see CIRCLES OF STONES.

'Stonewall' Jackson, see JACKSON, THOMAS JONATHAN.

Stoneware, see POTTERY.

Stonework, see MASONRY.

Stone Worship, see FETISHISM, and IDOLATRY.

Stonington, seaside resort of Connecticut, U.S.A., in New London co., situated on Long Is. Sound, 40 m. S.W. of Providence. Pop. 2000.

Stonyhurst, Rom. Catholic public school, 4 m. S.W. of Clitheroe in Lancashire, England. It had its origin in the College of St. Omer, founded in France in 1592. The members of the latter took refuge in Bruges and in Liège during the eighteenth century, after the suppression of the college in France, and in 1794 moved to the house of a Lancashire squire at S. There is accommodation for some 400 boys.

Stony Stratford, mkt. tn. of Buckinghamshire, England, on Watling Street and the R. Ouse, 8 m. N.E. of Buckingham. It has engineering works. Pop. 2500.

Stool of Repentance, seat or pew in churches in Scotland, upon which persons who had come under the censure of the eccles. authorities for some sin, such as drunkenness or lying, were made to stand.

Stools, evacuations from the bowels. Normally they consist of undigested food, digestive juices not absorbed, fragments of epithelium, etc. In disease of the alimentary canal they often give valuable diagnostic indications, through the presence of blood, mucus, casts, parasites, bacteria, etc. Constriction of the intestine is sometimes shown by small, round masses, called sheep-dung S. Lead-pencil S., or faeces of small diameter, are not necessarily indicative of intestinal stricture.

Stopping, see under MINING.

Stop-order. The effect of obtaining a S. on a fund in court is to stop the payment out to any person other than he who has obtained the S. Ordinarily the assignee of a chose in action (q.v.) must give notice (see NOTICE) to the legal holder in order to perfect his title as against third persons who may have charges on the same property; but when the chose in action is in court a S. is required in lieu of a notice.

Stoppage in Transitu, right conferred on the unpaid vendor of goods who has parted with the goods to stop them on the insolvency of the buyer, before they have reached the latter's actual or constructive possession, and to resume possession until they are paid for. S. in T. differs from lien (q.v.) in two respects: it can be exercised only when the buyer is insolvent and only when the goods have left the possession of the seller. The effect of S. in T. is not to rescind the sale, and, indeed, the buyer can recover damages if the vendor resells when he ought not. But in some cases the vendor may at once resell against the buyer: (1) where the goods are perishable; (2) where the right of resale was expressly reserved in the contract of sale. Apart from these cases the seller must give notice of his intention to resell, and also give the buyer a reasonable opportunity to pay or tender (q.v.) the price.

Storage, Cold, see REFRIGERATION.

Store, Bill of, see BILL OF STORE.

Storehammer, see HAMAR.

Stork (*Ciconia*), family of wading birds with long conical bills, long three-toed legs, and large wings. The white or house S. (*C. alba*) was formerly plentiful in Britain, but is now only an occasional visitor. It is widely distributed on the Continent, in many parts of which it is strictly protected for its service in destroying reptiles, small mammals, and insects, and in devouring offal. Its great, clumsy nest is often to be seen on a house top or church spire. Its plumage is greyish white, its quills and longest feathers on the wing coverts black, and the beak and legs red. It migrates to Africa in winter. The black S. (*C. nigra*) has the upper surface black and the lower parts white. This species also is protected, and, during migration, occasionally strays to Britain. It is widely found in south and central Europe, Asia, and parts of Africa. The adjutant, ibis, heron, and spoonbill are related types.

Storm, Theodor Woldsen (1817-88), Ger. poet and novelist, b. at Husum, Schleswig. He studied law at Kiel and Berlin, and spent the greater part of his life as magistrate and judge in the service of Schleswig-Holstein and Prussia. First became known as a lyric poet by his *Gedichte* (1852), and his first novel was *Immensee* (1852), which gained him general recognition, and was followed by numerous other short stories, including *Psyche* (1875), *Hans und Heinz Kirsch* (1882); *Der Schimmelreiter* (1888), etc. A sense of melancholy pervades many of his poems, which treat of childhood, family, love, and death. It occurs also in his novels, the earlier often romantic, the later true masterpieces of realism and feeling for tragedy. Three of his stories were pub. as *Drei Noellen* (ed. by Dr. P. Vrijdaghs and W. Ripman, 1932). His collected works were pub. 1868-77. See lives and studies by Gertrud Storm, 1911-12; H. Jess, 1917; A. Biese, 1921; E. Steiner, 1921; P. Schütze (4th ed. 1925); F. Stuckert, 1940; and K. Roll, 1940.

Storm, wind of force 11 on the Beaufort wind scale, i.e. between 64 and 75 m.p.h., during which in the days of sailing vessels a man-of-war could only carry S. stay-sails. Commonly S. is also used, if less rigidly, to describe any violent atmospheric commotion, such as a violent gale, line-squall, rainstorm, snowstorm, hailstorm, duststorm. See CYCLONE; HURRICANE; RAIN; THUNDERSTORM; TORNADO; TYPHOON; WIND.

Storm Troops (*Sturmabteilung*), see S. A. AND S. S.

Storm Warnings, see WEATHER FORECAST.

Stornoway (Stjarna's Vagr or Bay), seaport and police burgh of Lewis Is. (E. coast), Outer Hebrides, Ross-shire, Scotland, on S. Harbour, 180 m. N.W. of Oban. It was made a burgh of barony by James VI. It is the chief tn. in the Western Isles, and an important fishing centre, especially for herrings. Pop. 4700 (nearly doubled in the fishing season).

Storting (Old Norse, *stor*, great; *ting*, assembly), national Parliament of Nor-

way, the 150 representatives of which are elected every fourth year by adult suffrage (of twenty-three years of age). The S. is convened every year *suo jure*, and not by any royal writ or writ of the executive, and is divided into a Lagting or Upper House, composed of one-fourth of the members, and an Odelsting or Lower House, composed of the remainder. Legislative power is vested in the S. The royal veto may be exercised twice, but if a Bill passes three S. formed by separate and subsequent elections, it becomes law automatically. Questions relating to laws must be considered by each section separately, and all new laws must first be laid before the Odelsting, from which they pass to the Lagting for acceptance or rejection. If the sections cannot agree they hold a joint session and the final decision must be by a two-thirds majority.

Story, Short, see SHORT STORY.

Stoughton, tn. of Norfolk co., Massachusetts, U.S.A., 18 m. W. of Boston. Manufs. include cardigan jackets, boots, shoes, and rubber. Pop. (1910) 8700.

Stour, name of sev. Eng. rvs.: 1. The boundary between Suffolk and Essex. It flows into the estuary of the Orwell at Harwich, and is navigable to Sudbury. Length 47 m. 2. The Great Stour, rises near Lenham, Kent, and flowing past Ashford, Canterbury, and Sandwich, enters Pegwell Bay. Length 40 m. It has two tribs., East S. and Little S. 3. A trib. of the Hampshire Avon, rises in Wiltshire, and flowing through Dorsetshire and Hampshire, joins the Avon at Christchurch. Length 55 m. 4. A trib. of the Severn, which it joins at Stourport (q.v.). Length 20 m.

Stourbridge, municipal bor. and mkt. tn. of Worcestershire, England, 12 m. W. of Birmingham, on the R. Stour. It includes the former townships of S. Wollaston, and Swinford. It has a tn. hall (1887), an Edward VI. grammar school (1552), which Dr. Johnson attended (1726-1727), a blue-coat school (1667). The tn. has glass manufs., estab. by Hungarian immigrants about 1556, brickworks manufs. of leather and hardware, and coal mines near by. Pop. 34,000.

Stourbridge Fair, see FAIR.

Stourport, urb. dist. and mkt. tn. of Worcestershire, England, at the junction of the Severn and Stour, the former being crossed here by a handsome bridge. The terminus of the Staffordshire and Worcestershire Canal, it is a centre of inland navigation. Carpets, iron and porcelain goods, and wire products are made, and there are petrol storage depots. Pop. 10,000.

Stout, alcoholic beverage, popular in England, concocted from a brew of ordinary and burnt malt, with caramel and malt substitutes added. Alcohol, carbohydrates, organic acids, and water are the prin. constituents of the finished product. There are varieties of S., such as oatmeal, invalid, etc. In neuralgia troubles the drinking of S. is often beneficial, especially when mixed with milk. See also under BREWING, Varieties of Beer.

Stovaine, see ANÆSTHESIA.

Stove, see HEATING.

Stove Houses, see HOTHOUSE.

Stow, John (1525-1605), Eng. antiquary and chronicler, b. in London. He was a tailor by trade, but had a lifelong passion for antiquarian research, and the writing of hist. Though honoured for his work, he remained poor, and received patents to take gifts from James I. S. is best remembered by his *Surrey of London* (1598). His statue is in the city church of St. Andrew Undershaft, and is still honoured by the custom of placing a new quill pen in his hand each year. He ed. Chaucer's *Works* (1561), and pub. *A Summarie of Englyshe Chronicles* (1565) and *The Chronicles of England* (1580, republished as *The Annales of England*, 1592). The *Surrey* was later issued in sev. revised eds. See ed. by C. L. Kingsford, 1908-27 (from the text of 1603), and ed. in Everyman's Library, 1912.

Stowe, Harriet Elizabeth Beecher (1812-1896), Amer. novelist and philanthropist, b. at Litchfield, Connecticut, U.S.A. In 1836 she married Calvin Ellis S. Her first pub. was *The Mayflower* (1843). *Uncle Tom's Cabin* appeared in *The National Era*, in serial form, in 1850, and on its pub. as a book two years later attained an almost unexampled popularity. Half a million copies were sold in the U.S.A., and it was trans. into twenty-two foreign languages. It had a great influence in stirring up public opinion in the N. of the U.S.A. against slavery. In 1853 S. visited England to lecture on the slavery question. Among her succeeding novels were *Dred, a Tale of the Great Dismal Swamp* (1856); *The Minister's Wooing* (1859); and *Old Town Folks* (1869). See lives by C. E. and L. B. Stowe, 1889; C. Gilbertson, 1937; and F. Wilson, 1942.

Stowell, Lord, see SCOTT, WILLIAM.

Stowe School, Eng. public school at Buckingham, founded in 1923. The central building was erected in the eighteenth century and was the seat of the dukes of Buckingham and Chandos. The first headmaster (1923-49) was J. F. Roxburgh. The school accommodates some 550 boys.

Stowmarket, mrkt. tn. and urb. dist. of Suffolk, England, on the Gipping, 12 m. N.W. of Ipswich. Its manufs. include paints and agric. implements. Pop. 7400.

Stow-on-the-Wold, mrkt. tn. and urb. dist. of Gloucestershire, England, on the Fosse Way, 20 m. N.E. of Cheltenham. It is a place of recognised charm, with an old church and a fourteenth-century market cross. Pop. 1500.

Strabane, mrkt. tn. in co. Tyrone, N. Ireland, on the R. Mourne. Shirts and underclothing are made. Pop. 6000.

Strabismus, see SQUINTING.

Strabo (c. 63 B.C.-A.D. 25), Gk. geographer and historian, b. at Amasia in Pontus. He travelled extensively in Greece, Italy, Egypt, Sardinia, and Ethiopia. His historical memoirs remain only in fragments, but his *Geographica*, the most important work of antiquity on that science, is extant, almost complete, in seventeen books. There is an ed., with trans. of *On the Troad*, by W. Leaf (1923),

and a complete ed. in the Loeb series, with trans. by H. L. Jones (5 vols., 1922-28).

Strabolgi, Joseph Montague Kenworthy, tenth Baron (b. 1886), Brit. sailor, politician, and author, entered the R.N. in 1902, and served in the First World War. He was a Liberal M.P. from 1919 to 1926, and a Labour member until 1931. He succeeded to the peerage in 1934, and became chief Labour whip in the House of Lords. His publs. include the autobiographical *Statesmen and Others* (1933); *The Battle of the River Plate* (1940); *Singapore and After* (1942); *Sea Power in the Second Great War* (1943); and *Conquest of Italy* (1944).

Strachey, Giles Lytton (1880-1932), Eng. author, b. in London, studied at Trinity College, Cambridge. He contributed to reviews, and attained prominence with *Landmarks of French Literature* (1912). S. became famous in 1918 with *Eminent Victorians* (lives of Cardinal Manning, Florence Nightingale, Arnold of Rugby, and Gen. Gordon). In 1921 his life of *Queen Victoria* appeared, arousing wide interest and much controversy. His next large biography was *Elizabeth and Essex* (1928). S. was a critic of literature as well as of hist., his rational insight being proved by *Books and Characters* (1922), studies of Racine, Voltaire, the later Shakespeare, etc., and by his Leslie Stephen lecture on Pope (1925). He also contributed some ninety full-length reviews to the *Spectator* (1904-14), then under the editorship of John St. Loe S. (q.v.) who was his cousin. S. estab. a fashion for a new type of biography, in which, however, his imitators too often repeated his faults without his virtues, after the immense and usually tedious works of his predecessors. His point of view, which gave his work its tremendous readability, ultimately mars his standing as an historian. He was primarily a humanist, and historical problems he saw as problems of individual behaviour and eccentricity. Thus he missed the real political significance of such men as Prince Albert and Disraeli. Even within his limits he showed some serious defects; he could not bear to be dull, and therefore strained his material for the sake of humour and interest. His *Elizabeth and Essex* shows these faults most clearly; he was basically out of sympathy with the Elizabethan Age. His best, if least popular works, are his first and *Books and Character*. Always an exquisite stylist, S. was at his best a fine scholar also. His collected works were pub. in 1919. See studies by G. Bous, 1935; C. Clemens, 1942; and Sir Max Beer-bohm, 1943.

Strachey, John St. Loe (1860-1927), Eng. author and newspaper proprietor, b. at Sutton Court, Somerset, educated privately and at Balliol College, Oxford. From 1896 to 1897 he ed. the *Cornhill*, and in 1897 became editor and proprietor of the *Spectator*, which was maintained in a most influential position under his guidance. In 1925 he retired from the management of the *Spectator*, although he continued contributing. The last years of his life were devoted to writing books,

including two vols. of autobiography (*The Adventure of Living*, 1922, and *The River of Life*, 1924) and one novel (*The Madonna of the Barricades*, 1925). Other books include *From Grave to Gay* (1897); *The Problems and Perils of Socialism* (1908); *Economics of the Hour* (1923); *The Rescendium* (1924); and *American Soundings* (1926). See life by Amy Strachey, 1930.

Stradella, Alessandro (c. 1645-c. 1681). It. composer, b. at Naples. He taught singing in Venice, and went later to Turin and Rome, but little is known of him except that he was murdered at Genoa. His vocal work is notable for energy of expression, and the broader form of aria with richer instrumental accompaniment. He is credited with five operas, six oratorios, including *S. Giovanni Battista* (pub. 1676), and sev. cantatas.

Stradivari, Antonio (? 1644-1737), one of the greatest makers of the violin, associated with Cremona. He was an apprentice under Nicolo Amati, and until 1684 devoted himself chiefly to small models in the Amati style. In 1690 he began making 'long Strads,' and finally, after 1700, he discarded the Amati style and pursued original lines. Two famous 'Strads' are the Boissier (formerly owned by Sarasate) and the 'Alard,' considered his masterpiece. He is famous also as a maker of violas and violoncellos. See life by Hill (new ed., 1909).

Strafford, Sir Thomas Wentworth, first Earl of (1593-1641), Eng. statesman, b. in London of an estab. Yorkshire co. family. He studied at St. John's College, Cambridge. He entered Parliament, and soon became prominent in the parl. opposition, strongly criticising the actions of Charles's ministers. He supported Eliot against Buckingham and was imprisoned for refusing to pay the forced loan. Wentworth was one of the instigators of the movement which resulted in the Petition of Right, though his views fell short of those expressed in the final draft, and in 1629 he went over to the king's party. He was concerned, not with the principles of government, but with its efficacy and efficiency, believing that Parliament should be essentially advisory, the king and his ministers being the effective executive. Therefore he considered that the prime need was for able royal ministers, and eagerly accepted the king's offer to make him one. He became president of the Council of the N., where he vigorously upheld the rights of the Crown. Charles, however, did not give him real support, and when Wentworth was made Lord Deputy of Ireland in 1633 the appointment was not so much a mark of favour as a royal way of removing an embarrassing enthusiast. By his policy of 'Thorough' Wentworth had in six years estab. the most efficient gov. Ireland had ever known.

Charles gave him his confidence only when it was too late. In 1639, after the first Bishops' war, he summoned Wentworth to him and created him Earl S. S. urged the king to summon Parliament, apparently hoping that national hatred of the Scots would persuade the opposition

to vote supplies. Perhaps his successful handling, cajolery, and bullying of the Irish Parliament, still in fact as well as in theory an advisory body, made him forget the real progress towards parl. sovereignty that had been made in England; nor did he realise the extent of Pym's hatred towards his former friend. In 1640 Pym moved S.'s impeachment, but it soon became clear that the impeachment could not succeed. He was then proceeded against by attainder. Charles was persuaded to sign the death warrant and S. was executed.

His character remains to some extent enigmatic, though, if his belief in good government is accepted, his actions can be proved throughout consistent. His contemporaries accused him of overwhelming ambition, yet this seems false, for had this been his prime motive he could have remained with Parliament and come to power as one of its leaders. He chose to be the servant of a king who consistently undermined his actions, who never liked him, and who only turned to him when he was in desperate straits. See lives by C. V. Wedgwood, 1935, and Lord Birkenhead, 1938. See also C. H. Firth, ed., *Papers Relating to Thomas Wentworth, first Earl of Strafford* (Camden Miscellany, vol. ix), 1890, and Gervase Holles (A. C. Wood, ed.), *Memorials of the Holles Family, 1493-1656*, 1937.

Strahan, seaport of Montague co., Tasmania, on Macquarie harbour, the outlet for the copper mine at Mt. Lyell. There is railway communication with Burnie, on the N. coast. Pop. 8500.

Strain and Stress. Strain is the change in size or shape or both of a body under the action of stress; stress is a set of forces in equilibrium maintaining a strain. Within certain limits the ratio stress to strain is a constant, called the modulus of elasticity. Stress is measured in force per unit area, strain has no dimensions. Stresses though composite in practice may be divided for theoretical purposes into two classes: normal stresses which tend to increase or decrease size without altering shape (as when a motor-tyre is inflated); tangential or shearing stresses, a 'couple,' which tends to change shape without changing size (as when a book is distorted by forcing the covers in opposite directions). Solids resist both these stresses, i.e. have high elasticity and rigidity; liquids offer great resistance to compression, but practically none to change of shape, i.e. have very low rigidity; gases have low elasticity and rigidity. In the case of a wire stretched under the action of a longitudinal stress the strain is compound, as the wire alters simultaneously in size and shape. In the equation

$p = q_L$, q is called Young's modulus, and has important practical applications; this constant depends on both the elasticity and rigidity of the given material. See also ELASTICITY; METALLURGY; SHEAR; STRENGTH OF MATERIALS.

Strait, narrow connecting passage, usually formed by land subsidence, between two seas or oceans.

Straits Settlements, general name before 1946 for the Brit. Crown Colony, which comprised Singapore, Penang, and Malacca in Malaya; Labuan, off the N. coast of Borneo; and Christmas Is. and the Cocos-Keeling Is. to the S. of Sumatra. All these ters. are situated in the E. Indies, on and off the Malay Peninsula. Far-reaching post-war political changes, announced in 1946, had for their purpose the simplification and reform of the system of gov. throughout Brit. Malaya (*q.v.*). Under these changes, which introduced a Malayan Union to embrace all Brit. Malaya (excepting Singapore for the time being), the pre-existing combination of the S. S. of Penang, Malacca, and Singapore in one political unit was readjusted so that the settlement of Singapore should be a separate colony under a separate governor, while the settlements of Penang and Malacca should be administered with the Malay States, also under a separate governor, in the new federation of Malayan Union. This change, as regards the S. S., was effected under the Straits Settlements (Repeal) Act, 1946.

Stralsund, seaport of Mecklenburg (Prussian prov. of Pomerania), Germany, on the Strela Sound, connected with the mainland, residential and industrial suburbs by bridges. The old tn. still preserves a medieval appearance, with narrow streets and gabled houses, fourteenth-century churches, and a tn. hall of the thirteenth to fifteenth centuries. The tn. was founded by Prince Jaromar I. of Rugen about 1209, and became an important member of the Hanseatic League. It withstood a siege by Wallenstein (1628) during the Thirty Years war. It was ceded to Sweden in 1648 and restored to Prussia in 1815. The tn. is an important trading centre. There are manufs. of chemicals and sugar, and engineering and shipbuilding. Pop. 43,600.

Stramonium, in pharmacology a drug obtained from the leaves and seeds of *Datura stramonium*, or jimson weed. It contains the alkaloids atropine and hyoscyamine. It is used as a substitute for belladonna in asthma, neuralgia, rheumatism, etc. The leaves are smoked in a pipe or in the form of cigarettes for asthma.

Strand, London thoroughfare running N.E. from Trafalgar Square to Fleet Street. It is first mentioned in the *Anglo-Saxon Chronicle* for 1052, and its name probably applied also to the present Fleet Street, forming a continuous thoroughfare parallel to the Thames.

'**Strand Magazine**,' pioneer Eng. monthly magazine of light popular literature, with copious illustrations, founded in Jan. 1891 by George (afterwards Sir George) Newnes, who from the start was the editor-in-chief. Later H. Greenhough Smith, who was acting editor until the death of Newnes, became sole editor, and remained for more than forty years. Early success was achieved by the *Adventures of Sherlock Holmes*, illustrated by Sidney Paget's imaginative likenesses of Holmes and Watson; while later numbers contained the humorous tales of W. W.

Jacobs, with their realistic studies of Thames river-side low life, the effectiveness of which was enhanced by the illustrations of Will Owen. It was to the S. M. that Kipling contributed *Puck of Pook's Hill* and H. G. Wells *The First Men in the Moon*, both works of higher literary craftsmanship than the usual run of popular magazine stories. Later interest was sustained by P. G. Wodehouse's immutable 'Jeeves' and the pleasant trifles of Denis Mackail. With the March 1950 issue the S. M. ceased pub. owing to the economic difficulties of the time. Its circulation at that time was 100,000.

Strand Theatre, in Aldwych, London, opened in 1905 as the Waldorf, Duse playing the lead in the first production, *The Second Mrs. Tanqueray*, by Sir Arthur Pinero. Its name was changed to Strand in 1909. Successful plays include *Anna Christie* (1923); *1066 and All That* (1935); and *Arsenic and Old Lace* (1942). There was an earlier theatre of the same name in the Strand from 1836 to 1905.

Strangles, see under HOARSE (DISEASES).

Strangulation, constriction of a part so as to arrest circulation of the blood. The commonest form is suffocation by constriction of the windpipe. In a case of death by S., all the evidences of asphyxia are present, and the marks of the strangulating agent are seen on the neck. *Strangulated hernia* is one in which the blood is prevented from circulating by the constriction of the neck of the sac. If not relieved by surgical interference the tumour swells and the bowel ultimately mortifies at the neck of the sac, with the result that the contents of the tumour are discharged into the abdominal cavity.

Stranraer, seaport and royal burgh of Wigtownshire, Scotland, on Loch Ryan, 8 m. N.E. of Port Patrick. Its chief building of interest is the old castle. Its large tidal harbour is used as the terminus of a cross-channel service with Ireland. It trades in dairy produce, and has oatmeal mills and nurseries. Pop. 8300.

Strasbourg, or **Strassburg** (Fr. *Strasbourg*), cap. of the dept. of Bas-Rhin, France, in Alsace-Lorraine, at the junction of the Ill and the Bruch, 2 m. W. of the Rhine, near its junction with the Rhine-Rhone and Rhine-Marne canals. It is a fortress of the first class, and is the seat of a Rom. Catholic bishop. The univ., founded in 1567, and suppressed from 1790 to 1872, has about 2700 students. Much of medieval S., which stood on an is. in the R. Ill, flowing northwards through the plain of Alsace to join the Rhine a little below the city, is still preserved. Angled with the medieval core are gracefully symmetrical buildings of the eighteenth century. The most interesting buildings are the cathedral (eleventh to fifteenth centuries), the church of St. Peter (twelfth to thirteenth century with an eleventh-century transept), the church of St. Thomas (thirteenth to fourteenth century), and the Gr. Renaissance Rathaus (1582-85). S. (Rom. *Argentoratum*) was the scene of a victory of Julian over the Alemanni (357). It became a flourishing

imperial tn., and numbered among its famous citizens Eckhart, Tauler, Gottfried von Strassburg, Sebastian Brant, and Thomas Murner. It was seized by France under Louis XIV. in 1681, but surrendered after siege to the Gers. in 1870. After the First World War it passed, with Alsace-Lorraine, to France, but was lost again to the Gers. on the Fr. collapse in 1940. In Nov. 1944 the Amer. Seventh Army crossed the N. Vosges to reach the Rhine at S., and on Nov. 24 advanced elements of the Fr. Armoured Div. were fighting in the streets of S. (see further under WESTERN FRONT IN SECOND WORLD WAR). There

STRASSBURG, CATHEDRAL FROM THE WEST

was severe structural damage both to the cathedral and to the eighteenth-century bishop's palace, but, generally speaking, the damage was of a repairable character. S. was selected as the headquarters for the Council of Europe in 1949. S. was important from ancient times as a communication centre. Once freed from the restricting circle of its fortifications, many industries were estab., including metals, machinery, motor vehicles, glass, paper, and tobacco. It is famed for its preserved foods, especially *pâté de foie gras*. Pop. 175,500. See B. Newman, *The Sisters. Alsace-Lorraine*. 1950.

Strassburg, Gottfried von, see GOTTFRIED. **Strasser, Gregor** (1892-1934), Ger. politician, b. at Geisenfeld in Upper Bavaria. He took part in Hitler's *putsch* of 1923. Later he organised the National Socialist party in the Reichstag. Until 1932 he was an important figure, but after that date, opposing, for example, Streicher's

anti-Semitism, he lost favour. S. was murdered in the 1934 purge.

Strasser, Otto (b. 1897), Ger. politician, b. at Windsheim. He joined his brother Gregor (see above) in the Nazi party and directed its Berlin publishing house from 1926 to 1930. He then founded the Black Front, suppressed when Hitler came to power in 1933. S. fled abroad, finally to America.

Strata Florida (*Ystradflur*), par. and vil. of Cardiganshire, Wales, N.E. of Tregaron. (The modern Welsh name is **Caron Uwch Clawdd**.) Near by are the ruins of a Cistercian abbey, one of the largest in Wales, near the source of the Teifi. It was founded in 1164, and suffered during the wars of Edward I. (1294). A W. portal in the transitional Norman-Eng. style (twelfth century) remains, and the foundations and some interesting tiles have been excavated.

Strategy and Tactics. MILITARY: By strategy is understood the art of planning a campaign in war; the attempt to gain advantage over an enemy before any actual conflict takes place. Success depends on correctly foreseeing the enemy's scheme, while arranging one's own plans in such a manner as may be unexpected by him. For such a purpose a thorough knowledge of the topography of the scene of war is of first importance. Climate and season are additionally factors of early importance. Beyond this, again, come all plans which aim at crippling the enemy resources, particularly in trade and commerce. Strategy, however, cannot be relied on to outweigh deficiency in numbers, or want of training, organisation, and equipment; it rather consists in the scientific use of these, and in our co-ordination of effort by land, sea, and air.

Tactics, while consisting often of strategy in miniature or well-defined conditions, is the term applied to the execution of plans, with variations as found immediately necessary, when actually in contact with the enemy. The lines of battle being drawn out, the operations until victory is won or defeat sustained are tactical, then again merge into strategy until actual conflict once more ensues. It is obvious that tactics are mainly a matter of the study of contact in its fullest sense. Whereas strategy has in many ways remained the same throughout hist., tactics have been modified by the introduction of every new tool, arm, method of fortification, etc. Under the head of tactics must also be considered the arrangement of the attacking army in marching before contact with the enemy, the disposition of forces in the field, the securing of controlling positions, entrenching, taking cover, the keeping of reserves, the order in which detachments enter into conflict, the setting in motion of large or small flanking movements.

An important tactical innovation was the successful opposition to the charge of the armoured and mounted knights by the Flemings in the Middle Ages. Archers and pikemen were so employed against the Eng. cavalry by the Scottish at the battle of Bannockburn, with disastrous results

to the cavalry, who, however, having learnt the lesson, employed it against the Fr. in the Hundred Years war with equal success. The use of gunpowder produced a much slower change in tactics, but of like nature. The introduction of the rifle and its perfected bullet made precision in aim surer and range greater; artillery has served the same end, and machine guns have further made a more open formation necessary. The rapid and sure means of communication and means of transport have kept pace with these changes, so that a battle front may now extend over many miles.

Warfare has grown so complex that in the Brit. Field Service Regulations issued since the First World War a set of general principles has been laid down for the guidance of officers; they are: (i.) *Maintenance of the objective*, the destruction of the enemy's main forces on the battlefield, is the governing consideration which must always be kept in view. (ii.) *Offensive action* alone can bring victory. (iii.) *Surprise*, strategical, tactical, or in the employment of material, is the most effective and powerful weapon in war; whether in attack or defence, the first thought of a commander must be to outwit his adversary. (iv.) *Concentration* of superior force, moral and material, at the decisive time and place, and its resolute employment in the battle are essential for the achievement of success. (v.) *Economy of force*: to economise strength while compelling a dissipation of that of the enemy must be the constant aim of every commander. (vi.) *Security*: the security of a force and of its communications is the first responsibility of a commander. To guard against surprise; to prevent the enemy from obtaining information; to dispose his covering troops so as to allow his main forces to move and rest undisturbed—these are the considerations which must govern his actions in attack and defence. (vii.) *Mobility* implies the power to manoeuvre and act with rapidity, and is the chief means of effecting surprise. (viii.) *Co-operation*: only by effective co-operation can the component parts of any force develop fully their inherent power. All leaders down to those of the smallest units must endeavour to apply, at all stages of a fight, this principle of mutual support. These principles are for guidance only and must be modified as circumstances dictate. Very few tacticians concur on the application of principles to particular campaigns or operations, but those given above have been formulated after careful study, and may be accepted without much qualification.

Some Second World War Developments.

—The conception formed in the First World War that artillery barrage fire is essential to prepare the way for advancing assault troops still holds good, but its function is more usually to smother the enemy forward infantry while the attacking sappers clear a gap for the armour through the minefields. The tank attack which drives on through one or more such gaps followed by motorised infantry must proceed on the assumption that there is no additional

artillery fire-screen far in the rear; all available field artillery will be needed to keep open, and if possible widen the shoulders of the original breach.

The Second World War showed, especially on the E. front, a considerable development of 'pincer' attacks, designed to envelop the objective from both flanks simultaneously, in complete contrast to the frontal offensive. The form of double envelopment usually employed was one which provided for a special disposition of formations for assault within and behind its own wings, which by supposition have already engaged the enemy. The forces detailed to carry out the pincer attack move behind their own wings and, at the opportune moment, move in an oblique direction, thereby possibly securing more protection against air detection. Resistance is necessarily strongest at the moment when the deeply echeloned pincers have half encircled their victim and are closing in. Co-operation between all divs. along the attacking front is essential, for in no circumstances may the divs. facing the enemy front stand by inactive while their own outflanking pincers are pressing on, and, although their movements are of secondary importance, the frontal attack, or at least its simulation, obviously becomes of the greatest importance in the final stage of the operation when the encircled enemy is unable to extricate his divs. from the claws of the pincers. This was illustrated at the battle of Stalingrad when von Paulus's Sixth Ger. Army was eliminated, and by many other, if less spectacular, enveloping operations for by-passing 'hedgehogs' on the Russian front.

The failure of the Ger. Army before the defences of Moscow in Nov.-Dec. 1941 demonstrates the flaws in the Ger. strategy so successfully exploited in the previous months in White Russia. When the break-in N. and S. came short of their objectives the Ger. high command hoped that by shortening the front of attack they would make up for their lack of forces in depth. The modern conditions of increased mechanisation and fire-power require that the attacking force should be echeloned in much greater depth before the attack is opened, and not only must the attacking commander have ample formations at his disposal, but they must pierce to the rear of the defensive lines in the quickest possible time. It will not suffice merely to pierce the defensive zone by an attack of attrition, the attack must be launched regardless of loss, and carried through at top speed. Even if the attacking commander does reach the rear of the adversary's zone after a struggle of tanks and anti-tank guns, his armour will not necessarily be able to exploit the 'break-through' by the method of 'fanning out'; for exhaustion may compel them to halt just when dynamic exploitation may be vital to future operations. These considerations emphasise, too, the fact that reconnaissance, before and during an offensive, is still as important as ever in strategy.

Critics of post-war Amer. strategy

doubt whether the policy of bases stretched out to vast distances was in fact the wisest from the Amer. point of view, because communications, whether by air, sea, rail, or road, consume manpower and resources of all kinds. They are especially critical of distant bases in the Pacific; for bases in the W. Pacific, without large garrisons and large mobile forces, will be a source of strategic weakness rather than of strength.

Strategic bombing also has its critics. Some argue that bombardment not followed by assault must involve a great waste of energy and resources. Heavy damage may be done to production, but owing to the inaccuracy of strategic bombing, it is considered by some to be the most wasteful of all forms of attack. Finally, these critics contend that of all methods of waging war this is the one least well adapted to achieve the object of war, which is peace (see further under AERIAL WARFARE).

NAVAL: Naval strategy is governed by the same principles of war as those described in the preceding section. Its aim is the manipulation of naval forces for the control of sea lanes and the denial of those lanes to the enemy. Tactics, on the other hand, is the art of disposing and handling forces in contact with the enemy, but in these days of long-range missiles and aircraft, the border line between the two is often imperceptible. This fundamental aim of maritime warfare, the protection of sea communications, may appear essentially defensive, but its implementation requires an offensive strategy, because the surest way of affording protection is by the destruction of the menace that threatens, for example, the enemy fleet and its auxiliaries. So Brit. naval strategy has always aimed at bringing enemy ships to action at every opportunity. One way of achieving this was by the imposition of blockade which might force an enemy fleet to give battle so as to free the restrictions imposed. In the old days it was possible to establish a close blockade off enemy coasts, but in view of the air and submarine menace that is no longer possible. So close blockade was first abandoned for open blockade by the Brit. Navy during the First World War, and Brit. indignation over the fact that, in consequence, the enemy did not sully forth to enable the R.N. to fight a fleet action was only equalled by Ger. fury that Brit. ships were not placed off their coasts where they could be attacked by superior forces. But, though blockade failed to bring the enemy fleet to action, it was an important feature of naval strategy in the economic war.

Convoy is another form of naval strategy. Not only does it enable the maximum protection to be afforded to merchant shipping, but it also provides the best opportunities for offensive action against enemy submarines. More U-boats in both world wars were destroyed by ships escorting or operating with convoys than under any other circumstances. It also offers a bait to other enemy naval forces (though this is not always desired), and might well result in a decisive fleet action.

Attack at source by means of aircraft or long-range missiles is now a surer and more feasible operation than it used to be, and one of the most outstanding examples of this in the Second World War was the fleet air arm attack on the It. fleet at Taranto on Nov. 11, 1940.

Without adequate and well-positioned bases, however, no naval strategy is possible. They are essential for the exercise of sea and air power. With the development of air power absolute command of the seas is no longer possible, so naval strategy to-day aims at gaining zones of maritime supremacy. As already pointed out, a tactical situation may now develop long before surface forces are in sight of one another; but the aim of a commander seeking battle is, whenever possible, to interpose his force between the enemy and his base, take advantage of the light and the wind, and bring maximum fire-power to bear from more than one direction, while being in a position easily to manoeuvre his ships to comb enemy torpedo tracks. Before the advent of the aeroplane in naval warfare, ships would aim to deploy in a long column at right angles to the bearing of the enemy when sighted, but to-day consideration in the formation and disposition of ships must be given to repelling air attack while possibly engaging a surface enemy force. Ships, too, may be further apart than formerly, thus making it uneconomical for an enemy to use atom bombs and more difficult for other aircraft to attack with success. But a balance has to be drawn, for the further ships are apart, the less the effectiveness of any anti-submarine screen they may have.

Stratford: 1. Suburb of London in the co. bor. of W. Ham, Essex, England, 4 m. E.N.E. of St. Paul's. It has light and heavy industries, particularly chemical works, manufs. of soap, printing inks, varnish and paint, and railway machine shops and depot. 2. Cap. and port of entry of Perth co., Ontario, Canada, on six lines of the Canadian National Railway, which has repair shops here. Furniture is made in large quantities. Other products are electrical appliances, machinery, knitted goods, and felt boots. 3. Tn. of Taranaki prov., N. Is., New Zealand, 25 m. S.E. of New Plymouth, on the main railway line to Wellington, and the junction for Auckland. Pop. 4100. 4. Tn. of Fairfield co., Connecticut, U.S.A., 5 m. N.E. of Bridgeport. Pop. 22,600.

1490 by Sir Hugh Clopton, lord mayor of London. The tn. is famous as the bp. of Shakespeare, and is visited every year by travellers from all parts of the world. Here may be seen the reputed bp. of the poet in Henley Street, purchased for the nation in 1847 for £3000. Anne Hathaway's cottage, 1 m. from the centre of the tn.; the graves of the poet and his wife in the church of Holy Trinity; 'The Cage,' which was for thirty-six years the home of Judith, Shakespeare's younger daughter wife of Thomas Quiney, vintner; Hall's Croft, old-timbered residence of Susanna, the poet's elder daughter, who married Dr. John Hall, his executor, Wilmcote, the house of Shakespeare's mother, Mary Arden, a fine timbered manor house of the Tudor period; and

Ernest Daniels

THE SHAKESPEARE MEMORIAL THEATRE, STRATFORD-ON-AVON

Stratford de Redcliffe, Stratford Canning, first Viscount (1786-1880), Eng. diplomat, b. in London, educated at Eton and King's College, Cambridge. Through the good offices of his cousin, George Canning, he became secretary of the embassy at Constantinople in 1808, and minister plenipotentiary in 1810. He exercised great skill in negotiating the treaty of Bucharest between Russia and Turkey in 1812. After service in Switzerland (1814-20), where he settled the problems of federal gov., he became minister to the U.S.A. (1820-24). He was envoy to St. Petersburg (1824), and to Constantinople (1825), and later entered Parliament. He was at Constantinople again in 1842 as ambas., and remained there throughout the Crimean war, largely influencing the political reforms and foreign relations of Turkey and earning for himself the title of 'The Great Elchi' (great ambas.). His papers, etc., were pub., with preface by A. P. Stanley, under the title of *The Eastern Question* (1881).

Stratford-on-Avon, municipal bor. and mkt. tn. of Warwickshire, England, 22 m. S.S.E. of Birmingham, pleasantly situated in the wooded valley of the Avon. The riv. is crossed by a fine bridge, erected in

King Edward VI. grammar school, founded c. 1429 by Rev. Thomas Jolyffe M.A., of Stratford, and re-endowed by Edward VI. The Shakespeare Memorial, mainly due to the munificence of C. E. Flower (1830-92) and his wife, comprises a library with 10,000 vols. of Shakespeare ed., and dramatic literature, and a gallery of pictures, including the 'Droeshout' portrait. The Memorial Library and Reading Room are available for use by accredited students. The red-brick Shakespeare Memorial Theatre (1877-79), where performances of his plays were given annually, was destroyed by fire in 1926; the festival plays were performed in a temporary theatre until the completion in 1932 of the new memorial theatre, the architect of which was Elizabeth Scott. The art gallery and museum, containing pictures and exhibits illustrative of the hist. of the theatre and of Shakespeare's production, adjoins the memorial theatre building in Waterside. S. is a place of great antiquity. The chapel of the guild of the Holy Cross dates from the thirteenth century. Holy Trinity church occupies the site of a Saxon monastery, and dates from the thirteenth century. The tn. hall, first erected 1633, was

rebuilt in 1768. Here are complete records of the sequence of bailiffs, mayors, and tn. clerks from 1553 (including the poet's father, John Shakespeare), and of high stewards from 1610. Alveston was, in 1924, incorporated in the bor. The tn. trades in cattle and agric. produce; 4 m. E. of the tn. Charlecote Park and its sixteenth-century house were acquired by the National Trust in 1945. See W. S. Brassington, *Shakespeare's Homeland*, 1913; J. H. Bloom, *Medieval Stratford*, 1915; H. E. Forest, *The Old Houses of Stratford*, 1925; E. I. Fripps, *Shakespeare's Stratford*, 1928; M. C. Day and J. C. Trewin, *The Shakespeare Memorial Theatre*, 1932; J. C. Trewin, *The Story of Stratford-upon-Avon*, 1950; and A. Burgess, *Warwickshire*, 1950.

Strathalbyn, tn. of Hindmarsh co., S. Australia, 35 m. S.E. of Adelaide, on the R. Angas, and the railway to Port Elliot, in the S. Mt. Lofty Ranges. It is one of the beauty spots of the state, and is the centre of a rich dairying dist. Pop. 1200.

Strathaven (Strathavon), mrkt. tn. and holiday resort of S. Lanarkshire, Scotland, on Avon Water, 11 m. S.E. of Glasgow. It has a ruined fifteenth-century castle. Manufs. include silk: this industry has revived in recent years. In the Middle Ages S.'s silk was very famous, and the tn. had considerable importance. Grain and cheese are also produced. Pop. 5900.

Strathclyde, kingdom formed by Brit. folk fleeing from the Angles, c. 560, and covering the W. part of the lowlands of Scotland, Westmorland, and the greater part of Cumberland. Its cap. was Alclyde, the rock fortress at Dumbarton. It came from time to time under Northumbrian influence, but preserved its Brit. outlook until in 924 it submitted to Edward the Elder.

Strathcona and Mount Royal, Donald Alexander Smith, first Baron (1820-1914), Canadian politician, b. at Archibaldtown, Morayshire, Scotland, emigrated to Canada, and entered the Hudson's Bay Company's service in 1838. He introduced potato-growing into Labrador, where he was stationed. In 1869 he was governor of the company's ter., and in 1871 became chief commissioner of the N.W. S. was special commissioner during the Riel rebellion in the Red River Settlements. He was a member of the first Executive Council of the N.W. Ter., represented Winnipeg and St. John's in Manitoba legislature (1871-84), was M.P. for Selkirk in the Dominion House of Commons (1871-72, 1874, and 1878), and for Montreal W. (1877-96). He was largely instrumental in forming the Canadian Pacific. S. was made K.C.M.G. (1886); G.C.M.G. (1896); and was ennobled in 1897. From 1896 until his death he was high commissioner for Canada in Britain. At his own expense he raised a troop of 600 men (Strathcona's Horse) who served gallantly in the S. African war.

Strathmore and Kinghorne, Earl of, Scottish title held by the Lyon family, the Strathmore barony since 1445, and the earldom of Kinghorne since 1606. John, the ninth earl (1737-76), took the addi-

tional name of Bowes. Lady Elizabeth (Angela Marguerite), daughter of Claude George (1855-1944), the fourteenth earl, married Prince Albert, duke of York, in 1923, and in 1936 became queen consort when he succeeded to the throne as George VI. on Dec. 11. The family seat is Glamis Castle, Angus.

Strathmore, wide valley of Scotland, bounded on the N. by the Grampians, and on the S. by the Lennox, Ochil, and Sidlaw Hills.

Strathpeffer, vil. and spa of Ross and Cromarty, Scotland, 4½ m. W. of Dingwall. It has mineral springs. Pop. 1000.

Strathspey, Highland dance derived from the reel, and associated with the Spey valley ('strath'), where it is believed to have originated.

Stratigraphy, study of strata, see under GEOLOGY, *Historical Geology*.

Stratocumulus, see under CLOUD.

Stratosphere. Normally the temp. of the atmosphere decreases with height, although there may be, depending on the prevailing weather conditions, intervals where the temp. does not change (isothermal) or even increases with height (an inversion). Above some level, known as the tropopause, the isothermal or inversion condition becomes the normal state, this region being known as the S. The region below the tropopause is called the troposphere, and the average decrease or 'lapse' of temp. varies from 1½-2 °C./1000 ft. near the surface to 3 °C./1000 ft. near the tropopause. The tropopause varies in height from about 12 m. in equatorial air to about 5 m. in arctic or antartic air, so that the tropopause (and therefore at least the lower part of the S.) has an approximate temp. varying from 80° C. near the equator to 40° C. in summer and 60° C. in winter near the poles.

The cause of these temps. and the sudden change in lapse rate at the tropopause is not yet completely understood. Because it is nearly isothermal vertically the S. is very stable and convection does not occur; only by quasi-horizontal mixing can homogeneity with the troposphere be maintained. For this reason flying conditions in the S. are usually very smooth, there being no cloud and no danger of icing because of the dryness. The S. consists of approximately the same gases as the troposphere (mainly oxygen and nitrogen), but the quantities of both ozone and water vapour are variable. Very few reliable measurements of water vapour have been made in the S. since the only successful instrument at low temps., the Dobson-Brewer frost-point hygrometer (see HYGROMETER), has to be carried by aircraft, the first measurements being made in 1943: it was then thought that the S. was exceptionally dry with a sudden drop in vapour content at the tropopause, but it has recently been shown that there are also occasions when the vapour content does not drop suddenly. The presence of ozone in the S. has not yet been explained but it is believed that the action of ultra-violet light from the sun upon oxygen at high levels in the S. forms the three-oxygen-atom molecule of ozone which

diffuses slowly to lower levels, the maximum quantity being found between 12 and 20 m. Little is known of the S. at high levels, although there have been Amer. observations using V2 rockets; these, together with sound-ranging experiments, give estimates of temp. which show a maximum at about 30 m. of 45–50° C., and a minimum at 50 m. of about –70° C., but very variable, probably as much as 25–30° C. change in a day, and 40° C. difference between summer and winter. Prof. S. Chapin, in the *Philosophical Magazine* (Series 7, vol. x., 1930, p. 345) attributes these high temps. to the presence above the ozone layers of one-atom molecules of oxygen which can absorb radiation from the sun, and thus increase in temp. At very high levels (60 m.) the temp. is believed to vary by as much as 100° C. during the day. In the S. winds are mainly westerly, particularly in the lowest levels where 100 m.p.h. is not uncommon, and 200 m.p.h. has been exceeded. Since the temp. varies widely the winds also vary widely. Over S.E. England, at 100,000 ft., the highest level at which winds have been directly measured, R. J. Murgatroyd and C. J. B. Clews found the winds to vary from moderate westerly in winter to light easterly in summer. See also METEOROLOGY. See B. Haurwitz, *The Physical State of the Upper Atmosphere* (reprinted, with addition, from *Journal of the Royal Astronomical Society of Canada*), Toronto, 1941; R. J. Murgatroyd and C. J. B. Clews, 'Wind at 100,000 feet over South-east England', *Geophysical Memoirs*, vol. x., No. 83, H.M.S.O., 1949, and 'Meteorological Office Discussion: Rocket-sondes', in *Meteorological Magazine*, vol. lxxviii., March 1949, p. 69.

Stratton, urb. dist. (with Bude), and mkt. tn. of N.W. Cornwall, England, 1½ m. E. of Bude, a favourite summer resort. Pop. (estimated) with Bude 5100.

Stratum, see under GEOLOGY.

Stratus, see under CLOUD.

Strauss, Johann (the elder) (1804–49). Austrian dance-composer, b. in Vienna. He founded his own orchestra in 1825, with which he became famous abroad. He composed waltzes, marches, quadrilles, polkas, etc. See lives by R. Kleinecke, 1894, and F. Lange, J. Lanner, and J. Strauss (2nd ed.), 1919.

Strauss, Johann (the younger) (1825–1899), Austrian composer, b. in Vienna, son and pupil of the above. From 1849 he led his father's orchestra, giving it up in 1863 to his brothers Joseph and Eduard, to concentrate on composition. He achieved great popularity, and the name of the 'waltz king,' by his romanticist talent, gift for melody and rhythm, and delicate instrumental technique. *The Blue Danube* is perhaps the most famous of his 400 waltzes. His light operas include *Indigo* (1871); *Die Fledermaus* (1874); *A Night in Venice* (1883); and *The Gypsy Baron* (1885). He also composed polkas, galops, and other dances, etc. See lives and studies by F. Lange, 1912; R. von Procházka (5th ed.), 1913; L. Schnitzer, 1920; E. Decsey, 1922; S. Lowy, 1925; K.

Kobald, 1925; H. E. Jacob, 1937; and W. Jaspert, 1939. See also Adele Strauss, *Johann Strauss schreibt Briefe*, 1926.

Strauss, Richard (1864–1949), Ger. composer, b. at Munich. He studied under Meyer at Munich, and at twenty-one was appointed assistant conductor to Bulow at Meiningen. Here he met Alexander Ritter, who married Wagner's niece and who won him over from the 'absolute' and classical ideals and style in which S.'s earliest works were composed. S. came to be chiefly associated with the symphonic tone-poem, examples of which are his *Don Juan* (1889) and *Till Eulenspiegel* (1895), these two being usually considered the greatest; *Thus Spake Zarathustra* (1896); *A Hero's Life* (1899), and the *Alpine Symphony* (1923). His chamber music, songs, and pianoforte works are also well known to a limited public, while in contrast his musical comedy *Der Rosenkavalier* (1911) achieved a wide popular fame. S. also did important work in the operatic sphere, and his *Ariadne in Naxos* (1912, and rearranged 1917) is highly regarded. The 'orchestral operas' *Feuersnot*, *Salome*, and *Elektra* contain examples of S.'s realism. S. was a natural and fertile musician, a master of orchestration, and a composer able to build gorgeous works, colourful, and rhythmic, out of simple thematic material. Beginning as a romantic, and ending as a classic, he was always a humanist, and the last of the great Ger. composers in that line. His latest works include *Arabella* (1933); *Die Schweigsame Frau* (1935); *Daphne* (1938); *Friedenstag* (1938); *Die Liebe der Danae* (1940); *Capriccio* (1942); *Metamorphosen* (1945); and the charming oboe concerto (1945). See lives and studies by O. Bie, 1906; E. Newman, 1908; M. Steinitzer, 1911; H. T. Finck, 1917; R. Specht, 1921; T. Archer, 1938; J. Gregor, 1939; H. Tenschert, 1944, 1945; W. Schuh, 1947; and H. Ehinger, 1947.

Stravinsky, Igor (b. 1882), Russian composer, b. at Oranienbaum, near St. Petersburg. In 1907 he became a pupil of Rimsky-Korsakov. His first composition, a symphony, entirely academic, and his second, a suite of songs called *Le Faune et la bergère*, were performed in 1908. After the death of his master, a new stimulus came from Diaghilev, who produced S.'s ballet *The Firebird* in 1910, his first masterpiece. The ballet *Petrushka* (1911) showed a polytonal effect, but *Le Sacre du printemps* (1913) created new musical values of revolutionary significance. Later works, based on Russian folk songs, included suites and a cantata, *Les Noces* (1923), and *Histoire du soldat* (1918). After the First World War S.'s work shows a new austerity, as in the suite *Pulcinella* (1920), and the one-act opera buffa *Mavra* (1921–22). From 1923 he turned to absolute music in the classical manner as in *Octet* for wind instruments (1923), the oratorio *Oedipus Rex* (1927), and the ballet suite *Apollon Musagètes* (1928), written in America. *Le Baiser de la fée* (1928) and *Capriccio* (1929) filled old forms with new ideas. The *Symphony of Psalms* (1930) expressed a religious aspect of his

later period. A movement towards definite classicism was made in the symphony in C. From 1940 S. settled in the U.S.A. (he became an Amer. citizen in 1945) and in 1942 presented *Dances concertantes*. Later works include *Scènes de Ballet*, 1944, and a symphony in three movements, 1945. S.'s experiments have had a great effect upon contemporaries, and more than any other composer he mirrors in his work the development of modern music. He pub. an autobiography, *About My Life*, in 1936. See studies by H. de Schloezer, 1929; H. Fleischer, 1931; G. F. Malpiero, 1912; and E. W. White, 1947.

Straw, stalk or stem of various corn crops such as wheat, barley, oats, rye, maize, leguminous crops, and also flax and hemp.

Strawberry, fruit, or, more correctly, cluster of achenes surrounding the juicy receptacle, of various species of the genus *Fragaria* (family Rosaceae). The fruit of the wood S. (*F. vesca*), the only Brit. species, is small but very delicately flavoured. The hantuboy S. sometimes grows wild, but is a garden escape. From it and the Chile S. (*F. chiloensis*) and scarlet S. (*F. virginiana*) the cultivated varieties are mostly derived.

Streatham, residential suburb in the metropolitan bor. of Wandsworth and co. of London, 6 m. from St. Paul's. It was once a spa noted for medicinal springs that were the resort of rank and fashion at the beginning of the eighteenth century. It has a fine common of 60 ac. The site of Thrale Park where Johnson used to visit is in S. Park, but its family mansions in large gardens have been replaced by the amenities of modern community life. S. contains the Brit. Home for Incurables (1894) and a Magdalen hospital. The par. church registers go back to 1538 inclusive, but the first historical mention of S. is the record of a joint deed of gift made in A.D. 675 by which Chertsey Abbey was endowed with lands at 'Toting cum Stretham.'

Streator, city of LaSalle co., Illinois, U.S.A., on Vermilion R., 50 m. N.E. of Peoria. It is a railway and agric. centre, and has important manufs. and coal mines. Pop. 16,000.

Street, tn. and urb. dist of Somersetshire, England, near to Glastonbury. Shoes and leather board are made. Pop. 3500.

Street-cars, see TRAMWAYS.

Streicher, Julius (1891-1946), Ger. politician, b. at Fleinhausen. After the first World War he began a violent anti-Semitic and nationalistic movement at Nuremberg. His insignificant party of 'Ger. Socialists' then got into contact with Hitler's National Socialists at Munich, and from 1922 S. and Hitler became firm friends. After Hitler was released from Landsberg prison he made S. Gauleiter at Nuremberg. He founded a special weekly paper for 'the struggle for truth against

traitors' entitled *Der Stürmer*, at first, concerned mainly with scandal and gossip, but soon specialising in Jew baiting. After Hitler's triumph in 1933 S. was able to fill the role of tyrant. The views of the *Stürmer* soon prevailed throughout Germany, and when Hitler decided on boycotting Jewish shops S. was made Aktionsführer (riot leader). Later he became governor of Franconia. S. was sentenced to death at the Nuremberg trial (q.v.) and executed.

Strelitzia, genus of Musaceae which occurs exclusively in Africa, and contains only five species. *S. reginae* is known as the queen's-flower, bird's-tongue flower, or bird-of-paradise flower, because of its showy orange and blue colours.

Streltsi, or **Streltsy**, see RUSSIA. History.

Stremonius, St., see AUSTREMOINE.

Strength of Materials. Substances used for building purposes, such as wood, metal, etc., have a certain limit of resistance, and yield to stresses and strains of various kinds. The study of this limit falls under the above head. The amount of stress and strain that a substance will withstand before it breaks can only be determined by elaborate experiments on that substance with specially designed apparatus. Before making a structure it is necessary to know the kind and amount of stress to be laid on it. This known, the engineer must use material of sufficient strength and of suitable size and shape to resist this stress. There are four strains which a material may undergo, namely: (1) extension; (2) bending; (3) twisting; (4) compression. Whatever combination of these strains there may be there are really only three resistances called into play, namely: (1) the tenacity of the substance, i.e. the resistance to extension; (2) the resistance to shearing strain (see ELASTICITY); and (3) the resistance to compression or crushing. For many substances (1) and (3) are the same, but for others, notably cast iron, the resistance to crushing is much greater than the tenacity. For engineering purposes the different strengths are classified under the following heads: (1) tenacity; (2) resistance to bending; (3) resistance to twist; and (4) resistance to thrust, i.e. resistance to a pressure applied at both ends. This is really a combination of a resistance to bending and a resistance to compression.

Streptocarpus, genus of Gesneriaceae, found in Africa. It contains thirty species, usually known as Cape primroses, which are downy herbs, bearing beautiful flowers generally of a purple or blue colour.

Streptococci, see BACTERIA.

Streptomycin, see under PENICILLIN and TUBERCULOSIS.

Stresa, vil. and health resort in Novara, Italy, on the W. shore of Lake Maggiore, and on the Simplon Railway, 75 m. N.E. of Turin. S. was the scene of two international conferences. (1) In Sept. 1932, a conference of fifteen European states to discuss the economic and financial recovery of central and E. Europe; (2) In April 1935. See EUROPE (HISTORY), *Stresa Conference*.

Stresemann, Gustav (1878-1929). Ger. statesman; *b.* in Berlin, of a family of brewers with Liberal traditions in politics. He attended the Andreas Realschule and Leipzig Univ. At twenty-four he founded the Union of Saxon Industrialists, an association of the smaller textile manufacturers. At twenty-eight, as a National Liberal, he entered Parliament; and, until his death, he was out of it only for a brief period, 1913-14, when he travelled. During the First World War he was an annexationist. In 1917 S. became leader of the National Liberals. After the revolution of 1918 he led a section that became the Ger. People's party. Though a monarchist, in Aug. 1923 he became chancellor of the republic, being later succeeded by Wilhelm Marx. He was foreign minister in various govts. until his death. In 1925, for the satisfaction of France, S. proposed a security pact, which was made at Locarno in Oct. At the general election of 1924, his old allies the Nationalists having opposed the Locarno pact, he came out as a supporter of the republic. In March 1926 he was at Geneva, expecting that Germany would be admitted into, and also be put on the Council of, the League of Nations. He was there again in Sept., when that end was achieved. He made Germany the first great power to adopt The Hague Statute's 'optional clause' for universal arbitration, and accepted the Amer. proposals to outlaw war. S. shared the Nobel peace prize with Brandt in 1926. The main object of his policy in the last three years of his life was to secure the evacuation of the Rhineland in return for Ger. acceptance of a reparations settlement, and this was the central theme of his discussion with Brandt at Thoiry. He lived to see his plans brought to a successful issue at The Hague in 1929. But as regards the E. European question S. had no plan for the final adjustment of Ger.-Polish relations. His essays and speeches were pub. in Engl. trans. by C. R. Turner (1930), and his diaries, letters, and papers, ed. and trans. by E. Sutton, 3 vols. (1940); see also Baron von Rheinbaben, *Stresemann*, 1929; R. Olden, *Stresemann*, 1930; and W. Gorch, *Gustav Stresemann*, 1947.

Stress, see STRAIN.

Stretchers, see BRICKWORK.

Stretford, municipal and parl. bor. of Lancashire, England, 2 m. S.W. from Manchester. S. lies in the heart of the industrial N., and has a large part of the great industrial estate of Trafford Park within its boundaries. The tn. is served by the Bridgewater and Manchester Ship Canals. Trafford Park was the ancestral home of the de Trafford family for nearly a thousand years, tradition claiming that the family was settled there in the reign of Canute. In the Middle Ages weaving and papermaking were carried on in S., and in the eighteenth century pig-killing was a well-estab. local trade, earning the dist. the name of Porkhampton. In 1933 S. was made a municipal bor. by the grant of a royal charter. At Old Trafford are situated the headquarters of the Lancashire Cricket Club. In 1896 Trafford

Park Estates Ltd. was formed to undertake industrial development, and to-day, with its position on the Manchester Ship Canal, the area has become one of the greatest industrial estates in the world. It contains 200 factories, and among its many industries are numbered those of electrical, mechanical, automobile, and sanitary engineering, farm machinery, metal casting, brass founding, food manufs., lead mills, gear works, timber yards, saw-mills, chemical works, die-casting, printing, flour milling, sheet metal works, ship repairing and building, abattoirs, bacon and gut manufs., and asbestos works. Pop. 61,500.

Stretto, see FURGE.

Strickland, Agnes (1796-1874). Eng. historian, *b.* near Southwold, Suffolk. She wrote in 1833 *Historical Tales of Illustrious British Children*, and also for the young, *Tales and Stories from History* (1836). Her best-known and more famous work, written in collaboration with her sister Elizabeth, is the *Lives of the Queens of England* (1840-48, from which was derived *The Life of Queen Elizabeth*, Everyman's Library, 1906); followed, amongst others, by *Lives of the Queens of Scotland and English Princesses connected with the Royal Succession of Great Britain* (1850-1859) and *Lives of the Last Four Stuart Princesses* (1872).

Stricture, narrowing of a canal in the body by inflammatory or other changes in its walls. The term is most commonly used of urethral S., caused by ulceration due to gonorrhoeal infection. The S. should be kept open by occasionally passing a bougie into the channel. S. of the oesophagus can be treated by dilatation with a bougie unless it is due to malignant ulceration, when food must be administered *per rectum* or directly into the stomach. Malignant S. of the intestines is met by short-circuiting or by cutting out the affected portion.

Strigidae, see OWLS.

Strike, General The (1926), 'sympathetic' strike by the trade unions of Great Britain undertaken in support of the Miners' Federation in their dispute with the coal-owners. In consequence of the obviously unsound condition of the coal-mining industry the gov. had in 1925 granted the owners a year's subsidy to enable them to carry on without insisting upon a reduction in miners' wages, at the same time setting up a commission under the chairmanship of Sir Herbert (later Viscount) Samuel to inquire into the state of the industry. The commission recommended (March 6) that a scheme of reorganisation of the industry be put into operation as soon as practicable. The gov. subsidy was due to expire in May 1926, and the owners posted notices of this and of their intention not to continue to employ the miners thereafter except at lower rates, but they made no definite proposals until after the expiry of the notices, and then did not include any plans for substantial reorganisation. In consequence the T.U.C. called a conference of its constituent unions and reported that it could see no alternative

to a general sympathetic strike as a means of furthering the miners' cause. The executives resolved that a strike be called as from midnight May 3-4.

The vast majority of the organised workers ceased work, though the essential services were partially carried on by volunteers acting upon plans outlined by the gov. In the light of the experience of the miners' strike of 1919 and the railway strike of 1920. There was a general absence of disorder, and no concerted attempt to effect a political coup. In the absence of newspapers, the gov. took control of the radio, and issued a journal of its own, the *British Gazette*, whilst the T.U.C. pub. the *British Worker*. Sir H. Samuel was invited by a negotiating committee (which included miners' representatives) to interpret certain parts of the report of his commission and to act as mediator. The Samuel memorandum was prepared as a basis of settlement and accepted by the T.U.C. in the belief that it would be acceptable to the gov., but when it was presented to the executive of the Miners' Federation they refused its terms, notwithstanding that it had the backing of their own representatives on the negotiating committee. The T.U.C. feeling that the other unions had gone as far as they could in supporting the miners, advised the executives of its constituent bodies to call the strike off, and it ended inconclusively on May 13.

The legality or illegality of the G. S. was widely discussed, and Sir John Simon in particular put forward a closely reasoned argument for its illegality. This view found no general support amongst lawyers and the fact that it was considered necessary to make sympathetic strikes illegal by the Trade Disputes Act (*q.v.*) (repealed by the Labour Gov. in 1946) appears to afford evidence that the G. S. was not contrary to law. The G. S. involved over 2,000,000 employed persons, and caused the loss of about 162,000,000 working days.

Strikes and Lock-outs. A strike is defined as the cessation of work by employed persons acting together or their refusal to continue work in order to compel their employer(s), or to aid other employed persons to compel their employer(s), to accept or not to accept terms or conditions of or affecting their employment. A lock-out is the refusal of an employer, by means of closing the place of employment, to continue to employ persons normally employed by him in order to compel them, or to aid other employers to compel persons employed by them, to accept terms or conditions of or affecting their employment. A strike or lock-out is a legal act as part of a trade dispute within the Trade Disputes Act, 1906, i.e. a dispute between employers and workmen or between workmen and workmen connected with the employment or non-employment of particular persons or with terms and conditions of employment. The average number of stoppages due to S. and L. each year was 859 for the years 1918-26, 903 for 1927-45, and 1777 for 1946-49. The average number of work-

people involved each year was 1,354,000 for the years 1918-26, 371,000 for 1927-1945, and 503,000 for 1946-49. The average number of working days lost each year was 4,268,000 for the years 1918-26, 2,765,000 for 1927-45, and 2,086,000 for 1946-49. The averages for the years 1918-26 include figures for the General Strike (*see* STRIKE, GENERAL THE. *See further under* LABOUR DISPUTES. *See also* INDUSTRIAL RELATIONS; LABOUR LEGISLATION; TRADE DISPUTES ACTS; TRADE UNIONS; *also* UNITED STATES, *Industrial Relations and History*.

Strindberg, Johann August (1849-1912). Swedish novelist, dramatist, poet, and essayist, b. in Stockholm. The poverty, repression, and unhappiness of his childhood explain something of his later development. He studied at Uppsala Univ., interrupting his career there for a time for financial reasons. From 1874 to 1882 he was an assistant at the Stockholm Royal Library.

S. was an extremely prolific author. His novel *The Red Room* (1879, trans. 1913) was acclaimed as Scandinavia's first realist-social novel. He was influenced at this time by Dickens, the Goncourts, and possibly Flaubert; to these he added his own bitter, penetrating observations on humanity. He adopted much of Nietzsche's doctrine, being one of the supreme examples of the Idealist literature, though his Idealism was distorted by his extreme, introspective pessimism. S. was thrice married and divorced; his hatred of women and peculiar conception of paternity, seen in embryo in *The Red Room*, and becoming almost maniacal in the collections of short stories, *Marriages* (1884, 1885), and the plays *The Father* (1887, trans. 1907), and *Miss Julie* (1888, trans. 1911) had their origin in his own abnormality and acute inferiority complex, and eventually became an obsession. He spent some time in a mental sanatorium. S. never fully recovered from the breakdown he suffered when prosecuted for blasphemy on the pub. of *Marriages*. In later years he turned from Nietzschean Idealism to evolve a religious mysticism, which found expression in the dramatic trilogy, *To Damascus* (1898 1904, trans. 1933 35). He may have been influenced by Swedenborgianism, but dramas such as *The Spook Sonata* (1907, trans. 1916) show a dabbling in the psychic and the occult.

S. was Sweden's greatest dramatic artist, and possibly her greatest literary figure. The dramatic construction of his plays is superb. He was a very versatile artist: the years which produced his angry masterpiece, *The Father*, produced also the charming tale, *The Duellers of Hemso* (1887) and he wrote sev. travel sketches and light essays. *See* lives by A. Jollivet, 1931, and Frida Strindberg, 1936. *See also* C. E. W. L. Dahlstrom, *Strindberg's Dramatic Expressionism*, 1930, and H. Taub, *Strindberg als Traumdichter*, 1945.

Stripes and Chevrons, devices worn on the sleeves of uniformed forces to indicate rank, conduct, or some other attainment. The Fr. adopted stripes to indicate the

rank of non-commissioned officers towards the end of the eighteenth century, a practice which was copied by the Brit. some years later. Chevrons, to indicate periods of good conduct, were instituted later. Stripes are V-shaped, whilst chevrons are A-shaped. In 1916 a system of indicating that a soldier had been wounded in the First World War was introduced which consisted of a perpendicular stripe of gold wire worn on the left sleeve. A stripe was worn for each occasion of being wounded. In the Brit. service a red worsted chevron was worn on the right sleeve by all ranks who served overseas during 1914 and a blue one for each year of service overseas after 1914. In the U.S.A. overseas chevrons are still worn: they are A-shaped and are worn near the left cuff. A chevron was granted for each period of service of six months in the European zone. Rank chevrons (A) in the U.S. Army are worn as follows: master sergeant, three stripes and an arc of three bars (chevron for first sergeant includes a diamond in the field); technical sergeant, three stripes and an arc of two bars; staff sergeant, three stripes and an arc of one bar; sergeant, three stripes; corporal, two stripes; first-class private, one stripe. In the Brit. service good conduct badges are not worn by corporals and higher ranks. In the foot guards lance-corporals wear two stripes (the same as full corporals in other arms), but with good conduct stripes.

Strobilanthes, large genus of Ruellieae. *S. flaccidifolius*, growing in Assam and Burma, yields a blue dye. *S. dyerianus*, cultivated in Britain, is a dwarf evergreen shrub, with long indurated leaves, purple beneath with violet flowers in spikes.

Stroboscope, device for causing a moving object to appear stationary, utilising the optical phenomenon of stroboscopic effect. The S. consists either of a shutter or of a means of illumination by a series of light flashes, so arranged, that at a given point when viewed or illuminated is in the same position at each occurrence. Machinery in motion is examined by this method.

Stromboli, see under LIPARI ISLANDS.

Stromness, burgh, mkt. tn., and seaport on the S.W. of Mainland (Pomona), Orkney Is., Scotland, 14 m. W. of Kirkwall. S. Harbour (W.), lying N. of Hoy Sound, is the best in N. Scotland. Pop. 1500.

Strong, Emilia Frances, see DILKE, LADY.

Strong, Leonard Alfred George (b. 1896), Eng. writer and poet, b. at Plympton in Devon, of W. country and Irish parentage, educated at Plymouth, Brighton, and Wadham College, Oxford. He was for twelve years a teacher, in 1930 becoming a free-lance journalist and writer. His first vol. of verse, *Dublin Days*, was pub. in 1921. His work includes poetry, biography, short stories, belles-lettres, and many novels, and he has ed. a series of one-act plays for Methuen & Company Limited, of which he is a director. He is also a lecturer and broadcaster.

Strongbow, name of Richard de Clare,

second earl of Pembroke (d. 1176), who joined Dermot, king of Leinster, in the latter's recovery of his kingdom from the king of Connaught, married his daughter, and succeeded him. In 1172 he acknowledged Henry II.'s overlordship. He did much to increase Eng. power in Ireland.

Strontium, metallic chemical element, symbol Sr, atomic number 38, atomic weight 87.6. It occurs in nature as strontianite (SrCO_3) and celestine (SrSO_4). The metal is obtained by the electrolysis of the fused chloride and is white in colour. It readily oxidises in air and decomposes in water at ordinary temps. (melting-point 800°C , sp. gr. 2.5). Heated in hydrogen it forms a hydride (SrH_2) which when heated *in vacuo* yields pure Sr. Two oxides of Sr are known, the monoxide and dioxide. The monoxide, strontia, slakes like lime, forming Sr. hydroxide (Sr(OH)_2). Excepting the sulphate, carbonate, and phosphate, the salts of Sr. are soluble in water. They impart a crimson colour to the flame, and are therefore used in pyrotechny. The hydroxide is largely used in the manuf. of beet sugar.

Stroud, dist. of Rochester, Kent, on the l. b. of the Medway.

Strophanthus (Gk. *στροφῶς*, cord; *ἄνθος* flower), genus of Apocynaceae, the species of which are found from S. Africa to China. There are over twenty of these, and they consist of small trees or shrubs bearing peculiar flowers which have long and thread-like lobes on their petals. *S. hispidus* yields the *uñé* poison, and the seeds are used in pharmacology to stimulate the action of the heart. *S. sarmentosus* yields an acid from which cortisone may be produced for use in the treatment of arthritis.

Strophe (Gk. *στροφή*, a turning), term used in versification to denote a collection of prosodical periods, combined into a structural unit. It derives from a movement of the Gk. chorus. See ANTI-STROPHE.

Stroud: 1. Tn. of Gloucestershire, England, on the W. Region main line from London, 8½ m. S. by E. of Gloucester. For many centuries broadcloth and scarlet-dyed cloth have been manufactured in the neighbourhood. There are also breweries, saw-mills, and manufs. of plastics and fibre board. Pop. 45,000. 2. Tn. of New S. Wales, in Gloucester co., 113 m. N. of Sydney by rail. There is a goldfield near by. Pop. 1100.

Stroud Green, N. suburb of London, on N. by W. of St. Paul's.

Structural Formulas, in chem., are formulae expanded in such a way as to represent what are believed to be the relative arrangements of the atoms in a molecule. Thus the S. F. of alcohol, $\text{C}_2\text{H}_6\text{O}$, is $\text{CH}_3\text{—CH}_2\text{—OH}$. Further expansion gives a *graphic formula*, e.g.

Structural Steelwork, steelwork applied to buildings and to engineering structures

other than bridges. After the successful use of cast iron in bridge-building in the latter half of the eighteenth century, builders began to make use of this metal for columns and, later, to replace timber, for beams carrying the floors of large buildings, such as factories. By the end of the century good-quality wrought iron was being produced, and this was used in the form of rolled 'I' sections for beams in place of cast iron, which, however, was retained for the compression members. The use of wrought iron in this way made it possible to construct much lighter and stronger structures than was possible with

STRUCTURAL STEEL WALL
FB, floor beam SF, stone facing

cast iron. The first rolled-steel joist was made in England in 1855, but in spite of the low cost of production of steel by the Bessemer and Siemens-Marten processes of manu., it was not commonly used in structural engineering in Britain until some thirty years later. Steel used in modern S. S. is rolled into lengths which have 'I,' 'T,' angle, rectangular, channel, or other cross-sections. The dimensions of these various sections are standardised, and, for the convenience of the designer, the properties of the standard sections are available in the form of tables in engineering handbooks. Broadly, the procedure is to build up a steel frame or skeleton which will carry the loading and transmit it to the foundations, the various members being usually riveted together, though welded joints are coming increasingly into use. As the walls are chiefly weather screens, and contribute little to the strength of the structure, there is no need for them to be thick or heavy, thus saving weight and, in the case of high buildings,

floor space. They are built into the framework. This system of building lends itself to speedy construction, because when the frame is complete work can proceed simultaneously on sev. floor levels. By the use of standard details and connections much economy is effected both in the drawing-office and on the job. The unit stresses observed in Britain are commonly limited to $7\frac{1}{2}$ tons per square in. safe load. Owing to the increased height of buildings, particularly in U.S.A., special attention must be paid to the foundations. For this purpose piles or steel caissons are sometimes required or a complicated arrangement of joist, or 'grilles,' used to spread the weight. In special cases, where the property limits require it, stanchions are supported on the projecting ends of cantilever beams properly secured for stability. In all tall and narrow buildings wind effects have to be provided for by diagonal bracing or by stiffening knees between floor girders and uprights. The walls themselves also help to preserve the rigidity of the structure and prevent vibration due to wind pressure. Steelwork alone, although not combustible, cannot be considered immune from fire. Due to the distortion of the metal framework consequent upon the heat, steel buildings have been known to collapse; therefore it is good practice to encase the steel in concrete, terra-cotta, or other fire-resisting material. Another point which must not be overlooked in steel-framed structures is corrosion. Experience gained from an examination of buildings which have been demolished shows that when encased in concrete the tendency of the steel to corrode is negligible. Rust is also prevented by the use of good quality paints. In recent years reinforced concrete (*q.v.*) has proved a serious rival to S. S. See A. Morley, *Strength of Materials*, 1916; J. Husband and W. Harby, *Structural Engineering*, 1928; E. A. Salmon, *Materials and Structures*, 1931; and A. J. S. Pippard, *Analysis of Engineering Structures*, 1936.

Struensee, Johann Friedrich, Count (1737-72), Dan. statesman, b. at Halle in Saxony. He studied medicine, and in 1768 was appointed physician to the King of Denmark, whom he accompanied on his tour to Germany, France, and England. In 1771 he became minister of state, and carried out many reforms. His policy, his foreign birth, and his suspected liaison with Queen Carolina Matilda, brought about his downfall, and he was executed for treason. See lives by V. Lange, 1926, and J. M. Wehner, 1938.

Struma (Turkish *Kara-Su*), riv. of Bulgaria and Macedonia, rising in the former and flowing into the gulf of Rentina.

Struma, see under GOUTRE.

Struma, see SCROFULA.

Strutt, John William, and Robert John, see RAYLEIGH, BARON.

Stry, or Stryj, tn. in the Ukrainian S.S.R. (formerly in Poland), on the R. Stryj, 41 m. S.W. of Lvov. There are railway repair shops, metal industries, and the manu. of matches. Pop. 30,700.

Strychnine ($C_{21}H_{22}O_2N_2$), alkaloid occurring in *Strychnos nuxvomica*, *S. colubrina*, *S. ignatii*, *S. icaja*, and other trees of the same genus. The alkaloid is contained with brucine in the bark, leaves, seeds, and root. S. is a crystalline solid, insoluble in water, but soluble in alcohol and chloroform. It has an alkaline reaction and a bitter taste; optically it is levo-rotatory. The alkaloid and its salts are used in medicine as tonics and stimulants. It is especially employed in collapse from alcoholism, pneumonia, emphysema, etc., the dose being under $\frac{1}{10}$ grain. In larger doses it acts as a powerful poison, one grain being a fatal dose in many instances. The symptoms of poisoning commence with a stiff neck, and shortly the patient is seized with tetanic convulsions, the muscles being contracted for a minute at a time; often the body is thrown into the form of an arch, the patient resting on his head and heels. The treatment must commence with emptying the stomach with an emetic or the stomach-pump. Chloral and potassium bromide have been found useful in counteracting the spasms.

Strychnos Nuxvomica, Indian tree of the order Loganiaceae. It contains sev. alkaloids, the chief of which are strychnine (*q.v.*) and brucine.

Stryi, riv. of the Ukrainian S.S.R. rising in the Carpathians and flowing into the Dniester.

Stuart, Arabella, or **Arbella** (1575-1615), only child of Charles S., duke of Lennox, younger brother of Henry, Lord Darnley, the father of James I. James and she, therefore, were full cousins, and she was, before the birth of his son Henry, in Feb. 1594, the next in order of succession to the Eng. throne to James. Her name was brought forward in 1603, after the accession of James, in the affair of the alleged plot called 'the Mam,' for which Sir Walter Raleigh was tried. One of the charges against Raleigh was that he designed to raise the Lady Arabella to the throne, under the protection of Spain. There is no probability that any such design ever was entertained. Her situation, however, was a difficult and dangerous one. She was secretly married to Wm. Seymour, second son of Lord Beauchamp, the eldest son of the earl of Hertford; but it was discovered in 1610, and Seymour and the lady placed in separate confinement. Arabella escaped from Highgate and Seymour escaped from the Tower. Seymour reached Flanders in safety, but Arabella was captured in Calais Roads and placed in the Tower, where she died. See E. T. Bradley, *Life and Letters*, 1889.

Stuart, or **Stewart, Charles Edward Louis Philip Casimir** (1720-88), known as the 'Young Pretender,' being the elder son of the Chevalier de St. George, the 'Old Pretender,' born in Rome. He served in the wars of the Polish and Austrian Succession, distinguishing himself when very young at Gæta (1734) and Dettingen (1743). In 1743 he headed an unsuccessful Fr. invasion of England, but in 1745 succeeded in landing at Eriska in the Hebrides. Marching southwards he entered Edinburgh and held his court at

Holyrood. He defeated Cope at Prestonpans. With a troop of 6500 men he invaded England, and marched as far S. as Derby, when his advisers, seeing no prospect of success, urged him to retreat to Scotland. There he was again victorious at Falkirk (1746), but was overwhelmed by Cumberland at Culloden, and for many months hid in the fastnesses of the Highlands with a price of £30,000 on his head. Before the end of the year he escaped to France, whence he was expelled in 1748. He spent the remainder of his life as a fugitive on the Continent, living for some time in Rome. He married Louisa von Stolberg in 1772. See lives by A. C. Lwald, 1875; A. Lang, 1900; and W. D. Norrie, 1903-4; C. Mackenzie, *Prince Charles and his Ladies*, 1934; D. Nicholas, *The Young Adventurer: Prince Charles and the '45* 1949; E. M. Porcelli, *The White Cockade: Adventures of Bonnie Prince Charlie*, 1949; and Sir C. Petrie, *The Jacobite Movement: the Last Phase*, 1950.

Stuart, or Stewart, Henry Benedict Maria Clement, Cardinal York (1725-1807), called by the Jacobites Henry IX., the second son of the 'Old Pretender.' He took part in the rising of 1745, and on his return to Italy became bishop of Ostia and cardinal (1747), archbishop of Corinth (1759), and bishop of Tusulume (1761).

Stuart, House of, see STUART.

Stuart, James (c. 1531-70), see MORAY, EARL OF.

Stuart, James (d. 1596), see ARHAN, EARL OF.

Stuart, James Francis Edward (1688-1766), Prince of Wales, commonly styled the 'Chevalier de St. George' and later known as the 'Old Pretender,' the son of James II. by his second wife, Mary of Modena. The prince was born in June, and in Dec., when the king had decided to fly the country after the landing of the Prince of Orange, he was taken to France. In 1701 James II. died, and his son was accepted by the Jacobites as king of England under the style of James III. He served with distinction in the Fr. Army before the peace of Utrecht, and in 1715 went to Scotland to take part in the unsuccessful Jacobite rising. He married Maria Clementina Sobieski in 1719. The rising of '45 was the last attempt to secure his restoration. See T. F. Henderson, *The Royal House of Stuart*, 1914, and G. N. Clark, *The Later Stuarts, 1660-1711*, 1934.

Stuart, John, see BUTE, EARL OF.

Stuart, Leslie (real name Thomas A. Barrett) (1866-1928), Eng. organist and composer, b. at Southport. He was organist at Salford and in Manchester, and from 1895 was in London. He composed popular songs and operettas, of which *Floradora* (1899) was the best known.

Stuartia, camellia-like deciduous shrubs of the order Trosterniaceae, having creamy or white flowers. The three species grown are pentagyna, pseudocamellia, and virginica. Propagation is by layering.

Stubbs, George (1724-1806), Eng. painter, b. in Liverpool, studied anatomy

and became a lecturer at York hospital. He was well known for his sporting pictures, and became A.R.A. in 1780. There are examples of his work in the Victoria and Albert Museum and the National Gallery. S. pub. *The Anatomy of the Horse* (1786), illustrated by his own engravings.

Stubbs, William (1825-1901), Eng. historian and churchman, b. at Knarborough, and educated at Ripon Grammar School and Oxford. From 1850 to 1866 he held the living of Navestock, Essex, and was then appointed prof. of modern hist. at Oxford. In 1884 he was consecrated bishop of Chester, and five years later translated to the see of Oxford. His chief pub., *Constitutional History of England* (1874-78), is a work of monumental scholarship. His *Select Charters to 1307* (1870) have been pub. in many eds., and he contributed valuable introductions to the Rolls series of nineteen vols. of chronicles (A. Hassall, ed. 1902). His letters were ed. by W. J. Hutton (1904).

Stucco, It. word applied in most languages to plaster of any kind used as a coating for walls to give them a finished appearance. Stucco work or *stuccatura* is interior ornament in imitation of carved stone.

Stuerbout, see BOUTS, DIEBICK.

Stuffing, see TAXIDERMY.

Stuka, Ger. term for dive-bomber, particularly applied to the Ju. 87 and the Ju. 87b. The former, a twin-seat monoplane with fixed undercarriage, had a speed of about 200 m.p.h., and was used in close co-operation with armoured formations as, for example, in Poland and in France in 1940. The bomb load was some 1000 lb. It was also used against aerodromes, shipping, and other specific targets.

Stukeley, William (1687-1765), Eng. antiquary, one of the founders of the Society of Antiquaries, an exponent of Neo-Druidism, practised as a doctor in Boston (Lincolnshire), London, and Grantham, and after 1729 was successively vicar in Stamford, Somerby, and Queen Square, London. He pub. *Stonhenge, a Temple Restor'd to the British Druids* (1740) and *Abury* (Avebury, q.v.) (1743). See S. Piggott. *William Stukeley, an Eighteenth-century Antiquary*, 1950.

Stupor, term used to describe states of partial insensibility. Its difference from true coma is one of degree and in severe cases its diagnosis from the latter may present some difficulty. Broadly speaking, in S. the causative condition only produces a dulling (sometimes, indeed, to a very considerable degree) of consciousness in contrast to the total loss that is present in coma. In the type of S. met with in cases of mental disease, the total absence of feeling and emotion is often more apparent than real: many patients who during their illness displayed indifference to their condition and environment, seemingly amounting at times to complete unawareness, and who exhibited no evidence whatever of spontaneous activity, give after recovery a detailed and vivid account of all they have experienced.

In the literature of psychological medicine various attempts have been made to classify S., e.g. as (1) anergic and (2) restive, or (a) benign, (b) depressive, (c) katatonic, and (d) maniacal. See also UNCONSCIOUSNESS.

Sturgeon, fish which constitute the family Acipenseridae in the order Chondrostei. They are large and have elongated bodies, bearing five rows of large bony scutes; the mouth is small, has no teeth, and in front of it are four barbels. S. are voracious feeders on small animals and plants. Caviare is made from the ovaries and isinglass from the air-bladders of sev. Russian and Amer. species. Of the twenty or so species only *Acipenser sturio* is occasionally found off Brit. coasts. The S. is fish royal.

Sturgeon Bay, vil. in Door co., Wisconsin, U.S.A., 7.5 m. N.E. of Appleton, on the E. of Green Bay, Lake Michigan. There is a harbour and lumber mills.

Sturla Thordsson, see THORSSON.

Sturluson, or **Sturlason**, see SNORRI STURLUSON.

Sturm, St. (d. 779), first Ger. to become a Benedictine, a favourite disciple of Boniface. He chose the site of Fulda, and became abbot there. He was regarded as second only to Boniface as apostle of Germany.

Sturm und Drang, see GERMANY, *Literature and Literature*.

Stuttering, see STAMMERING AND STUTTERING.

Stuttgart, cap. of Württemberg-Baden, Germany, formerly cap. of Württemberg, on the Nesenbach, an affluent of the Neckar, 127 m. S.E. of Frankfurt. It occupies a picturesque position in a valley surrounded by vine-clad hills, and further off by wooded mts. The chief features of interest included three late-Gothic churches, a sixteenth-century castle, a sixteenth- and an eighteenth-century palace, the Akademie (once the seat of the Karlschule), containing the library. S. became a tn. in 1250, and from the fifteenth century was the cap. of the Württemberg dukes and kings. The city is a centre of the printing and publishing trades, and is noted for the Daimler-Benz motor works, and chemical, electrical, and textile products. The tn. was heavily bombed during the Second World War. In the allied advance of 1945 the First Fr. Army occupied S. on April 22. Pop. (1939) 460,000.

Stuyvesant, Peter (1592-1672), Dutch colonial governor, became director-general of the New Netherlands in 1646, until the surrender of New Amsterdam (New York) to the Eng. in 1664. He spent his later years in New York, and his farm (Bowery) gave its name to the Bowery.

Stye, or **Hordeolum**, inflammation of the modified sweat glands between the eyelashes. It commences with a hardening of the skin about the part, followed by swelling and soreness. Suppuration of the lower layers of the skin next takes place, and the central core subsequently sloughs off. Gentle fomentation tends to ease inflammation; care should be taken not to irritate the conjunctiva. Refractive

defects in the eyes are often factors in the incidence of S.

Style, Old and New, see CALENDAR.

Stylikes, St. Simon, or Simeon (Gk. *στυλῖος*, pillar), monk of Syria in the fifth century, who spent the last thirty years of his life on a pillar, 72 ft. high and 4 ft. square at the top, erected near Antioch. He preached by day, and crowds of pilgrims flocked to receive his exhortations. He died in 459 at the age of seventy-two.

Styria (Ger. *Steiermark*), former duchy and crownland of Austria, later a prov., bounded by Upper and Lower Austria (N.), Burgenland (E.), Yugoslavia (S.), and Carinthia and Salzburg (W.). Its surface is diversified by the outlying spurs of the E. Alps, the Dachstein (9830 ft.), Hochgolling (9390 ft.), Predigtstuhl (8349 ft.), Grosser Rosenstein, and the Eisenhut reaching the highest elevations. The chief rvs. are the Enns in the N.W. and the Raab and the Mur in the central dists. Half the prov. is still forest land, and maize, oats, rye, and roots are cultivated. There are rich deposits of iron ore, graphite, and lignite, and iron and steel goods are manufactured. Eisenitz, Leoben, Koflach, and Vordernberg are centres of mining dists. There is a univ. at Graz, the cap. S. formed part of the Rom. prov. of Noricum. In the sixth century A.D. there was an influx of Slovenes. Ottokar, count of Steyr, gained possession of the area in 1056, it became a dukedom in 1180, passed to Austria in 1192, to Ottokar II. of Bohemia in 1260, and to the Hapsburgs in 1282. S. suffered from the Turks, and from religious disputes. In 1918 Yugoslavia received the S. dists. occupied by Slovenes, and raised further claims after the Second World War. Area 6326 sq. m. Pop. 1,280,000.

Styx, in Gk. mythology, the name of the prin. riv. in the nether world, around which it flows seven times. S. is described as a daughter of Oceanus and Tethys. As a nymph she dwelt at the entrance of Hades, in a lofty grotto supported by silver columns. As a riv. S. is described as a branch of Oceanus, flowing from its tenth source; and the R. Cocytus again is a branch of the S.

Suabia, see SWABIA.

Suaheli, see SWAHILI.

Suarez, Francisco (1548-1617), Sp. philosopher and theologian, b. at Granada, entered the Society of Jesus as a student at Salamanca, 1564. He became prof. of theology at Coimbra (1597 onwards). He became leader of a school of neo-scholastics, opposed to the Thomists. His *Defensio catholice fidei Anglicanae sectae errores* (1613) roused the ire of James I. by attacking the Eng. oath of allegiance. His collected works were pub. in 1856-61. See study by J. Lewesmeier, 1938.

Subaltern, see LIEUTENANT AND SECOND-LIEUTENANT.

Sub-Carpathian Russia, see RUTHENIA.

Subconsciousness, see PSYCHOLOGY.

Subiaco: 1. City of Italy in the prov. of Rome, 33 m. E. by N. of Rome, picturesquely situated in the Sabine Mts. The modern tn. appears to have grown up after the estab. of the anct. Benedictine

monasteries in the vicinity. Of these the most remarkable are the Santa Scolastica, which was built by the abbot Honoratus and in the eleventh century ranked as a principality, and the Sacra Speco, the buildings of which are clustered round the cave in which St. Benedict himself found asylum. Among other leading features of S. are Nero's villa and an eleventh-century castle, both in ruins. Paper and pottery are produced. The first book printed in Italy was the *Lactantius* of S. (1461). The tn. suffered heavy damage during the Ger. retreat of 1944, when a mass of fleeing vehicles was trapped in the main street and annihilated. The cupola and transept of the cathedral were very badly damaged and S. Pietro, a recently restored church, was virtually destroyed, but the above-named monasteries escaped essential damage. Pop. 9100. 2. N.W. suburb of Perth, W. Australia.

Subinfederation, see LAND LAWS.

Subject and Subjective. *Subject* means the mind as knowing something or as affected by a thing, while *object* is that which is known or which affects the mind in a certain way. Mind may be known in a direct, internal, or subjective way, by directing attention to what is going on in the mind at the time of its occurrence or afterwards. This is known as *introspection*, or the method of internal or *subjective* observation. On the other hand, mental phenomena may be studied as they present themselves externally in other minds. This constitutes the external, indirect, or *objective* method of observation. So, for example, a knowledge of others' thoughts may be arrived at by their speech or their motives by noticing their actions. Both methods possess difficulties. *Abstraction* is needed in the observation of one's own mental life, and to withdraw attention from the more striking events of the external world and to fix it on the more obscure events of the inner world is obviously difficult. On the other hand, there is a tendency, in reading the minds of others, to project one's own modes of thinking and feeling into them. Close attention must be given to the differences and similarities of external manifestation, and an effort of *imagination* made by which, through our own remembered experiences, we feel our way into a new set of circumstances.

Sublimation. When a solid, on the application of heat, passes straight to the gaseous state without first becoming liquid, it is said to sublime. On cooling the solid state is reassumed. S. depends on the fact that the boiling-point of the solid substance is lower than its melting-point at the pressure of the atmosphere. This by increase of pressure a substance which sublimates can be made to go through a liquid stage before passing into the gaseous state. By S. non-volatile impurities which are originally present are left behind, and thus a method of purifying substances which sublime is estab. Arsenious acid, benzoic acid, corrosive sublimate, and sulphur are purified by this means. When calomel (mercurous chloride) is sublimed, dissociation takes

place, a certain amount of recombination occurring on cooling. With ammonium chloride the substance is dissociated into ammonia and hydrochloric acid, which recombine on cooling (see DISSOCIATION). For the use of the term S. in psychology, see under FREUD, SIGMUND.

Sublingual Glands, smallest of the salivary glands, situated one on each side of the floor of the mouth, beneath the tongue. They have numerous ducts, which open along the sublingual fold in the mucous membrane of the floor of the mouth.

Submachine Gun. Its Ger. name, *Maschinenpistole*, shows at once its origin and function, i.e. a weapon intended to be to the pistol what the machine gun is to the rifle. Developed probably from the Mauser Parabellum, an automatic pistol of heavy calibre with detachable stock and a magazine containing some two dozen rounds, the first S. G. to be extensively manufactured was the Thompson (whence 'Tommy gun') under U.S. patent. Ostensibly sold for 'sporting' purposes, its chief users up to 1939 were Amer. bandits and policemen. A similar weapon, the 'Suomi pistol,' was used by the Finns in the 'winter war' of 1940-41, and at the same period the Ger. patrols on the W. front were armed with Schneisser S. Gs. These were all-metal weapons with folding stock and straight vertical magazine. The Suomi pistol inspired the prototype of the Russian S. G., which, like it and the Thompson gun, can be fitted with a vertical drum holding about 100 rounds, and fires bullets of heavy pistol calibre (about 45 m.m.). Other makes used in the Second World War were the Steyr-Solothurn and the Beretta.

A simple type of S. G., the Sten, was evolved in Great Britain. Its parts were mainly of stamped steel, and especially suited for mass production. It had a simple 'blow-back' open-bolt action, was subject to few stoppages, and was of a calibre which permitted it to fire standard Ger 9 mm. pistol ammunition. Thousands of these weapons were dropped to partisans in occupied Europe. It was also used by Brit. airborne troops, commandos, and the Home Guard.

S. Gs. are 'personal,' not support infantry weapons. None is effective over 200 yds. Their chief use is in patrolling and street fighting, and in the final stages of an assault. Russian cavalry adopted them instead of carbines. In the last stages of the Second World War the establishment of the Ger. *Folksgrenadier* battalions provided a S. G. to every man in an infantry section, but few units appear to have been completely equipped on this scale.

Submarine Cables, see CABLE.

Submarine Forests, see under SUBSIDENCE.

Submarine Mines, see MINES, MILITARY AND NAVAL.

Submarines are vessels designed to operate both on the surface of the sea and submerged. Up to the present they have remained exclusively a naval craft, being used as a weapon of war, though in 1931 a submarine, *Nautilus*, was tried by Sir Hubert Wilkins for work under the ice

in the Arctic. During both world wars they played a most important part, particularly in the hands of the Gers., who made use of them to destroy merchant shipping with disastrous results to the Allies.

S. are submerged by flooding special ballast tanks, and in order to rise again to the surface the water in these tanks is discharged overboard, through valves placed at the bottom of the tanks, by means of compressed air. In addition, certain of the main ballast tanks have connections to electric pumps, which are sufficiently powerful to deliver against the greatest pressure of water ever likely to be met with in practice, and these may be used to empty the tanks in the event of the compressed air failing or other emergency. The time taken by a submarine to submerge in order to avoid being sunk by enemy action is of paramount importance, one or two minutes only being required by a modern vessel.

Earliest types of S. were circular in cross-section and the hulls consisted of a single shell, stoutly constructed to withstand the crushing effect of the water when submerged. Nowadays the double hull is adopted, particularly in the largest types. In this form the inner hull is the pressure hull and the outer is merely a light shell which is shaped to produce greater seaworthiness and to offer less resistance to surface propulsion, thus permitting higher surface speeds to be obtained. The space between the two hulls is used as ballast tanks. Sometimes certain of the ballast tanks are used for the storage of oil fuel in order to increase the range of action of the submarine. The conning-tower is built up from the pressure hull and is fitted with water-tight hatches at the bottom where it connects with the hull and at the top on a level with the bridge. As the conning-tower is the last portion of the vessel to be submerged it is generally stoutly constructed to resist gunfire. It also serves as a base to which the two or three periscopes are bracketed for support. Modern periscopes consist of a tube about 35 ft. long with glass prisms at the top and bottom; the top of the periscope normally projects about 3 ft. out of the water, whilst at the other end there is an eyepiece by which an observer in the vessel can see what is taking place on the surface. In modern S. Diesel engines driving twin screws generally provide the surface propulsion, and electric motors drive the propellers when submerged.

The first reliable practical attempt at building a submarine vessel appears to have been in the seventeenth century, when a Dutchman, Cornelius Drebbell, successfully navigated a boat, manned by twelve rowers, in the Thames. An interesting part of the invention was a fluid which would restore the 'vital parts' to vitiated air. An inventor, Dav, lost his life in a vessel intended to remain under water for twelve hours, in 1774, in Plymouth Sound. To Bushnell, an Amer., belongs the honour of undoubted success; his boat was fitted with two 'oars on the principle

of the screw,' a rudder at the stern, a valve to admit water for sinking the vessel, force pumps for driving it out again, and a device for attaching explosives to the bottoms of vessels. His ship was tried in 1775. In 1800 Robert Fulton, of steamship fame, made tests with an egg-shaped boat in the Seine and off Brest, remaining four hours under water, to a depth of 25 ft. He attached a torpedo to the bottom of an old hulk and blew it up. Compressed air was used in this vessel. In 1859 Delaney, another Amer., devised a similar vessel, and an Amer. shoemaker, Phillips, is said to have spent a day at the bottom of Lake Michigan with his wife and family in 1851.

In conjunction with Nordenfeldt, the Swedish gun-maker, he built two others, which were sold to the Gks. and Turks respectively. A large one sold to Russia was built at Barrow-in-Furness, came round to the Solent, but was wrecked on the journey to St. Petersburg. These were all fitted with vertical screws. J. F. Waddington of Liverpool constructed a boat with horizontal rudders, driven by motors regulated by a pendulum for keeping the boat level.

A Fr. engineer, Goubet, in 1885 built a successful submarine boat, and four others were in use in 1897 in the Fr. Navy electrically propelled and fitted with compressed air reservoirs. In 1888 the

SECTIONAL DIAGRAMS OF THREE TYPES OF SUBMARINE: 1, SINGLE HULL; 2, SADDLE TANK; 3, DOUBLE HULL.

A, electric batteries, B, compressed air bottles, C, main ballast tanks, D, auxiliary ballast tanks, for stores, E, living and machinery spaces, F, pressure hull, G, hatches, H, conning tower, K, keel, L, periscope, wireless and radar masts raised; M, periscope, wireless and radar masts lowered; N, periscope, wireless and radar masts in raised position.

A Ger., Bauer, experimented in 1830 with a boat which was lost, but recovered later; he also carried out experiments for the Russians during the Crimean War. About the same time Scott-Russell, the builder of the *Great Eastern*, built a boat manned by twelve rowers in diving suits. In 1863 both Federals and Confederates tried submarine boats, the latter building the *David*, screw-propelled and steam-driven, but fighting 'awash.' It was armed with a spar torpedo and carried out an unsuccessful attack on an ironclad. Another *David* of a different type was built, and sank the *Housatonic*, though the spar torpedo was carried again in the 'awash' position; this boat was swamped in the manoeuvre and was lost with her crew.

In 1866 Flack, a Ger. inventor, lost his life in Valparaiso Bay, with seven companions, in the first trial submersion of his boat. The Rev. G. W. Garrett in 1876 performed successfully with a small model at Liverpool, and built a larger boat driven by steam under high pressure in a large boiler; this was lost off the Welsh

Gymnote, designed by Gustave Zédé after the idea of Dupuy de Lôme, was built; the outcome of the trials was the building of the *Gustave Zédé*, 1898, 160 ft. long, 270 tons, with electric motors developing 360 h.p., which was very successful in actual manoeuvres. This was followed by the *Moose* and the *Parfard* type, improvements on the *Gustave Zédé* and the *Narval*. The last named was oil-driven on the surface, with electric motors for submarine work. Another type, the *Peral*, named after its inventor, and launched at Cadiz, was very successful. Up to the end of the nineteenth century Great Britain did not take any active part in the development of the submarine, being content to leave the work in the hands of foreign nations and private individuals, and regarding this type of vessel as having no real utility against such a strong fleet as hers. However, with the introduction of electricity for under-water propulsion great strides were made by the Fr. and Nordenfeldt, but the most practical design was that of an Amer., J. P. Holland. Following The Hague

Conference of 1899, the Brit. Admiralty ordered five Holland type S. These were 63 ft. long, 11 ft. 9 in. beam, of circular cross-section, and shaped somewhat like a fat cigar. When submerged their displacement was 120 tons, and they were propelled on the surface by an internal combustion engine of 160 h.p. which gave a speed of 10 knots; when under water an electric motor of 70 h.p. propelled the vessel at 7 knots. The latter was driven from electric batteries, which could be recharged when on the surface by the petrol engine. The armament consisted of one torpedo-tube and five torpedoes, and as each was fired water was admitted to special tanks to counteract the loss of weight, thus maintaining the relative buoyancy. The method of submerging was by first admitting water into the tanks and then diving by the aid of hydroplanes or horizontal rudders, great care being taken to avoid diving too deep owing to the danger of crushing the hull by the great pressure of the water. The supply of fresh air was maintained from tanks of compressed air, whilst special apparatus was installed to purify air which had become vitiated. The crew numbered seven. These first S. were known as the 'A' class, and were shortly followed by larger, much improved vessels of 'B' and 'C' classes. Progress continued. The 'D' class were of 604 tons and, propelled by Diesel engines, had a speed of 14 knots. The hull design was radically altered, the main ballast tanks being external to the pressure hull, thus giving more room for machinery and living space inside the pressure hull. Modern S. are all built on this principle. The 'E' class of 850 tons and 1600 h.p., armed with five 18-in. torpedo tubes, followed in 1911-13, a 3-in. gun being added during the First World War. These S. were the main-spring of the Brit. war-time submarine fleet.

Fr. and It. designs became available in 1911 from which sprang the 'F', 'W', 'V', and 'S' classes. They were built just before the First World War and were not successful; they have no war record. The 'G' class with the saddle tank design of the 'E' class, but of the double hull type and armed with five torpedo tubes—two bow, two beam, and one stern—followed in 1915. Other war types were the 'J' class of 1820 tons, surface speed 19 knots with three Diesel-driven propellers, followed by the 'K' class of 2400 tons, steam-driven on the surface at 24 knots, armed with two 4-in. guns and eight 18-in. torpedo tubes. Strength of hull was sacrificed to speed in this type in an effort to build a submarine capable of keeping up with the fleet. But this requirement was of doubtful tactical value and the loss of submarine qualities outweighed the surface advantages. At the other end of the scale were the 500-ton 'R' class of low surface speed (8 knots) but with enormous battery power, giving them a designed speed submerged of 15 knots. This class was designed for submarine versus submarine work. Later in the war was produced the 'L' class, a

greatly improved 'E' of 1000 tons, 17 knots, Diesel-driven, 9 knots submerged speed, with six torpedo tubes (21-in. in the later numbers) and one 4-in. gun. Some of the 'E' and 'L' class were fitted to carry mines externally. Three 'M' class were also built but had no war service. They were of 2000 tons displacement, with a surface speed of 15 knots from 2400 h.p. Diesel engines and carried a 12-in. gun firing a 850-lb. shell at a maximum range of 20,000 yds. The gun could only be loaded or fired on the surface, but the submarine could be dived with the gun loaded. It was thus possible to fire the first round within a few seconds of passing periscope depth on surfacing. M 2 later had the gun replaced by a small aeroplane catapulted from a pressure-tight hangar. M 3 was converted to carry 100 mines externally and was the prototype of the 'Seal' class submarine minelayer used in the Second World War. The 'H' class, also built during the First World War in Canada, was a single hull type of 500 tons and was prefabricated in sections. Ger. U-boat development in the First World War consisted of enlarging a standard type, radical alterations being abandoned in favour of rapid construction. In the Brit. Navy no new types were produced after the First World War until 1925 when the giant X 1 of 3600 tons and carrying four 5.5-in. guns in two watertight turrets, in addition to torpedo tubes, joined the fleet. This was a failure and no attempt was made to follow up the type, although the Fr. *Sourcefou* was even larger, carrying 8-in. guns and a small aircraft. The *Oberon*, a submarine of conventional type, displacing 1380 tons on the surface and 1800 submerged, was the next Brit. naval contribution and formed the prototype of the following 'O', 'P', and 'T' classes. From this time, except for a short period in the Second World War, all Brit. S. have carried names instead of numbers.

The London and Washington Conferences (q.v.), together with the urge for economy in naval construction, limited the Brit. submarine fleet, but a further type of fast patrol submarine, the 'River' class of three boats, was built in 1932. Of 1850 tons surface displacement these S. had a speed of 22 knots from twin Diesels of 10,000 h.p., six 21-in. torpedo tubes, and one 4-in. gun besides a big radius of action. After the It. crisis of 1935 the Brit. reverted to smaller boats with the 'S' class of 770 tons and 14 knots surface speed, 10 knots submerged, with six torpedo tubes, and the 'U' class of 630 tons and 11 knots speed with four torpedo tubes. The last class to be laid down before the Second World War was the 'T' class of 1320 tons, 15 knots, 10 torpedo tubes, and one 4-in. gun. These three types with the earlier 'O', 'P', and 'R' classes, the 'Seal' class minelayer, and the 'River' class formed the submarine fleet which rendered such magnificent service during the Second World War. Ger. U-boat building policy, until allied anti-submarine methods forced them to experiment, was similar in both world wars,

i.e. the development and enlargement of a proved type. In 1944 the Gers, introduced the Schnorkel, a breathing tube which did away with the boat having to surface to charge batteries, and also designed three new types: one large, one small with increased submerged speed, and one type which never reached production. This last was the true submarine which never requires to come to the surface and therefore demands only one method of propulsion. The designed speed of this new type was said to be well in excess of 20 knots submerged and will doubtless, at some future date, form the prototype of all submarine vessels. U.S.S. developed on standard lines from the Holland type of 1900 and during the First World War were mainly of the medium-sized patrol type. Nothing newish has been brought into actual service although many experiments have been made. The construction of a large 1500-ton type patrol class, with a surface speed of 21 knots from twin shafts each having two or four engines geared to the shaft, was started in 1940 and formed the main part of the U.S. submarine fleet in the Second World War. These 'Fish' class S. are of a very fine type with powerful armament, big radius of action, and the best living accommodation of any S. in the world. Air conditioning and air purification have been brought to a high state of efficiency. During the Second World War U.S.S. played a leading role in the Pacific war and also took part in certain operations on the African and European seaboard. S. of the Russian fleet have been built up from many sources, including Brit., and, as far as is known, form a heterogeneous collection of medium-sized patrol boats and small coastal types. Nothing is known of their post-war construction, but it is highly probable that Ger. technique has been largely used. During the Second World War Russian submarine patrols were mainly in inland waters of the Black Sea and Baltic with a few operating off the N.E. coast of Norway.

Up to the present there has been no attempt to reach any agreement on the limitation of naval armaments as was laid down at the London and Washington Conferences between the two world wars. The use of S. for unrestricted warfare against all types of shipping which was so condemned during and after the First World War led to attempts to return to the agenda of The Hague Conference of 1899 when the Russian Gov. proposed the total prohibition of S. as weapons of war, but found no response in the uneasy peace following the Second World War. Total war at sea, whether by the declaration of 'sink at sight' zones, or the acceptance that any enemy merchant ship sighted is taking part in that country's war effort and is therefore a fighting unit, has no more been questioned than the use of bombers over enemy towns and cities. Submarine development of the future seems, therefore, to be dictated by the amount of money each country is prepared to spend on it rather than by con-

siderations of any illegality of this form of warfare.

See H. C. Fyfe, *Submarine Warfare*, 1902; M. F. Suter, *The Evolution of the Submarine Boat, Mine, and Torpedo*, 1907; T. W. Corbier, *The Romance of Submarine Engineering*, 1913; Sir H. Newbolt, *Submarine and Anti-Submarine*, 1918; W. G. Carr, *By Guess and by God, The Story of the British Submarine in the War*, 1936; K. Edwards, *We Dive at Dawn*, 1939; D. Masters, *Up Periscope*, 1942; and *Brassley's Naval and Shipping Annual*.

Submaxillary Glands, pair of salivary glands situated far back beneath the lower jaw on each side. Each gland is about the size of a walnut, and discharges its secretion by the submaxillary or Wharton's duct opening on the sublingual papilla on the floor of the mouth.

Subotica (Hungarian Szabadka), tn. of Vojvodina prov., Yugoslavia, near the Hungarian frontier 120 m. N.W. of Belgrade. It is a railway junction, and is the centre of a grain-producing area. Footwear, leather, and linens are made. Pop. 112,600.

Subpoena, name of the writ for calling a witness to bear evidence (*subpoena ad testificandum*). It is applied for only where it is feared the supposed witness will not voluntarily come forward or is actively hostile to the party calling him. The writ for calling upon any person to bring to court books, deeds, or other documentary evidence is called a *subpoena duces tecum*.

Subrogation, principle of S. in insurance is a deduction from the well-established rule that a contract of insurance of property is no more than a contract of indemnity. The principle as stated in the leading case of *Castellain v. Preston* is that, as between the insurer and the insured, the former is entitled to the advantage of every right or remedy, legal or equitable, of the latter, by the exercise of which rights and remedies the loss insured against can be or has been diminished.

Subsidence, or Depression of the Land, one of the great secular movements of the earth's crust, caused probably by the contraction of the earth on cooling. Evidence of depression is afforded by submerged forests, tirds, coral is., and by the disappearance of human construction. Submerged forests occur at sev. places on the Eng. coasts and in Holland and N. France. Fjords of Norway and the firths of Scotland are evidence of submerged valleys. On the coast of Dalmatia Rom. roads and villas have been reputed to be visible below the sea, but there is no real satisfactory evidence of regional change of level there in historic times, and the information regarding submerged Rom. villas is unreliable. In S. Sweden streets are submerged, and on the coast of Greenland a space of more than 600 m. is perceptibly sinking.

Subsidies: 1. Taxes in aid, as the S. formerly granted to the kings of England. S. were taxes imposed not immediately on property, but upon persons in respect of their reputed estates, at the nominal rate

of 4s. in the £ on lands, and 2s. 8d. on goods or personality. These S. were first voted in the reign of Richard I. and later came to be a fixed sum of £70,000. In 1398 a subsidy on wool and leather was granted to Richard II. for life. These S. were discontinued after 1663, when a land tax was substituted. 2. A sum of money paid by one state to another under the terms of a treaty, to purchase the service of auxiliary troops, or to acquire the aid of a foreign state in a war against an enemy. Thus Great Britain has at various times paid large S. to nations that have been her allies in war, especially against the Fr. in the eighteenth century. 3. Gov. grants to industries, commercial undertakings, etc., such as those made to shipping and air lines, and grants made to encourage beet sugar growing in this country. The best-known S. in the United Kingdom are the food S. of the Second World War and after. Particulars of the cost of these and other gov. S. in the United Kingdom in the years 1946-48 are given below (condensed from Cmd. 7649).

	1946	1947	1948
	£,000,000

Subsoil, layer of soil which usually occurs under the true soil; it sometimes extends downwards to a great depth, but in a hilly or rocky dist. is frequently absent altogether. It is always lighter in colour than the true soil, and is lacking in organic material, though it often contains plant food which has been washed down. As a rule there is little or no advantage in incorporating any of the S. with the layer above, but if it is broken up by deep digging or by the S. plough, deep-rooting plants are benefited.

Substance, in philosophy, that which exists in itself. This is the essential notion, and as such can be predicated of God. A created S. is that which exists in itself and arrives as a subject in which attributes (accidents) inhere. Such is the teaching of Aristotle and the scholastics, who classified S. according to their perfection as complete (e.g. God, angels) and incomplete (e.g. human and animal souls), and according to their degree of unity as single (God, angels, souls) and complex (man, animal, plant). This view was repudiated by Locke and others, who held that every object has some *fundamental* or *essential* quality, which, being present, preserves its identity, and which, being

removed, it is no longer the same S., but another. According to this system, therefore, S. is unknowable, or at least unknown, to which Kant attached the name *noumenon* (q.v.), while *phenomenon* (q.v.) indicates the exterior knowable quality of group of qualities which shows itself to our senses or is conceived directly by our intelligence. Scholastic philosophy, on the other hand, regards the Kantian doctrine as a contradiction in terms leading to scepticism or agnosticism. See BRUKELEY; DESCARTES; HUME; KANT; LOCKE.

Substitution. In Rom. law no man could 'institute' or name an heir to his own heir who was past pupilarity (minority), so that substituted heirs or S. could take effect only as conditional institutions; i.e. the S. could succeed only in the event of the institute proving unwilling to take up his inheritance. In old Scots law clauses of S. in tailzies (entails) of heritable property gave the substitute a right as heir of provision at what time soever the institute died. S. in wills, marriage contracts and bonds, however, did not as a rule amount to more than conditional institutions.

In mathematics S. is the replacement of one algebraic quantity by another of equal value differently expressed, a device which is particularly useful in the integral calculus where solutions can often be obtained by the introduction of a new independent variable.

Subways, construction under the footways of streets used for telegraph wires, electric light, and power cables, gas, water, and other pipes. These S. are so constructed that there is room for a man to walk and work in, while at intervals inspection entrances are constructed, thus removing the necessity of breaking up the footways when it becomes necessary to repair the pipes underneath. S. are also a feature in the underground system of railways, connecting different tube railways together. Another feature is the construction of S. at the junction of important thoroughfares in cities to avoid the congestion of pedestrian traffic and lessen the danger to life. The Kingsway subway in London is used for electric trams. In the U.S.A. the term is applied to the underground electric railway systems of New York city. Except where they run under the rvs. and at one or two land points owing to the conformation of the terrain, the S. are in no sense 'tubes' like those of London. In the main they are tunnels built at a small distance beneath the surface of the streets. See also TUNNELLING.

Succath, see PATRICK, ST.

Succession. The law of S. is that according to which the S. to the property of deceased individuals is regulated. This may be (a) in cases where a deceased party has died intestate, when the order of S. is according to fixed rules for the most part based on the canon law (see DISTRIBUTION, STATUTES OF; INHERITANCE; and PRIMOGENITURE); (b) according to a settlement (q.v.) by deed, will, or other instrument, under which land or any interest in land or other property stands for the time

being limited (*see* LIMITATION) to or in trust for any persons by way of S.

Succession, Apostolic. *see* APOSTOLIC.

Succession, Intestate. The rules of I. S. as laid down in the Statute of Distributions, 1890, were considerably changed by the Administration of Estates Act, 1925. There is now no separate heir to land. Entirely new rules of succession are applied to a massed estate, irrespective of the character of the assets; these take the form of statutory trusts closely resembling the kind of trusts most usually adopted in modern wills and settlements (*see* SETTLEMENT; TRUSTS AND TRUSTEES). The new code of I. S. applies both to realty (*q.v.*) and personalty. As regards realty, the auct. rule of primogeniture (*q.v.*) or inheritance by the eldest son, the right of dower or the widow's third, and of 'curtesy' or the widower's life interest, gavelkind (*q.v.*), bor. Eng. (*q.v.*), and other special customs are all abolished. As regards succession to personalty: parents are now on an equal footing, a mother is now restored to her former preference over an intestate child's brothers and sisters; relatives of the whole blood are preferred to those of the half-blood; and relatives more remote than first cousins are now excluded altogether from the distribution. Further the widow's first charge of £500 is increased to £1000, and the widower enjoys the same privilege; and finally, the widow or widower now, in addition, succeeds to all the 'personal chattels.'

The Act of 1925 provides that, after payment of funeral expenses, debts, death duties, and costs of administration, the personal representatives are to hold the entire residuary estate on trusts as follows: (1) The widower or widow receives £1000 free of death duties and also the 'personal chattels,' i.e. furniture, plate, books, stores, excluding, however, chattels acquired for business purposes. (2) If the intestate leaves no issue who live to take a vested interest, the personal representatives hold the balance of the residue on trust for the relict for life. (3) If the intestate leaves issue who live to take a vested interest, then, as to one-half of the residuary estate, it is held in trust for the relict for life, and as to the other half, in trust for the issue in their appropriate 'statutory trusts.' If any child has predeceased the intestate its share goes to his or her issue who are alive at the death of the intestate and who reach the age of twenty-one or marry. If any child dies under twenty-one years of age, and unmarried, his share goes automatically to increase the shares of his brothers and sisters. Power is also given by the Act to make advancements out of a share that has not yet vested. (4) If the intestate leaves issue, but no widow (or widower), the whole residuary estate goes to the issue, regard being had to the 'statutory trusts,' or, in other words, a child must have attained majority or have married or marry under the age of twenty-one. (5) If the intestate leaves no issue, the residuary estate, subject to the rights of the relict above mentioned (if any), goes automatically to the intestate's father or

mother or equally to both, if living. (6) If the intestate leaves no issue or parent, then, subject to the right of the relict (if any), the residuary estate is held upon trust for the following persons: (a) brothers and sisters; (b) half-brothers and half-sisters; (c) grandparents in equal shares; (d) uncles and aunts; (e) half-uncles and half-aunts; and (f) the intestate's widow (or widower) absolutely. The life interest of a husband or wife may be redeemed by payment to him or her of a capital sum so as to permit immediate distribution of the whole estate. Nephews, nieces, and cousins take *per stirpes*, as opposed to taking *per capita*; i.e. they take by representation, or, in other words, they take amongst them the share their deceased parent would have taken had he or she survived the intestate. For the former rules of intestate succession, which are still important in tracing title to land, etc., *see* DISTRIBUTION, STATUTES OF.

Succession, Royal. Inheritance by heirs male when applied to the royal office, is the Salic Law (*q.v.*), which prevailed in France and other continental countries. Down to 1688 the Eng. S. was regulated by custom. Parliament claiming some right to intervene. In 1701, when it became evident that both William and his sister-in-law Anne would probably die without issue, the Act of Settlement was passed to provide for the S. after their deaths. This is the Act under which, as modified by the Act of Abdication of Edward VIII., the Crown is still held. It was confirmed, as to the Protestant S., by Acts passed in 1702, 1706, 1707, and 1709. The Act of Settlement (1) declares that if a Papist obtains the Crown the subjects of the realm are thereby absolved of their allegiance; (2) settled the Crown on the Electress Sophia and the Protestant heirs of her body; and (3) expressly excludes any person holding communion with the church of Rome, professing the popish religion, or marrying a Papist. The guiding purpose of the Act of Settlement was to exclude the exiled James II., his descendants, and all other Papists from the S., and in order to do so Parliament sought out the nearest Protestant to the old royal line, and they found her, rather remotely, in Sophia, the youngest and only Protestant of the twelve children of Elizabeth of Bohemia, herself the daughter of James I. No queen before the passage of this Act had succeeded with a wholly undisputed title; but under its terms it is placed beyond doubt that a king's daughter succeeds in preference to her father's, though not to her own, younger brother. It is by virtue of this rule that Queen Victoria ascended the throne instead of her uncle, Ernest, duke of Cumberland (though he inherited Hanover, which was under the Salic Law), and by the same rule that Princess Elizabeth, and not the duke of Gloucester, became heir-presumptive. Her child, Prince Charles Philip Arthur George (b. 1918), follows her and is himself followed by his future descendants of either sex and then by his sister, Princess Anne Elizabeth Alice Louise (b. Aug. 15, 1950), and the latter's

descendants, all these coming before Princess Margaret and her future descendants of either sex.

Succinic Acid ($C_4H_4O_4$), dibasic acid occurring in amber, from which it is prepared by distillation in iron retorts. It can be obtained synthetically from its elements or from ethyl acetoacetate or ethyl malonate. It crystallises in colourless prisms (melting-point $185^\circ C.$), readily subliming, has an unpleasant acid taste, and is only sparingly soluble in cold water, alcohol, and ether.

Succory, see CHICORY.

Succubi, see DEMONOLOGY.

Succulent Plants, those which have developed fleshy parts owing to the storage of food in them. The cacti store food in thick stems, the leaves of which are reduced to scales or thorns, and in many other plants, e.g. the aloe and agave, the leaves are fleshy and packed with food.

Suchet, Louis Gabriel, Duc d'Albuféra (1772-1826), Fr. soldier, b. at Lyons, joined the revolutionary army, and served in Italy and elsewhere. As commander of the left wing of Masséna's army, he repelled the Austrian troops under Melas (1800), and so saved France from a S. invasion. Having assisted in securing the capitulation of Saragossa, he was made generalissimo of the army of Aragon (1809), and in two years pacified that prov. In 1810 he defeated the Sp. general, O'Donnell, and captured Lerida; two years later he crushed Blake's army and occupied Sagunto and Valencia. He went over to the Bourbons in 1814, rejoined Napoleon in 1815, and after a period of exile returned to France in 1819.

Suchow, or Soochow, tn. and treaty port of China, built on a group of is. E. of Lake Tai-hu, 56 m. W.N.W. of Shanghai, in the prov. of Kiangsu. There are silk looms, and the city is noted also for its cheap reprints of Chinese classics. Glass, metal, lacquer, and carved woods are also produced. A splendid city in the Middle Ages, S. has suffered from its demolition at the hands of the Taipings in 1860. Pop. 260,000.

'Sucker State,' see ILLINOIS.

Sucking-fish, term applied to all members of the acanthopterygian family Echeeneidae, the Remoras, in the div. Discoccephali, on account of the suctional oval disk they bear on the upper part of the head. By means of this disk they attach themselves to large floating objects, such as ships, or swift-swimming animals, as sharks, and they are to be found in all seas. Other S. are the suckers, which form the family Gobiocoleidae, and the lump-suckers, which form the Cyclopteridae.

Suckling, Sir John (1609-42). Eng. poet, playwright, and prose writer, b. at Whitton, Middlesex, son of a knight who held office as secretary of state and comptroller of the household to James I. S. studied at Cambridge, and then entered Gray's Inn. He inherited an ample fortune and large estates on the death of his father in 1627, and travelled abroad and is said to have served for a time under Gustavus Adolphus. On his return in 1630 he was knighted. He equipped a troop of men

for Charles's campaign against the Scots, which, however, fled at first sight of the Scots at Duns, an event which was lampooned in the ballad *Sir John Suckling's Campaign*. Later he became involved in a plot to rescue Strafford from the Tower, and had to flee to France, dying in Paris, probably by his own hand.

A wit, very generous, a noted gambler, and the inventor of the game of cribbage, he was highly popular. Though he wrote in more than one medium, it is as a poet that he still lives. Some of his shorter pieces are incomparable for charm and daintiness, such as *Constancy*, and the songs *I prithee send me back my heart* and *Why so pale and wan, fond lover?* S. clearly owes something to Donne, and wrote in the metaphysical fashion of the day. Generally speaking S. excels when dealing with concrete subjects or using imagery with which he is directly familiar. Light-hearted cynicism in the affairs of the heart is a characteristic of his pieces. His works were collected posthumously in *Fragments aurea* (1646). There are collected eds. of his works ed. by W. C. Hazlitt (1874, 1892), and by A. H. Thompson (1910). See life by A. Suckling, 1836, and K. M. Lynch, *The Social Mode of Restoration Comedy*, 1927.

Sucre: 1. State of Venezuela on the Caribbean coast and the gulf of Paria, with Monagas to the S. and Anzoategui to the W. There are petroleum and asphalt deposits. The cap. is Cumana. Pop. 291,000. 2. Or **Chuquisaca** (Indian for 'golden bridge'), tn. in the dept. of Chuquisaca, Bolivia, 8839 ft. above sea level and 48 m. N.E. of Potosi. Its halls of congress and president's palace recall that the city was once the headquarters of gov. S. is, however, the legal cap. and the actual seat of the judiciary, the univ., and the archbishop (La Paz being the actual seat of government). A bishopric since 1552, and the seat of the archbishop of La Plata and Charcas since 1609, it possesses a cathedral dating back to 1553. The univ. of St. Xavier was founded in 1624. The best buildings, besides the cathedral, are the government and legislative palaces, the palace of justice, consistorial building, and Junin College. A rail-car line runs to Potosi. In the vicinity are orchards and vineyards. Pop. 32,000 (including Indians and Cholos).

Sucrose, see SUGAR.

Suction Cleaners, see VACUUM CLEANERS.

Suction Gas Plants, see GAS MANUFACTURE, *Gas for Fuel or Power*.

Sudan, or **Soudan**, formerly the name of a vast tract of equatorial Africa lying south of the Sahara Desert and Egypt, and stretching from Cape Verde on the W. coast to Massowah on the E. It extended south to the Congo basin and the equatorial lakes, with Abyssinia and Brit. E. Africa forming its E. boundary. It was also known as Negritia, or Bilad-es-S., the 'Land of the Blacks.' Later it was divided into three geographical portions: Fr. S. on the W., central S., and the Anglo-Egyptian S. on the E. The S. included Senegal, the Fulah country, portions of Fr. Congo (now Fr. Equatorial Africa), the

Guinea Coast (now split up into various protectorates), part of the Congo Free State (now Belgian Congo), Sokoto, Bornu, Wadai, Kanem, Darfur, Kordofan, and many other minor states. The Fr. extended their possessions by exploration and military occupation from the W. coast eastwards beyond Lake Chad to the borders of the Anglo-Egyptian S., and southwards to the Ubangi and Congo Rts. As the various regions lying within the W. half and southern portions of the S. have, by a series of international conventions and treaties, been delimited (for further details concerning these protectorates and colonies, see the articles on *SUDAN*, *FRENCH*; *SENEGAL*; *NIGERIA*; etc.), therefore only the E. portion, the Anglo-Egyptian S., will be dealt with here.

This region lies south of Egypt and extends southwards to Uganda and the Belgian Congo, a distance of about 1400 m., and from the Chad Military Ter. in the W. to the Red Sea in the E., about 1200 m. It is bounded on the S.E. by Eritrea and Abyssinia. The estimated area of S. is 967,500 sq. m., and the pop. is estimated at 7,547,500, partly Arab, partly Negro, and partly Nubian. Native tribes include the Ababde, Baggara, Bisharin, Denka, and Nuér (see separate articles), and the Hadendoa. The latter were prominent in the Mahdist revolt of 1882 to 1898 (see *MAHDI*), the term 'fuzzy-wunzy' being applied to them and to the Baggara. They are pastoral nomads living between the Abyssinian border and Suakin, in the Nubian Desert, and are included among the Beja (*q.v.*) peoples. Europeans number some 5600. The Nile traverses the region from north to south, with a large bend westwards about lat. 20° N., enclosing part of the Nubian Desert, which extends to the Red Sea coast. The Libyan Desert lies to the immediate W. Where the Nile enters the Anglo-Egyptian S., it is known as the Bahr-el-Jebel (or White Nile), receiving in its course the waters of the Bahr-el-Ghazal and Sobat Rts. At Khartoum it receives the Bahr-el-Azrek (or Blue Nile), an important affluent flowing N.W. from Abyssinia; henceforth it flows on as the Nile, taking in the Atbara above Berber. Between Wadi Halfa and Khartoum there are five of the six Nile cataracts. Along the shore of the Red Sea, running almost parallel to it, is an extensive range of mts., which attain their highest elevations in Jebel Erba (7480 ft.) and Jebel Sotuba (6889 ft.). Ports along a coast-line of nearly 400 m. include Port S. and Suakin; the trade of the former has greatly increased since the estab. of railways. S.W. of Khartoum is Kordofan, a plateau of some 2000 ft. elevation, while further W. is Darfur, with heights exceeding 6000 ft.

The most fertile regions are those lying east and south of Khartoum, watered by the Atbara and the Blue and White Niles. Here there are large areas under durra (the staple native food), millet, sesame, and pulse. The anct. wealth of the S. lay in gold, ivory, slaves, and ostrich feathers; to-day it is cotton which is grown principally in the deltas of

the Gash and Baraka Rs. The lack of a guaranteed grain supply, brought into existence the Gezira irrigation scheme, for the launching of which the Brit. Gov. guaranteed loans to over £11,500,000 sterling to cover the construction of the dam over the Blue Nile at Sennar and the main canalisation. A strict rotation of crops is observed, and the Gezira's anct. claim to be the granary of the S. is well substantiated by the durra (millet) sections. In 1940 the estimated grain crop from the irrigated area was 87,000 tons out of a total of 358,000, and in 1941 109,000 out of a total of 383,000. The scheme enables at present an area of 850,000 ac. to be cultivated between the Blue and White Niles, and one-quarter is under cotton. The S. is the chief source of the world's supply of gum arabic, the finest gum forests, apart from Kordofan, being in the Blue Nile dist. and Kassala. On the banks of the White Nile the soil is not so favourable, but in the forests near by the gum acacia, ebony tree, the rubber creeper, and the bamboo are found. The upper reaches of the Blue Nile flow through dense forests, which extend as far as Abyssinia; here valuable fibres and tanning materials abound. A large supply of papyrus is obtained from the sudd area in the upper reaches of the White Nile. Other products include sesame leaves and pods, ground-nuts, chillies, dates, ghee (clarified butter), hides and skins, timber, trochus, and mother-of-pearl shell, bees-wax, and honey. Cattle and sheep are reared, S. supplying Egypt with much of her meat, and other livestock includes camels, goats, horses, and asses. There are salt-fields near Port S. which, though they already supply all internal needs, leaving some over for export to Abyssinia, are capable of great expansion. Cotton exports in 1947 were valued at £8,437,507, gum at £61,390,776, and cotton seed at £61,607,117. Total exports were valued at £615,494,517. Total imports were valued at £616,773,633, the prin. items being cotton piece-goods and metals and metal products. Trade is carried on chiefly with Britain, Egypt, and India. N. of Khartoum the country is mainly desert, save for narrow strips of cultivated land on the banks of the Nile.

The S. is divided into nine provs. or *mudiriyyas*, under governors or *mudirs*, and each prov. is further divided into dists. under commissioners with Sudanese administrative officials. Most dists. contain local administrations under the control of native local government authorities. Urb. local administration is now mostly in the hands of municipal or tn. councils, which contain a majority of Sudanese and a proportion of elected members. Civil justice is administered by the chief justice and judges of the high court, who are also members of the appeal court, and by subordinate dist. judges. The religious law of Islam is administered by the Muslim law courts in matters of inheritance, marriage, divorce, and family relations generally among the Muslims. There are dist. and prov. courts, and a high court (Makhama) at Khartoum

presided over by the Grand Kadi. There is a S. penal code. Serious crimes come before major courts, consisting of a president and two members. Decisions of major courts must be confirmed by the governor-general, to whom also there is a right of appeal. Lesser crimes are tried by minor courts of three magistrates and by magistrates' courts. In the N. sphere higher education is represented by the Gordon Memorial College, now in process of transition to univ. status. There are two secondary schools, with some 500 pupils. Two junior secondary schools were estab. in 1942 for vocational training. There are about a dozen intermediate schools which prepare boys for entry to the secondary school or for direct entry to minor gov. posts. There are 128 elementary schools for boys and 69 for girls. There are technical schools at Omdurman and Atbara, the latter solely for the needs of the S. railways. In the southern sphere the missions are the main agents of the gov. in education.

The chief tns. are Khartoum, the cap. (pop. 45,000); Omdurman, the Mahdi's cap. (pop. 116,000); Khartoum North (pop. 93,000); Wadi Halfa. Merowe, El Obeid, Port S., Suakin, Kassala, Nahud, Atbara, Wad Medani, and El Damer. The railway from Wadi Halfa to Khartoum was finally completed in 1905, and now Port S., Suakin, Merowe, Karcima (in Dongola), Senna, and El Obeid are also served; the total mileage open is 2013. Gov. passenger and cargo steamers ply the Nile, and regular services are estab. over 2300 m. From Khat, on the upper White Nile, there is motor transport to the Belgian Congo and the Uganda frontier. There are thirty-five wireless stations and about 6400 m. of telegraph and telephone routes. S. Airways operate regular services from Khartoum to Juba, Asmara, El Geneina, and Port S., with intermediate stops.

The N. part of the Anglo-Egyptian S. contains many interesting antiquities, notably the rock-hewn temple at Abu Simbel, the pyramids and temples near Wadi Halfa, and the numerous pyramids at Meroe. Anciently the region, then known as Kush, later as Ethiopia, had great trade with Egypt, and from about 1500 to 1200 B.C. was part of the Egyptian domains. Kush was an independent kingdom, c. 750 B.C. to A.D. 350, the cap. changing from Napala to Meroe about 300 B.C. In the sixth century B. Sudan was converted to Christianity; a century later the Muslims arrived and eventually Christianity was replaced by Mohammedanism. Southern S. remained pagan, for until the nineteenth century it was entirely cut off by the sudd, or barriers of reeds and mud that blocked the Nile. Again under the rule of Egypt, which country was itself ruled by Turkey, the S. was misgoverned. Gen. Gordon was appointed governor-general (1877-79), and attempted its reorganisation. Then, in 1883, occurred the revolt of the Mahdi, resulting, in 1885, in the fall of Khartoum and Gordon's death. The Mahdi's successor, the Khalifa, held his own for nearly

thirteen years, desolating the country and reducing the pop. from 8,500,000 to under 2,000,000. In 1896 Lord Kitchener, having organised a new army, moved forward out of Egypt into Dongola, and in the following year advanced to Abu Hamad and began building the S. railway across the Nubian desert from Wadi Halfa to Abu Hamad. Then, in 1898, a joint Brit. and Egyptian Army marched against the Khalifa's cap., and shattered his power at the battles of Atbara and Omdurman. He himself was killed (Nov. 1st, 1899) at Gedid by a force led by Sir Reginald Wingate. Soon after this the latter succeeded Lord Kitchener as governor-general of the S., and thus began that beneficent period in which the country developed remarkable rapidity in agriculture, trade, communications, and medical services. In twenty-five years, from a state of utter desolation, the country's foreign trade reached more than £13,000,000 and its revenue £6,000,000.

On Jan. 19, 1899, Lord Cromer, the Brit. consul-general then in control of the rehabilitation of Egypt, and who had initiated and carried through the policy of conquest, concluded with the Egyptian Prime Minister, the agreement which since then has governed the status and administration of the S. This agreement gave to the S. a constitution in the form of a condominium between Britain and Egypt. It provided that the governor-general should be appointed by khedivial decree on the recommendation of the Brit. Gov., and should be removed only by such decree with the consent of the Brit. Gov. The governor-general was invested with full legislative powers, but since 1910 a council has been associated with him in the discharge of his executive and legislative powers. In 1943 an advisory council was instituted for the northern S. (the two southern provs. of Equatoria and Upper Nile being excluded), consisting of eighteen Sudanese members nominated by the councils of the six N. provs., three by each prov., council of two members (one Sudanese) chosen from the members nominated by the governor-general to represent social and economic interests. An ordinance was promulgated on June 19, 1948, setting up a legislative assembly and an executive council for the Anglo-Egyptian S., the ordinance being a practical move in the direction of self-government for the Sudanese people.

Egypt's Claim to Sole Sovereignty of the Sudan.—Proposals for the future of the Anglo-Egyptian S. were discussed by the Brit. and Egypt Govs. in 1946 during the treaty negotiations in the autumn of that year. It was tentatively agreed that the titular sovereignty should be vested in the Egyptian Crown, but that the joint administration should continue for some years and the Sudanese should eventually have the fullest freedom in choosing their own constitutional future.

Sudan, French, colony of W. Africa, formed in 1904 from the ters. of Senegambia and the Niger, less the Senegal protectorate, which was returned to Senegal. Until 1920 it was known as the Upper Senegal Niger. In 1933 a part of the Upper Volta was added, and other minor changes were later made. It is bounded N. by the Algerian sphere; S. by the Ivory Coast, Fr. Guinea, and the Upper Volta; W. by the frontier of Fr. Guinea, the Falcémé R. separating it from Senegal, and Mauritania; and E. by the Niger colony. Its area is 582,500 sq. m., and includes two-thirds of the course of the Niger, the Upper Senegal valley, and a large part of the Sahara. The prin. tribes are Hambaras and Mandingo. It supports large herds of cattle, and ground-nuts, millet, maize, cotton, rice, sesame, gum arabic, and karité are produced. Pottery, brickmaking, jewellery, weaving, and leather-making are the native industries. The chief tns. are Bamako, the cap. (pop. 21,200), Kayes (10,000), Sikasso (10,000), Gao (9,400), Ségu (7,600), Ouahigouya (7,000), Timbuctoo (6,500), Goundam (6,000), Dire (6,000), and Djenné (5,300). Bamako and Kayes are joined by railway to the Senegal coast at Dakar. There are air services to Dakar, Brazzaville, and Algiers. Irrigation schemes have been carried out in the Ségu dist. on the Niger R. There are schools in all the prin. tns. There is a Mussulman superior school at Timbuctoo called a *médresa*, and in 1934 a similar institution was opened in Timbédra for sons of chiefs. The colony is under civil administration. The S. is represented in the Fr. National Assembly, the Council of the Republic, and the Assembly of the Fr. Union. Pop. 3,080,000. *See* M. R. Delavignette, *Afrique occidentale française*, 1931; J. Hall, *Timbuctoo*, 1934; and Y. Urvoy, *Histoire des populations du Soudan central*, 1936.

Sudbury: 1. Municipal bor. and mrkt. tn. of Suffolk, England, on the R. Stour, 16 m. S. of Bury St. Edmunds. The tn. consists of three parts in each of which is an interesting fifteenth-century church, and there is a fifteenth-century grammar school. The prin. manufs. are concerned with flour-milling, malting, and textiles, woollen manuf. being introduced by the Flemings in the fourteenth century. In the vicinity are Long Melford and Clare. Pop. 6700. 2. Part of the bor. of Wembley, 8 mi. from Euston, on the

Harrow road. S. has been included in the extensive urb. development of Wembley since 1900. 3. City of N.W. Ontario, Canada, cap. of a dist. of the same name, 300 m. N.W. of Toronto, on the Canadian Pacific and Canadian National Railways. In the dist. 90 per cent of the world's nickel supply is produced; lumbering is also important. S. became a tn. in 1893 and a city in 1930. It is a tourist centre for hunting, fishing, and camping. Pop. 42,000.

Sudermann, Hermann (1857-1928), Ger. playwright and novelist, b. at Matziken, E. Prussia, educated at Königsberg and Berlin. After editing a small political paper, he turned to literature and produced a steady succession of plays and novels, gaining a wide reputation. He later returned to prose and found material in the life and folklore of his Lithuanian home. A collected ed. of his stories and novels appeared in 1919 and of his plays in 1923. There are Eng. trans. of sev. works, including the important novels *The Mad Professor* (1928); *The Wife of Steffen Tromholt* (1929), and *The Dance of Youth* (1930), and the autobiographical *Book of My Youth* (1923). *See* lives and studies by M. Harden, 1903; K. Busse, 1927; S. Goldstein, 1929; and J. Leux, 1931.

Sudetenland, land formerly occupied by the Ger. minority in Bohemia, concentrated chiefly near the Ger. frontier formed by the Sudetic Mts. They were mainly descendants of the Ger. colonists invited by the Premyslid dynasty in the Middle Ages. Before the Second World War they numbered 4,000,000 or over 20 per cent of the pop. of Czechoslovakia, and controlled two-fifths of its industries. This Ger. minority was a useful lever in Hitler's hands to force the gateway into Czechoslovakia. Hence the Nazis alleged that this Ger. minority was always bitterly opposed to its inclusion by the treaty of Versailles in the new state of Czechoslovakia, and that it was ill-treated by the Czechs. Its deputies later pursued an obstructive policy in the Czech chamber, though the Ger. Clericals joined the gov. bloc. President Beneš, while acknowledging that the Sudeten Gers. had grievances, refused to entertain the idea of giving them national autonomy within the state. After the Ger. annexation of Austria, their leader, Henlein, urged on by Hitler, now increased his demands and called upon the Czech Gov. to transfer the Sudetic region to the Ger. Reich. This demand was, of course, rejected, but by the Munich Pact (9.9.) the orderly taking over of the Sudetenland by Germany was provided for. On the basis of the Potsdam Conference some 3,500,000 Gers. were evicted after the end of the Second World War.

Sudetic Mountains, mt. system of S.E. Germany, which extends from the Biezwia basin in Moravia to the Saxony and Bohemia borders. The prin. divs. are the Riesengebirge, Isèrebirge, Glatzer, Adlergebirge, Eulengebirge, etc.

Sue, Joseph Marie (1804-59), Fr. novelist, known as Eugène S., b. in Paris, studied medicine, and served in Spain and at Navarino as an army surgeon. In 1829, on his father's death, he inherited ample means and settled in Paris. The novels *Plick et Plock* and *Atar Gull* were pub. in 1831. In 1835-37 his conspicuous failure, *L'Histoire de la marine française*, was pub. His novels, realistic and ingeniously constructed, had great popular success, perhaps the best known being *Les Mystères de Paris* (1842), describing the underworld of the cap. *Le Juif errant* (1844-45) was an attack on the Jesuits. *Les Mystères du peuple* (1849-56) was suppressed in 1857. In 1848 S., who was an extreme Socialist, was elected a representative of the Assemblée Nationale, but on the election of Napoleon III. was expelled from Fr. ter., and retired to Annecy.

Suetonius, Gaius Suetonius Tranquillus (c. A.D. 75-160), Lat. historian, grammarian, and critic, b. in Rome, the son of a Rom. officer, became an advocate and later *magister epistolarum* to the Emperor Hadrian. His *Vite Duodecim Caesarum* has survived almost complete. A trans. is in Bohn's Classical Library. See F. C. Papes, *Suetonius, Lives of Twelve Caesars* (trans. H. M. Bird), 1931.

Sueur, Eustache le, see **LE SUEUR**. **EUSTACHE**.

Suevi (modern Swabians), Germanic people, said by Caesar to inhabit Baden, and by Tacitus a region to the N. and E. of this.

Suez: 1. Administrative div. of Egypt. Area 101 sq. m. Pop. 108,200. 2. Cap. of the above, a seaport on the head of the gulf of Suez and W. of the S. mouth of the Suez Canal, 76 m. E. of Cairo. Port Ibrahim, 2 m. S. of Suez, is a fine harbour at the entrance to the canal. Pop. (1937) 49,700.

Suez Canal, waterway cut through the isthmus of Suez to connect the Mediterranean and the Red Sea. Such a canal seems to have been constructed in the time of Seti I. (1380 B.C.). The first serious steps towards making the modern canal were taken by Napoleon in 1798, but little progress was made till, in 1854, Ferdinand de Lesseps constituted the *Compagnie Universelle du Canal Maritime de Suez*, and drew up a scheme in concert with two Fr. engineers, Linant and Mougel. This was passed by the International Commission with a few alterations, and the work was begun in 1856. The canal was opened for working in Nov. 1869. The total expenditure of the company was £32,807,822 francs. This company was an Egyptian concern, authorised in 1856, with a capital of 200,000,000 francs in 400,000 shares of 500 francs each. Britain acquired from the khedive in 1875 a total of 176,602 shares for £4,000,000.

The canal was enlarged and improved in 1885-89, the depth finally being 9 metres, and the minimum width in straight parts from 65 to 75 metres, according to location, and on curves 80 metres. The canal

runs from Port Said along the edge of Lake Menzala, through the Bala Lakes, Lake Timsa, and the Great and Little Bitter Lakes to Port Ibrahim. The total length is 103 m., of which 21 m. are in lakes. It can be used by the largest vessels, and the average time of transit is about fifteen hours. A freshwater canal runs from the Nile to Lake Timsa, with branches parallel to the maritime canal. By a convention (Oct. 29, 1888) the canal was exempted from blockade, and vessels of all nations, whether armed or not, are to be allowed to pass through it in peace or war.

The effect of the First World War and the events of the years immediately after it upon the working of the canal was to increase Brit. influence in its control. The strategic importance to India of this waterway was recognised as much by France and Italy as by Britain. Under Article 8 of the Anglo-Egyptian Treaty of 1936 the defence of the S. C. zone is maintained by Brit. troops until such time as the contracting parties agree that the Egyptian Army can ensure, by its own resources, the liberty and entire security of navigation of the canal. Included in the general development of Egypt and the N.E. of Africa, following the First World War, was the building of Port Fuad, a new city opposite Port Said on the Asiatic side of the canal. The S. C. is a source of revenue to both the Fr. and Brit. Govs. The £4,000,000 which the Brit. invested in the purchase of the shares of the khedive of Egypt in 1875 has been repaid in dividends almost tenfold. On March 31, 1945, the Brit. holdings were valued at £32,035,239. The management of the canal is vested in a council of thirty-two administrators, of whom ten are Brit. A swing bridge, constructed after the outbreak of war in 1939, across the canal, estab. communication between Cairo and Beirut.

By the application of Egyptian company law Egypt has secured substantial gains in the control of the canal, particularly in the employment of Egyptian workers and in the appointment of additional representatives on the board. By the agreement of March 7, 1949, between Egypt and the company, the whole property reverts to the Egyptian Gov. at the end of the ninety-nine-year concession in 1968. In the meantime Egypt will take annually 7 per cent of the gross profits, with a minimum of £E350,000. Improvements have kept the canal up to date, and an improvement programme finished in 1933 allows the passage of ships up to 45,000 tons burden. The latest programme, set out in the above convention of March 1949, will cost nearly £5,000,000 and the work will take five years. The canal will be deepened another 20 in., permitting the passage of ships of 36-ft. draught.

The growth in traffic has been enormous. In 1880 2026 ships totalling 3,000,000 tons used the canal. In 1913 the figures rose to 5085 ships and 20,000,000 tons; in 1938 to 6171 ships and 34,000,000 tons; in 1948 to 8686 ships and 55,000,000 tons.

Suez, Gulf of, W. arm of the Red Sea after its bifurcation in lat. 28° N., whence it extends N.W. for 190 m. to lat. 30° N. It lies between Egypt and the Sinai Peninsula. Average breadth, 30 m.

Suez, Isthmus of, neck of land connecting Asia and Africa, having S. the gulf of Suez and N. the Mediterranean, and through which is cut the Suez Canal (*q.v.*). Minimum width, 72 m.

Suffocation, see ASPHYXIA.

Suffolk, Charles Brandon, Duke of (1481-1545), Eng. nobleman and soldier, son of Wm. Brandon, was brought up at the court of Henry VII., with whom he was a great favourite. He distinguished himself in the Fr. campaign in 1513, was created Viscount Lisle in that year, and duke of Suffolk a year later. In 1514 he married Mary, sister of Henry VIII. and widow of Louis XII. of France.

Suffolk, William de la Pole, fourth Earl and first Duke of, see POLE, WILLIAM DE LA.

Suffolk, most easterly, and one of the largest Eng. cos., is bounded by Norfolk, Cambridge, and Essex on the N.W. and south and by the North Sea on the E. The coast line, which is generally low and singularly regular, has been much encroached upon by the sea, a process which is still continuing. On the coast are the well-known watering places of Lowestoft, Southwold, Aldeburgh, and Felixstowe. The surface of the co. is flat on the E. and undulating on the S. and W. In the extreme N.W., near Mildenhall, is a small area of fenland, to the W. of which extend low chalk hills (352 ft.), outliers of the Chilterns. On the N.E. are the Broadlands (*q.v.*) as in Norfolk and around Brandon there is a large tract of heathland known as the Breckland, where many relics of prehistoric man have been found. The rivers are generally small, the most important being the Deben, Orwell, and Stour (forming the southern boundary of the co.), and lesser ones include the Waveney (separating S. from Norfolk), Blyth, Alde or Ore, Lark, Linnet, and Little Ouse. Many of them are navigable in the lower reaches for barges, wherries, and small craft. Nearly all the co. is under cultivation, and the soil, though not rich, is extremely varied and fertile. Barley, oats, and wheat are grown on a large scale, and farming, especially since the Second World War, is in a very flourishing condition. Cattle, sheep, and pigs are reared, but the special local breed of horse, known as S. Punch (see under HORSE), once extensively used for agric. purposes, has to a great extent been displaced by the tractor and mechanical cultivation. The coast fisheries are amongst the most important in England, and Lowestoft handles the bulk of the herring and mackerel catch. Manufs. are chiefly concerned with agric. requirements, and farm implements are made at Ipswich, Stowmarket, and Bury St. Edmunds, and artificial manures (for which coprolites are dug) at the two former places. In addition, there are chemical works, and factories connected with linen, woollen, and horse-hair in-

dustries. Ipswich, the co. tn., and Lowestoft, are both ports, and other important tns. are Bury St. Edmunds (the shire tn. of west S.), Aldeburgh, Beccles, Eye, Southwold, and Sudbury, all of which are municipal bors.; lesser tns. are Bungay, Hadleigh, Halesworth, Haverhill, Saxmundham, Stowmarket, and Woodbridge. Communications are generally good and the co. is traversed by numerous roads, many of which, however, are apt to be somewhat winding. There is an excellent network of railways, though some of the smaller branch lines have been closed and bus services substituted. For administrative purposes the co. is divided into two divs. of E. and W. Suffolk, containing twenty-one Hundreds, and five parl. divs., which include the co. bor. of Ipswich. S. derives its name from having been settled by the South Folk in the latter part of the fifth century. The co. suffered much from the later incursions of the Danes. Walton was the scene of the landing of the earl of Leicester in 1173 when he marched against Henry II. During the fourteenth century S. became one of the richest cos. in England owing to the influx of Flem. weavers from abroad. During the Civil wars it was a stronghold of Parliament. Interesting remains of monastic buildings may be seen at Bury St. Edmunds (Benedictine), Leiston (Premonstratensian) Kersey, Butley and Ixworth (Augustinian), Sibton (Cistercian), and Clare (Austin Friary), and there are castles at Bungay, Clare, Eye, Framlingham, Haughley, Lidgate, and Orford, and fortified manor houses at Mettingham and Wingfield. Many of the numerous churches are of great size and beauty, and they are frequently ornamented with patterns in flint-work. Long Melford, Lavenham, Southwold, Blythburgh, Woolpit, and Mildenhall being the best. Over forty churches have round towers, many of which date from the twelfth century. The domestic architecture is of great interest and Moyses' Hall, Bury St. Edmunds (twelfth century), and Little Wenham Hall (thirteenth century) are the earliest examples. Fine houses are at Hengrave, Helmingham, Long Melford, and elsewhere; Braughes Park and Ickford House are little known mansions in remote country. Area 948,269 ac. Pop. (estimated 1949) 405,000. See A. Suckling, *History and Antiquities of Suffolk*, 1846; 1848; T. H. Bryant, *Suffolk*, 1912; D. Maxwell, *Unknown Suffolk*, 1926; M. R. James, *Suffolk and Norfolk*, 1930; H. M. Cautley, *Suffolk Churches and their Treasures*, 1938; A. Mee, *Suffolk* (King's England), 1947; W. Addison, *Suffolk*, 1950; and Victoria County History.

Suffolk, tn. of Virginia U.S.A., in Nansemond co., 75 m. S.E. by S. of Richmond. Pop. 12,000.

Suffolk Breed, see under SHEEP.

Suffolk Punch Breed, see under HORSE.

Suffolk Regiment, Brit. regiment, formerly 12th Foot, raised in 1685, fought under William III. in Ireland and Flanders, and under George II. at Dettingen. In 1719 it served as Marines in Sir George

Byng's fleet, and was present at the defeat of the Sp. fleet off Messina. In 1743 it took a notable part in the War of the Austrian Succession at Dettingen. It is one of the few select 'Minden' regiments, and also took part in the famous defence of Gibraltar (1779-83), going on to India to gain further honours at Seringapatam. The regiment served in the Kafir war of 1851-53, in the New Zealand war of 1860-1866, and in the second Afghan war of 1878-80. It was again in S. Africa for the war of 1899-1902. During the First World War it raised twenty-three battalions, which served in France, Flanders, Macedonia, Gallipoli, Egypt, and Palestine. In the Second World War the 1st Battalion fought in France in 1940, the 4th and 5th were at the defence of Singapore, the 7th was in N. Africa and Italy with the Royal Armoured Corps, and the 2nd served in Burma.

Suffragan, see BISHOP, *Suffragan Bishops*.

Suffrage, Women's, see WOMEN'S SUFFRAGE.

Sūfism, term based on the Lat. form 'Sufianus,' was introduced in 1821 by the Ger. F. A. Tholuck, to render the Arabic word *ṭasawwuf*, meaning 'spirituality' or 'spiritual theology,' including asceticism, mysticism, and emotional faith. A follower of *ṭasawwuf* is called *sūfī*. The latter word is derived from Arabic *sūf*, 'camel's hair,' and refers to the plain garment worn by the *sūfīs*, resembling the garments of some monks. S. started from practical asceticism (e.g. al-Ḥasan al-Baṣrī, d. 729), and as a revolt against Muslim ritual; it became a distinct religious movement in its final mystico-panteistic form. S. interprets God, the one Being, as infinite moral good and eternal æsthetic beauty, the ecstatic love for whom shall relieve the soul of the pain of human desires. To attain to this ecstasy, S. demands implicit obedience to, and utter concentration of the mind emotionally and intellectually on, the Divine Being. Although often associated with Buddhism and with Christianity, it is probable that the strongest external influence which has affected S. is Neo-Platonism, which reached the Muslim world through the trans. into Arabic of works like the *Theology of Aristotle* (trans. during the caliphate of al-Mu'tasim, 833-842), but in the main it was a purely internal and national reaction, analogous in a way to Christian mysticism of the Middle Ages. There was a long struggle between S. and the other Muslim theological schools. S. has coloured almost the whole of Persian literature. See R. A. Nicholson, *The Mystics of Islam*, 1914, *Studies in Islamic Mysticism*, 1921, and *The Idea of Personality in Sūfism*, 1923.

Sugar, name of a class of sweet-tasting carbohydrates, which is subdivided into simple Ss. or monosaccharoses and the compound Ss. di- and trisaccharoses, etc. The mono compounds are termed pentose, hexose, heptose, according to the number of carbon atoms, 5, 6, or 7, in the molecule. They are hydroxy derivatives of paraffin hydrocarbons with an aldehyde or ketone group in the molecule (hence termed aldose

or ketose Ss.) from which their property of reducing Fehling's solution is due. Pentoses have the general formula $C_5H_{10}O_5$ and hexoses $C_6H_{12}O_6$. Examples of the former are arabinose and xylose and of the latter dextrose (glucose or grape sugar) and levulose (fructose or fruit sugar.) The disaccharoses have the general formula $C_{12}H_{22}O_{11}$ and include sucrose (cane S., the ordinary S. of commerce, whether derived from cane or beet); maltose (malt S.); and lactose (milk S.). Raffinose, $C_{18}H_{32}O_{16}$, is the best-known trisaccharose. Di- and trisaccharoses in water solution can be split into constituent monosaccharoses by heating with dilute acids or by action of enzymes. In this reaction one or two molecules of water are absorbed and the change is termed hydrolysis. Sucrose by hydrolysis yields glucose and fructose, the mixture being known as invert S. because the optical rotation of the solution is changed from the positive due to sucrose to the negative due to invert S. Invert S. with a little sucrose constitutes the major part of honey and, with rather more sucrose, golden syrup, the residuum being water and salts. In jam manuf. some inversion of sucrose is due to acidity of the fruit. Maltose on hydrolysis yields two molecules each of glucose and galactose. Sucrose, the most important S. and the most easily assimilable of all Ss., is very soluble in water, 3 parts to 1 at ordinary temp. and increasing with temp. rise, it is insoluble in absolute alcohol but will dissolve in aqueous alcohol. It crystallises from water in monoclinic prisms and melts at c. 188° C., giving a glassy mass on cooling (barley S.). Prolonged heating causes gradual dehydration, darkening, and production of caramel. Concentrated sulphuric acid or hydrochloric acid chars S. with the characteristic odour of burnt S.

Sucrose is commercially extracted from the stem of the S.-cane or from the root of the S.-beet. Smaller quantities are also obtained from S.-palm, S.-maple, and sorghum cane. The S.-cane contains 11 to 15 per cent S. and its juice 8 to 21 per cent. The latter is squeezed out in roller-crushing mills under great pressure, and the juice, after heating and clarifying by addition of lime cream to precipitate impurities (non-Ss.), is settled in tanks and the clear juice separated. Steam-heated quadruple effect evaporators concentrate it and it is then boiled in vacuum pans at low temp. to yield massecuite, a mixture of S. crystals and mother syrup. The latter is separated by spinning the massecuite in high-speed centrifugal machines. The mother syrup is reboiled, yielding a further crop of S., and its residual syrup reboiled a third time, yielding from the centrifugals a third crop of S. and cane molasses. The latter is economically exhausted of sucrose, although it still contains 35-45 per cent. The mixed Ss. constitute the brown raw cane S. which is sent to refineries for further purification by the carbonation process (lime and carbon dioxide gas) and bone charcoal process after which boiling yields the white

refined S., granulated, caster, icing, and cube. S.-beet roots contain on average about 17 per cent sucrose and the juice 12-15 per cent. The roots are washed, sliced, and extracted by hot water in diffusion batteries or continuous counter-current vessels and the juice purified by the carbonation process; after filtration follows a procedure identical with that in the cane S. industry. Raw beet S. also needs refining. The molasses from beet S. contains about 50 per cent sucrose. U.S.A. and continental practice is to treat it by the Steffan lime process or the barium process to recover more S., but this is not the custom in the United Kingdom. Both cane and beet factories may produce white S. by further purification of the clarified or the carbonated juice respectively, but the products are rarely of the high purity of refined S.

World production of S. in thousands of metric tons for 1948. Beet, Europe (including U.S.S.R.) 6517, of which the United Kingdom produced 484; U.S.A., 1644; Canada, 79. Cane, W. Indies, 7021; Central and S. America, 3419; Canada and U.S.A., including Atlantic and Pacific possessions, 2492; Asia, 2082; Africa, 1427; Oceania, 884.

See G. Purrie, *Sugar*, 1925; International Sugar Council, *Sugar Year Book*, 1918; N. Decerr, *History of Sugar* (vols. I and II), 1949 and 1950.

Suggia, Guilhermina (1888-1950), Portuguese cellist, b. m. Oporto of It. descent, studied under her father and under Klingel at Leipzig. Following her début at Leipzig Gewandhaus concerts, she toured Europe. In 1906 she married Pablo Casals (q.v.), and gave up concert playing for six years. In 1912 she again toured. Later she settled in London, and gained Eng. nationality by her second marriage.

Suicide. A *felo de se* or S. is by Eng. law a person who, being of years of discretion and in his senses, takes his own life. The absence, real or supposed of this last condition is now very generally assumed by coroners' juries in order to save the reputation of the deceased, to ensure Christian rites of burial, and, doubtless, to express sympathy with deceased's dependants. It is also, by Eng. law, S. to kill oneself unintentionally in an endeavour to kill another maliciously. If two persons agree to commit S. together and one escapes and the other dies, the survivor is guilty of murder. The ann. figures of suicides in the United Kingdom showed a steady decline from 1938 to 1942; they then began to increase, showing an especially marked rise in 1946 as compared with 1945; the figure for 1947 was 4710, that for 1938 being 5794.

Suidæ, see **Pto.**

Suidas, Gk. lexicographer of about the tenth or eleventh century A.D. His lexicon is frequently quoted by Eustathius (twelfth to thirteenth century). It is an encyclopædic dictionary, with numerous literary quotations of considerable value, though uncritical and unequal. It was compiled from numerous writers, and it contains many passages from anc. writers whose works are lost.

Suifu, or **Suchowfu**, tn. of Szechwan, China, on Yangtze, 130 m. S.W. of Chungking. It is a trade centre, chiefly with Yunnan. Pop. 80,000.

Sui Juris (Lat. 'in his own right'), legal phrase borrowed from the Rom. law of emancipation, denoting a person who, not being an infant, lunatic, married woman restrained from anticipation, or otherwise under any legal disability (see **RESTRAINT UPON ANTICIPATION**) is legally capable of managing his own affairs, or of suing and being sued in his own right. In the law of trusts where there is only one beneficiary interested in the trust property, and such person is S. J., the trustee's *raison d'être* is gone and the beneficiary can call for a conveyance of the full legal estate.

Suir, riv. of Eire, rising in Tipperary, flowing S. past Thurles and Caher, and past Clonmel, Carrick, and Watford, and uniting with the Barrow to form Watford Harbour. Length 100 m.

Suite, form of instrumental music. The governing principle of the S. is the stringing together of a number of movements, originally dances, but now any pieces the composer desires, including chosen numbers from operas, ballets, etc.

Tate Gallery

SUGGIA, BY AUGUSTUS JOHN

Suiyuan, prov. of Inner Mongolia, N. China. It has eighteen cos and two administrative bureaux. The cap. is Kweisui. Farming is the chief occupation of the central area, which is linked by a series of canals with the Yellow R. Products include wheat, coal, and livestock. The inhab. live a nomadic agric. life. Area 134,146 sq. m. Pop. 2,167,000.

Sujbulak, see **SAJJBULAKH**.

Sukkur, or **Sakkar**, tn. and dist. of Sind, Pakistan, on the Indus. The tn. is the starting point of the railway traversing the Bolan and Nari passes to Quetta,

The Lloyd Barrage (*see under* LLOYD OF DOLOBRAN) lies near by. There are railway carriage works. Area of dist. 5550 sq.m. Pop. 6,926,600. Pop. of tn. 86,500.

Sukwo, *see under* MELANESIA.

Sulaimaniya, or **Suleimaniye**: 1. N.E. prov. (*Uwa*) of Iraq, in Kurdistan, bordering on Persia. Pop. 222,700. 2. Cap. of the above, a centre for trade with Persia. Pop. 30,000.

Suleiman, *see* SOLYMAN.

Suleimaniye, *see* SULAIMANIYA.

Sulimov, cap. of the Cherkess Autonomous Region of the R.S.F.S.R., 60 m. S. of Voroshilovsk, in an agric. dist.

Sulina: 1. Centre of the three estuarine arms of the Danube, flowing through the Dobrudja. Length, 50 m.; width, 100 yds.; depth, 15 to 60 ft. 2. Port of Dobrudja dist., Rumana, at the mouth of the above, 120 m. N.E. of Constanta. Grain, wood, wine, and cattle are exported. Pop. 6000.

Sulla, name of a Rom. patrician family of the Cornelia gens.

L. Sulla (138-78 B.C.), surnamed *Felix*, the Dictator. He was questor in 107, when he served under Marius in Africa, and also with great distinction in the campaigns against the Cimbri and Teutones; but Marius becoming jealous of the rising fame of his officer, S. in 102 changed to a command under the colleague of Marius, Q. Catulus, who entrusted the chief management of the war to S. S. now returned to Rome. He was praetor in 93, and in the following year was sent as propraetor into Cilicia, with special orders to restore Ariobarzanes to his kingdom of Cappadocia, from which he had been expelled by Mithridates. S. met with complete success. The enmity between Marius and S. now increased, and S.'s increasing reputation had already led the aristocratic party to look to him as one of their leaders; but the breaking out of the social war subdued all private quarrels. Marius and S. both took an active part, but the achievements of S. threw those of Marius into the shade. S. gained some brilliant victories over the enemy, and took Bovianum, the chief tn. of the Samnites. He was elected consul for 88, and received from the Senate the command of the Mithridatic war. Marius, envious at not having received the command, obtained the expulsion of S., but S. returned to Rome at the head of his legions, which resulted in the proscription of Marius and his leading adherents. S. set out for Greece at the beginning of 87, in order to carry on the war against Mithridates. After driving the generals of Mithridates out of Greece, S. crossed the Hellespont, and early in 84 concluded a peace with the king of Pontus. S. now prepared to return to Italy, where, during his absence, the Marian party had obtained the ascendancy. He landed at Brundisium in the spring of 83. In the following year the struggle with the Marian party was brought to a close by the decisive victory gained by S. over the Samnites and Lucanians under Pontius Telesinus before the Colline gate of Rome. This victory

was followed by the surrender of Praeneste and the death of the younger Marius. S. was now master of Rome and Italy, and one of his first acts was to draw up a list of his enemies who were to be put to death, called a *Proscriptio*. S. had been appointed dictator for as long a time as he judged to be necessary, during which period he endeavoured to restore the power of the aristocracy and Senate, and to diminish that of the people. In order to strengthen his power, S. estab. military colonies throughout Italy. S. likewise created at Rome a kind of bodyguard by giving the citizenship to a great number of slaves who had belonged to persons proscribed by him. After holding the dictatorship till the beginning of 79, S. resigned this office, to the surprise of all classes. He retired to his estate at Puteoli, and there died in the sixtieth year of his age. *See* T. Mommsen, *History of Rome* (vol. iv.) and C. Oman, *Seren Roman Statesmen*, 1902.

Sullana, tn. of Peru, S. America, in the dept. of Pura on the Chura It., and on the Payta-Pura railway. Pop. 12,000.

Sullivan, Sir Arthur Seymour (1842-1900), Eng. composer, *b.* in London. He entered the Chapel Royal choir in 1854, shortly afterwards studying at the Royal Academy under Stendale Bennett and Goss. His first important work was an overture, written during his student days at Leipzig (1858), where, with Franklin Taylor, Carl Rosa, and J. F. Barnett, he was a pupil at the Conservatoire; his masters included Plaidy, Moscheles, and Richter. As the associate of Sir W. S. Gilbert, he wrote many light operas for the Savoy, e.g. *H.M.S. Pinafore* (1878); *Pirates of Penzance* (1880); *Patience* (1881); *Iolanthe* (1882); *Mikado* (1885); *Iolanthe* of the *Guard* (1888); *Gondoliers* (1889). S. also composed choral works: *Light of the World* (1873), *Martyr of Antioch* (1880), *Kenilworth* (1884), and *Golden Legend* (1886); the grand opera *Traviata* (1891); and other operettas such as *The Rose of Persia* (1900), anthems, hymn tunes, etc. *See* life, letters, and diary by H. Sullivan and N. Flower, 1935, and life by J. Thorpe, 1918.

Sully, Maximilien de Bethune, Duc de (1559-1641), Fr. statesman, *b.* at Rosny. In 1572 he was placed by his father, the baron de Rosny, in the service of Henry, the young king of Navarre. His father died about 1575 and left him entirely his own master. At first Rosny accepted an ensigncy in the regiment of foot of which his relation Lavardin was colonel. He was persuaded in 1581 to accompany the duke of Anjou to the Netherlands, but he returned in 1583 to the king of Navarre, and was almost immediately dispatched to Paris to watch the intrigues there going forward. In that year he also married Anne de Courtney who died, however, in 1589. By his second wife, Rachel de Cocheflet, whom he married in 1592, he had nine children. Rosny's devotion to the cause of Henry was deep and unalterable; he was employed in many delicate and difficult negotiations, and at the battle of Coutras (1587), where he commanded

the small park of artillery, he contributed much to the victory. The services of Rosny, after the assassination of the Fr. king Henry III., and until the entry of Henry IV. into Paris (March 1594), were great. He was appointed a member of the great council of finance (1596). His first step was to obtain the appointment of a commission of inquiry into the state of the revenue and its collection. He was soon afterwards promoted superintendent of finance, and entered upon his duties with great zeal. S. decreased taxation and reformed the corrupt system of collection, and greatly improved the finances of the country. His success in this dept. led to his appointment as grand-master of the artillery, director of the marine, master of works, and director of bridges and highways. He became in fact sole minister of France. In 1606 he was created duc de Sully and a peer of France. The murder of Henry IV. in 1610 terminated the career of S. as minister, but he retained sev. offices, in which he continued to be active. He was appointed a marshal of France by Louis XIII. in 1634. In his later years he prepared his *Mémoires* of the great and royal economies of Henry IV. for pub. These were pub. between 1634 and 1662 (Eng. trans. 1756, 1856). See studies by E. Lavisse, 1880, and II. Carre, 1932.

Sully-Prudhomme, René François Armand (1839-1907), Fr. poet, b. and educated in Paris. His works, mostly of a philosophical nature, include *Stances et poèmes* (1865); *Les Épreuves* (1866); *Les Solitudes* (1869); *Les Destinées* (1872); *Les Vaines tendresses* (1875); *La Justice* (1878); *L'Expression dans les beaux arts* (1884); *Le Bonheur* (1888); *Réflexions sur l'art des vers* (1892); a metrical trans. of the *De rerum natura* of Lucretius; and *Étude sur Pascal*. He was elected to the Academy in 1881, and received the Nobel prize for literature in 1901. His best work is marked by a severe beauty of form and a serene melancholy of thought, and often shows great intellectual power. S.-P. believed that happiness could only be achieved by brotherly love, self-sacrifice, and pain. His *Journal intime* was pub. in 1922. See studies by Camille Hémon, 1907; E. Zyromsky, 1907; E. Estève, 1925; and P. Flottes, 1930.

Sulphate of Magnesia, see EPSOMITE.

Sulphite Wood Pulp in paper manuf. is prepared from coniferous wood from which bark and knots have first been removed. The wood is then crushed and boiled in lined boilers of large capacity with bisulphite liquor. Digestion may take 20 hrs. under 75-lb. steam pressure or 80 hrs. under 45-lb. pressure. The earliest patent for the process was taken out in 1867 by Silghman, but was not commercially successful until Ekman's improvements in 1890. There are large sulphite pulp mills at Corner Brook, Newfoundland.

Sulphonal, $(\text{CH}_3)_2\text{C}(\text{SO}_2\text{C}_2\text{H}_5)_2$, is prepared by condensing acetone with ethyl mercaptan in the presence of hydrochloric acid, and oxidising the resulting mercaptole with permanganate. It forms colourless crystals (melting-point 126°C .) slightly

soluble in water, and is used largely as a hypnotic or soporific (dose 15-45 grains).

Sulphonamides. These drugs were discovered in 1935 by Domagk, working for the Ger. firm of Bayer (I. G. Farbenindustrie, Elberfeld); he showed that the aniline dye prontosil was effective in controlling an infection of mice by the lethal bacteria known as hemolytic streptococci. The numerous antiseptics already known to be capable of destroying bacteria were too toxic for use in the body, though Ehrlich had introduced salvarsan in 1909 as a means of combating spirochaetes, which are closely related to bacteria, and mepacrine (atebrin) was used in 1930 against the malarial parasite, a protozoal animal. In 1936 Colebrook at Queen Charlotte's Hospital used prontosil clinically for patients suffering from puerperal (childbed) fever, caused by hemolytic streptococci. In the same year also Fr. workers at the Pasteur Institute were able to show that the active part of the prontosil molecule was sulphonamide.

$\text{NH}_2\text{—}\langle\text{—}\rangle\text{—}\text{SO}_2\text{NH}_2$, the simplest S., from which many others have since been prepared by replacing a hydrogen (H) atom in the SO_2NH_2 group with another radicle. Sulphapyridine, for example, con-

tains the pyridine molecule $\langle\text{—}\rangle$ and is

whilst sulphaguanidine contains guanidine

The S. vary somewhat amongst themselves in their action, but they are in general effective not only against the hemolytic streptococci of puerperal fever, tonsillitis, erysipelas, etc., but also against the bacteria of pneumonia, gonorrhoea, and staphylococcal infections. S. have certain disadvantages; they may cause nausea and vomiting; owing to their low solubility they are liable to crystallise in the kidneys and impede the flow of urine unless ample fluids are taken; in susceptible persons they cause a rash. They may also cause agranulocytosis i.e. a shortage of granulocytic white corpuscles in the blood. The S. have been partly, but not entirely, supplanted by penicillin (q.v.) and other antibiotics. See II. Hawkins and J. Stewart Lawrence, *The Sulphonamides*, 1950.

Sulphur, symbol S, atomic number 16, atomic weight 32.06, a free-metallic element which occurs in the free state chiefly in volcanic dists., e.g. Italy and Sicily, Iceland, Japan, Texas, and Louisiana, U.S.A. In combination with other elements

S. is widely distributed, occurring in the sulphates gypsum (CaSO_4), heavy spar (BaSO_4), and Epsom salts (MgSO_4), and also in the sulphides of zinc (blende), lead (galena), antimony (stibnite), and in pyrites. To free natural S. from earthy impurities it is stacked in brick kilns having a sloping floor and ignited with burning brushwood. Some S. burns and the heat of its combustion causes the remainder to melt and flow away from the impurities into rough moulds. About one-third of the total S. present is wasted by this method. Pyrites is sometimes burned in order to obtain S., but more generally the pyrites is roasted with excess of air to obtain S. dioxide for the sulphuric acid manuf. A great source of the supply of S. was the alkali-maker's waste (see ALKALI). The S. was obtained from this material by Chance's process, which consists in decomposing the moist waste with lime-kiln gases (carbon dioxide). Calcium carbonate and hydrogen sulphide are the ultimate products of the reaction, the latter of which is either burned with excess of air to S. dioxide and used in the sulphuric acid manuf., or burned with a limited supply of air and the S. obtained in the free state. The crude S. thus obtained is purified by distillation from iron retorts into brickwork chambers. In these chambers the S. condenses and forms a powdery deposit, the 'flowers of S.' of commerce. As the distillation goes on the temp. rises, the powder melting to an amber-coloured liquid which is run out into wooden moulds, forming the well-known 'roll S.' In the Frasch process, used in the U.S.A., superheated water is forced down into the S. (*in situ*, below ground). The S. melts and is forced to the surface, together with air, by means of special pumps. The process is very efficient, and most of the S. of commerce and industry is now obtained in this way. S. exists in the allotropic forms: octahedral (α), monoclinic (β), and amorphous (γ), also as nacreous (crystalline), plastic, and colloidal, whilst there are two forms of liquid S. (λ and μ). The vapour of S. is a mixture of S_8 , S_6 , S_4 , S_2 in varying proportions according to temp. Native S. is octahedral, and is a pale yellow solid, soluble in carbon disulphide and in benzene, turpentine, etc. It is an extremely bad conductor of electricity and heat. At 114.5°C . S. melts to an amber-coloured mobile liquid. When the temp. is further raised, the liquid darkens in colour and becomes more viscid, until at 230°C . the liquid appears almost black and cannot be poured from the vessel. Further rise of temp. causes the liquid to regain its mobility, and at 448°C . it boils to a brownish vapour. Prismatic S. is obtained when melted S. is allowed to cool under ordinary conditions, or when crystallised from a hot solution in oil of turpentine. It forms monoclinic crystals which melt at 120°C . Monoclinic S. is not stable, but slowly passes to the rhombic form at ordinary temps. Plastic S. is formed when melted S. is poured into water. It is tough and elastic and insoluble in carbon disulphide, but is

unstable and in a few days passes to the rhombic state. The amorphous variety of S. is insoluble in carbon disulphide, and can be obtained by adding hydrochloric acid to a solution of sodium thiosulphate. 'Flowers of S.' is mostly the octahedral or rhombic variety, although some amorphous S. is present. 'Milk of S.' used in medicine is produced by the action of hydrochloric acid on calcium polysulphide. S. burns easily in air, forming S. dioxide. It combines directly with many metals and non-metals, forming sulphides, e.g. iron and copper burn brightly in S. vapour. S. is used as an insulator in pyrotechnics and in medicine as an aperient.

A few of the more important simple compounds of S. are the following: *Hydrogen sulphide* or sulphuretted hydrogen (H_2S) is a gas which escapes from volcanoes, and is also found in some mineral waters which are reputed cures for rheumatism and some skin diseases. It is commonly prepared by the action of dilute hydrochloric acid on ferrous sulphide in a Kipp's apparatus ($\text{FeS} + 2\text{HCl} = \text{H}_2\text{S} + \text{FeCl}_2$). Hydrogen sulphide is a colourless, poisonous gas, with a smell like that of rotten eggs. It is fairly soluble in water, its solution being slightly acid to litmus. It burns in air with a lilac flame, forming S. dioxide, water, and free S. Its value in the laboratory is as a reducing agent and on account of the fact that it precipitates the sulphides of certain metals from solution. The gas is absorbed by lime, with the formation of calcium hydrosulphide, and also by calcium sulphide (see *Chance's process* above). *Sulphur dioxide*, sulphurous anhydride (SO_2), is a gas met with in the emanations from volcanoes, and is formed wherever S. or its compounds are burned in air. For the manuf. of sulphuric acid, S. dioxide is prepared by roasting pyrites in air $4\text{FeS}_2 + 11\text{O}_2 = 2\text{Fe}_2\text{O}_3 + 8\text{SO}_2$. The laboratory method of preparation consists in heating copper turnings or S., with sulphuric acid, or by the action of an acid on a sulphite, when the gas is evolved. S. dioxide is a colourless gas with a suffocating smell, and is very soluble in water (1 vol. of water at 0°C . dissolving 80 vols. of gas), forming an acid solution (see *Sulphurous Acid*). The gas is easily liquefied (at -10° under ordinary pressure) and is thus supplied in that condition in syphons. The liquid is used as a refrigerator, low temps. being produced by its rapid evaporation. The solution of the gas in water is used as a reducing agent and for bleaching straw and wool. S. dioxide is used as a disinfectant and as an 'antichlor' to remove last traces of chlorine from articles bleached with the latter. *Sulphur trioxide*, sulphuric anhydride (SO_3), is produced when a mixture of oxygen and S. dioxide is passed over heated platinised asbestos, or it may be conveniently prepared by gently distilling pyrosulphuric acid. It is a white crystalline solid (melting-point 15°C .) which fumes in contact with air and combines violently with water to form sulphuric acid.

Sulphuric Acid, *Hydrogen Sulphate*, or *Oil of Vitriol* (H_2SO_4), is formed when

sulphur trioxide is dissolved in water. Commercially the acid is formed by two processes—the 'Chamber' and the 'Contact' processes.

Chamber Process.—This depends upon the formation of sulphur trioxide from the dioxide and the subsequent solution of the former in water. Sulphur dioxide does not become oxidised to the trioxide without the aid of a catalytic agent. When sulphur dioxide and oxygen are mixed with nitrogen peroxide in the presence of steam a series of reactions takes place resulting in the formation of S. A. The exact course of the reaction is still incompletely understood, but the following simple scheme is often adopted:

If a meagre supply of water is present, white crystals of nitrosylsulphuric acid, $\text{SO}_3(\text{OH})\text{NO}_2$ (chamber crystals), appear, and it is probable that this compound represents an intermediate stage in the formation of S. A. by the chamber process. The sulphur dioxide is produced by burning sulphur or more generally by roasting pyrites in kilns with a regulated supply of air. Sometimes spent oxide (ferrie oxide which has been used to remove sulphuretted hydrogen from coal gas) is used as the source of sulphur for the production of sulphur dioxide. The supply of nitrogen peroxide requires to be replenished owing to loss, the gas being generated by the action of S. A. on nitre contained in earthenware pots and placed in the flue of the pyrites burners. Three to four parts of nitre are required for every 100 parts of sulphur burnt as pyrites. Recently the oxides of nitrogen have been obtained from ammonia by a catalytic process involving the use of platinum gauze. The S. A. plant consists of four main parts, viz.: Apparatus for (1) producing sulphur dioxide; (2) for the production of oxides of nitrogen; and (3) for the absorption of oxides of nitrogen from the gases leaving the chambers; and, (4) lastly, the chambers in which the reactions take place. The hot gases are first passed through a chamber to remove any suspended dust, and then into the Glover tower, which is packed with flints, stone, or quartz. Down this a stream of S. A. containing nitric oxide dissolved from the Gay-Lussac tower (see below) is allowed to spray, and the ascending gases expel nitric oxide from the descending acid, whilst the oxygen present converts the nitric oxide to nitrogen peroxide. Some chamber acid is also allowed to flow down the tower and is concentrated thereby. From the Glover tower the gases next pass to the bottom of the lead chambers, where sprays of water are introduced through the roof, when the reaction proceeds which results in the production of S. A. Nitric oxide is formed and is oxidised to nitrogen peroxide. The lead chambers are supported at a considerable height above ground on cast-iron columns. The material of the chamber is pitch pine lined with

lead sheeting (weighing about 6 lb. per sq. ft.). Each chamber is about 100–130 ft. long, 20–30 ft. wide, and 25 or even more feet high. Great care is essential in the construction and workmanship of these chambers. After the bases have reacted in the chambers they pass next to the Gay Lussac tower, which is packed with coke. Strong acid pumped from the Glover tower trickles down, and this dissolves any remaining oxides of nitrogen in the gases. The acid is then pumped back to the Glover tower. S. A. collects in the chambers and is withdrawn when it reaches a sp. gr. of 1.6, otherwise the leaden chambers are corroded. The acid if so required is further concentrated in leaden pans, or if a high degree of concentration is wanted, in glass or platinum vessels. Impurities, such as lead sulphate, arsenic, and oxides of nitrogen, are generally present in the acid. The arsenic is removed by precipitation as the sulphide and other impurities are got rid of by distilling the acid after addition of ammonium sulphate. In modern practice the lead chambers are often entirely dispensed with, and are replaced by one or two extra Glover towers, in which the formation of the acid takes place.

Contact Process. The principle involved in this method is that sulphur dioxide and oxygen unite to form sulphur trioxide in the presence of a suitable catalyst, at temps. which are not too high. A mixture of sulphur dioxide (from burning sulphur or from roasted pyrites) and air is cooled, thoroughly freed from dust and other impurities by passing through dust chambers, washed with a small amount of alkali, and then, after being heated to about 400–450 °C., subjected to the action of a catalyst. In the Béchamp process the catalyst is made of platinum asbestos, spread in layers in vertical steel cylinders. The gases pass up outside these tubes and are then deflected through them. Great care must be taken to ensure that the temp. does not rise too high. The resulting gases, which contain sulphur trioxide, are then treated, and the sulphur trioxide is absorbed in strong S. A. (97–98 per cent), water being added so as to keep pace with the absorption of the trioxide and to maintain the acid at about the same strength. Ferrie oxide and vanadium preparations are also employed instead of platinum as the catalytic agent. Other methods have been tried from time to time for the manufacture of S. A., and amongst them may be mentioned the method which uses as the starting point calcium sulphate, a substance which occurs in the mineral form as gypsum and anhydrite.

S. A. is a colourless, oily liquid (sp. gr. 1.84) which has a great affinity for water. The strongest acid contains about 2 per cent water, and on cooling to 0 °C. this acid forms colourless crystals which melt at 10.5° C. On account of its powerful affinity for water, the acid is used as a desiccating agent. If the acid is poured on wood or sugar the elements of water are withdrawn and carbon left. The mixing of the acid with water is accompanied by a great evolution of heat, hence

care must be taken when mixing, otherwise explosive ebullition takes place. S. A. is used in the Lobblanc process for carbonate of soda, in galvanising, tinning, explosives, artificial silk, plastics, and aerated water industries and many others, and in the production of dyes, and many important organic 'intermediates.' The acid is dibasic, forming both normal and acid salts. Of the normal salts, *seu.* occur in nature, viz. barytes (BaSO_4) and Epsom salts (MgSO_4). The sulphates are mostly soluble in water, those of lead, calcium, and strontium are only sparingly soluble, while barium sulphate is insoluble in water and in acids. This last salt is, therefore, used as a test for the presence of the acid. Addition of a soluble barium salt to a sulphate is followed immediately by the precipitation of the insoluble barium sulphate. The acid salts are similar in properties to the normal salts, but have an acid reaction. The alums are a well-known group of double sulphates (*see* ALUM). Pyrosulphuric, Nordhausen, or fuming S. A. is obtained by dissolving sulphur trioxide in S. A., and was formerly prepared by the distillation of ferrous sulphate in clay retorts. It is a colourless, strongly fuming liquid (sp. gr. 1.88) and solidifies on cooling to a crystalline mass (melting-point $35^\circ \text{C}.$). It forms a stable series of salts known as the disulphates. *See also* OLEUM. *See* H. A. Auden, *Sulphuric Acid and its Manufacture*, 1930, and A. M. Fairlie, *Sulphuric Acid Manufacture*, 1936.

Sulphuric Ether, *see* ETHER.

Sulphurous Acid is known only in solution and is contained in a solution of sulphur dioxide in water ($\text{SO}_2 + \text{H}_2\text{O} = \text{H}_2\text{SO}_3$). *Seu.* hydrates with six, ten, and fourteen molecules of water are known. The solution smells strongly of sulphur dioxide and gradually oxidises in air to sulphuric acid. It is dibasic and forms two series of salts: normal sulphites prepared by the action of excess of hydroxide or carbonate of the metal upon the acid, *e.g.* sodium sulphite (Na_2SO_3); acid sulphites such as potassium hydrogen sulphite (KHSO_3) prepared by having excess of acid acting on the hydroxide. The alkaline sulphites are soluble in water, the sulphites of other metals being insoluble or nearly so. The metabisulphites (*e.g.* $\text{K}_2\text{S}_2\text{O}_5 \cdot \text{SO}_2$) and the bisulphites are also derivatives of the acid and are used in photography. Chemically the sulphites and the acid are reducing agents.

Sultan, Muslim title of dignity borne by numerous E. and African rulers; *e.g.* those of Turkey (until 1922) and Morocco. The former was the 'Sultan of Sultans' or 'Padishah.'

Sultanabad, tn. in the prov. of Hamadan, Persia, 80 m. S.W. of Qum, on the Trans-Iranian Railway. There is trade in carpets. Pop. 35,000.

Sultanpur, dist. and tn. of the United Provs., India, 60 m. N.E. of Allahabad, on the Gumbi R. Area of dist. 1699 sq. m. Pop. 1,100,400. Pop. of tn. 10,500.

Sulu (Sooloo, Yolo, or Jolo) Archipelago, archipelago of the S. Philippines, having the Sulu Sea on the N.W., the sea of

Celebes on the S.E. There are about 190 is., divided into six groups. Products include coffee, rice, hemp, sesame, indigo, and cocoa; shell and pearl fishing, weaving, and cord-making are carried on. The cap. is Sulu (Jolo), on the N.W. coast of Sulu Is. Area 1560 sq. m. Pop. 120,000, mostly Moros. For the naval battle, Oct. 23-24, 1944, in the Sulu and Surigao Seas, *see* PACIFIC CAMPAIGNS IN SECOND WORLD WAR.

Sumach, Sumac, and Shumack, names given to *Rhus coriaria*, a species of Anacardiaceae found in S. Europe. Its leaves when ground are used in dyeing and tanning. The W. Indian S. is a species of *Brunellia*. The shrub, *colinus*, of this genus, with light purple flowers, is also known as the smoke plant. *Typhina*, a tree with greenish-yellow flowers, is the stag's horn S. The species is poisonous, especially *Rhus toxicodendron* (poison ivy) and *R. venenata* (poison elder).

Sumatra, large is. of the United States of Indonesia, lying W. of Borneo and S.W. of the Malay Peninsula, trending from N.W. to S.E., its W. shores being washed by the Indian Ocean and its E. shore by the Malacca Straits and the China Sea. Its surface is mountainous, especially near the W. coasts, where there are *seu.* volcanic peaks which rise to an altitude of nearly 10,000 ft. Towards the S. the mts. form a range running close to the sea coast, where the heights of the peaks are less imposing, but the volcanoes are more active, one of them, Kaba, sending out a continuous stream of lava for three years at the end of the nineteenth century. Krakatoa (*q.v.*) lies on a little is. between Sumatra and Java. The country is watered by numerous rivers, the Asahan, Musi, and Jambi being the chief; these, and others on the E. side, are navigable. There are 431 m. of state railways, and air services from Palembang to Batavia, Singapore, and Medan. The prin. ports are Palembang, in the S.E., Padang in the W., Sabang in the N., and Belawan in the N.E. Numerous is. surround the coast, the largest being Banka Is. in the S.W. Parts of the is. are densely forested, vegetation is luxuriant, and the climate is tropical, lying in the zone of alternate monsoons, giving it a dry and hot season from May to Sept. and a rainy season from Nov. to March. The equator divides the is. into two almost equal parts. In the N. of Sumatra, near Achin, coal is mined, and petroleum extracted at Palembang. Snak, Deli, and Achin. Gold, copper, iron, sulphur, naphtha, alum, and saltpetre are also found in the neighbourhood of the volcanoes. Magnetite, lignite, and marble can be quarried, and there are tin mines. The vegetation is luxuriant, and on the W. coast are forests of teak, santal, and ebony trees, valuable for their wood, and the even more valuable gum-producing camphor and benzoin trees. Coco-nut and sago palms flourish, and in Achin areca-palms, capable of supplying Sumatra with areca-nuts. Tobacco grows well on the W. coast, and other products include pepper, nutmegs, spices, sago, millet,

cocoa, coffee, betel-nuts, and rice, which are all extensively grown. Wild animals abound, the birds are in great variety, and insect pests swarm. Many varieties of fish are found in the S. waters, and there are extensive shad fisheries, particularly on the E. coast. These fish are mainly exported from Paleubang and Djambi. The cliffs of Achin yield the swallows' nests used by the Chinese for soup. The oldest native elements of the pop., the Kubu, Uhe, Luhu, etc., and the proto-Malayan races, the Batak, Gajo, Achinese, etc., were driven into the interior by Muslim Malays of the coast. There are Javanese on the plantations in the N. and S., and Arabs, Indians, and Chinese live in the tns. as traders. The most advanced of the native peoples are the Menangkabans, of the W. coast plateaus, their weaving, silver-work, and architecture being well known. Sumatra was a Hindu kingdom from the seventh to the thirteenth centuries. Then came the Arabs, who introduced the Muslim faith. The Portuguese estab. trading posts in 1509, but were expelled by the Dutch towards the close of the sixteenth century.

Palembang was raided by Jap. aircraft on Feb. 7, 1942; the Dutch destroyed the oil wells on Feb. 14, and the tn. was occupied by the Jap. forces on Feb. 21. From Jan. 24 to 29, 1945, Brit. aircraft from the carriers *Illustrious*, *Indomitable*, *Indefatigable*, and *Victorious* destroyed the oil refineries at Palembang, of major importance to the Jap. war effort in this zone. The is. was liberated in the autumn of 1945. See also *INDONESIA; INDONESIA (DUTCH)*. See E. M. Loeb, *Sumatra: its History and People*, 1935; E. S. de Klerck, *History of the Netherlands East Indies*, 1938; F. M. Schutjer, *Forgotten Kingdoms in Sumatra*, 1939; and B. H. Vlekke, *The Story of the Dutch East Indies*, 1945. **Sumba**, see SANDALWOOD ISLAND.

Sumbawa, is. of Indonesia, one of the Lesser Sunda Is., Malay Archipelago. Area 4300 sq. m. Pop. 180,000.

Sumer, or **Sumer**, term which the anc. Semites (i.e. the Accadians) of Mesopotamia applied to the country of the lower valley of the Tigris and Euphrates, i.e. S. Babylonia.

Little is known of the early hist. of S. or of the origins of the Sumerians. It is still uncertain whether they were the aboriginal inhab. of Mesopotamia or whether they came from outside. It seems, however, more probable that they were early immigrants, that they entered Mesopotamia in the first half of the fourth millennium B.C., and conquered the land from the Semites, who continued the struggle for over 1500 years, until with the help of new Semite invaders they gradually pushed the Sumerians into the southern portion of the valley, and finally (in the first centuries of the second millennium B.C.) defeated them completely. The Sumerians represented the dominant cultural group of the Near E. for the aforementioned 1500 years. In which period they invented the first known system of writing (gradually developed into the 'cuneiform writing,' q.v.), and

produced a vast and highly developed literature, consisting of myths, hist., hymns, liturgies, epics, commercial documents, etc. Even after the loss of political independence, the Sumerian cultural supremacy continued for many centuries. The Accadians adopted from

British Museum

SUMERIAN FIGURE OF THE GUDEA PERIOD, FOUND AT LAGASH IN 1923

It shows a Sumerian governor, either Gudea himself or his son, Ur Ningirsu.

them the script, the literary and liturgical language, and a large part of their literature.

Sumerian Language (in Accadian, *lišan šumēri*, or 'language of Sumer'). Its affinities are still a matter for discussion. Different philologists claim to have discovered in it resemblances to Basque, Georgian, Chinese, Turkish, Bantu, and other languages, but particularly to Ural-Altaic or Caucasian forms of speech. Its structure is complicated and not yet fully understood, though it can now be trans. with a considerable degree of accuracy. Sumerian was an agglutinative speech, i.e. it was composed of monosyllabic roots, whose meaning was extended or modified by prefixed and suffixed grammatical particles; e.g. *šaḡ* = 'heart,' *šaḡ-mu* = 'my heart,' *šaḡ-mi-la* = 'from my heart.' These particles could be attached to whole clauses or sentences as well as to individual words, e.g. 'From the terror of God' is *Nig-huš-dingir-a-la*, where *dingir* = 'God,' *nig-huš* = 'terror,' *-a* (for *-ak*) = 'of,' and the ablative particle *-la* governs the whole preceding phrase. The formation of the verb was extremely complicated. To the simple root were attached prefixes and suffixes whose force is not always clear, so that a finite verb-form is not a single word but

a concatenation. Take the root *du* = to build'; *Tugul dingir-ra-ni e mu-na-ni-du* means 'The king built a temple for his god.' Some scholars suggest that the S. L. had a series of vocal 'tones,' like Chinese, which distinguished homonyms. For example, *sag*, 'heart,' and *šag*, 'to be gracious,' were probably distinguished in speaking by the pitch of the voice. Two dialects or literary styles are distinguishable in the Sumerian documents—the *eme-ku* or pure speech and the *eme-sal* or broad speech. The latter is used only in religious documents and is distinguished from the much commoner *eme-ku* by certain differences of orthography and pronunciation: e.g. the *eme-ku* for 'god' is *dingir*, the *eme-sal* is *dumir*. See C. J. Gadd, *A Sumerian Reading-book*, 1924; L. A. Waddell, *Indo-Sumerian Seals Deciphered*, 1925; *Sumer-Aryan Dictionary*, 1927, C. L. Woolley, *The Sumerians*, 1929; D. Diringer, *The Alphabet* (2nd ed.), 1949.

Sumir, prov. of Babylonia (q.v.).

Sumla, see **STUMLA**.

Summary Jurisdiction. The S. J. of justices of the peace is a power conferred on justices by various Acts of Parliament to try certain minor offences without the aid of a jury and to make orders for payment of money on *complaint*. There is an appeal to a court of general or quarter sessions against a conviction, sentence, order, or decision of a court of S. J. Either party to the appeal may be granted legal aid (Summary Jurisdiction (Appeals) Act, 1933). See *Stone's Justices' Manual* (ann.). See also **JUSTICES OF THE PEACE**; **POLICE**.

Summational Tones, see under **RESULTANT TONES**.

Summer, that portion of the year when the pole of the hemisphere in question is inclined towards the sun and thus has its highest temp. In the N. hemisphere summer lasts from the entry of the sun into the zodiacal sign of Cancer, about June 22, till the autumnal equinox of Sept. 21. The summer of the S. hemisphere corresponds to the N. winter.

Summer Time, see **DAYLIGHT SAVING**.

Summons, in law, a citation to appear in court. It is a written notification, signed by the proper officer, to be served on a person, warning him to appear on a specified day to answer the claim of the plaintiff. In the high court procedure a *writ* of S. is the initial document of a common law action. It contains *inter alia* an endorsement of the nature of the claim made, or of the relief or remedy required in the action, so that the defendant may know why he is sued. In some cases the plaintiff is allowed to state the particulars of his case *in full detail*, but the use of such *specialty endorsed writs* of S., which take the place of a statement of claim, is only permitted in some half-dozen specified cases of liquidated demands (Order XIV. of the Rules of the Supreme Court). An *originating* S. is a document by which any person claiming to be interested under a deed, will, or other written instrument may apply to the court for the determination

of any question of construction or interpretation arising under the instruments and for a declaration of his rights. It is the customary mode of commencing numerous actions in the chancery div. The issue of a *default* S. in the co. court is the ordinary mode of commencing an action for the recovery of a debt in that court. A *judgment* S. is issued to enforce a judgment debt under pain of committal. See also under **POLICE**, **Arrest and Summons** and **Police Courts**.

Sumner, James Batcheller (b. 1887), Amer. biochemist. He worked on the chem. of enzymes and proteins, and shared the 1946 Nobel prize for chemistry.

Sumo, see under **WRESTLING**.

Sumperk, Schönberg, or **Mährisch-Schönberg**, tn. of Moravia (Czechoslovakia, on the R. Tress, 29 m. N.W. of Olmutz. It manufs. linen and silk. Pop. 12,700.

Sumptuary Laws (Lat. *sumptuarius*, from *sumptus*, expense) were designed to restrain the expenses of citizens in wearing apparel, equipages, diet, furniture, etc. S. L. were promulgated by Solon in Athens, by Sparta, and by Sulla, Caesar, and Augustus in Rome. In England Edward II. and later kings issued S. L. (see also **MORTON, JOHN**). The last was a Scots law of 1621.

Sumter, city of S. Carolina, U.S.A., cap. of Sumter co., 81 m. N.W. of Charleston. It is a trade centre for an agric. region, and exports cotton and tobacco. Pop (1940) 52,400.

Sumter, Fort, see **FORT SUMTER**.

Sun, the, parent body of the solar system to which all the planets (including minor planets), practically all the comets, and numerous meteor streams belong, has a mean parallax of about 8 790". corresponding to a mean distance of about 92,900,500 m. Its angular diameter at mean distance is taken as 1919 26" corresponding to a real diameter of 864,000 m. It should be pointed out that these values vary according to circumstances. The *Nautical Almanac* uses 1922 36" for the S.'s ephemeris, but the true semi-diameter is based on a value 1919 22", adopted in 1891, which is still used for eclipses; the difference represents the allowance for irradiation which is removed for eclipse purposes. The S.'s mass is taken as 333,434 times that of the earth, whose mass has been calculated to be 5.89×10^{21} tons, so the mass of the S. is 1.96×10^{27} tons. The volume of the S. is 1,300,000 times the earth's volume, but its density is only 0.253 that of the earth, corresponding to a sp. gr. of 1.41. The S.'s surface gravitational attraction is twenty-eight times that of the earth, which implies that a man weighing 11 stones on the earth would weigh 308 stones on the sun, provided the weighing took place on a spring balance. Its equator is inclined to the ecliptic at an angle 7° 15' and to the plane of the earth's equator at 26° 15'; its axis points approximately midway between the Pole Star and Vega, that is, to a point whose right ascension and declination are 18 hrs. 44 min. and 64° N., respectively. The S. is classed as a G type star and its age is believed to be of

the order 3,000,000,000 years, though it may be considerably more.

Rotation.—The density of the S. indicates a gaseous condition, confirmed by spectroscopic evidence, and hence rotation must differ from that of a body like the earth which rotates as a whole. The retardation of the S.'s rotation towards the poles was first observed by Carrington in 1860, and the most recent results largely confirm his figures. The period of rotation at the equator is 24.7 days, in lat. 45° it is 28.2 days, in lat. 60° nearly thirty-one days, and near the poles about thirty-four days. In recent times the spectroscope has shown that the period at the equator has fluctuated, having increased by two days, and then decreasing again.

So far as it has been possible to classify the phenomena which compose the S., they may be grouped under the following heads: the photosphere (*q.r.*), the reversing layer, sun-spots (*q.r.*), the chromosphere (*q.r.*), and the corona; beyond these is the general question of radiation.

Reversing Layer.—Kirchhoff's theory regarding the dark lines in the solar spectrum supposed a layer of gaseous matter, through which light from the photosphere must pass to reach the earth. At the temp. of the S. this would be incandescent, and would give a bright line spectrum if separately observed. This was accomplished in the total eclipse of 1870 by Prof. Young. At the moment of totality, the light of the photosphere being obscured, the bright lines forming the spectrum of the reversing layer were visible as a 'flash spectrum.' Metallic lines are numerous, and the layer, which is continuous with the chromosphere, has a thickness estimated at about 200 m.

Corona.—The corona is the uppermost envelope of the S. Attempts to photograph it in daylight were unsuccessful until recent times. A special apparatus is used on a mt. where the turbid layers of the atmosphere are absent. The light from the corona is a pearly white, and it often extends to a distance of twice the diameter of the S. The nature of the corona is not definitely known, and its structure is complex. Its shape is found to vary with the sun-spot cycle, being compact during a period of sun-spot maximum, while huge coronal streamers occur at a sun-spot minimum. According to Perrine (1918), the distribution and form of the coronal streamers are connected with magnetic and electrical phenomena. The light from the coronas is partially polarised, a phenomenon characteristic of light scattered by small particles. Hence some of the light is merely reflected sunlight of light from the photosphere, but the spectrum of the corona reveals a number of bright lines that have not been identified with any known element. The lower portion of the corona contains hydrogen and the light emitted is pale green.

Radiation.—The quantity of sunlight has been estimated at about 3×10^{27} candlepower, but less than 80 per cent of this reaches the earth owing to atmo-

spheric absorption; its intensity is given as 150 times that of the limelight. Yet were the S. deprived of its absorbing envelope of gases, it would shine with two to five times its present power, and would appear blue, those rays being most absorbed. The light of the S. distinctly fades towards the limb, the outer portions passing through a greater thickness of absorbing envelope. The temp. of the photosphere has been estimated at 6000°C . Young states that the heat received from the S. would be sufficient to melt a layer of ice 226 ft. thick on the earth's equator annually; the energy on each square foot of the earth's surface, if utilised in a perfect heat engine, would be sufficient annually to raise a 100 tons to the height of a mile; at the S.'s surface a thickness of 64 ft. of ice would be melted in 1 min. Of the total heat energy of the S. the earth receives $1/22 \times 10^8$. Fluctuations in the radiation of the S. have occupied attention with very varying results, and Abbot and his colleagues have shown that the value of the solar constant varies in the period of the sun-spot cycle; it may be as much as 3 per cent higher at sun-spot maximum than at its minimum. Studies of these fluctuations made at Mt. Wilson since 1921 by Peltier showed the important part played by violet and ultra violet radiation. An amplitude of change of 3.5 per cent is frequent, while 10 per cent is sometimes reached. The 'solar constant' expresses the total intensity of solar radiation outside the earth's atmosphere at mean solar distance; simultaneous observations in 1909 and 1910 on Mt. Wilson (1 m. high) and Mt. Whitney (3 m. high) gave values in the former case of 1943–1904, in the latter 1979–1933 calories per sq. cm. per min. The value usually adopted is 193 calories per sq. cm. per min., which is equivalent to an emission of energy of 3.8×10^{34} ergs per sec. The effective temp. of the S. is determined by Stefan's law, Wien's law, or Planck's formula; these enable the physicist to calculate the S.'s effective temp., that is, the temp. its surface would have if it were a perfect radiator. It is not easy to measure the spectral energy curve of the S. because various corrections must be made, amongst which may be noticed the reduction in intensity due to the scattering of the S.'s rays as they pass through the earth's atmosphere. Complications arise from the fact that this effect is more pronounced for the short wave-lengths—blue and violet—than for the longer wave-lengths, and the effect becomes very pronounced when the S. is close to the horizon. By making a series of measurements of the intensity of the S.'s radiation for different parts of the spectrum during various hours of the day it is possible to estimate the amount of sunlight that would be received at different wave-lengths if atmospheric effects are entirely eliminated. It has been found that when the sun is in the zenith, which implies the most favourable conditions, not more than 70 per cent of its radiation reaches sea level. Absorption bands have a great influence in the red and infra-red

spectrum, where the bands of water vapour, carbon dioxide, and oxygen are chiefly found. When the true spectral energy curve of the S. has been determined, the temp. of the S. can be found from Wien's displacement law, which connects the wave-length of maximum emission, expressed in terms of μ , which is one thousandth of a millimetre, with the absolute temp. T , by the formula $\lambda_{\text{max}} T = 2930$. The maximum intensity has been found to be in the blue-green region at wave-length 4750 approximately. This is expressed in Angstroms, and the corresponding value in units of μ is 4750×10^{-4} . Hence it is easily found that $T \approx 2930^{\circ} (4750 \times 10^{-4}) = 6168^{\circ}\text{K}$, or about 5900°C . Extreme accuracy is unattainable in dealing with such high temps., but the figures are probably very close to the true temp.

The spectrum of the S. has shown the existence there of about sixty of the terrestrial elements. The spectrohelio-graph (*q.v.*) has been applied to the study of the separate lines over the S.'s surface, so that, for example, iron or calcium or hydrogen 'layers' of the S. are photographed. The three layers mentioned are supposed to be in that order of distance from the S.'s centre. But further, a study of the separate lines of each element gives some idea of the pressure and temp. conditions at different depths within the S.'s surface. Eddington has shown that the temp. at the centre of the S. must be of the order of 20,000,000 $^{\circ}\text{C}$., and from the consequences of the theory of relativity Jeans has shown that the radiation from the S. causes a diminution of its mass at the rate of 4,000,000 tons per sec. The source of the S.'s energy is now supposed to be the transmutation of hydrogen into helium, accompanied by the annihilation of matter (*see STARS*). *See SUN-SPOTS*; also CHROMOSPHERE; PHOTOSPHERE; RADIATION; SOLAR SYSTEM; SPECTRUM. *See T. Sun Animalcules, *see* HELIOZOA.

Sun-arcs, *see under* LIGHTS, ARTIFICIAL.

Sun-bittern, or *Eurypyga helias*, heron-like bird of the family Eurypygidae, which occurs in the N. part of S. America. It is fairly large, and has a long neck, slender bill, and pervious nostrils; the plumage is mottled, but the chief shades are brown, black, and white. It frequents the marshy banks of large rivers.

Sunbury: 1. Tn. of Pennsylvania, U.S.A., co. seat of Northumberland co., on the Susquehanna R. It has flour and planing mills, railway workshops, foundries, machine shops, and silk-mills. Pop. 15,500. 2. Tn. of Victoria, Australia, in Bourke co., 28 m. N.W. of Melbourne. Pop. 4000. 3. Tn. of Middlesex, England, on the Thames, 17 m. S.W. of

London. Here is Kempton Park race-course. Pop. 21,500.

Sunda Islands, in the Malay Archipelago, are situated in the Indian Ocean. They comprise Java, Sumatra, Borneo, Celebes, Banka, etc., among the Great Sunda group and in the Lesser Sundas are Bali, Lombok, Sumbawa, and Timor, etc.

Sunda Sea, *see* JAVA SEA.

Sunday, *see* SABBATH.

'Sunday Chronicle', one of the Kemsley newspapers, was founded in 1885 and caters for the middle-class reader. It is a national newspaper with a long literary tradition, further enhanced when, in 1939, the paper absorbed the *Sunday Referee*, which had always appealed strongly to readers interested in literary and theatrical affairs. The S. C. made newspaper hist. in 1940 by printing simultaneously in London, Manchester, and Glasgow. The sale (1950) is approaching 1,200,000.

'Sunday Dispatch', one of the oldest Brit. newspapers, founded in 1801 as the *Weekly Dispatch*. It campaigned against many social evils and supported a strong armament policy. In 1875 it was bought by Ashton Dilke, and later passed to Sir George Newnes. In 1903 it was acquired by Lord Northcliffe, and is now allied to the *Daily Mail* in the Associated Newspapers group. The S. D. is pub. in London, and has a Manchester ed. Its greatest period of progress was after Charles Eade became editor in 1938, the sale increasing in twelve years from 700,000 to about 2,400,000 (1950).

'Sunday Empire News', national Sunday paper which devotes regular space each week to empire affairs. One of the Kemsley group of newspapers, its general appeal is that of a family newspaper with particular emphasis on sport. Founded in 1881 as the *Empire*, its title was changed in 1917 to the *Empire News*, and in Dec. 1944 to the S. E. N. In sixty years its circulation rose from 20,000 to more than 1,700,000 and to-day is considerably in excess of 2,000,000.

'Sunday Express', Eng. Sunday newspaper, founded in 1918 by Lord Beaverbrook. A newspaper of the Express group, the S. E. is printed simultaneously in London, Manchester, and Glasgow. It is independent in politics. It seeks contributions from the leading figures throughout the world in all walks of life, dealing with outstanding events. The average net sale for Feb. 1950 was 2,859,133.

'Sunday Graphic', Eng. Sunday newspaper estab. in 1915 by Sir Edward Hulton as the *Illustrated Sunday Herald* as a companion to the *Daily Sketch*. In 1923 it was acquired by Lord Rothermere and in 1924 passed to Kemsley Newspapers Ltd. (then Allied Newspapers). The name was altered to S. G. in 1929, is pub. in London, and has a Manchester ed. It is the Sunday counterpart of the *Daily Graphic* with a similar policy and national outlook. The sale (1950) is approaching 1,250,000.

Sunday Island, largest of the Kermadec is., 600 m. N.N.E. of New Zealand, 20 m. in circuit. It is uninhabited and belongs to Britain.

'Sunday Pictorial,' first picture Sunday newspaper in England, estab. in 1915 by Lord Rothermere a week before the estab. of the *Illustrated Sunday Herald* (see SUNDAY GRAPHIC). The *S. P.* never lost this initial advantage. Its early issues carried articles on the war by Horatio Bottomley (*q.v.*). Rothermere's shares were sold in small lots; the present position is that the bulk of the shares of the *S. P.* and of the *Daily Mirror* is held by the same people, and the directors of both are mostly the same, under the same chairman. Between them the two companies control the *Nigerian Daily Times*, the Anglo-Canadian Pulp and Paper Mills, and other companies. The sale (1950) is in excess of 5,000,000 copies weekly.

'Sunday Referee,' see under SUNDAY CHRONICLE.

Sunday School, place where religious instruction is given to children and young people on Sundays. S. Ss. are usually attached to a church or chapel. The catechising of the young was adopted by the Christians from Judaic practice, but its application fluctuated in scope at different periods and places. The idea of S. Ss. to rejuvenate religious life was suggested by St. Charles Borromeo and Luther. In eighteenth-century England specific instruction of children by the clergy was generally rare and limited, and many children, especially from the poorest classes, never attended a place of worship. Hannah Ball founded a S. S. at High Wycombe in 1769. About 1774 a Dissenter organised a type of S. S. at Nailsworth, Gloucestershire, but the main impulse towards the foundation of the Eng. S. S. movement came from the Anglican Robert Raikes (*q.v.*) and his friend Stocks, rector of St. John's. Both founded S. Ss. in Gloucester in 1780. They tried to attract the poorest children, and to give them a good religious knowledge. Raikes taught his pupils reading and writing also, but was primarily concerned with the Scriptures, and never believed that his schools should take the place of day establs., though for his own pupils Sunday was generally the only day available for instruction of any kind. The movement grew rapidly. Wesley gave it wholehearted support. Some Dissenters complained that it broke the Sabbath, but others adopted the idea enthusiastically, and this made some Anglicans suspicious of it. As the Fr. Revolution progressed it was suggested by some that S. Ss. were fostering Jacobinism by educating the poor beyond their station, or by actively inculcating revolutionary doctrines; but generally S. Ss. probably helped to avert an Eng. revolution. Early S. S. teachers were paid, but they are now voluntary.

In 1803 the interdenominational S. S. Union was formed and still continues as the National S. S. Union. During the nineteenth century its members adopted the 'uniform system' of teaching, which led to greater efficiency, but also to rigidity, and in 1902 graded methods were adopted. In recent years teaching by pictures, dramatics, film-strips, flannel-

graph, etc., has been increasingly practised. During the nineteenth century a number of 'secular S. Ss.' were organised by trade union and other bodies, which gave entirely secular instruction to children and adults. To-day the term S. S. is confined to those strictly religious in scope. The movement is important in national as well as religious hist. as providing one of the links between the charity schools and regular and universal elementary education. The World's S. S. Association was instituted in 1907. See G. Venable, *The Gloucestershire Centenary of Sunday Schools*, 1880, and G. Kendall, *Robert Raikes*, 1939.

'Sunday Times,' Eng. Sunday newspaper, founded in 1822 and originally owned by a Mrs. Beer, whose husband owned the *Observer*. It passed to Herman Schmitt, who in 1897 had estab. the *Sunday Special*, this being amalgamated with the *S. T.* in 1904. Its purchase in 1915 by the present Viscount Camrose and Viscount Kemsley was the prelude to a period of rapid development both in circulation and in quality. Lord Camrose was editor-in-chief until 1937, when he was succeeded by Lord Kemsley, the brothers having separated their business interests. To-day the *S. T.* is a leading Sunday quality newspaper. Literary, dramatic, and musical criticism of a high standard has long been a prominent feature of the paper, which is also noted for its regular articles on foreign affairs, politics, economics, finance, art, and films. The sale (1950) is 540,000.

Sunday Trading and Sunday Closing. A succession of Acts, including the Sunday Observance Acts 1625, 1677, and 1780, has attempted to regulate business and entertainments on Sundays. The basis of the law as to S. T. is the Act of 1677, which provides that 'no tradesman, artificer, workman, labourer, or other person whatsoever (*sc. ejusdem generis*) fourteen years of age or upwards' may 'do or exercise any worldly labour, business, or work of his ordinary calling upon the Lord's Day, works of necessity or charity alone being excepted.' By an Act of 1871 no prosecution for penalties may be launched except with the consent of the chief officer of a police dist. or of two justices or a stipendiary, a provision which has largely stultified the Act of 1677. 'Tradesman' in the above context means one who carries on the business of buying and selling, so that, according to the decision in *Palmer v. Snow* (1900), barbers were not bound to close on Sundays, and, apparently, farmers were outside the Act (*R. v. Sibbester*). An Act of 1930 provided for the compulsory closing of hairdressers' and barbers' shops on Sundays but this Act was repealed by the Shops (Sunday Trading Restriction) Act, 1936. Public houses can legally be open at certain hours in England; in Scotland each locality decides the question for itself. As regards shops where refreshments or newspapers are sold the law before 1937 (when the above 1936 Act came into operation) was tacitly ignored, and in Jewish quarters Sunday

had long been regarded as the weekly shopping day. The Act of 1936, however, regularised the whole position as to shops and made general provision for closing on Sunday. Exemption orders, however, may be granted in a number of instances (specified in Schedule I.): these include the sale of intoxicating liquors; meals and refreshments; table waters; ice-cream; milk; medicines and surgical appliances; aircraft, motor, and cycle supplies and accessories; tobacco; newspapers, magazines, and periodicals; books, etc., from railway bookstalls; guide books, photographic films, etc., at museums, galleries, etc.; games and sports requisites at any place where that game or sport is carried on; fodder; post office business; and the business of a funeral undertaker. Partial exemption orders may be granted (Schedule II.) for the sale of bread and flour, confectionery, and fish. There are also special provisions for holiday resorts for the sale of articles required for bathing or fishing, photographic requisites, toys, souvenirs and fancy goods, books, stationery, postcards, etc., and any article of food. There are special provisions, too, for London concerning street markets, where, having regard to the character and habits of the pop. there, S. C. would cause hardship. Shops for persons observing the Jewish sabbath must be registered for S. T. by the local authority. The Act makes provision for the requirements that must be complied with before any person may be employed on Sunday as a shop assistant (*see under SHOP ACTS* as to hours, and holidays). The Act does not extend to Scotland or N. Ireland. The Retail Meat Dealers' Shops (Sunday Closing) Act, 1936, provides for the compulsory closing of retail meat traders' shops and stalls on Sundays.

The Sunday Entertainments Act, 1932, which was passed in consequence of proceedings taken under the Sunday Observance Acts to recover penalties for opening or making use of a place for entertainment on Sundays where the public pay for admission, empowers the licensing authorities to grant licences for the opening of cinema halls in their areas notwithstanding anything in any enactment relating to Sunday observance, on condition that certain provisions to safeguard the welfare of employees are carried out. Before the Act of 1932 the local authorities allowed cinemas to open on Sundays provided the proceeds went to charity, although, strictly, this practice was illegal under the Sunday Observance Act of 1780. Consequently they were open in some dists., *i.e.* the Co. of London, but closed in others. The Act of 1932 was passed to bring uniformity into the law. The Act does not apply to Scotland or N. Ireland.

Fishing is legally (by an Act of 1861) permissible on Sundays but only for salmon with rod and line. It is an offence to take or kill game on a Sunday, but rabbits are excluded from the Act. *See P. F. Skottowe, Law Relating to Sunday, 1936. See also LORD'S DAY OBSERVANCE SOCIETY.*

Sunder, Lucas, *see* CRANACH, LUCAS.

Sunderbans, or Sunderbands, name given to the jungle region of swamps and is. in the southern part of the deltas of the Ganges and Brahmaputra, partly in Pakistan and partly in India.

Sunderland, seaport and co. bor. of Durham, England, at the mouth of the Wear, on the N.E. Region of Brit. Railways. Including in the municipal bor. Monkwearmouth and Bishopwearmouth, it is the largest tn. in Durham and the largest shipbuilding tn. in the world. The tn. itself is well built, with fine shopping streets, parks in the tn. centre as well as in the suburbs, and the riv. running through. There are plans for a new layout of the centre of the tn. Educational establs. include the Bede Grammar School, a new grammar school at Seaburn, a technical college, training college, college of arts and crafts, and technical college affiliated to Durham Univ. The church of St. Peter at Monkwearmouth dates back to 674, and parts of the original building still survive. The riv. is crossed by three bridges. The harbour and docks are on the seaboard and the riverside quays and staithes within a few minutes' distance from the open sea. The South Docks comprise the North and South Hudson Docks, 40½ ac., and the Hendon Dock, 11 ac. The North Dock, on the N. side of the riv., is a tidal dock of 6 ac. The Corporation Quay is a modern deep-water quay, 1062 ft. in length, in the Wear just above the entrance to the South Docks. Coal was shipped from the Wear in the reign of Richard II. In addition to its great trade in coal and coke exports iron and steel, machinery, paper, coal tar, creosote, oil, pitch, lumber twine, glassware of various kinds, and general cargoes. The riv. is well adapted, with its numerous 'elbows,' for the building of vessels up to 23,000 tons dead weight. The first mention of shipbuilding at S. occurs in 1346. To-day there are nine shipyards on the riv., nearly all of them with a strong 'family' tradition. The three staple industries of shipbuilding, marine engineering, and ship repairing provided work for many subsidiary industries and trades, electrical and other equipment, heavy forgings, etc. A wide variety of other industries include the manuf. of glass, pottery, paper, furniture, agric. implements, vehicles, and chemicals.

The hist. of S. dates back from Saxon times, complicated by the application of the name Wearmouth indiscriminately to Monkwearmouth, or Monk's Tn., on the N. side of the riv., Bishopwearmouth on the south side, and to S. Monkwearmouth was associated with the monastery of Jarrow, but it was destroyed by the Danes in 860 and lay in ruins until the monastery was rebuilt in 1075. Bishopwearmouth had meanwhile grown in importance; the shipping trade steadily increased, and at the end of the twelfth century Wearmouth became a bor. Bishopwearmouth appears to have become identified with S. by the year 700. The older Wenmouth, the Monk's Tn., made little progress and remained agric. until the

first shipbuilding yard was estab. in 1775. The tn.'s first charter was granted by Bishop Pudsey in the twelfth century. The bor. received a charter of incorporation from Bishop Morton in 1634. The iron bridge, built in 1796, was remodelled in 1859 by Robert Stephenson, and was in its turn displaced by the present bridge, opened in 1929. There is an aluminum alloy bridge between two docks, the first of its kind in the world.

S.'s shipbuilding and repairing industry proved of the greatest value in both world wars. A S. firm developed the prototype of a standard ship that became the model for the Amer. mass-produced Liberty merchant ships. Between Sept. 1939 and Sept. 1944 the nine Wear yards built and launched 245 merchant ships, totalling more than 1,500,000 gross tons, or at least a quarter of the merchant tonnage produced in the kingdom during this period. S. itself suffered heavily from enemy bombing. Pop. 180,000.

Sunderland. This long-range patrol flying-boat has been the standard patrol aircraft of Coastal Command of the R.A.F. since 1938 and is still in service (1950). It had a splendid record of service throughout the war and Coastal Command S. were responsible for the destruction of a great many enemy submarines. It has a wing span of 112 ft. and usually carries a crew of seven or eight, being capable of patrols lasting more than twelve hours.

Sundew, see *DROSER*.

Sun-dials, see under *HOROLOGY*.

Sundsvall, seaport of Sweden in Västernorrland, on the E. coast, on a wide bay of the Baltic, 28 m. S.W. of Härnösand. Its harbour is sheltered by Ålno Is. Shipbuilding, saw-milling, steel works, brick-making, and breweries are the chief industries, and a trade is carried on in timber, paper, wood pulp, and fish. The tn. was rebuilt after a fire of 1888. Pop. (1949) 21,800.

Sunfish, see *CENTRARCHUS*.

Sunflower, or *Helianthus annuus*, species of Compositae found in America and cultivated in Britain for its large heads of golden florets. It is an annual and a perennial plant; the perennial varieties spread rapidly. The oil is of great value for margarine and cooking purposes. The residue, after crushing, is used as cattle cake. Average yields in England are about 17 cwt. of seed an acre. The Jerusalem artichoke, *H. tuberosus*, is a related species.

'Sunflower State,' see *KANSAS*.

Sungari, Songari, or **Sunghwakiang**, large riv. of Manchuria, rising near the Korean frontier, in the Shan-alm Mts., and flowing N.W. to join the R. Namn and then N.E. to join the R. Amur, in about 47° 38' N., 135 m. S.W. of the influx of the Ussuri. Its total length is about 850 m.

Sungaria, see *ZUNGARIA*.

Sunghwakiang, see *SUNGARI*.

Sunion, see *COLONNES, CAPE*.

Sunium Promontorium, see *COLONNES, CAPE*.

Sunkiang, prov. of N.E. Manchuria,

bordering on the U.S.S.R. The border areas are forested and hilly; in the W. are fertile plains. Timber, millet, kaoliang, and soya beans are produced. The cap. is Mutankiang; Harbin is an important tn. Area 31,185 sq. m. Pop. 4,535,000.

Sunlight Treatment, or Heliotherapy, application of sunlight to the prevention, cure, or alleviation of certain diseases. One of the earliest records of S. T. is that in the fifth century the neurologist Celsus Aurelianus prescribed sun-baths for 'chronic affections.' The radiations most useful in S. T. are in the infra-red and ultra-violet regions of the spectrum. The radiant heat given by the infra-red rays dilates the capillaries in the skin. As superficial circulation increases, circulation in more congested parts is relieved, and more white corpuscles, the phagocytes, are conveyed to superficial suppurating wounds, where they ingest bacteria which promote suppuration. The ducts of the sweat glands also are dilated, and so dermal circulation is increased. Ultra-violet rays are absorbed by the skin and blood capillaries, and produce a marked effect on metabolism. In particular they permit the synthesis of vitamin D by the skin. Rats have been kept alive in this way, whereas those on similar diet, but without irradiations, died.

On account of this synthesis of vitamin D, the ultra-violet rays prevent and cure rickets. S. T. has also been extensively used in the treatment of tuberculous joints and bones. In this treatment the direct action of the rays on bacteria plays a great part. Exposure to the sun must, however, be carefully controlled; injudicious exposure may be harmful, for instance, in pulmonary tuberculosis. Sunlight and ultra-violet rays are also harmful to the eyes, e.g. causing 'snow blindness.'

Since ultra-violet rays are readily absorbed by fog and mist and the polluted atmosphere of industrial tns., the best S. T. is obtained at high altitudes. Dr. Rollier's 'school in the sun,' in the Valais Alps, has served as a model for children suffering from tubercular trouble, lupus, rickets, and other diseases.

Ultra-violet rays produce a marked effect on the pigmentation of the skin; but the function of this reaction is doubtful; it may be merely an incidental effect, or it may protect the body from excessive radiation. See also *ULTRA-VIOLET LIGHT*.

See E. Mayer, *Clinical Application of Sunlight and Artificial Radiation* 1926; A. Rollier, *Heliotherapy* (2nd ed.), 1927; P. Hall, *Ultra-violet Rays* (4th ed.), 1929; and F. H. Humphris, *Artificial Sunlight and its Therapeutic Uses* (5th ed.) 1929.

Sunn, or **Sunn-hemp**, fibre obtained from the stems of *Crotalaria juncea*, a leguminous plant of the E. Indies.

Sunnites (Sunnis), orthodox section of the Muslims. See under *MOHAMMEDANISM*.

Sunshine Recorders are instruments for recording the time during which the sun is not obscured by cloud, fog, etc. That recommended by the meteorological authorities of Britain is the 'Campbell-Stokes,' devised by J. F. Campbell in 1853 and improved by Prof. Sir George

G. Stokes in 1879. It has a glass globe which acts as a lens, the sun's image being received on a card in the zodiacal frame. The card is accurately marked in hours and fractions. The concentrated rays of the sun burn a trace as the sun travels across the sky, the breaks showing the periods of obscured sun. Three grooves are provided to receive the cards, one each for winter and summer, and one for autumn and spring.

The Campbell-Stokes sunshine recorder is in general use throughout the world except in America, where an electric sunshine recorder is in use which consists of two air-filled glass bulbs connected by a short tube containing mercury, all enclosed in a vacuum. When the sun shines the lower bulb, which is coated with lamp-black, absorbs more heat than the upper, the mercury rises and closes contact between two platinum wires in the tube which are connected to the recording apparatus. It is also sensitive to diffused radiation so that its results cannot be compared directly with those from the Campbell-Stokes, which records only direct sunshine of strength greater than 0.3 gm. cal./sq. cm./min. Amer. practice is to add a 'low sun correction' when the sun is shining at dawn or sunset and the instrument fails to register; Brit. practice is to record 'bright sunshine' without any correction. Quantitative measurements of the sun's radiation are given by a pyrheliometer (*q.v.*). S. R. do not give a record of cloudiness, which is usually visually estimated, though some indication is given at night by the starshine camera (*q.v.*).

Sunshine State, see NEW MEXICO; SOUTH DAKOTA.

Sun-spots were discovered by Galileo in 1610, some two years after the invention of the telescope, but independent claims for discovery have been made for Harriot, Scheiner, and Fabricius. They may occasionally be seen with the naked eye by using a darkened glass to view the S. Viewed by means of a telescope, a large number of S. are often visible. They vary greatly in size, some large ones being one-twentieth the diameter of the sun, or five times that of the earth; occasionally groups are found. Schwabe (1843), from observations extending over twenty years, discovered a periodicity of about eleven years; Wolf and Woller after him have completed a record up to comparatively recent times and extending back as fully as possible to 1610. Newcomb from these finds 4.62 years as the period of increase in numbers, 6.51 as that of decrease, the full period being 11.13 years; in each case on the average. The full period ranges between extremes of 7.3 and 17.1 years. Lockyer, Halm, and Woller discovered that the more intense the outbreak of spots in any period the shorter the time required for maximum development and also for subsequent decay. Further, the period from maximum to minimum is always greater than the increasing period. Underlying these periods there is an unchanging cycle. Shuster in a mathematical analysis finds three well-marked

periods of 11.125, 8.32, and 4.77 years. All three are nearly even fractions of 33½, and the sum of the reciprocals of the first two equals the reciprocal of the third. The periodicity of S. is shared by the faculae, the prominences, which are most numerous at sun-spot maxima, the corona, terrestrial aurora, and the earth's magnetic field. There is a close connection between the periodicity of S. and terrestrial magnetic storms (see MAGNETISM), and as the spectrum of the light from a sun-spot exhibits the Zeeman effect (*q.v.*) it is established that there are intense magnetic fields in their neighbourhood. Magnetic storms appear to be distinctly connected with large S., while climatic changes on the earth, such as exceptional rainfall and drought, have been connected with the general periodicity. S. show a marked distribution in lat., occurring mainly between lat. 10° and 30° both N. and S., but seldom outside 40°; or within 0° to 15°. The disturbances producing S. appear to arise about 30° lat. and spread to a maximum in about lat. 16°, dying out in 8° or 10°; before this period has lapsed a new disturbance rises. Very great difficulty is experienced in observing or photographing details of spots on account of the heating of the earth's atmosphere, and much disagreement results in points of importance. Secchi noted the appearance of eruption and bright faculae before the development of a spot. Lockyer considered the spot antecedes the faculae. An umbra and penumbra are noticeable and a 'greenness' precedes the spot development; the form is approximately circular and retains its shape; dissolution commences with bridges of light, brighter than the surrounding photosphere, striking across, and the 'luminous matter of the photosphere seems to tumble pell-mell into the chasm' (Secchi), leaving faculae which subside. The life of a given sun-spot is short, some disappearing in a few days, while it is an exception for one to exist for a few months. Spots have a small proper motion of their own apart from the sun's rotation, and any change of structure appears to be accompanied by a westward rush.

Spectrum.—This is generally weaker than that of the photosphere, particularly in the violet, a result at least partly due to diminished temp.; a strengthening of the line of sodium, calcium, vanadium, and chromium (partly), and a distinct weakening of all the hydrogen and silicon lines; but in the total Fraunhofer lines a strengthening; this points to a coolness of the reversing layer just above the spots. A further evidence of such cooling is the presence of the linings due to titanium oxide and the hydrides of calcium and magnesium. The work of Hale from 1908, from a study of the Zeeman effect (*q.v.*) in the lines, showed that S. are not of the same polarity, double spots often being of opposite polarity, which is considered to indicate the presence of vortices or whirling motions within the spots. Evershed found that the gases in S. ascended, the speed of the current being greatest for gases at the deepest levels.

At higher levels the direction of flow was found by St. John to be reversed, the gases moving inwards. From a study of a large number of lines he concluded that the outward velocity at low levels was 0.6 m. per sec., and that the velocity decreased at higher levels until a neutral level was reached where the gases were almost stationary. The general modern view of S. appears to be that they are cyclonic disturbances with gases radiating outward at the upper end or huge vortices of electrified particles; into the region of diminished pressure the upper-level hydrogen is sucked and its temp. increased. The vortices are in opposite directions in the N. and S. hemisphere, as are those of the terrestrial atmospheres.

Sunstroke, Heatstroke, or Insolation, condition of prostration or fever brought about by excessive exposure to the sun's rays or to a high temp., e.g. in stoke-holds. The primary cause is probably the disturbance of the temp.-regulating centre in the medulla of the brain. The body temp. rises and there are disturbances in the respiratory and circulatory processes akin to those seen in shock. The extent and form of these disturbances determine the various types of the disease. Thus, syncope may be the predominant symptom; the patient is sick and giddy, and ultimately falls into a fainting condition with a very weak pulse. He should be placed in a recumbent position, and efforts should be made to restore the circulation by stimulants, such as ammonia, ether, etc. Asphyxia may be the prevailing symptom, as in the form of S. known as heat apoplexy. This condition is marked by dark flushing of the face, protruding eyes, and stertorous breathing. The best treatment is the application of cold by rubbing the skin with ice. Besides these two well-defined types of S., there are numerous varieties in which different forms of respiratory or circulatory disability are manifest. The treatment should be symptomatic. The form of S. known as heat cramps, or miner's cramps, is caused by shortage of salt in the diet. It is likely that deficiency of salt is a contributory cause in other types of S. also.

Sun Worship has been common at all times and in all parts of the world, for the sun is naturally regarded as the source of life. The sun-god was worshipped in Persia as Mithra, in Egypt as Ra, in Greece as Apollo, and under other names in Peru, N. America, and N. Europe.

Sun Yat-sen (1866-1925), Chinese statesman and first president of republican China, a missionary convert's son, b. in a farming vil. in Hsiang Shan Hsien in Kwantung, a coolie and the son of a coolie. He was educated at a school in Honolulu (1879-83) and at Queen's College, Hong Kong (1884-86), where he became a Christian. In 1892 he graduated in medicine in Hong Kong.

In 1894, following the outbreak of war between China and Japan, S. went to Honolulu and founded the Society for the Restoring of China (Hsing Chung Hui), and returned to China the next year and

plotted an armed rising, with the projected seizure of Canton as a base of the revolution. But the plot failed, a price was set on his head, and he fled to Europe. He remained there from 1896 to 1898, during which time he developed his political and social ideas by the study of the socialistic literature of England and the Continent. He returned to the E. and lived in Japan from 1898 to 1900, where he met the leaders of the popular parties. During 1906-11 he took part in, or directed numerous up-risings, most of them abortive, but that at Wuchang, on Oct. 10, 1911, was successful, and some thirteen of eighteen provs. responded to the revolutionary call and declared their independence of the Manchu dynasty. Later in the year the newly formed Senate elected him provisional president of the republic and in 1912 the Nanking Assembly inaugurated him president, but he resigned his office after fourteen days in favour of Yuan Shih-kai, the emperor having abdicated and thereby ended over 260 years of Manchu rule in China. But Yuan proved to be a reactionary and a traitor to the republic and in the ensuing few years a bitter struggle went on between his newly organised party, the Kuomintang (the People's party), and the reactionaries under Yuan, who died in 1916. In 1917 S. had himself elected president of a Southern Chinese Republic, at Canton, but he fled before Gen. Chen Chiung-ming in 1922. In 1924 he undertook a radical reorganisation of his party on the model of the Communist party in Soviet Russia. He was converted from Marxist doctrines, however, and thus were laid the foundations of the later struggle between the Communists and the Kuomintang.

S. died in Peking of cancer on March 12, 1925. His greatest contribution to Chinese nationalism lies in the vigour and force of his personal leadership, which re-vitalised and made it the irresistible driving force, first against the alien rule of the Manchu dynasty and later against foreign domination in China. After his death he became greatly venerated in China. His pubs. include *The International Development of China* (1922); *Memoirs of a Chinese Revolutionary* (1927); and *The Three Principles of the People*.

See N. Gangulee, *The Teachings of Sun Yat-sen*, 1945.

Suomen maa, Suomi, see FINLAND.

Superannuation Schemes may be divided into two broad classes—contributory and non-contributory. The former, as the name implies, are those schemes where the superannuitant has paid into a superannuation fund a certain ann. per centage from salary during the years of service. In the non-contributory scheme no such levy from salary has been made. The contributory scheme is by far the more generally prevalent. Teachers, local officers, officials in insurance offices, employees of many well-estab. industrial concerns are amongst those who enjoy its benefits. Details of the different contributory schemes vary, but the following cover most of those in operation: (1) definite retiring age; (2) definitely fixed

percentage contributions from salary to the superannuation fund; definitely fixed pension rates payable on retirement. In many cases provision is made for a subscriber to draw *pro rata* rates, if he is compelled for any reason to retire prematurely. Perhaps the best-known example of the non-contributory system is that obtaining in the Brit. civil service. The grant of superannuation benefits to civil servants is regulated by a series of statutes known as the Superannuation Acts, 1834 to 1949. The Acts determine the limits within which the Treasury may grant superannuation benefits, but there is no right to any benefit. All pensions are awarded by the Treasury and the decision of the Treasury on an application for superannuation benefit is final. Until 1909 all estab. civil servants were pensionable under the Superannuation Act of 1859. The Act of 1909 provided benefits calculated actuarially to be approximately equivalent as a whole to those under the Act of 1859, but so adjusted as to secure, at the cost of a diminution of pension on retirement by one-fourth, payment of a lump sum, called an additional allowance, on retirement, together with provision for dependants in the event of death in the service. The ann. pension is calculated on a basis of $\frac{1}{60}$ of salary for each year of service, subject to a maximum of $\frac{40}{60}$. The Act of 1935 defined the calculation of the additional allowance on a basis of $\frac{1}{30}$ of salary for each year of service, subject to a maximum of $\frac{1}{30}$, the salary, in all cases, being the average of the salary received during the last three years of service. Under the same Act women civil servants, who have been pensionable since the Act of 1859, were granted the same bases of calculation (i.e. additional allowance and pension calculated on eightieths) as men. By this, and by sev. other Acts, including that of 1949, modifications and additional payments in cases of differing eventualities have been constituted. These include provision for dependants of various classes, and the Superannuation Act of 1949 set up a completely new scheme of (contributory) pensions for widows and dependants, as well as making amendments to earlier Acts.

Superfortress, see FLYING FORTRESS.

Superheterodyne, see under RADIO RECEIVERS.

Superior: 1. Largest, most elevated, and most westerly of the five Great Lakes of N. America, and the largest body of fresh water on the globe. About one-third is in Ontario, Canada, and the rest in Minnesota, Wisconsin, and Michigan, U.S.A. It is fed by numerous streams, the chief being the St. Louis, and discharges by St. Mary's R. at the E. end into Lake Huron. There are numerous is. The water is very pure and abounds in fish. The length is 420 m., greatest width 160 m., mean depth 900 ft. Area 31,800 sq. m. 2. Cap. of Douglas co., Wisconsin, U.S.A., at the mouth of the Nemadji and St. Louis Rrs., at the W. end of Lake Superior, 6 m. S. of Duluth, with which it shares a good harbour. Iron ore and

copper are exported. There are manufs. of matches, iron and steel ware, and ship and railway wagon building. Pop. 35,000.

Superior and Superiority. In Scots law the person who makes a grant of land or a *feu* to a grantee is called the *superior* or *feu superior*, and the grantee is or was called the vassal. If the grantor be himself a vassal his grantee is sub-vassal and he himself mid-superior, while the mid-superior's superior is over-superior in relation to the sub-vassal. The interest retained by the superior in the *feu* is styled *superiority* or *dominium directum*, which interest was originally the ownership of the land subject to the more or less precarious right of the vassal: the interest acquired by the vassal was the *dominium utile*, i.e. the beneficial ownership.

Supersonics, vibrations of matter of frequency greater than those of sounds that can be detected by the human ear (see SOUND, *Ultrasonics*). Supersonic speeds (see next article) are speeds greater than that of sound.

Supersonic Speeds. Knowledge of motion at S. S. has come in the past from the study of the flight of such projectiles as bullets, shells, and rockets. In 1949 aircraft travelled above the speed of sound, and considerable research effort has now been applied to the problems of supersonic aircraft design. The supersonic aircraft differs from a projectile in the following main particulars: (1) It will normally have a considerably longer duration of flight to fulfil its useful function; (2) it must carry its human cargo safely and thus cannot be subjected to high accelerations in take-off and manoeuvre; and (3) it must be controllable at all speeds up to its maximum and must fly on an even keel. The initial uses for supersonic aircraft will be research and military. Although the human frame is not affected by speed it is affected by high acceleration and pilots will probably fly in a prone position, possibly wearing 'anti-g' (anti-gravity) suits to minimise the effect of the high acceleration and high manoeuvre forces. Before passengers can be carried considerable research will be necessary.

The design of a supersonic aircraft is complicated because the aircraft has to be stable and controllable under three sets of conditions. It must take off, land, and perform the first and last parts of its flight in the subsonic range; it must pass through the transonic range, and must fly safely in the supersonic range. Of the three the problems of transonic range are the most serious as changes in air-flow characteristics are taking place rapidly and erratically. The most important difference between air-flow at supersonic speed and subsonic speed is that at high speed irreversible phenomena, in the form of shock waves, are set up. These give rise to a very considerable increase in drag and thus power consumed, and fundamentally affect the stability problems. For the subsonic range, aircraft of the conventional type with reasonable aspect ratio are preferred. For the transonic

range considerable sweep-back on all surfaces, a low aspect ratio wing, or a combination of the two is desirable. For the supersonic range thin-pointed aerofoils and high fineness ratio fuselages are considered essential. Present opinion indicates that the most satisfactory form is that of a delta wing aircraft. In plan form these aircraft look rather like an obtuse-angled isosceles triangle travelling apex first, or a very squat house. The wing section is pointed, symmetrical and thin, the body blending into the wing to reduce body-wing effects. Control of the aircraft is by unconventional means and takes the form of spoilers or flaps producing drag moments about the thrust line in such a way as to produce a minimum of buffeting. Opinions differ on the best practical method of achieving this. The controls may be operated manually, but would preferably be automatic, or at least boosted, to prevent undue force being required by the pilot.

Existing engines are of the compact gas turbine type, probably with after-burning, rocket, or ram-jet (see JET PROPULSION). The gas turbine is limited by the throughput of air, and reaches maximum efficiency when the air passing through the first stage of the compressor reaches the local speed of sound. Gas turbines cannot be used efficiently for speeds greater than twice the speed of sound. The rocket has great power and increases in efficiency with the speed of the aircraft. Its best use would be as a booster to take the aircraft quickly through the transonic range and enable a ram-jet to take control.

A ram-jet is not practical under speeds of about one and a half times the speed of sound, but increases in efficiency with increasing speed of flight. The delta-winged aircraft is practical structurally, but when travelling at high speeds air friction causes heating of outside surfaces, thus affecting material strength, and refrigeration will be necessary. Such aircraft will, of course, be fully pressurised as they will be flying at great heights.

Superstition, see IDOLATRY; FOLKLORE.

Superstitious Uses, see CHARITIES.

Super Tax, first imposed in Britain by the Finance Act of 1909 when Lloyd George was chancellor of the exchequer, being a further impost on incomes exceeding £5000 per annum, levied on that part which exceeded £3000. S. T. with certain alterations continued to be levied up till the year 1928-29 (payable Jan. 1, 1929) based on the statutory income for the year 1927-28. It was then replaced by the Surtax (see UNDER INCOME TAX).

Suppé, Franz von (Francesco Cavaliere Suppé Demelli) (1820-95), Austrian composer of Belgian descent. *b.* at Spalato (Split), studied under Czibulka, Ferrari and Seyfried. He settled in Vienna, where he conducted at the Leopoldstadt Theatre (1862-95), for which he wrote nearly thirty operettas. His best-known works are the *Poet and Peasant* and *Light Cavalry* overtures, and the opera *Boccaccio*. For the last thirty years of his life he was director of music at the An der Wien theatre. See study by O. Keller, 1905.

Supply, grant of money provided in order to meet the expenses of government by the representatives of the people. The principle that the redress of grievances should be a return for S. granted by Parliament gained practical recognition at the revolution of 1688, when S. was granted annually and the necessity for ann. S. ended the necessity legally to enact that Parliament should meet every year. The power of voting S. is invested in the Commons, but the Lords have the right to reject, but not to amend, such Bills. From this principle arises the system of 'tacking,' that is, making an ordinary measure into a financial one by tacking a financial clause to it. A money Bill, or Bill of S., must, however, receive the consent of Lords and King.

Supply and Demand. The economic commonplace that the price of a commodity depends on S. and D. means that the price of commodities must be so adjusted whether consciously or unconsciously as to equalise the demand with the supply; and that, as a general rule, the demand increases with a decrease in price, and, conversely, the demand decreases with an increase in price. Where the supply is absolutely limited (e.g. rare or first eds. of books) the supply is made equal to the demand by increasing the price to such a point that the demand-in-excess is withdrawn; in other words, the so-called *effective* demand then equals the supply. Where the cost of production rises with every additional supply (e.g. under certain conditions coal and wheat) by reason of the greater proportional outlay of labour and capital the supply must be increased to meet every increase in demand. Where the supply can be increased without a corresponding increase in the cost of production (e.g. manufactured goods), prices rise temporarily when the demand exceeds the supply, but fall with the stimulated increase in supply. The conditions of supply of a commodity or service are always to be regarded as independent of the conditions of a demand for that commodity or service; and in speaking of *given* conditions of supply we mean that the following determining factors are assumed to be constant: the character and resources of those who offer the commodity or service, their individual or collective efficiency, and their knowledge of the arts of industry. Similarly, the conditions of demand are said to be *given* when it is assumed that the following determining factors are constant: the resources and the tastes of those who desire the commodity. Neither the conditions of supply nor those of demand are sufficient alone to determine either the price or the amount at which the sale or purchase will be transacted, in all cases the two sets of conditions in conjunction are required to determine the two unknown quantities, price and amount. The price and amount which are determined so as to satisfy conjointly the conditions of supply and those of demand are spoken of as the equilibrium price and the equilibrium amount in reference to these conditions; this does not mean that no transaction takes place except at

the equilibrium price; but that when the equilibrium price and the corresponding equilibrium amount are reached, then the conditions of S. and D. would not tend to produce any readjustment of price. The equilibrium between S. and D. of conditions depends essentially upon the action of producers in anticipating the demand. Generally speaking, the equilibrium price is the average of the varying market prices, which of course presupposes constancy in the conditions of S. and D. during the period over which the average is taken. See A. Marshall, *Principles of Economics*, 1920; W. T. Layton and G. Crowther, *An Introduction to the Study of Prices*, 1935; H. D. Henderson, *Supply and Demand*, 1910; F. Benham, *Economics*, 1918.

Supply and Transport, see *ARMY*. *An Army in the Field*; *ARRIMANCHES*, *HARBOUR OF*; *COMMISSARIAT*, *LINE OF COMMUNICATIONS*; *LOGISTICS*; *MOTOR TRANSPORT*, *MILITARY*; *PIPELINE*; *QUARTERMASTER*; *ROYAL ARMY SERVICE CORPS*.

Supply, Commissioners of. The Scots C. of S. first appointed by the Act of Convocation, 1667, were for over a century, before co. councils were instituted in 1889, the leading local authority. Their special or primary function was to levy the land tax. In 1857 by the County Police Act they were given the duty through a police committee of providing a co. police force. The qualification to act as a commissioner has since 1851 been either a property or an *ex officio* one, and the surviving duties are few.

Supra-orbital Neuralgia, see *under* NEURALGIA.

Suprarenal Glands, or Capsules, triangular organs situated above the kidneys. Each consists of a cortical portion and a medulla. The cortex is made up of three layers of polygonal cells called respectively *zona glomerulosa*, *zona fasciculata*, and *zona reticularis*. From the cortex fibrous septa extend towards the exterior of the organ and divide the cells into groups. The medulla consists of polygonal cells and nerve fibres. It is believed that the function of the suprarenal capsules is concerned with pigment production, and a conspicuous symptom of Addison's disease, which is associated with disease of the suprarenal glands, is a bronze discoloration of the skin. Suprarenal extract from the glands of the sheep is used in the treatment of Addison's disease, but still more for checking hemorrhage.

Supremacy, Royal, exercise of supreme eccles. authority by the Crown. In theory medieval Church authority descended from pope to bishops, but in practice kings had wielded large administrative powers. R. S. was first enforced in England by Henry VIII. in 1534. Repealed by Mary, it was reimposed under Elizabeth in 1559. R. S. was enacted in Scotland in 1560. In 1689 the Convention Parliament required all holders of office in Church and State to take 'the oath of supremacy.' This oath in its form, however, merely denied the papal supremacy; it contained no positive statement of the R. S. By an Act passed in 1791 it was provided

that no person should be liable to be summoned to take the oath of supremacy, or prosecuted for not obeying such summons. Rom. Catholics, upon taking an oath in which the civil and temporal authority of the pope is abjured, may hold office without taking the oath of supremacy.

Supreme Council, see *PEACE CONFERENCE*.

Supreme Court of Judicature. The Judicature Act, 1873, united the then existing courts of chancery, queen's bench, common pleas (*q.r.*) (Westminster), and exchequer (*q.r.*), the high court of admiralty, the probate court (*q.r.*), the court for divorce and matrimonial causes, into one S. C. of J. in England. The old London court of bankruptcy remained a separate court until 1881, when it became consolidated with the S. C. of J. by the Bankruptcy Act, 1883. The supreme court consists of two permanent divs., the court of appeal and the high court of justice; the former in two divs. of three judges, each one of which is presided over by the master of the rolls (see *PAPER ROLLS*). The Lord Chief Justice, who is the head of the king's bench div. (*q.r.*) the president of the probate, divorce, and admiralty div., and the lord chancellor (*q.r.*) are *ex officio* judges of the court of appeal, but never sit there, except that the lord chancellor sometimes sits on the opening day of a term. When necessary a judge of the high court (see *PUISNE JUDGE*) may be called in. Except on questions of costs an appeal lies to the court of appeal from every judgment or order of the high court, but only by leave from an inferior court (see *INFERIOR COURT*). The high court of justice exercises an original jurisdiction in all matters formerly dealt with by the old consolidated courts, and an appellate jurisdiction from the co. courts and petty sessional courts. In this appellate jurisdiction the cases are heard by two judges sitting as a 'divisional court' for 'civil paper cases,' or by three judges for 'Crown paper cases,' respectively. Bankruptcy and winding-up work are assigned to particular puisne judges. Admiralty cases are heard before a puisne judge or the president of the probate, divorce, and admiralty div., with or without the assistance of nautical assessors. The judges of the court of criminal appeal are selected from the judges of the king's bench div. (*q.r.*), generally presided over by the lord chief justice.

Supreme Court of the U.S.A., see *UNITED STATES (LAW)*.

Sur, see *TIRE*.

Surabaya, or *Soerabaya*, seaport of Java, Indonesia, at the mouth of the Kali Mas R. It was the naval and military headquarters of the Dutch E. Indies. It is served by railway, and petroleum is found near by. There are metal industries and dyeworks. Exports include coffee, kapok, cotton, rice, tobacco, tapioca, and sugar. The tn. fell to the Jap. on March 10, 1942. Allied bombers raided it, the heaviest attack being that on July 22, 1943. After the Jap. surrender S. became a centre of Indonesian Nationalist

revolutionaries. Fighting in S. between Brit. troops and the Indonesians broke out at the end of Oct. 1945 following the announcement by the Allies that a military gov. would be set up. After the murder of Brig. Mallaby Brit. destroyers arrived at S., and Brit. forces soon cleared most of the tn. See JAVA. Pop. 250,000.

Surajah Dowlah, nawab of Bengal, captured the fort connected with the Eng. factory at Calcutta in 1756, and shut up his prisoners, numbering 146, in the military prison, 18 ft. square, afterwards known as the Black Hole of Calcutta. For this atrocity he was punished by Clive, who inflicted a crushing defeat upon him at Plassey in 1757.

Surakarta, or **Soerakarta**, tn. of Java, Indonesia, on the Solo. It is the centre of the Java railway system, and an important commercial tn. It has the large palace or Kraton of the 'Susuhunan.' Pop. 100,000.

Surat, city of Bombay, India, cap. of the dist. of the same name, on the Tapti, 16 m. from its mouth. There is an old citadel and numerous mosques, and the tn. was the chief port of the Mogul Empire in the sixteenth and seventeenth centuries. An Eng. settlement was estab. in 1612, and the East India Company's headquarters were here until 1687. The manuf. of silk and cotton goods is the chief industry. Cereals and cotton are the main products of the dist., which has an area of 1651 sq. m. and a pop. of 881,000. Pop. of tn. 171,400.

Surds, algebraical quantities the root of which cannot be exactly obtained. Thus the square root of 2, the cube root of 3, the fourth root of 4 are S. in that the quantity cannot be exactly determined. The above are written in algebraical notation as $\sqrt{2}$, $\sqrt[3]{3}$, $\sqrt[4]{4}$. S. are often called irrational or incommensurable quantities. The order of a surd is denoted by the root index, thus $\sqrt[3]{a}$ and $\sqrt[n]{a}$ are S. of the fifth and n th order respectively. S. of the second order are often called quadratic S.; those of the third order *cubic surds*, and those of the fourth order *biquadratic surds*. Two S. may be multiplied together, provided they are of the same order, by taking the same root of the product of the numbers under the root sign, thus, $\sqrt{3} \times \sqrt{2} = \sqrt{3 \times 2} = \sqrt{6}$. The reciprocal operation also holds true $\sqrt{50} = \sqrt{25 \times 2} = 5\sqrt{2}$, and in this way a surd may be reduced to one of a simpler form; when the S. does not admit of further reduction it is said to be in its simplest form. An expression involving two or more simple S. is called a compound surd; thus $3\sqrt{a} - 4\sqrt{b}$ is a compound surd.

Suretyship, Contract of, see GUARANTEE.

Surf, see under SEA WAVES and SWELL.

Surface, in geometry. Imagine an infinite number of contiguous points in two dimensions and we have a S. and breadth but no thickness. Any two contiguous regions in space must be separated by a S., and space itself must be bounded by a closed S. A S. is said to close if a point inside it cannot be joined to a point outside by any line without piercing the S.

An open S. is bounded by a line. Any equation in three variables x, y, z represents a S. The latter is classified by the form of its equation. Thus $x^3 + y^3 + z^3 = 1$ is called a cubic S. or one of the third order. A S. of the n th order is cut by any right line in n points, real or imaginary, and a plane cuts it in a line of the n th order. Investigators have dealt with S. of orders up to the third fairly fully, but no pub. has appeared on S. above the third order. Cones, cylinders, and other S. which are cut out by a right line moving in some assigned manner are called 'ruled' S. See SPHERE; CYLINDER; ELLIPSOID.

Surface Tension. Many phenomena show that liquids behave as if they were enclosed in a stretched membrane. The shapes of drops slowly forming at the end of a water tap may be imitated approximately by pouring water into a hoop across which is stretched a thin sheet of rubber, showing that the real drops of water behave as if enclosed in an elastic membrane. It may be demonstrated theoretically that the shape assumed by a given volume of liquid so that its surface area is a minimum is a sphere. Small drops of mercury spilled on a table likewise assume the spherical form under the influence of the S. T., though large drops deviate from this shape because of the effect of gravity on them. The spherical shape adopted by soap bubbles whose weight plays a negligible part is also due to S. T. The effect of S. T. is due to the different conditions that obtain at the surface of a liquid compared with the conditions in the body of the liquid. At a point in the interior of the liquid, a molecule is subjected to the attractions of neighbouring molecules that on the whole are equal in all directions. A molecule near the surface, however, is subjected to downward attractions by the molecules below it that are much greater than any attractions due to momentary visitations of the gaseous molecules above it. The surface film exists only in this sense; that the molecular attractions cause the liquid to behave as though it were enclosed by a membrane. The capillarity (q.v.) of liquids (an essential for the life of plants and trees) is due to S. T. Different liquids have different S. Ts.; petrol dropped on water reduces the S. T. of the film covering a pool, a fact of great practical importance in destroying the larvae of the mosquito that can hang from the surface of clean water when breathing.

See, for qualitative descriptions, C. V. Boys, *Soap Bubbles*, 1920, and W. Bragg, *Concerning the Nature of Things*, 1952; the quantitative aspects of the subject are discussed in J. H. Poynting's and J. J. Thomson's *Properties of Matter*, 1920; in N. K. Adam's *The Physics and Chemistry of Surfaces*, 1930; and in E. K. Rideal's *Surface Chemistry*, 1930. See also R. S. Burdon, *Surface Tension and the Spreading of Liquids*, 1919.

Surf-bird, or *Aphriza virgata*, species of Charadriidae closely related to the turnstone. Its plumage is brown with white markings, and the bird occurs on the Pacific coasts of America.

Surgeons, Royal College of, see ROYAL SURGERY, that branch of the healing art in which operative measures are relied on. Strictly speaking, the science of medicine involves only those methods of procedure consisting of the administration of substances which, by becoming incorporated into the bodily system, are expected to induce such changes as will lead to the diminution or cure of the disease. S., in contradistinction, involves actual manipulation of the part, either with the hand or with instruments. The term medicine is, however, usually held to embrace the whole science and art of healing, together with contributory sciences. As knowledge of the human frame and of the agencies which affect it for good or evil extends, so does it become more difficult to treat of S. as a separate science or a separate branch of practice. The administration of drugs as a therapeutic measure merges into inoculation with anti-toxic sera and other substances, and also into the application of such agencies as electricity, heat, cold, X-rays, etc. It is then not a long step to methods of treatment involving vibration, massage, etc., with a view to inducing changes in the chem. of the body. Practically the only measures that are popularly regarded as surgical are those involving the removal of diseased parts and substances foreign to the normal organism. Although modern practice in medicine and S. has many inter-connecting features, the two arts have a separate hist., and at some periods there has been a hostile relationship between practitioners of the kindred methods.

The beginnings of S. may be studied in the practices of native tribes. Wounds are dressed, foreign bodies removed by hand or by cutting, dislocations reduced, fractures set and bound, while in desperate cases amputations are resorted to. Experience quickly shows them that a diseased part is a pain and a danger, and that the natural recuperating powers of the body are aided by the removal of a desperately diseased portion. The early civilisations of Egypt, Greece, Mesopotamia, India, and China found a place for the surgeon in their social organisation, and such operations as incisions for the removal of dropsical fluids, amputations with subsequent treatment of the stump with boiling oil or pitch, the removal of concretions from the bladder, trepanning of the skull, etc., seem to have been practised at a very early period. The science of S. was transmitted to Europe by Byzantine writers, and somewhat later by practitioners who followed the Arabian tradition. The Dark Ages added little to the surgeon's art, which was confined to the monasteries, where collections of books of a scientific character enabled the clergy to minister to the needs of the pop. As with medicine, however, monastic surgical science became impregnated with superstition. The lancet was the only instrument in common use, and the practice of bleeding for any and every complaint was controlled by the observation of the changes of the moon and such phenomena. For some reason the monks

were interdicted from the practice of S. in 1139 and again in 1163, but the interdict was not wholly effective. In 1540 the two callings of barbery and S. formerly practised by the same individuals, were separated, though the same guild controlled both. Throughout Tudor and Stuart times the surgeons shared in the prosperity of physicians and were favoured with the confidence of the higher classes. The greater power of the physicians' organisation enabled them to restrict the practice of surgeons, and it was enacted that no major operation, that is, an operation involving danger to life, should be attempted without the presence of a physician. In 1745 the surgeons seceded from the Barber-Surgeons Company and formed the Company of Surgeons, which estab. the Surgeons' Hall at the Old Bailey. In 1800 the old company became the Royal College of Surgeons (*q.v.*).

With the more efficient organisation and the improved methods of surgical education the profession improved considerably in status. In the nineteenth century progress in anatomical knowledge led to the tendency to specialise, which is still operative. The introduction of anaesthetics greatly enlarged the scope of S. Actual speed became of smaller importance, and the knowledge resulting from careful and methodical operations resulted in a wider range of surgical possibilities. The inauguration of antiseptic methods by Lord Lister is on the whole the most important item in the events of surgical hist. The mortality due to operative infection diminished enormously, and surgical methods gained much wider confidence. As a result of Lister's work, the abdomen and later the thorax and the brain have come within the prov. of the surgeon. Joints, even the knee joint, which was formerly notorious for its liability to infection, are opened with impunity, whilst fractures are reduced by the 'open' method which involves an incision.

Considerable progress has been made recently in the S. of the autonomic nervous system, with its two divs. of sympathetic and parasympathetic. The functions of these two divs. are opposed to one another; for instance, the sympathetic system when stimulated causes contraction of the arteries, whereas the parasympathetic has the opposite effect of expanding these vessels. Consequently surgical removal of part of the sympathetic chain results in dilatation of the corresponding arteries, as was exemplified in the operation of lumbar sympathectomy performed in 1949 on King George VI. by Prof. (now Sir) James Learmonth, of Edinburgh. Mention should also be made of the recent advances in plastic S., resulting particularly from the experience gained in both world wars and continuing the work of such pioneers as Tagliacozzi; extensive grafting is now performed, not only of skin but also of underlying tissues such as fascia, cartilage, and even bone. Abdominal S. has become increasingly daring and radical, as witnessed by the operations of Prof. Grey

Turner, of Newcastle and London, and of the Chicago School. In thoracic S. such operations as removal of a lung (pneumonec-tomy) are possible, and congenital defects of the heart are being corrected surgically by Helen Taussig and Blalock in the U.S.A., by Brock at Guy's Hospital and by Mercer at Edinburgh. Great progress has been made also in orthopaedic S., in which branch the names of Hugh Owen Thomas (inventor of the Thomas splint) and his pupil Sir Robert Jones, both of Liverpool, will be especially remembered. As an example of a modern orthopaedic procedure may be mentioned the operation for lengthening a leg, which is now possible up to a maximum of as much as 5 in. See also LARYNGOSCOPE; LISTER; LITHOTOMY; X-RAYS.

Surkhan-Darya, region of the Uzbek S.S.R., in the S.E., with the Tadzhik S.S.R. on the E. and Afghanistan on the S., where the Amu-Darya forms the frontier. The railway from Stalınabad to Termez and Kelif traverses the region. Termez is the cap.

Surplice (Lat. *superpellicium*), above the fur dress), loose white linen garment with wide sleeves, worn over the cassock by clergy and certain of the laity at choir offices and at certain other times. The Anglican S. reaches to the knees, is pleated from the yoke, and made with simple sleeves. The Rom. Catholic S. is usually ornamented with lace and reaches only to the hips. The older form, however, is becoming more popular in many Rom. Catholic churches. The S. was once worn over furs by priests when conducting service in cold churches.

Surrealism, art movement expressed largely in painting, though possessing much influence in sculpture and literature. Its main tendency consists in the relation of forms and symbols seldom found together in everyday life, producing dream-like sensations or an expression of the subconscious. Charles Madge called it 'a method of dealing with the irrational without sacrificing a rational point of view.' S. is an essentially romantic movement, enjoying its full flowering in the nineteen twenties, but it can claim roots as far back as the fantasy and symbolism of Bosch and Brueghel, and affinities in the last century with Henry Fuseli, and later Gustave Moreau and Odilon Redon. Among the first exponents of S. in the present century was Giorgio di Chirico, who was painting his strange landscapes and prancing horses before the First World War. S. owed much to Dadaism and Vorticism, which had arisen towards the end of the war, and resulted in the work of Max Ernst and the charming and witty paintings of Paul Klee (q.v.) and Joan Miró. Marc Chagall

gained colourful and humorous inspiration from peasant life, and Salvador Dalí, with his meticulously painted work, achieved not only artistic but considerable commercial success. For a time Picasso worked along surrealist lines. In England the movement is reflected particularly in the work of Edward Wadsworth, Roland Penrose, Edward Burra, and in the stage designs of Leslie Hurry.

Surrender, see CAPITULATION.

Surrey, Henry Howard, Earl of (c. 1517-1547), Eng. poet, the son of Lord Thomas Howard, afterwards duke of Norfolk (see below). He was earl marshal at Anne Boleyn's trial in 1536, and the same year accompanied his father against the Yorkshire rebels. He took part in the unsuccessful siege of Montreuil in 1544, and when commander of Boulogne in 1545-46 was defeated at St. Etienne. He was imprisoned on a charge of treasonably quartering royal arms (these were the mythical Arms of the Confessor), and executed on Tower Hill. S. seems to have been a disciple of Wyatt, but he was the better artist, and also was more dominated by the Petrarchian convention. The elegiac tone is natural to him, and he is distinguished by a love for nature, mingling with personal feelings in his love sonnets. It is in some impersonal sonnets, however, as that on Sardanapalus, that his merit best shows itself. For the sonnet on the lt. model cultivated by Wyatt, S. substituted the less elaborate and easier Eng. form which Shakespeare afterwards adopted, of three quatrains with different rhymes, ending with a couplet. But his chief claim to fame is that he introduced blank verse, of five iambic feet, into Eng. in his trans. of the second and fourth books of the *Aeneid* (reprinted 1814). Eng. poetry thus acquiring a magnificent instrument which, once perfected, became the metre of epic and drama. S., like Wyatt, was much in advance of his time, and a whole generation passed before his lead was followed. His *Description and Praise of his Love Geraldine*, together with forty other poems, was printed in Tottel's *Songes and Sonettes* (1557, ed. H. E. Rollins, 1928-29). See ed. of his poems by F. M. Padelford, 1920, 1928, and E. Bapsi, *Deux gentilshommes—poètes de la cour de Henry VIII.*, 1891; also G. Bullett (ed.), *Sixteenth Poets of the Sixteenth Century*, 1917.

Surrey, Thomas Howard, Earl of, and **Duke of Norfolk** (1473-1554), took part in the battle of Flodden in 1513, and as warden-general of the Marches devastated the Scottish border and forced Albany to retreat in 1523. Having already held the positions of lord-lieutenant of Ireland in 1520-21 and lord treasurer in 1522, he was made earl marshal in 1533. He was, however, ousted from favour by Hertford, and condemned to death, but Henry VIII.'s death prevented his execution, and on Mary's accession he was released. See also HOWARD.

Surrey, S.E. co. of England, lying S. of the Thames, and bounded W. by Berkshire and Hampshire, E. by Kent, N. by Middlesex and London, and S. by Sussex.

It is about 40 m. from E. to W., and about 27 m. from N. to S., with an area of 449,216 ac. and a pop. of (1939) 1,418,600. Ten members are returned to Parliament from the co., and nine from bors. Although one of the smaller cos. in area, Surrey is densely populated near London, where a large proportion of its pop. lives. Its surface is greatly undulating and hilly in parts, the N. Downs passing through the centre of it. From the Thames valley the land rises steadily until, along the Farnham-Guildford-Dorking-Redhill road, which divides the co. into N. and S., the highest points in the N. Downs are reached: Box Hill (590 ft.) at Dorking (789 ac. being owned and 288 ac. protected by the National Trust), and Leith Hill (967 ft.), about 3 m. S. of that in the best known and highest in the S.E. of England, Hindhead and Botley Hill, from all of which splendid views of the surrounding scenery can be obtained. In between Box Hill and Leith Hill lies a chain of land marks, from the Devil's Punch Bowl in the W. under Hindhead (895 ft.) to Woldingham in the E. (797 ft.), while S. of the dividing road the land falls away sharply to the weald of Sussex. The soil differs considerably in different parts of the co.; in the extreme S.W., around Hindhead, are wide tracts of barren heath. The N. Downs are chalk, and elsewhere the soil is rich, and is mainly under corn and grass. Market gardening is extensively carried on in the Thames valley. Hops are cultivated to some extent near Farnham; fuller's earth is found in the neighbourhood of Reigate. Paper mills on the Wandle, lavender-growing at Mitcham, and flower-gardening are old-established activities. Sheep are reared on the Downs. Besides the Thames the co. is watered by the Mole, Wey, and Wandle, and each of the Thames tribs. has its own tribs. The chief tribs. are Croydon, Richmond, Wimbledon, Kingston, Reigate, Guildford, Farnham, Godalming, and Woking, which have various industries, but the bulk of the manufs. is carried on within the limits of Greater London. There are fine botanic gardens at Kew, which contain an important observatory. At Richmond is a fine public park; there are race-courses at Epsom and Hurst Park, near Molesey. Croydon, Brooklands, and Dunsfold have aerodromes. Of the historic houses, such as Claremont at Esher or Nonsuch on the Epsom road, or Addington near Croydon, little is left. Sutton Place, Clondoun, Albury Park, and Peper Harow, all of them near Guildford, and Denbies near Dorking, are fine Surrey homes.

The most important events in the hist. of Surrey are the defeat of the Danes by Ethelwulf at Ockley in 851; the crowning of seven Saxon kings at Kingston between 901 and 978; and the signing of Magna Carta by King John at Runnymede in 1215. Traces of Rom. occupation are to be found in various parts of the co., and there are villas at Ashstead and Titsey. The only Rom. roads are such bits of Stane Street, from Chichester, as survive at Ockley and

Dorking, and of a section between Godstone and East Grinstead. The chief historical remains are Farnham Castle, Guildford Castle, the ruined castle built by Wolsey on the S. bank of the Mole at Esher, and the abbeys of Waverley and Newark, also in ruins. Wm. de Warenne was the first Norman earl of Surrey, and sheriff of both Sussex and Surrey. The earldom continued in his family till the reign of Edward III., when it devolved on the FitzAlans and Mowbrays, and thence to the Howards of Norfolk. The earldom of Surrey is now held by the dukes of Norfolk. See W. Jerrold, *Surrey* (Dent's Co. Guides), 1901; E. Parker, *Highways and Byways in Surrey*, 1908, and *Surrey*, 1947; G. C. Harper and J. C. Kershaw, *The Downs and the Sea: Wild Life and Scenery in Surrey, Sussex and Kent*, 1923; G. Home, *The Charm of Surrey*, 1929; D. C. Whimster, *Archæology of Surrey*, 1931; F. J. C. Hearnshaw, *The Place of Surrey in the History of England*, 1937; and A. Mac, *Surrey*, 1938.

Surrey Regiment, East, formerly the 31st and 70th regiments. The 31st, raised in 1702 as Marines, did good service in various parts of the world, it became a foot regiment in 1715 and fought at Dettingen, where it gained its nickname of 'Young Bulls.' It served in the Amer. War of Independence, and later under Wellington in the Peninsula, then had a distinguished career in India. The 70th was raised in 1758 in Glasgow, and nicknamed 'Glasgow Greys.' It served in the W. Indies and Canada, in 1863-1866 in the Maori wars, and in the Second Afghan war, 1878-79. In 1881 the two regiments were linked to form the present regiment, which served in Egypt and the S. African war (1899-1902). During the First World War it raised eighteen battalions, which served in France, Flanders, Italy, Macedonia, Egypt, Aden, Mesopotamia, and N. Russia. In the Second World War the regiment fought in France in 1910, and in Africa, Sicily, and Italy. A battalion served throughout the Malayan campaign with the 6th Indian Infantry Brigade.

Surrey Regiment, West (The Queen's Royal Regiment (West Surrey)), the old 2nd Foot, raised in 1661 for service in Tangier, and under Charles II. called the Tangier Foot. Its roll of honours is a long one, having participated in operations in Tangier (1662-80), Namur (1695), Egypt (1801), Peninsula (1808-14), Afghanistan (1839), S. Africa (1851-53), China (1860), Burma (1885-87), S. Africa (1899-1902). It was granted naval buttons in commemoration of its service in Lord Howe's fleet on the Glorious 1st June, 1794. During the First World War it raised twenty-five battalions, which served in France, Flanders, Italy, Gallipoli, Egypt, Palestine, Mesopotamia, and N.W. Frontier, India. The regiment also fought in the Third Afghan war of 1919. In the Second World War three battalions formed the 169th Brigade of the famous 56th London Territorial Div. and served in N. Africa. It took part in the landing in Salerno Bay (Sept. 1943) and

later fought on the Garigliano R. and in the debouchement into the plain of the Po. They attacked on April 11, 1941, along the shore of Lake Conacchio and took Bastia, and then, crossing the Lower Adige, reached Gorizia (1945), when the campaign ended. Other units of the regiment fought in Burma and the battle of Normandy.

Surrogate, one appointed by the chancellor and the archdeacon in a diocese to act as their deputies in granting marriage licences. He is also empowered to take affidavits in matters within the jurisdiction of these principals, and any other judicial business which he may be specially deputed by those principals to perform. The appointment is regulated by Canon 128 and the Statute 4 Geo. IV, chap. lxxvi., sect. 16. According to Canon 128, a S. must be 'either a grave minister and a graduate, or a licensed public preacher, and a beneficed man near the place where the courts are kept, or a bachelor of law or master of arts at least, who hath some skill in the civil and ecclesiastical law, and is a favourer of true religion, and a man of modest and honest conversation,' and any chancellor, commissary, or other eccles. judge who appoints a non-qualified person as his S. is liable by the same canon to suspension and censure.

Surtees, Robert Smith (1803-64), Eng. novelist, educated at Durham Grammar School. S. was articled to a solicitor, and duly qualified, but money came to him from the death of a relative, which enabled him to give himself up to the life of a sporting gentleman with journalistic and literary tastes. He founded the *New Sporting Magazine* in 1831, and there appeared his episodes in the sporting career of Jorrocks, a character who achieved lasting fame. They appeared in book form in 1838 as *Jorrocks's Jaunts and Jollities* (Everyman's Library, 1929), and Jorrocks figured also in *Handley Cross* (1813, 1854). S.'s spirited writings combine humour, realism, and fancy, not unlike the Dickens of *Pickwick*. His other works include *Mr. Sponge's Sporting Tour* (1853) and *Mr. Pacey Romford's Hounds* (1865). See study by F. Watson, 1933.

Survey, Courts of, courts created by the Merchant Shipping Act, 1876, to prevent unseaworthy or overloaded ships from going to sea. The Merchant Shipping Act, 1891, which replaces the above Act, provides for the constitution, powers, and procedure of C. of S. By these provisions a C. of S. for a port or dist. is to consist of a judge, sitting with two assessors (see REMARKS ON EXPERT WITNESSES UNDER EVIDENCE). The functions of the court are to act as a court of appeal from the decision of the Ministry of Transport as to the seaworthiness of any particular ship. (See MERCHANT SHIPPING ACTS, Part V., *Safety*.) The court also acts as a court of appeal from the refusal of a 'certificate for clearance of an emigrant ship and in other matters relating to safety at sea. Every case must be heard in open court. Where the Ministry of Transport think that an appeal involves a question of construction or design, or of

scientific difficulty or important principle, they may refer the matter to scientific referees approved by a secretary of state, and such referees will act instead of, and have the powers of, a Court of Survey.

Surveying and Levelling. Surveying has for its object the attainment of a mathematically accurate idea of the relative positions of all points on any portion of the earth's surface in such a manner that they may be plotted on a map or plan to some scale. Levelling, a branch of surveying, ascertains the relative vertical heights of points with regard to some datum level, such as mean sea level. Surveying may be of various kinds, each requiring various methods and degrees of accuracy: e.g. cadastral, topographical, hydrographic, photographic, geological, mining, and geodetical. The simplest form of surveying may be called *property surveying*, which is concerned with quite small plots of land. When boundaries are rectilinear the *chain* (*q.v.*) is the chief instrument. In Britain two forms are used: Gunter's and the 100 ft. Gunter's chain is 66 ft. or 4 poles long, each link being 7.92 in., and is adopted for most work except quite small tin plots. It has assumed a definite pattern by differently shaped brass tabs; at each end is a convenient brass handle. In most other countries the decameter chain is used. With each chain ten arrows or iron skewers are carried to place in the ground at each chain length. Where the lines to be measured are not rectilinear, the chain is used to give a line from which 'offsets' may be measured to important points by means of the offset staff, of ten links' length, total 6 ft. 7.20 in. To mark out lines flagged poles, 10 to 20 ft. long, are used; ranging rods, often of the same length as the offset staff, painted over each tenth with different colours, are also carried, together with bundles of laths; whites or thin sticks, 15 in. to 3 ft., with clefts for paper, to be used for small ranging; and a 33-ft. tape. It is usual to assign these implements to definite members of the surveying party, and carefully to organise, in every detail, the routine work. In using these instruments all measurements must be horizontal, not following unevenness of the ground, since they are finally plotted on a plane surface. If the unevenness or slope is not great stepping is the simple method adopted, the chain being stretched to the horizontal, its raised end being projected on to the ground by means of a plumb line when greater, the angle is taken with a clinometer (*q.v.*). The main lines of measurement, or base lines, should be central and intersect one another, thus giving checks; within the net thus marked subsidiary chain lines are taken forming triangles. Where possible as in 108., rectangles may be laid out, but in general the triangle is the figure plotted, its dimensions being easily checked by calculations from simple trigonometrical formulae. The nearer this triangle is to the equilateral the better; small angles should be avoided. It is further usual to arrange ties or lines across the triangles, the intersections forming useful checks to the other

measurements. Fig. 1 shows a method of measuring an inaccessible interior area by surrounding chain lines; the lines are produced forming chain angles; the angles A, B, C, D are checked by the tie lines shown at the angles. The true outline of the area is then found by offsets from the prin. lines. It should be clear that great saving in labour may be gained by a careful reconnoitre of the area to be surveyed;

FIG. 1. MEASUREMENT OF AN INACCESSIBLE INTERIOR AREA

there is always a simplest accurate design. The devices are innumerable, but one may be illustrated in connection with inaccessibility. Fig. 2 shows a method of finding the distance across a riv. between the stations B and C; the triangle BCb has a right angle at C and Cb is measured; Cb is produced to D and bD made equal to it; Dc is set off at right angles to bD

FIG. 2. MEASUREMENT OF DISTANCE ACROSS A RIVER

and c obtained by sighting through b to B. It is clear that $Dc = BC$, the distance which cannot be chained. There are two great difficulties in chain and offset work: uneven ground and inaccessibility, and the labour in covering extended distances. To obviate these triangulation is resorted to completely; any measurements are taken which will enable the complete

determination of the triangle (see TRIGONOMETRY). Some means of measuring the angles is employed, the simplest of which is the use of the plane table, incorporating a telescope or slotted sights at the ends of a ruler. A trough compass, to give the magnetic meridian, and

FIG. 3. SURVEY OF AN IRREGULAR AREA

a spirit-level are provided. From any station a sight to a distant station is taken and its direction ruled immediately without reading off the angle. Fig. 3 illustrates the survey of an irregular area, the prin. lines ABCD being the figure rectangular approximation checked by the lines A-BD.

Field Book.—All observations are here entered while in the field. Everything is

FIG. 4. OPTICAL SQUARE

arranged for ease of entry and computation afterwards, but particularly so that easy checks are provided as the work of observation proceeds. On the organisation of the field party and that of the observations entered in the field book depends the rapidity and accuracy of the survey, and much ingenuity is shown in methods which eliminate personal error and reduce the chance of mistakes to a minimum. In large surveys the field book is dispatched to headquarters, where it is used by draughtsmen in the plotting of the maps, the actual observer not being

consulted. This necessitates uniformity in the plan of field books.

The use of instruments for angular measurement, while lessening the difficulties and labour of chain survey, has its own troubles. Portability is an essential to such instruments, and great refinements are necessary in their construction if accuracy is to be secured, since a small inaccuracy in angle may mean quite a large and impermissible one in linear measurement. For this reason the cross-staff with sighting slots has largely gone out of use; it is a cylindrical or octagonal box on a rod, and has slots to give sights of 90° or 45° , and sometimes has its upper part capable of rotation, a scale showing the angle. The optical square (Fig. 4) gives a right angle, as required for offsets; a sight is taken along the chain line ES through the lower unsilvered part of M_1 , placed at 120° across ES. The mirror M_2 is placed at 45° to E, and by walking along the chain line ES until the object O is reflected from M_2 and M_1 , appearing exactly over the direct image of S and then to the eye, the rectangular position of O is obtained. An angle of 180° is required to determine when the observer is exactly in line between two flags; for this purpose a line-ranger, consisting of two prisms, arranged, as shown, in the centre piece of the Marindin telemeter, is used; the true alignment is obtained when the images of the flags coincide. Of all instruments the theodolite (*q.v.*) is the most complete, its arrangement of a telescope on a vertical circle on which it rotates as a diameter, these being mounted on a horizontal circle, allows any angle from a point to be taken for all points of the compass and for a large range above or below level. The dumpy level (*see LEVEL*) is one form of instrument used for levelling only. The clinometer is used for taking angles of elevation or depression, and is cleverly arranged for hand use. The most popular form is the Abney level in which the telescope carries two quadrants fixed to it, a spirit-level being capable of rotation round the middle of their common diameter; the level has an arm projecting into the graduations of the quadrants, and reading is carried out with the help of a vernier. The bubble of the level when central is visible through the telescope by reflection from a mirror, so that when the object and bubble are simultaneously visible, the height above horizon is shown on the scale. Another handy instrument, the box sextant, is very largely used for horizontal angles; for its theory *see* SEXTANT. Fig. 5 shows the prismatic compass; it carries a magnifying prism and sighting arrangements B and C, and silvering on the prism slope reflects to the eye the graduations on the compass card. For traversing the instrument is particularly handy and useful; at one reading, without adjustment, it gives the bearing of an object, *i.e.* its angle with the magnetic meridian. The telemeter (*q.v.*) is also used for rapid work over short distances. Many of the above instruments are combined; the patterns are innumerable and patent devices for labour-

saving and convenience, or for special work, such as curve-ranging, are added. The immediate advantage of angular survey is in the lessening of ties and checks in the triangles, the summing of the angles to 180° giving practically all that is necessary. It is customary, therefore, to start from a very carefully measured base and rapidly to cover with as large triangles as are compatible with accuracy the whole area to be mapped; the details of each triangle are then worked out by chain survey. For property surveying, steel or 'Invar' (an alloy of steel and nickel with coefficient of expansion less than one-tenth that of steel) tapes or wires of 100 ft. or 21 metres are used. They have the further advantage over rods in that wound on reels they can be dispatched by post for testing to the National Physical Laboratory, etc.

FIG. 5. PRISMATIC COMPASS

Base-line Measurement.—Two stations are selected, slightly elevated for convenience of sighting other points, from 1 to 12 m. apart. Terminals are sunk here, pillars erected firmly, and the ends of the base-line marked thereon. Between these firm tripods carrying small pillars are aligned, at equal distances, convenient for each tape measurement. The tape is stretched between these in turn, over frictionless pulleys, by means of weights suspended from straining trestles; an accuracy of 1 in 200,000 is obtainable and is sufficient for all topographic work.

LEVELLING.—In the simple form levelling is carried out by means of the Y dumpy level, which is merely a telescope with cross-wire in its focal plane, capable of movement in a horizontal plane which is determined by means of a sensitive spirit-level usually mounted over the telescope. Any object seen on the cross-wires is thus at the same level with them. The levelling staff, a rectangular staff, is used in conjunction with the level; it is marked in feet, tenths, and hundredths from the bottom upwards, and there are several patterns of marking, each aiming at special clarity. The telescopic form in

FIG. 6. RECORDING OF READINGS IN LEVEL BOOK

three sections is generally used. Simple levelling is carried out by arranging the telescope in a conveniently central situation for sighting two positions of such staff (or of the first and second staves

position, and so on. It is to be noted that these observations are independent of the height of the telescope cross-wires above the ground.

The above table (Fig. 6) shows the method of recording the readings in the level book. A datum level of 20 ft. below the first reading has been assumed. The method of finding what is known as the 'reduced level' at each successive point, and the checking at each stage of the record, will be obvious.

Where natural objects are observed as a base from which to commence levelling, a level mark, of crow's foot form, is cut, or a bench mark on an ordnance map may be used as a starting point. In practice circumstances will generally arise when several intermediate levels between the back-sight and fore-sight can be taken at each setting of the levelling instrument, an additional column for intermediate sights, between the back-sight and fore-sight columns, being accordingly provided in the level book. Fig. 7 shows, in plan, a typical set of such levels, taken from the first setting of the instrument at station A', to be followed by a corresponding set at station B' (not shown in fig.), and so on.

FIG. 7. INTERMEDIATE LEVELS

if two are employed), the 'back-sight,' i.e. the reading on the first staff just passed, is recorded, and then the telescope is turned as necessary for reading the 'fore-sight,' i.e. the reading on the next advanced position of the staff (or the second staff). The difference in the readings gives the difference in level of the ground at the foot of the two staff positions. Without moving the staff from its new advanced position the levelling instrument is carried bodily forward, duly adjusted, and a back-sight taken on this staff; while a new fore-sight is taken on the staff (or on the second staff) in its next new forward

FIG. 8. VERTICAL SECTION OF TRANSVERSE LEVELS

Fig. 8 shows a vertical section line of transverse levels carried up a hill-side across a longitudinal main line. A theodolite measures the general angle of slope

from station A to station E, and staff readings are taken at points B, C, D, and E, and their horizontal distance apart measured with a tape or chain. The reduced levels of these points in relation to the horizontal datum B¹, C¹, D¹, and E¹ can then be computed.

Precise levelling is a very accurate system of levelling carried along lines which may be upwards of 1000 m. long, in geodetic S. or for the execution of special large-scale engineering projects. Specially constructed instruments are employed, and special precautions are adopted in making the observations, which are too complicated for the general reader to be described here. A probable error of ± 1 millimetre per kilometre was achieved in the U.S. coast and geodetic line of precise levels from Sandy Hook to St. Louis (1109 m.).

Contouring delineates on a plan a series of lines of equal altitude, or lines of intersection of a hill by horizontal planes. The vertical intervals are obtained by levelling or by angular measurement. The contour lines may be obtained by levelling along other sections normal to the contours when plotted, or at each level on the original section the contours may be worked round by staff and level, the former being moved up and down the slope till the desired level is obtained. A peg is driven in here and the process continued. Setting out curves is a form of work often required. For this the theodolite is chiefly used. The radius of curvature having been determined, a point may be taken in the line from which the curve springs. Back- and fore-sights having been taken, the angle of the theodolite is set to give the chord, the length of which would be 1 chain. This is found by calculation or taken from tables. Two theodolites are often used, and the curve set out from opposite ends.

MEASUREMENT OF HEIGHT FROM AN AWKWARDLY PLACED BASE.

Heights.—Fig. 9 illustrates the method of obtaining height BC by means of a theodolite, where a base AD is awkwardly placed, the foot of the object being invisible from A. For the method of solving the triangles see **TRIGONOMETRY**. In this case angles CDB, CDH are observed from D, and the height of instrument DF above

the peg measured. From E the angles CAD, DAH¹ are observed. Thus $CDH + HDA = CDA$. In the triangle ACD, $180^\circ - (A + D) = C$ and $\sin c : c :: \sin D : d$. In the right-angled triangle CHD, $90^\circ - D = C$. In the triangle CBD, $180^\circ - (C + D) = B$ and $\sin b : b :: \sin D : d$ and $d = CB$.

TOPOGRAPHIC SURVEYING.—A simple land survey as a rule gives no reference to the exact position on a map of the country, nor is it concerned with anything beyond relative level. A topographic survey, on the other hand, must commence with astronomical observations of lat., long., and azimuth, as well as a determination of level relative to mean sea level. The last is taken by observation of tide-gauges over an extended time, and can be carried inland by the ordinary process of levelling. Before determining the base-line stations, it is usual to carry out a plane-table reconnaissance, during which many unforeseen troubles are discovered and avoided with the later theodolite operations. At the same time station points are determined and beacons erected, or suitable objects chosen as beacons. Any form will serve so long as it gives a suitable image for reading with the cross-wires of the theodolite, but ease of centring is important; i.e. the point vertically below the mark on the beacon must be easily and correctly determinable. On this point the station mark must be placed in such form and in such manner as to be permanent. The reconnaissance completed, a careful scheme of triangulation will have been determined; the base line is then measured by tapes with accuracy, and the theodolite takes the place of the plane table, all attention being now given to accuracy of angular measurement. In place of the vernier it is usual now to read the scale by means of a micrometer microscope (see **TRANSIT INSTRUMENT**), accuracy being increased five-fold.

Observation of Latitude.—This may be made at any point in the triangulation, and except for geodetic purposes it is not usual to fix more than one station astronomically. Any method may be adopted (see **LATITUDE AND LONGITUDE**), but the usual one is by observation of a star's altitude when near the meridian; this is repeated for two or three nights and with different stars, both N. and S., and accuracy should be obtained to one or two seconds of arc.

Observation of Longitude.—Local time is obtained by observation of pairs of stars E. and W. as near the prime vertical as possible. Greenwich time may be obtained from the mean of sev. chronometers, or by telephone or radio.

Observation of Azimuth.—This, the true bearing, or angle between the prime vertical and meridian with respect to the line chosen for determination, is obtained by observations of a circumpolar star or one near the prime vertical, and the beacon illuminated by a small light such as a bull's-eye lantern; it is often more convenient to take the observation with respect to some other point than the beacon, and to obtain the bearing of

the beacon with respect to this latter; the point is placed about a mile away. The true azimuth of the stars, and the difference between them and that of the station, afford a means of determining the true azimuth of the station, an accuracy of two or three seconds of arc being obtainable.

Theodolite Triangulation.—From any station a round of angles is taken between A and B, B and C, and so on to G and A, so that A is observed twice: by this means a check is placed on the angles, as their sum should be 360° . As a further check the round is taken sev. times. If this cannot be done directly, owing to weather, for instance, it is done indirectly by erecting some reference mark easily visible. The measured base is 'reduced to sea level,' since maps are projected on to one plane, so that the remainder of the triangulation obtained by angles is automatically reduced to the same level. Modern base-measurement being a comparatively easy process, the results of theodolite triangulation are fairly often checked by chaining. In small triangles, with sides of 1 or 2 m., the sphericity of the earth is negligible; in larger triangles this is shown on the readings, the three angles being more than 180° in sum. This spherical excess, depending on the area of the triangle, is easily calculated and forms another check. When subtracted from the sum, the difference between the result and 180° is known as the triangular error, and may be as much as two or three seconds in good topographical work. Spherical excess is given by the formula $E = ab \sin C \operatorname{cosec} 1'' 2^{\frac{1}{2}}$, but simplified formulæ are used for most purposes. One of the greatest difficulties is in connection with refraction; as this usually is supposed to act in a vertical plane it does not generally affect the horizontal angles, except with 'grazing rays,' which should be avoided. These are lines of sight passing close to steep slopes, where there is usually a horizontal temp. gradient. Vertical refraction in a horizontal ray is impossible to calculate; it may be avoided largely by observing in the early afternoons when it is a minimum, and by back-sighting, which eliminates it, if the conditions of the two observations are the same. Otherwise it must be corrected by calculation or reference to tables, a partial remedy only. The surveyor, when experienced, will determine it by experience, aided by a careful analysis of his readings from all other points. Over a ray of 30 m. the error may be 2 or 3 ft. with back-sight; it is more when one observation only is relied on, and very uncertain indeed in mountainous regions, or over water, sand, or snow. It may, however, be noted that a vertical angle taken from the level has only one reading error, whereas a horizontal angle has two. A great deal may be done in checking errors by the careful selection of the second and following chained lines. In more accurate topographic survey the system of triangulation is worked up into sequences of quadrilaterals, equivalent to tying the triangles, which gives regular checks. Geographical

position of stations may, in less extended surveys, be obtained graphically by carefully plotting the base, astronomically determined, on a plane-table graticule, or sheet with the lat. and long. arcs constructed according to the methods of map projection; if the corrected angles are plotted on the graticule, the stations will fall in their true geographical positions. In more extended work this is done by calculation, the computation having been greatly simplified in the tables of the survey of India. Levelling with the theodolite follows the same principles as for simple survey, with the addition of the important original linking up to mean sea level.

ORDNANCE SURVEYS.—The prin. triangulation of the United Kingdom occupied the first half of the nineteenth century. The base was laid out on Salisbury Plain and measured with steel, glass, and wooden rods, and triangulation was proceeded with over the whole country. Instead of using the modern method of chains of triangles along meridians and parallels, the country was arbitrarily divided into convenient triangles of about $\frac{1}{2}$ in.-side. Connection was estab. between Wales and Ireland by the lime-light; N. of Scotland the two is. Fair and Foul made it possible to extend to the Shetlands. No base was measured in Scotland, but another was laid out by Lough Foyle, compensating bars being used. The triangles were broken up into smaller ones averaging a little over a mile a side, and these were all chained over, even the contouring being done by chain. These contours, although accurate, are too far apart. The trigonometrical survey occupied about sixty years. The datum level was mean tide level at Liverpool, but a more scientific datum was obtained off Cornwall and in the North Sea. A base has since been measured at Lissiemouth in Scotland, and previous data were checked from it (*see also* ORDNANCE SURVEY; MAPS (MAPS OF THE ORDNANCE SURVEY)). In India survey has been of the highest standard, and has contributed enormously to the advance of geodesy. Australia and Canada are carrying out a complete geodetic survey. In S. Africa the geodetic survey is complete; the topographic survey is well advanced. Tropical Africa has been partially surveyed under the control of the Colonial Survey Committee (1905); this body has extended its work to other colonies and dependencies. Boundary surveys are largely completed in Africa, having been delineated chiefly for international political purposes. The Alaska boundary, and that between Chili and Argentina, are instances of extremely careful work.

ROUTE TRAVERSING has become an important branch of surveying, since it is often carried out with great labour, patience, and skill. It consists in careful observations of the route taken by an explorer, whereby his journey may be accurately laid down, and in the plotting of as much of the lateral feature as he is able to observe while travelling. The

work of Dr. Sven Hedin in Tibet is a model of this type of work. In the past much error has crept into maps, notably in Africa, owing to faulty instruments and inaccurate observations of the astronomical data for selected stations *en route*. The improvements in instruments and the encouragement by the Royal Geographical Society (*q.v.*) have led to much more accurate work. The explorer nowadays checks his route by astronomical observations as in topographic survey and usually carries sev. chronometers. Between stations he keeps a sort of dead reckoning. Distance may be measured by cyclometer or perambulator, a wheel of known circumference, often 10 ft., mounted in a fork and handles, and fitted with counting mechanism to give the number of turns; the sledge-meter used in Antarctic expeditions is a form of this. A bicycle may be so arranged. Distances measured this way have to be corrected for windings of the path and for inequalities of level up and down hills, etc. The experienced explorer usually relies on his own experience, together with the time taken to traverse the distance; he knows pretty accurately his own marching pace, the pace of his animals, of his party or of his vehicles. His chief difficulty lies in estimating rate up hills and down, particularly on slight, almost imperceptible gradients. Windings of the path, nature of surface, weather, etc., are all sources of error. His traverse, or connected series of straight lines, has to be watched in its various bearings, which is usually done by means of a prismatic compass. Fixing on a distant objective, he takes its bearing, and on reaching it repeats the process for another objective. This again is very difficult in hilly and forest land, particularly the latter. A portable theodolite is often carried and enables him to check his result to some extent two or three times in an extended journey. When he crosses the route of a previous explorer he may check by that, if, as is usual, he has previously obtained the records. Meanwhile he takes the bearings of distant and near landmarks from sev. points along his route, such cross-bearings forming another check on his traverse. He keeps a field book in which all these are entered, together with details of things he wishes to remember on either side of his track, *e.g.* forest, cultivation, swamp, etc. The most prominent distant features he will observe with the theodolite with greater accuracy. His astronomical bearings may be obtained within a mile by sextant, much closer by the theodolite for latitude. For longitudes his chief difficulty is Greenwich time, necessitating the carrying of sev. chronometers; in any case, however much care is taken, the rough journey, the joltings, and carelessness of native bearers may render them all unreliable. The errors of these may be checked, but with difficulty and laborious calculation, by observations of occultations of stars by the moon; the infrequency of these is a difficulty. With the sextant he may measure lunar distance, the distance between a star and the moon, but with

less accurate results. His compass bearings are not true bearings, since the needle varies in deviation from place to place and time to time; these must be checked by observations of azimuth, the difference between which and the compass bearing gives the deviation. It necessitates a knowledge of approximate latitude, the horizontal angles of the sun and a distant object, and the altitude of the sun. The true azimuth of the sun is known from its altitude and the latitude, and by applying to this the horizontal angle of the object its azimuth is determined. However careful and skilful the traveller may be, his route traverse is never accurate enough for correct maps. The process of levelling reduces itself to rougher methods than those of true surveying. The aneroid barometer is a usual means, but as it is affected by temp. and other weather conditions, as well as by height above sea level, only a very rough approximation can be made. If one be taken to the height required and another be kept in camp, simultaneous series of readings will give a better result. In parts of the world where variations are practically quite regular, the results of single observations may be relied on, *e.g.* S. Nigeria. The hypsometer, or boiling-point thermometer, is an instrument much used and gives somewhat less accurate results than the aneroid. The heights of mts. by these methods are given by various travellers with differences of sev. hundred feet.

Geodesy (q.v.) has for its aim the measurement of the earth considered as a nearly spherical body.

TACHEOMETRY.—In country difficult for ordinary traversing the tachometer may be used for the method of subtense measurement. At one end of the ray to be measured two poles about 50 yds. apart are placed at right angles to the ray, their distance apart being accurately measured. These are observed through the theodolite and the angle subtended measured; representing the angle by 2θ , the distance between the poles by $2s$, then the length of the ray $= s \tan \theta$. Another method for shorter rays is to use a theodolite with two wires at fixed distances apart on the field, and observe, along the ray, a graduated staff. The wires always give a fixed angle which will enclose more or fewer graduations on the staff, the further or the nearer it is respectively. The stadia marks, as the wires are called, are so arranged that the graduations have only to be multiplied by a factor to give the distance of the staff from the observer. This factor varies with the distance of the wires from the optical centre of the objective of the telescope which is changed in altering the focus for different distances. The correction for this is small and variable, but is made by adding to the computed distance the distance from the centre of motion of the instrument to a point on the axis, beyond the objective, at a distance equal to the focal length from the optical centre. The tachometer is an instrument which, by the introduction of a third lens in the telescope, the anallatic lens, eliminates the

correction and gives the reading at once. The instrument is useful for small surveys and military work, but not for extended surveys. When used on the slope, if the graduated bar is horizontal, the computed distance must be multiplied by the cosine of the slope to give the horizontal distance; if vertical the multiplier is the square of the cosine.

NAUTICAL SURVEYING carried out by ships along the coast depends on the same methods of observation and triangulation. In coast-lining a shore party carries out

These are found by ordinary sounding operations carried out by a boat directed from the shore. When the water is of sufficiently small extent, a cable may be stretched across and the sounding carried out from the shore by means of a sounding line attached to the cable. The methods of determining the position of the boat from the shore are numerous, but there are different ways of selecting rays parallel and intersecting. In the case of a lake, it is merely the process of contouring by means of sounding. Such a survey often

AERIAL SURVEY FOR TOPOGRAPHICAL MAPPING

From this photograph was produced the map shown opposite, both reproduced by permission of Hunting Aerosurveys Ltd

the usual methods in conjunction with the ship. Beacons are so placed that their bearings can be taken from the ship which makes a traverse along the coast. In more accurate coast-lining the whole of the work is done on shore, except for the determination of inshore depths, particularly the high-water line, which is often done from boats at anchor. Where stations are required in water special methods are naturally also required, and it is in these methods of carrying out the work at sea that nautical surveying differs.

Hydrographic Surveying deals more particularly with the area and depths of water stretches, at sea, a lake or riv. It includes the linking up with the shore triangulation, the mapping of the margin, but particularly the sounding of depths.

includes temp. observations, salinity, velocity, current, tides or seiches, transparency, etc.

MINE SURVEYING is another branch with its special methods. The linking up with surface survey is important; the first point is the fixing of the position of the upper and lower ends of a weighted wire let down the shafts, when a traverse from one to the other will give the basis for a complete survey and connect the underground with the surface. If one shaft only is available two wires may be suspended, thus giving short base lines above and below ground, the relative positions of which are known. Underground there is the necessity for special illuminations, and there is more use of magnetic bearings. Stations are usually marked in the roof, and pendulums sus-

pended for centering, the telescope being marked on the top. When a mine is entered by tunnel or sloping shaft, the surface survey can be carried down without trouble. The mine surveyor is naturally always extending, and his observations must include all that are necessary for following the beds of coal correctly.

PHOTOGRAPHIC SURVEYING.—In this method, first suggested by Aimé Laussedat, the positions of sev. stations are fixed by trigonometrical survey, and the sights

making, particularly in difficult country, for the mapping of cities, and for archaeological work, where its aid has been invaluable. Cameras for aerial photography are usually fitted with lenses of very long focus illuminating a field much larger than the plate; and protection against excessive light necessitates sev. partitions inside the camera, each with an aperture permitting only the useful rays to pass (*see also* next section).

AERIAL SURVEYING.—The first air photographs were taken from captive

AERIAL SURVEY FOR TOPOGRAPHICAL MAPPING

Map produced from the photograph shown opposite Scale 1 to 5,600, with contours at 50 ft. vertical intervals

usually taken on the plane table are photographed, and plotting from these is performed in the office later. The process of plotting is very complex, the method has, however, been extensively used in gov. surveys in Canada (*see* PHOTOGRAMMETRY).

Aerial Photography is a recent and important development. It came into notice during the First World War, when it provided vital reconnaissance information. The use of specially sensitised plates and light-filters enabled photographic evidence to be obtained when flying too high for visual observation to be effective, and the comparison of day-by-day records of the same area showed any movements made by the enemy. Photography was also far more efficient than visual observation in detecting camouflage. Aerial photography is now used for surveying and map

balloons, by Aimé Laussedat in 1858. Not until the coming of the aeroplane, however, and the many advances made as a result of the First World War did air survey begin to play an important part in cartography. Great developments took place between the wars. In Europe, especially in Switzerland and Germany, research was largely concentrated upon producing elaborate three-dimensional plotting apparatus designed to reconstruct the geometrical conditions at the moment of exposure, thus compensating for random errors of tilt in the photography. In England and in India more attention was paid to the simpler graphical methods of plotting. In the Second World War air photographs became of primary importance. Many inventions resulted, including thermostatically controlled cameras,

automatic pilots, camera stabilising controls, and the use of radar and radio aids to fix the position of the aircraft. Examples of aerial surveying are the photographing of 125,000 sq. m. of the timber area of Ontario to produce maps with a 1:15,000 scale, and of 5000 sq. m. in Colombia for exploration of oil resources. Two types of photograph are used in aerial survey, viz.: 'obliques,' taken with the camera depressed below the horizon, and 'verticals,' taken vertically downwards. The former is a perspective picture which shows natural features such as hills, ravines, etc., whilst the latter shows the ground as a plan and clearly defines local features such as marsh, cultivated lands, details of tns., tracks, etc. The verticals are most commonly used, producing a series of parallel strips overlapping laterally by 30 per cent. The shutter speed of the camera is regulated so that successive exposures overlap in the direction of flight by 60 per cent. Thus every object on the ground will appear on the exposures taken from three different air positions, thus reducing to a minimum the risk of gaps by inaccurate flying.

There are difficulties which arise in the taking and using of aerial photographs for survey purposes. The plane of the photographic plate should, to obtain a true perspective plan, be parallel with the ground surface; this rarely happens, and the angle between these two planes, called 'tilt,' has to be allowed for because it causes differences of scale. Again, the reflected light-rays from the photographed subject converge in a cone having its apex at the lens of the camera, therefore the higher a point such as a church steeple is, the further away from the centre of the photograph its image will appear, thus introducing distortion in the perspective view. The scale may be determined by comparing the distance between two points on the photograph with the distance on the map or actually measured off on the ground between the same two objects. The utilisation of aerial photographs for producing maps and plans is described under STEREOGRAPHOMETRY.

Thomas, *Surveying*, 1948.

Surveyors to Lloyd's Register, see under LLOYD'S REGISTER OF SHIPPING.

Surya, in Hindu mythology, the sun. He is represented as the son of Dyaus and the husband of Ushas the Dawn, and he moves in a car drawn by fiery horses. He is the preserver of all things stationary and moving, the source of life, and beholds the good and bad deeds of mortals.

Surya Siddhanta, famous astronomical work in Sanskrit, said to be a direct revelation from the sun. It consists of short aphorisms which form a set of rules

to calculate the positions of the heavenly bodies. It is sometimes identified with the Saura Siddhanta, one of the five earlier works on which the Panchasiddhantika was founded, a work by Varahamihira, who flourished about the beginning of the sixth century.

Sus, or **Sous**, riv. of Morocco, rising in the Atlas Mts., and flowing W.N.W. to the Atlantic.

Susa: 1. Or **Shushan**, anct. city of Persia, on the E. bank of the Choaspes, now in ruins, believed to have been founded by Darius I. It is mentioned in the O.T. (Daniel), and on its site numerous inscribed stones have been discovered.

2. Fort. tn. of Italy, in Piedmont, 30 m. W.N.W. of Turin. It has a ruined castle and a triumphal arch erected in honour of Augustus. There is also a cathedral dating from the eleventh century. It was the departure point for the old passes over the Mont Cenis and Mont Genève, and was once the cap. of Piedmont. There are textile industries. Pop. 7000. 3. Or **Sousse**, port of Tunisia, cap. of a prov., on the gulf of Hammamet. There was a Rom. harbour, and there are catacombs near by. Phosphates, olive oil, and esparto grass are exported. Pop. 28,500.

Susac, see under FUME.

Susanna, History of, book of the Apocrypha belonging to the group of additions to the Book of Daniel in two Gk. versions of the O.T. The story of the virtuous Susanna (a favourite theme of painters and sculptors) contains at least two folklore motifs, of the woman falsely accused and the clever young judge. The story was pagan in origin and had no didactic purpose at first. When the Jews adopted it they identified the youth with Daniel and changed all the other characters into Jews living in Babylonia during the exile, and the whole story became an edifying account of God's vindication of the innocent and of His punishment of the wicked. The probable place of origin of this book is Judea (if the original language was Heb. or Aramaic) or Alexandria (if it was written, as appears more probable, in Gk.); the probable date is 150-100 B.C.

Susiana, see KHUZISTAN.

Suspension Bridges, see BRIDGE.

Susquehanna, riv. of Pennsylvania, U.S.A., the main branch of which rises in Otsego Lake, and has a length of 200 m. The other branch rises in the Allegheny Mts., and after a circuitous course of 200 m. joins the main or E. branch at Sudbury, Pennsylvania. The united stream flows S. and S.E. past Harrisburg and Columbia, and enters Chesapeake Bay at Havre de Grace.

Sussex, maritime co. on the S. coast of England, fronting the Eng. Channel for 90 m., and bounded N. by Surrey, E. by Kent, and W. by Hampshire. It is 74 m. from E. to W., and about 28 m. in its broadest part. Area 908,985 ac. Pop. 635,300 (excluding co. hors.). Its coastline is unbroken by bays of any extent, but the promontory of Beachy Head, the termination of the S. Downs, juts out into the Channel. In the W. is the low

promontory of Selsey Bill. From Hampshire to Beachy Head, the S. Downs are generally within 5 to 10 m. of the sea, and with occasional heights of over 800 ft., Ditchling Beacon, off the Brighton road, being 813 ft. The co. is watered by the Ouse, Arun, Rother, and Adur. There are no large rivs., but the co. owes much to the many little streams that feed its few short rivs. The Rother, with its source in the region of Ashdown Forest, flows mainly E., forms a boundary with Kent for some distance, and with the Brede, reaches the sea at Rye. The Ouse from near Horsham, past Lewes to the sea at Newhaven, flows S.E. for most of its brief course. The Adur collects numerous little streams around W. Grinstead, and reaches the sea only 1.5 m. away at Shoreham. The Arun, from Surrey, flows S. with innumerable bends, by Pulborough, Amberley, and Arundel to the sea at Littlehampton. Other streams are the Lavant, Chilt. Stor. Cuckmore, etc. Sussex is noted for its seaside resorts, the prin being Brighton, Hastings, Eastbourne, Worthing, Shoreham, Littlehampton, Bognor Regis, Bexhill, St. Leonards, and Seaford. The middle of the co. is occupied by the weald, which was formerly the Anderida Forest, now an undulating and fertile tract. There is still much woodland, of which Ashdown Forest is the principle part of the anct. forest. On the downs, which cross the southern part of the co. from W. to E., large flocks of sheep are grazed, the Southdown breed being famous. Poultry farming and market gardening are important industries. The crops consist chiefly of wheat, oats, and turnips; fruit is extensively cultivated, and there are hop gardens in the E. The Sussex iron industry, once flourishing in the Weald, was of national importance in the sixteenth and seventeenth centuries. Fishing is engaged in along the coast; with the exception of Chichester, the harbours are not good, but Newhaven is a cross-channel port. Sussex contains the Cinque Ports Hastings, Winchelsea, and Rye. In the E. are the Romney Marshes; here, by the action of the sea, sev. tns. which were formerly ports, e.g. Rye and Winchelsea, are now inland tns. The co. returns six members to the House of Commons. At Goodwood, Lewes, and Brighton are well-known race-courses. The antiquities of Sussex are numerous and include the castles of Hastings, Arundel, Lewes, Bramber, Hurstmonceux, Pevensey, Bodiam (a National Trust property), etc., the abbeys of Battle, Bayham, etc., Chichester Cathedral, which was founded in the eleventh century. There are very many prehistoric camps, earthworks, and burial mounds; S. has been called the finest open-air museum of antiquity. There are notable Rom. remains. The chief historical events are the landing of the S. Saxons (in 447), the battle of Hastings or Senlac (1066), and the battle of Lewes (1264), while the co. was also the scene of the exploits of Jack Cade in 1450. From the Sackvilles of Buckhurst to Rudyard Kipling (Rottingdean), there

is a wealth of literary associations. See M. A. Lower, *History of Sussex*, 1870; W. H. Hudson, *Nature in Downland*, 1923; C. G. Harper and J. C. Kershaw, *The Downs and the Sea: Wild Life and Scenery in Surrey, Sussex, and Kent*, 1923; Hilaire Belloc, *Hills and the Sea*, 1927, and *The County of Sussex*, 1936; E. C. Curwen, *Archæology of Sussex*, 1937; A. Meo, *Sussex*, 1942; and R. F. Jessup, *Little Guide to Sussex*, 1949 ed.

Sussex Breed, see under CATTLE.

Sussex Regiment, Royal, formerly the 35th and 107th Regiments. The 35th was raised in 1701 at Belfast, and served in the defence of Gibraltar, 1704. It had a distinguished career in N. America and the W. Indies, and at Quebec under Wolfe gained its badge of the Rousillon plume, having defeated the Fr. Royal Regiment of Rousillon. It was in the Amer. War of Independence and the Indian mutiny. The 107th was raised in 1851 in India as the 3rd Bengal European Regiment. This regiment was employed in various parts of Bengal during the Indian mutiny. In 1861 it transferred as the 107th. In 1881 the two regiments were linked to form the present regiment. During the First World War twenty-three battalions were raised, which served in France, Flanders, Italy, Gallipoli, Egypt, Palestine, N.W. Frontier of India, and N. Russia. The regiment fought in France, E. Africa, and Burma in the Second World War. Units were part of the famous 4th Indian Div. which played a leading part at Sidi Barrani in the first great victory won by the Brit. Army in the war.

Sustentation Fund, see FREE CHURCH OF SCOTLAND.

Susterman, Lamprecht, see LOMBARD, LAMBERT.

Susz (Ger. *Rosenberg*), tn. of Silesia, Poland, 5.5 m. N. of Racibórz (Ratibor). Pop. 5300.

Sutcliffe, Herbert (b. 1894), Eng. cricketer, b. at Summerbridge, Yorkshire. First played for Yorkshire in 1919, and quickly estab. himself as an opening batsman. S. scored over a thousand runs in each of his twenty-one seasons and represented England on thirty-four occasions. During his career he scored 50,135 runs, with a highest score of 313, when with Holmes he estab. a new world record first-wicket partnership of 555 for Yorkshire v. Essex in 1932. His autobiography *For England and Yorkshire* was pub. in 1935 (new ed. 1948).

Sutherland, Carol Humphrey Vivian (b. 1898), Eng. historian and numismatist, graduated from Christ Church, Oxford. He became assistant-keeper of coins in the Ashmolean Museum, Oxford, and from 1943 president of the Royal Numismatic Society. His pubs. include *Coinage and Currency in Roman Britain* (1937); with H. Mattingly and E. A. Sodenham, the later vols. of *Roman Imperial Coinage* (1939 onwards); with J. G. Milne and J. D. A. Thompson, *Coin Collecting* (1949).

Sutherland, Graham Vivian (b. 1903), Eng. painter, b. in London. He was educated at Epsom College, and after a

year as engineering apprentice in the Midland Railway works at Derby went to Goldsmith's School of Art at New Cross. Basically a romantic artist, his dramatic and turbulent landscapes, studies of inanimate objects, his fine series of war paintings of devastation and heavy industry, and his later more composed water-colours have brought him considerable prominence in the field of modern art.

Sutherland, maritime co. of N. Scotland, bounded on the N. by the Atlantic, W. by the Minch, E. by Caithness, and S. by Ross and Cromarty. It forms a rough oblong about 62 m. long by 49 m. broad, with an area of 2028 sq. m., and a pop. (1948) of 14,000. The surface is mountainous in the N. and W., the chief summits being Benmore Assynt (3274 ft.), Conievelar (3234 ft.), Ben Clibrick (3154 ft.), with sev. others approaching 3000 ft. In the E. the chief heights are the Hill of Ord (1320 ft.), and Cnoc an Eircannaich (1698 ft.). The S. and S.E. of the co. is fairly level. The coast is rocky and deeply cleft by sea lochs, with bold headlands, such as Cape Wrath and Strathly Point on the N. coast. The most important inland lochs are those of Shin and Assynt, but there are over 300 smaller ones. The prin. rivs. are the Oykell with its tribs., the Shin and Gussley, the Helmsdale, Brora, and Fleet flowing S.E.; the Donard, Naver, and Halladale flowing N.; and the Inver and Luxford flowing W. The interior of the co. is covered with 'deer forests', trackless wastes, destitute of trees, or mt. moorland, abounding with roe deer. The most fertile as well as the most populous dist. is in the valley of Dornoch Firth, where the land is highly cultivated. Dornoch (pop. 725), the co. tn. and royal burgh, with a cathedral dating from 1223, is a holiday resort noted for its golf links. Brora is the commercial centre. Agriculture, mostly crofting and sheep farming is the prin. industry producing Cheviot sheep in large numbers, cattle, and oat and barley crops. Other industries are tweed manuf. at Brora and Rogart; brick making at Brora and Lairg; whisky distilling; herring and salmon fishing; hotel keeping, and catering for a large tourist trade. There is a small coal-pit at Brora. The co., with Caithness, returns one member to the House of Commons.

The co. is notable for the number of its prehistoric monuments. Sutherland was overrun by the Scandinavians at the beginning of the eleventh century, who continued their depredations in the twelfth century. During 1810-20 the first duke of Sutherland drove 15,000 crofters, who occupied the interior of the co., and were eking out a precarious existence, to the coasts and valleys, causing them to endure terrible hardships on the inhospitable land, and brought in flocks of sheep. This act was called the 'Sutherland clearances.' Dunrobin Castle, near Golspie, is the seat of the duke. Owing to difficulties of access and lack of roads, Sutherland remained in an extremely backward condition until recent years. Rail-

ways now serve the S.E. part of the co. and cover the E. coast from the S. shore of Dornoch Firth, running along the E. coast of Sutherland and then N. parallel to the Caithness border, turning about half-way due E. into Caithness. See H. F. Campbell, *Caithness and Sutherland*, 1920; J. Gray, *Sutherland and Caithness in Saga-time*, 1922; C. D. Bentinck, *Dornoch Cathedral and Parish*, 1926; F. T. Smith, *Sutherland: Land Utilisation Survey*, 1941; and D. Macdonald and A. Polson, *The Book of Ross, Sutherland, and Caithness*, 1948.

Sutlej, riv. of India and Pakistan, in the Punjab, rises in W. Tibet, near Lake Manasarawa at an altitude of 15,000 ft. above sea level. It flows through the Punjab from E. to S.W., receiving in its course the waters of the Chenab and the Beas, until it reaches the Indus near Mithankot, on the N.W. frontier of Rajputana. Its waters are much used for irrigation. Length 900 m.

Sutro, Alfred (1863-1933), Eng. dramatist; also the translator of sev. works by Maeterlinck. Educated at the City of London School and in Brussels. S. turned to writing plays after a successful career in business, and was the author of about thirty plays on social themes, including *The Walls of Jericho* (a comedy of modern society, 1904); *The Perfect Lover* (1905); *John Gayde's Honour* (1907); *The Marriage will not take place* (1918); *Uncle Anghow* (1919); *The Laughing Lady* (1922); *Far Above Rubies* (1924); *The Desperate Lovers* (1927). During the First World War he served with Army Intelligence and was awarded the O.B.E. in 1918. His autobiography, *Celebrities and Simple Souls*, was pub. in 1933.

Suttee, see SATI.

Sutton, Sir Richard, see BRASENOR COLLEGE.

Sutton and Cheam, bor. of Surrey, England, 4 m. W. of Croydon. The High Street is a picturesque part of the main road to Reigate, where it ascends the downs. It is a London dormitory suburb. Pop. 81,000.

Sutton Bridge, urb. dist. and riv. port of Lincolnshire, England, on the Nen R. near the Wash, 7 m. N. of Wisbech. It is in a potato-growing dist. and trades in corn and timber. Near by is the vil. of Long Sutton, noted for its old and beautiful church. Pop. 3000.

Sutton Coldfield, municipal bor. of Warwickshire, England, 7 m. N.E. of Birmingham, and a residential tn., is notable for a sixteenth-century housing scheme which was carried out by John Vesey (alias Harman), a native of the tn. who was appointed bishop of Exeter in 1519. Hardware is manufactured. A television station to serve the Midlands was opened at S. C. in Dec. 1949. Pop. 39,900.

Sutton-in-Ashfield, urb. dist. and manufacturing tn. of Nottinghamshire, England, 14 m. from Nottingham. The church of St. Mary Magdalene was built in the twelfth century and restored in the nineteenth. It has collieries, manufs. of cotton, hosiery, thread, light engineering,

plastics, tin boxes, cardboard boxes, and precision tools. Pop. 39,800.

Suture (*sutura*, a seam), term applied (1) to a form of articulation met with only in the skull, where union is accomplished by fibrous tissue continuous with the periosteum; (2) to a stitch or stitches closing the contiguous margins of a wound; (3) to the material (catgut, nylon, silk, etc.) used for closing the wound. Cranial Ss. are divided into true and false. The former, known as *sutura vera*, are those whose articulating surfaces are connected by a series of projections and notches dovetailed together. The margins of the bones are not in direct contact, however, but are separated by a membrane which is a continuation, externally of the pericranium and internally of the dura mater. False Ss. are those formed when roughened surfaces are placed in apposition with one another, as between the palatine processes of the maxillae. True and false Ss. are further subdivided. The true are of three kinds, namely, *sutura dentata* (toothed), *seriata* (saw-edged), and *imbosa* (overlapping). There are two varieties of false, which are known as *sutura squamosa* and *harmonia*. There is a great variety of Ss. which are used in bringing together the lips of a wound.

Suva, cap. of the Fil Islands, in the Is. of Viti Levu. Pop. 11,400.

Suvla Bay, Battle of, see GALLIOLI CAMPAIGN.

Suvorov, or **Suvórov-Rymnikski**, **Alexander Vassilyevich**, Count, Prince Italinski (1729-1800), Russian soldier, b. in Moscow. He obtained a lieutenantcy in a regiment of the line, was raised to the rank of first-lieutenant three years afterwards, and in 1758, when the war with Prussia broke out, received command of the garrison of Memel. In 1759 he was present at the battle of Kunnersdorf. Catherine II., in 1763, named him colonel of the Astrakhan regiment of infantry. Five years afterwards he was commanding officer of a part of the Russian troops which were engaged in warfare with the confederation of Bary in Poland. On his return he was made major-general, and in 1773 he was sent against the Turks under F.-M. Rumyantsev. Three victories by S. over the troops of Mustapha III. prepared for the complete defeat of the Turks, and, having effected a junction with the army of Gen. Kamenskoy, a fourth victory in June 1774, put an end to the struggle. Immediately afterwards he defeated the insurrection of the Don Cossack Pugacheff. In 1783 he subjugated the Kuban Tatars and those of Budziac, and was raised to the chief command, which he held throughout the second Turkish war, which broke out in 1787. In 1789 S. won the battle of Fokshany and captured Ismail. In 1792, when peace was made between Russia and the Porte at Yassy in Moldavia, the Empress Catherine appointed S. governor-general of the prov. of Yekaterinoslav, the Crimea, and the lately acquired provs. round the mouth of the Dniester. In 1794, when the Poles revolted, S. was sent against them. He

gained sev. victories over the insurgents, culminating in the capture of Pragal. On this occasion Catherine made him a field marshal. In 1799, after the death of Catherine, the Emperor Paul gave him the command of the troops which fought in Italy against the Fr. He inflicted sev. defeats on the latter and took his army into Switzerland across the Alps, but was recalled by the tsar. S. died shortly afterwards. He was one of the greatest Russian soldiers, and a military decoration is named after him. See lives by W. L. Biease, 1921, and K. Olskov (Eng. trans. 1914).

Suwanee, riv. of the U.S.A., rises in Georgia, flows S., and then enters the gulf of Mexico. It is navigable as far as White Springs. It is the 'Swanee R.' mentioned in the well-known song *Old Folks at Home*. Length 240 m.

Suwarow (botanical), see 'ARYOCAR.

Suzerainty, in international law a distinction is drawn between dependent states under S. and those under protection (see PROTECTORATE). A state under S. is one which has acquired certain of the attributes of international dependence from having become part of the suzerain; in all other respects it is presumed to remain dependent so that, for example, it is in a state of war when its suzerain is at war. In theory, the position of a state under S. does not differ from that of an individual state in a federation. Since the dissolution of the Holy Rom. Empire in 1806, states under S. have become rare, the chief instances being almost confined to states under the S. of the Porte, e.g. Moldavia, Wallachia, and Serbia, which had, however, definitely shaken off the Turkish yoke before being recognised, in 1878, as independent states. For long Egypt was in an anomalous position, for while nominally under the S. of the Porte, she was really a part of the Brit. Empire (see further under EGYPT). Korea furnishes an instance of a modern state which was under S., the country remaining under the S. of China until the Sino-Jap. war of 1894-95, which terminated China's claim; but Korea's nominal independence soon yielded to annexation by Japan.

Suzor-Côté, Aurèle de Foy (1869-1937), Canadian artist, b. at Arthabaska, prov. of Quebec. He studied in Paris at the Ecole des Beaux-Arts and the Académie Julien and Colarossi, and became R.C.A. in 1914. His landscape and figure work is marked by its simplicity, strength, and accuracy. Important pictures include 'Return from the Harvest Field,' 'Autumn Landscape, Evening,' 'Youth and Sunlight' and 'The Settlement on the Hill-side.'

Svalbard, see SPITS-BERGEN.

Svastika, see SWASTIKA.

Sveaborg, fortress on the gulf of Finland, occupying sev. is. 3 m. S. of Helsinki, called 'the Gibraltar of the North.' It was fortified in 1749 by the Swedes.

Svealand, see under SWEDEN.

Svendborg, seaport of Denmark on the is. of Fünen in Svendborg Sound, 23 m. S.S.E. of Odense. It has one of the best

harbours on the is. and is an outlet for the produce of the adjacent is. There are tanneries, shipbuilding yards, and foundries, and it exports agric. produce. Pop. 20,000.

Svendrup, Harald Ulrik (b. 1888), Norwegian meteorologist and oceanographer, b. at Sogn, W. Norway. He had a univ. education, and became assistant to Prof. Bjerkness, the meteorologist, in Oslo and Leipzig. He was the leader of scientific work on Amundsen's *Maud* expedition 1917-25, and again on the *Nautilus* expedition in 1931. From 1936-1948 he was prof. of Oceanography at the univ. of California. He is the author of many treatises, mainly about meteorology and oceanography, and is a director of the Norwegian Polar Institute, and chairman of the International Commission for Polar Meteorology.

Svendsen, Johan Severin (1840-1911), Norwegian composer, b. in Oslo. He was court conductor at Copenhagen from 1880 to 1911. His works, which show an attachment to the influence of his homeland, include four Norwegian rhapsodies, two symphonies, and other orchestral and chamber compositions, and songs.

Sverdlovsk: 1. Region of the R.S.F.S.R. in the Urals, covering, with the Molotov Region to the W., the area of the old Perm prov. The black earth areas in the E. of the region produce wheat, rye, and oats. The W. part is the industrial centre of the Urals, with mines of gold, platinum, copper, asbestos, and coal. There are heavy industries, and wood and textile manufs. Area 85,268 sq. m. Pop. 2,512,000. 2. Formerly **Ekaterinburg**, cap. of the above, on the Asiatic side of the Urals, 200 m. S.E. of Molotov. Developed after the revolution, it is the chief mining tn. of the Ural Mts. The Central Urals Copper-smelting Combine near S. is the chief centre of the non-ferrous metals industry. Copper is mined and refined at Revdya, near S. Tungsten ores are mined to the south of the tn. Platinum and phosphorus are also worked. Machinery for the metallurgical and mining industries is manufactured here. Its electric power station is linked by high voltage transmission cable with the other chief power stations in the Ural industrial region. Its other manufs. include linen, soap, candles, and precision instruments. There are also estabs. for polishing precious stones, and trade is carried on in cattle, cereals, iron, and woollen goods. It has a univ., two cathedrals, a monastery, and a mint for copper coinage. Here, in a house belonging to Ipatiev, the tsar, Nicholas II., his wife, and only son were murdered by the Bolsheviks in 1918. Pop. 425,500.

Sverdrup, Otto (1854-1930), Norwegian explorer, b. at Bindal. Going to sea while still a boy, he had already had wide experience when he joined Nansen's expedition of 1888, which crossed Greenland from E. to W. Nansen offered him the command of the *Fram*. In 1895 the ship was left in the pack-ice while Nansen made his abortive dash for the Pole. The manner in which S. navigated the *Fram*

home through the pack-ice was an epic of polar exploration, and was warmly praised in Nansen's *Farthest North*. From 1898 to 1902, S. attempted to circumnavigate Greenland. When he found that the way was blocked he turned his attention to exploring Grinnell Land, to the W. of Greenland, reaching a point some 82° N. in 1902. He sailed up Nansen Sound and Greely Fjord, into the heart of Grinnell Land, before turning back, the expedition occupying four years. Among the is. he discovered on the expedition were Axel Heiberg, King Christian Is., and the Ringnes Is. These have since been known as the S. Group, Canadian sovereignty over them being recognised in 1931. In 1914-15 he had charge of an expedition for the relief of missing Arctic explorers, and in 1920 he went to the rescue of the Russian icebreaker *Solovoi*, which was ice-bound in the Kara Sea.

Sverre (1151-1202), king of Norway, a native of the Færoer Is. He was proclaimed king in 1177, having been adopted as leader by the Birkebeiner. He was a military genius, and having defeated and slain Magnus at Nordes (1184), built up a powerful monarchy with the aid of the landowners. But he had as his enemy the Church, and in 1198 the land was laid under an interdict. S.'s last years were harassed by the rise of the Baglers or 'croziermen.'

Svistov, see **SISTOVA**.

Swabia, medieval Ger. duchy lying between Bavaria, Franconia, and the Rhine, once called Alamannia. After the fall of the Carolingian Empire the duchy was re-established, and in 1079 came into the possession of the Hohenstaufen. During the reign of Charles IV. (1316-78), emperor of the Holy Rom. Empire, the Swabian cities were leagued together and involved in the so-called 'war of the cities' (1377-89) in opposition to Charles's favourite, Everard II. of Württemberg, the counts of Württemberg having held authority over S. since the middle of the thirteenth century. Everard finally defeated the League, but a second Swabian League was formed in 1488 for the maintenance of public order, and with the support of the dukes of Bavaria regained their ter. from Ulric of Württemberg in 1519. The League continued its arbitration with success until 1534, when it expired. The name is generally applied to the area, and particularly to part of Bavaria. It is a fruitful agric. region with numerous small and medium-sized tns.

Swadlincote, urb. dist. of Derbyshire, England, 12 m. from Derby and 4 m. from Burton-on-Trent. There are earthenware and fireclay manufs., and in the vicinity are coal-mines. In the urb. dist. are Stanton, Newhall, and Church Gresley. Pop. 22,000.

Swaffham, mrkt. tn. of Norfolk, England, 15 m. S.E. of King's Lynn. It has a fine church with a carved roof of wood, a grammar school, and a market cross. There is considerable agric. trade. S. is noted for its cattle and sheep fairs. Pop. 3000.

Swahili, people inhabiting the coastal region of Kenya Colony and Tanganyika Ter., between Mombasa and Zanzibar. They are of Bantu origin, but have mingled freely with the Arabs, who have greatly influenced their customs, language, and religion. Most are Mohammedans, and their language Kiswahili (or Ki-Swahili) i.e. 'language of the coast,' usually in a debased form, is used as the *lingua franca* of E. Africa. Pop. about 1,000,000. See also under NEGRO-AFRICAN LANGUAGES, *Bantu*.

Swain's Island, see SAMOA.

Swaledale, in the N. Riding of Yorkshire, England, is 20 m. in length from Keld to Richmond. It is the narrowest and grandest of the N.W. dales. The Swale is noted for its waterfalls and fishing. Up to 1880 lead-mining supported a larger pop. than the agric. one of to-day. S. gives its name to an important breed of horned sheep. The spectacular Buttertubs Pass (1682 ft.) connects S. and Wensleydale. Arken-garthdale, a branch dale, starts from Reeth, the largest vil. once a mkt. tn., to lead to Tan Hill Inn, England's highest inn (1732 ft.). Below Reeth are the ruined nunneries of Marrick and Ellerton. See ELLA Pontefract, *Swaledale*, 1934.

Swaledale Breed, see under SHEEP.

Swallow (*Hirundo rustica*), well-known passerine bird, widely distributed throughout Europe during the summer, but winters in Africa and tropical Asia. It begins to arrive from the end of March, but in the course of its migration it is destroyed in large numbers in S. Europe for its plumage, and its numbers appear to be gradually diminishing. Its back and wings are blue-black; the throat and forehead chestnut; and the breast pale buff or pinkish. Its two outside tail feathers are elongated into a graceful fork, which is more pronounced in the male. Its nest, somewhat like a flattened cup, is made of mud, straw, hair, and feathers, and is usually built attached to the rafters or bars. S. feed entirely on winged insects, capturing them in the open mouth, which is lined with bristles made viscid by a salivary secretion. They are therefore of great economic value, and the increasing prevalence of gnats and other insects may often be traced to the disappearance of this bird. Other species include the red-rumped S. (*H. rufula*) of the E. Mediterranean. In the same family (Hirundinidae) are the martins. *Chelidon urbana*, the house martin, is smaller than the S. and also differs in having feathered feet and a pure white under-surface; its tail is less sharply forked and its wings are shorter. *Cotile riparia* is the sand martin.

Swallowing, or **Deglutition**, act by which food leaves the mouth cavity for the gullet. The contraction of the tongue muscles pushes the food from the top of the tongue backwards to the fauces. The soft palate is then raised by reflex action to prevent the food proceeding to the nasal cavity, and the glottis closes to prevent it entering the larynx. The constrictor muscles of the pharynx then urge

the food into the gullet, where it is impelled towards the stomach by peristaltic action. S. is assisted by the secretion of saliva, especially in snakes.

Swan, Sir Joseph Wilson (1828-1914). Brit. inventor, b. in Sunderland, and educated locally. The carbon process of printing in photography, the development of the 'rapid' plate in the same science, and many improvements in the processes of electro-reproduction, are due to him. He is best known, however, for the incandescent filament electric lamp, 1879, which was the first successful lamp of its kind. He also invented a miner's electric safety lamp. He became F.R.S. in 1894 and a knight in 1904.

Swan (*Cygnus*), genus of birds with elongated body and neck and short feet. The base of the bill is fleshy and naked, and the sexes are similar in plumage. About eight species are known, of which four have been known to visit Britain in the wild state. The mute S. (*C. olor*), supposed to have been brought by Richard I. to England from the crusades, is the semi-domesticated bird of rivers and ornamental waters. It has the front part of the bill orange. Its young are greyish-brown, while those of the smaller Polish S., a sub-species, are white. The whooper or whistling S. (*C. muscus*) has no knob at the base of the bill, the tip of which is black; it differs also in the carriage of its head and neck. The plumage is pure white with dull black legs and feet. It nests in the Arctic regions, Iceland, and Scandinavia and winters in Britain. Bewick's S. (*C. bewicki*), the smallest Brit. S., is a rarer winter migrant. The bill is black and the deep yellow of the basal portion does not extend below the nostrils. The trumpeter S. (*C. buccinator*) is a N. Amer. bird of great size. The bill and feet are entirely black. Another N. Amer. species is the common Amer. S. (*C. columbianus*), which usually has a yellow patch in front of the eye; it is slightly smaller than the trumpeter. Other species are the black-necked S. (*C. nigricollis*) of S. America and the black S. (*C. atratus*) of Australia, the favourite location being Swan Bay, an inlet near Port Stephens. It was first introduced into Europe early in the seventeenth century.

'Swan, The,' see CYGNUS.

Swanage, holiday resort on the coast of Dorset, England. There are quarries of Purbeck stone. Pop. 7500.

Swansea River, see SUWANEE.

Swansea (Welsh *Abertawe*), mkt. tn., seaport, and parl. constituency, and municipal bor. of Glamorganshire S. Wales, 45 m. W. of Cardiff, at the mouth of the R. Tawe, on a bay at the landward end of the Gower Peninsula. The industrial and maritime activities of S. are carried on eastwards of the High Street, the works and wharves being in the valleys beyond and down at the mouth of the Tawe. The residential parts of S. are well built, with wide streets and many parks, and have spread along the bay and over the hills behind to a height of 600 ft. above the sea.

The castle, said to have been originally built about 1120, was rebuilt in the mid fourteenth century; it is notable for its exterior arcading. The old guildhall or tn. hall, near the docks, built in 1847, is in the It. style. The new civic building, with lofty central tower, in Victoria Park, embraces the new guildhall, law courts, and Brangwyn Hall. Other prin. buildings are the Royal Institution of S. Wales, with a museum and a library; the public library, which includes the Corporation Art Gallery; the Glynn Vivian Art Gallery; and the Exchange Buildings or Chamber of Commerce. There are four large secondary and grammar schools, the oldest of which is the boys' grammar school founded in 1682 by Hugh Gore, bishop of Waterford. The Univ. College of S., a constituent college of the univ. of Wales, was estab. in 1920. Other educational institutions are the Municipal Technical College, the Municipal School of Arts and Crafts, and the Women's Training College.

The port of S. is the natural centre of the tn.'s commercial importance. Many industries have grown up round it, and there are numerous collieries within a radius of 20 m. Long recognised as the chief metal port of Great Britain, S. is now also the greatest Brit. oil port, while remaining the leading centre of the tinplate trade. The largest docks are the Queen's, opened in 1920 (150 ac.), and the King's (71 ac.), the former used for the oil trade. The South Dock basin is the centre of the fishing industry. Exports handled at the port are coal and coke, steel rails and iron work, tinplates, oil, merchandise, grain and flour, and cement; the imports are oil, merchandise, pitwood and mining timber, grain, and flour, copper ores, iron and steel, etc. There are also a municipal dry dock for vessels up to 2000 tons and a number of privately owned dry docks. In addition to its coal (the industry began in 1200) and oil, S. has natural resources in limestone, silica, brick earth, shales, sand, etc., and has for many years been the centre of one of the prin. steel-producing areas in the Brit. Isles, and most of the Welsh steel sheet and tinplate works are situated within a radius of 15 m. of the tn. S.'s metallurgical importance was founded on copper ore, and copper works multiplied from the early eighteenth century. The scientific process of refining the ore was initiated in the S. dist. The oil-refining industry yields a wide range of products. Steam trawling is also a thriving activity. Other industries are chains and lifting tackle, paint, batteries and accumulators, brewing, bricks, building and structural engineering, chemicals, concrete, electrical fittings, machinery, ship-repairing, zinc, and sulphuric acid. S. was a Rom. settlement and the tn. grew up around a Norman castle. It received a new charter in 1655, and in 1888 it became a co. bor. It returns two members to Parliament. S. suffered from heavy air raids in Feb. 1941. Pop. 164,800.

Swansea Bay, bay in Glamorganshire, Wales.

Swanwick, Anna (1813-99), Eng. educationist and feminist, b. at Liverpool. By her work in connection with the women's colleges, such as Bedford College, Gt. St. Mary, and Somerville, she did much to further the cause of the higher education of women. In addition to her philanthropic and scholastic work she pub. sev. books, making trans. from the Gk. and the Ger. See life by M. L. Bruce, 1903.

Swaraj, term usually interpreted as meaning 'home rule for India.' See under INDIA, *History*.

Swastika (from Sanskrit *su*, 'well' and *ast*, 'to be,' 'all be well'), a most ant. and widespread decorative motive, is also known as *fulfol* (perhaps from 'fill-foot,' i.e., a pattern 'filling the foot' of a painted window) or *fulfol cross*, or *crosse cramponnée*. In form the S. is a Gk. cross, the arms of which are like elbow-joints, all bent at right angles. It is to be found on early Elamite (Persia) ceramics of the fourth millennium B.C., as well as on ceramics of the second and first millennium

SWASTIKA

B.C. from Troy, Greece, Cyprus, India, Tibet, China, Japan, etc. It is also found in Christian inscriptions from the second century onwards, as well as among the Amerindians. It was often used as a charm against 'the evil eye,' and was used as a religious symbol by the Buddhists and Jains. Its origin is uncertain, but it seems to be a sun symbol, perhaps representing the movement of the sun. Adopted in 1910 by some Ger. groups as the symbol of the 'Aryan race,' it later became the official symbol of the Nazis.

Swat: 1. State of the Malakand Agency in the tribal ter. of the N.W. Frontier Prov. of Pakistan. Area 1000 sq. m. Pop. 446,000. 2. Riv. of the above, rising near the Kashmir border and joining the Panjkora after a southerly and south-westerly course. There is an irrigation scheme in its valley, and rice is grown.

Swatow, treaty port of China in the prov. of Kwangtung, on the E. coast at the mouth of the R. Han, on the railway to Canton. Wolfram is mined and sugar produced. The port was opened to foreign trade in 1860. Pop. 178,700.

Swaziland (called by the natives **Kwa Ngwane**), Brit. protectorate in the S.E. corner of the Transvaal, between the Drakensberg and Lebombo Mts., separated from Portuguese E. Africa and Natal on the E. by the Ubomo Mts. It is administered by the high commissioner for S. Africa through a resident commissioner at Mbabane. It has an area of 6704 sq. m. and a pop. of 186,800, including

183,400 Bantu and 2900 Europeans. Ama-Swazis are a branch of the Bantu race. The country is divided into three regions, running N. to S.; on the W. is the high veldt (4000 ft.), in the centre the middle veldt (2000 ft.), and in the E. the low or bush veldt (1000 ft.). The country is well watered, especially the high and middle veldts, and the climate is good except for a few months of extreme heat in summer. The low veldt is, however, somewhat malarial. The country has fine grazing land, and stock-raising is the chief occupation of the inhab., cattle numbering some 435,000. The agric. products consist of maize (the staple product), Kaffir corn and other cereals, ground-nuts, avocado pears, pumpkins, beans, tung nuts and sweet potatoes, cotton, and all kinds of fruit. Tin (alluvial) and gold are produced; coal is known to exist in large quantities in the low veldt. Other minerals are copper, pyrites, and asbestos, the latter now produced in large quantities at the Havelock mine. The chief exports are cattle, hides and skins, asbestos, tin, and tobacco. A police force was created in 1907, and is composed of twenty-seven Europeans and 149 natives. There are six gov. and one private school for Europeans, three for Europeans, and 198 for natives. Mbabane (European pop. 500) is the cap., and Bremersdorp, the former cap., is the only other town of importance. There are no railways, and roads are in process of improvement. In 1947-48 revenue was £335,465 and expenditure £413,814. The independence of S. was recognised by the Boers by the conventions of 1881 and 1884. A Boer colony settled there in 1886. Dual control was set up between Kruger and Great Britain, 1890. In 1894 administration, subject to reservations as to native rights, was taken over by the Transvaal. After the S. African war a professional administration was estab. and then, in 1906, it was made a Brit. Protectorate under the high commissioner for S. Africa. An elected European advisory council on European affairs was estab. in 1921. See Sir Lord Hailey, *African Survey*, 1938; B. A. Marwick, *The Swazi: an Ethnographic Account of the Natives of the Swaziland Protectorate*, 1910; and Hilda Kuper, *An African Aristocracy*, 1947, and *The Uniform of Colour*, 1948.

Swearing in its various forms, cursing, blasphemy, profane and obscene language, is an offence which is either dealt with summarily under an Act of 1745, or in case of blasphemy (q.v.) by indictment. Under the Act a scale of charges varying with the social status of the offender was imposed. It is still in force, but is not often made use of, because convictions can be obtained against most local offenders under either: (1) the Town Police Clauses Act, 1847, which punishes profane or obscene language in the streets, if uttered to the annoyance of residents or passengers, with a fine not exceeding 40s. or imprisonment with hard labour; or (2) the Metropolitan Police Courts Acts for S. in metropolitan dists.; or (3) by laws made under the Local Government

Act, 1888, and the Municipal Corporations Act, 1882, framed for the punishment of S. in the dists. of municipal corporations. See also OATH.

Sweating, see under DIAPHORETICS; SKIN.

Sweating Sickness. A curious malady first observed in England in 1485; subsequent epidemics occurred in Calais, among the Eng. inhab. only, in 1507, 1518, 1529, and 1551. It also occurred in Germany in 1652, 1802, 1861; and in France in 1718 and later. The onset was sudden, and was heralded by profuse, often frothy sweating, with dyspnoea and malaise; the tongue was coated, headache was complained of, and cerebral symptoms were common. A rash appeared in a few days. The disease was regarded with dread and was often fatal. The only modern diseases resembling S. S. are *miliary fever* (a disease observed in France, Germany, and Italy, but not in Great Britain), and *measles*, but it cannot be identified with either, or with any other infectious diseases known at the present day.

Sweating System. The S. S. of labour arose at the beginning of the nineteenth century, and was caused primarily by the practice of contractors placing the labour involved with sub-contractors. The system became known as the 'contract system,' and operated principally in the clothing trade. The system became a social scandal. It made possible the employment of impoverished unskilled workers at starvation wages, the work being done mainly in their own homes, though some of it was done in wretched dwellings belonging to the 'sweaters.' The evil attracted the attention of Charles Kingsley, who wrote a widely read pamphlet under the pseudonym of 'Parson Lot' called *Cheap Clothes and Nasty*, and Tom Hood, whose *Song of the Shirt* made an impression equally deep. Kingsley and Hood attacked the system upon humanitarian grounds, but authorities like Seligman wrote of it from the standpoint of sociological study. The effect of these exposures, and of the results of a House of Lords committee of 1888, led to an agitation against the system at the end of the century. The rapid increase of immigration of poor foreigners attracted by prospects of employment at rates of pay higher than those in their own country increased the evil. It was difficult for the sweated workers to organise themselves against exploitation because their work was for the most part temporary, depending upon the fluctuation of the business. They were therefore severely handicapped in any attempt to combat the low wages, long hours, and unhealthy conditions of their employment. The estab. of trade boards which prescribed a minimum wage, and the development of modern mass production, caused the decline of the system.

Sweden (*Sverige*), country of N. Europe comprising the E. portion of the Scandinavian peninsula; it is bounded on the N.W. by Norway, on the E. by Finland, the gulf of Bothnia, and the Baltic Sea, on the S. by the Baltic Sea, and on the W. by

the Kattégat. Its area (see below) includes the great lakes of Vänern, Vättern, Mälaren, and Hjälmaren. The N.W. part of the country is mountainous, the highest peak, Kebnekaise, reaching about 7000 ft.; the remainder is flatter, sloping to the E. and divided by many rivs., notably the Dal, Indal, Angerman, and Skellefte. This part may be regarded as divided into three separate regions: the N., or forest region; central, mining or agric.; and southern, agric. In spite of its northerly position S. has a relatively mild climate, owing to the influence of the N. Atlantic Drift. Climatic variations are, however, considerable: the average temp. in the south is 45° F., and in the N. (where summer only lasts two months) it is 36° F. The rainfall varies in different parts of the country, the average being 20-24 in. per year.

Area and Population.—The area of S., including lake water, is 173,378 sq. m. Its pop. in 1920 was 5,900,000, but since then has increased by almost exactly 1,000,000. The urban areas contain 42 per cent of the pop., smaller townships 19 per cent, rural areas 39 per cent. These figures include some 35,000 Finns and 10,200 Lapps. Pop. of the largest tns. (1949) is, Stockholm (the cap.), 733,600; Göteborg (Gothenburg), 343,900; Malmö, 185,900; Norrköping, 83,200; Helsingborg (Helsingborg), 70,700; Örebro, 64,700; Uppsala, 60,400; and Borås, 55,900.

Political Divisions.—The historical divs. of S. are Svealand, Götaland, and Norrland. The two former represent an old div. which, in turn, represents a difference of race and tradition, and which was divided by the great forest lands of S. Svealand may be regarded as the essential part of S., the mother prov. Here at the outlet of Lake Mälars is to be found the cap., Stockholm, one of the finest cities of Europe. The modern tn. far exceeds the limits of the met. one, but here still exist the old palaces and burial places of the royal house, fine schools and colleges, and many magnificent buildings. The tn. itself is the centre of the chief industries of S. and has a huge import trade, though its export trade is exceeded by Göteborg and Malmö. In the immediate neighbourhood is the tn. of Uppsala, which contains an historic cathedral and the oldest of all the Swedish univs., founded in 1477. The tn. of Falun, also in this dist., is noted for its copper-mines. Norrland (comprising the N. half of the country) has numerous coastal tns., most of which are at present increasing in size and prosperity; e.g. Gävle, Sundsvall, Umeå, and Luleå. The interior has few tns. of any size, but is especially notable for the many modern well-planned viks., which are being built to house the timber workers. A railway connects the mines of the Gallivare dist. with Luleå.

Within these three divs. are twenty-four administrative provs. (*län*) and the city and rural dist. of Stockholm. The provs. are governed by a prefect. Stockholm is governed by a governor. Both governor and prefects are nominated by the king.

Religion and Education.—There is complete religious freedom in S., though more than 97 per cent of the pop. adhere to the state church which is Lutheran Protestant. Since 1842 elementary education has been compulsory and free. For those entering employment immediately on leaving the elementary schools a course in the continuation school is compulsory. In secondary education the standard of technical education is particularly high. Besides the univ. at Uppsala, there is a state univ. at Lund (founded 1666), and a state medical faculty at Stockholm.

Social Welfare.—S. was one of the pioneer nations in the development of state-run social services: there are compulsory schemes guaranteeing old age pensions, medical treatment, maternity benefits, etc. In addition, since the beginning of the twentieth century, Swedish municipalities and other public bodies have built many modern residential estates, comprising flats and houses, in tn. and country to replace former slum-areas or undeveloped hamlets, and many Swedish building projects have served as models for similar schemes all over W. Europe.

Government and Justice.—The theory of Swedish gov. is grounded in four fundamental laws: the constitution of 1809; the amendment of 1866, constituting the Diet or *Riksdag*, and subsequent minor modifications in 1909 and 1921; the succession law of 1810; and the law of 1812, granting freedom of the press. Swedish elections, central and local, are by proportional representation. The *Riksdag* is divided into two chambers: the first being chosen on regional lines (i.e. elected by members of the prov. assemblies and councillors of six specified tns., which are not represented in the prov. assemblies), the second by universal suffrage every four years. Candidates for the second chamber must be over twenty-five years of age resident in their own constituency. All laws require the royal assent. Power to initiate taxation is reserved to the *Riksdag*. The executive rests with the king, acting on the advice of his Council of State. The sovereign and members of the Council of State must be members of the estab. (Lutheran) Church. Elected eo. and city councils (in specified tns. and tns. of more than 100,000 pop.) handle medical facilities. Municipality committees are autonomous in, for instance, poor relief, child welfare, old age pensions, unemployment relief, public utilities, law and order.

Judicial administration is not dependent on the gov. Its administration is supervised by the chancellor of justice (appointed by the king) and the attorney-general, appointed by the *Riksdag*. New rules dealing with legal procedure have been operating since 1948. Trial by jury is used only for cases dealing with the freedom of the press.

Finance.—The basic monetary unit in S. is the krona (plural kronor). The rate of the krona to the £ in 1950 was 14.50. The gov. budget for the fiscal year from July 1, 1947, to June 30, 1948, showed the

following estimates of income and expenditure (figures in million kronor). Revenue: income tax, 1876; import duties, 329; car tax, 263; tobacco tax, 397; liquor tax, 517; other taxes and sources of income, 797—total, 4179. Expenditure: national defence, 756; social welfare, 960; roads and other communications, 241; univs., schools, libraries, museums, churches, 482; agric. subsidies, 128; other expenditure, 966—total, 3533.

Direct taxes are paid in S. to the central gov. as well as to local authorities. The former are progressive, whereas the latter are proportional to the income. A system of family allowances came into force in 1918, allowing 260 kronor each year for every child under sixteen.

has a great export trade with Britain. Forests cover 56 per cent of the total land area, and as far as trade returns are concerned, timber export is S.'s greatest industry. Allied to this is the production from timber of pitch, tar, cellulose (sulphite pulp), and manufactured wood-pulp for paper-making; Swedish manufacturers have almost a world monopoly in the match industry. A fairly small textile industry is centred at Norrköping and Borås. The fishing industry is large, catches being valued as high as 90,000,000 kronor a year. Tourism is an increasingly important industry in S. The mineral wealth is enormous, the iron-mining industry being the greatest and most important. Huge

In the background is Lake Vattern

Communications.—Thirty-five per cent of all Swedish railways are electrified, and 88 per cent are gov.-owned. Total length of the railways is over 10,000 m. The road system totals 55,890 m., although only 3000 m. are hard-surfaced; fourteen national highways form the prin. traffic arteries. All parts of S. are linked by the services of A.B.A. (Swedish Air Lines).

Agriculture, Industry and Minerals.—S. is on the whole agric. and livestock are reared in many parts. This is an industry for which much of the country is very suitably adapted. The provs. which yield the greatest increase are Skåne and Halland in the S.W., and here much progress has been made during recent years. Nearly 30 per cent of the pop. are engaged in agriculture, over 240,000 being owners and 56,000 tenants of the land they cultivate. The prin. crops are oats, wheat, rye, barley, and potatoes. The wealth of forest lands and the excellence of the timber grown have done much to promote an industry which is still increasing steadily and

iron-ore deposits are to be found in Bergslagen and in Lappland; 8,895,000 tons were produced in 1947. Other minerals include silver, lead, copper, zinc, manganese, arsenic, gold, and aluminium. There is a very small coalfield in the extreme south of Lappland, which produced 415,785 tons in 1947. Lacking coal, S. has developed hydro-electric power to a great extent; the electrical industry is indeed one of the most flourishing in S. Three-quarters of the water power resources are situated in Norrland; the country's total possible output is estimated at over 40,000,000,000 kilowatt hrs. annually.

Foreign Trade.—The salient feature in S.'s trade since 1945 has been the unfavourable balance of trade, with import vol. largely exceeding and exports substantially lagging behind pre-war levels; 1948 imports were 113 per cent and those of 1947 96 per cent of the 1936-38 average; 1948 exports were 82 per cent, and the 1947 vol. 64 per cent of pre-war average. Greatest 1948 imports were

from Britain (17.2 per cent), U.S.A. (14.1 per cent), and Benelux (11.1 per cent). Exports in 1948 were 17 per cent to Great Britain, 15.2 per cent to Scandinavia, and 12.2 per cent to the Benelux countries.

Defence.—Military service is universal and compulsory, about 35,000 men being trained annually; the war strength of the army is about 600,000 based on modern lines and mechanised. A home guard for local defence is attached to the army. The Swedish Navy consists of more than 100 vessels, including coastal defence craft, cruisers, destroyers, and submarines. There are naval bases at Stockholm, Karlskrona, and Göteborg. By 1949 one billion krona had been spent on new aircraft, including Brit. Vampire fighters and the Swedish jet fighter, the Saab J-29, capable of 650 m.p.h.

History.—The prehistory of S. is of great importance in a study of the early settlement of N.W. Europe. There has been much detailed research along modern lines, particularly into the chronological relation of archaeological cultures and the phases of glaciation. A convenient summary is to be found in H. Shetelig's and H. Falk's *Scandinavian Archaeology*, 1937, but most of the literature is in Swedish technical pubs. The early hist. of S. is wrapped up in legend and saga. The country appears to have been inhabited by two separate but closely related races, the Sver and the Goter, names which can, of course, be traced in many place-names at the present time. The old mythology of the N., or debased forms of it, remained the religion of many of the people until the twelfth century, although Christianity was introduced at a very much earlier period. It failed, however, to assimilate the whole of the country until much later. During the fourteenth century Finland was added to the territory of S., but the ruling dynasty of S. was so weak that the nobility and clergy were able to extort privilege after privilege, which left the monarchy weak. Finally in 1397, they united themselves with Norway and Denmark by imploring the aid of Margaret of Denmark, who by the Union of Kalmar united the three kingdoms. But the union was far from being successful. It succeeded in its immediate aim, but later monarchs became irksome to the Swedes. They had no sympathy with a monarch, Ger. in race and ideas, who would do little for their national aspirations. They formed national parties, and sev. times rebelled, their most famous leader being Engelbrecht Engelbrechtsson. They were not successful, however, until the sixteenth century. Christian II. of Denmark aimed at the extirpation of the Swedish nobility; S. rebelled under Gustavus Vasa, a Swedish noble, who, in 1523 after a two years' rebellion, was acclaimed and elected by the *Riksdag* as Gustavus I. of S. But S. did not regain total freedom immediately. Denmark still held possession in the S. mainland and the is. of Gotland.

Gustavus I.'s reign marked a period of

the struggle between Catholicism and Protestantism. A dispute between king and papacy over an appointment to the archbishopric of Uppsala led to a breach with Rome and the introduction of Lutheranism. The enrichment of many of the nobles as well as of the crown from the confiscated eccles. (especially monastic) property, ensured the permanence of Lutheranism in S., and by 1529 Protestantism had been adopted as the state faith, largely for political and financial reasons. By the end of his reign Gustavus had estab. some stability and some financial soundness in the country, but his work was not continued by his sons, Eric XIV. (1560-68) and John III. (1568-1592), both of whom inclined towards Rom. Catholicism and did little by their foreign wars, chiefly with Denmark and Russia, to strengthen their country, though Estonia was eventually acquired at the cost of many years of war. John III. made a serious attempt to restore Rom. Catholicism in S. His son Sigismund, also a Rom. Catholic, became king of Poland in 1587, succeeding his father as king of S. five years later. His efforts to convert the country were opposed by all classes, for Lutheranism had by this time become a popular religion. In 1600 he was deposed in favour of his uncle, who succeeded him as Charles IX. Charles aimed at a great Protestant League, of which he should be the leader, but he died before he had accomplished this, leaving the throne to Gustavus Adolphus.

S. in 1641 was lacking in pop., internal communications, and material resources, and her geographical position was unfavourable for the expansion of her trade, since her way to the open sea was controlled by Denmark. Gustavus Adolphus had great military and political capacity, he began the policy of turning the Baltic into a 'Swedish lake'. He ended the war with Denmark, recovering ter. lost by his father. War with Russia gave S. control of what is now the Baltic coast of Russia, whilst war with Poland ended in a truce (1629), which confirmed S. in possession of Livonia and gave her a grip on the mainland of Germany. Gustavus Adolphus now appeared as the Protestant champion of Europe. Between 1629 and 1631 he won a series of spectacular triumphs; the Catholic League was defeated, the Catholic general, Tilly, outmanoeuvred and finally killed, and Gustavus Adolphus was able to penetrate to the south. He was recalled by the attacks of Wallenstein in Saxony, and fell at the victory of Lutzen in 1632. He was the real founder of the greatness of S. He made her a strong power by his domestic and financial reforms, and he won for her a great place in the councils of Europe. The gov. was centralised and strong; the army was reformed; and S. for the next century was one of the great powers in Europe. In fact, her resources were always strained to the utmost to maintain this position; and her Baltic possessions were to embroil her in a series of wars which she could not afford but without which she could not hope to keep them. Gustavus Adolphus

was succeeded by his daughter Christina, whose minority was made famous by the statescraft of the chancellor Axel Oxenstjerna. The success of S. was seen at the treaty of Westphalia, which marked the zenith of Swedish power. She became the controlling power of Germany, the Protestant champion of Europe, and the greatest power of the N. In 1645 Denmark was forced to give up her right to tolls in the Sound and ceded Halland to S. In 1654 Christina became a Catholic

and it was at this stage that the strain of maintaining a scattered empire, surrounded by ambitious countries with large pops. and resources, began to tell on a country which had only a small pop. and few natural resources of her own. Charles astonished Europe by his enterprise and dash, and won many brilliant victories, penetrating, on one occasion, deep into Russia. But he had against him a formidable coalition of powers, and his schemes were too grandiose to be possible

The painting 'Narva,' by G. Cederström, in the National Museum, Stockholm

and abdicated in favour of her cousin Charles X. He continued the work of Gustavus Adolphus. He attacked Denmark and gained some ter., and in 1660, the year of his death, by a treaty with Poland he added still more to the ter. of S. Charles XI., who succeeded, was only four years of age, and his long minority saw the wasting of the resources of S. by an effete nobility. Yet Charles himself proved to have inherited the military genius of the Vasas. When he assumed the crown he fought a series of wars by which he was able to preserve intact the ters. of S., and then turned his attention to domestic reform. He curbed the power of the nobility, and left S. reformed and restored at his death in 1697. Charles XII., the wonder of Europe, succeeded. He spent the twenty years of his reign in almost constant war-

of fulfilment even by a military genius of his calibre. In the end he was clearly defeated and his death probably alone saved S. from utter disaster. During the next fifty years, under the rule of Ulrica Eleonora (d. 1720) and Frederick (d. 1731), much of her ter. was ceded to Hanover, Prussia, and Russia. She could no longer be regarded as a first-class power. The eighteenth century witnessed in S. a great struggle between rival factions for constitutional monarchy, which was won by the constitutionalists in 1723, when the king gave up much of his prerogative. But this reform was carried to extremes; party quarrels between the 'Caps' and the 'Hats' (q.v.) were frequent and bitter, and the state of the country quickly became practically anarchic. Gustavus III. restored the monarchical constitution by a *coup d'état*, but of the type of a limited

monarchy. Gustavus also raised the prestige of the nation by his successful wars with Russia and Denmark. He was assassinated in 1792. In the reign of his son, Gustavus IV., practically all the foreign possessions of the country were lost to Russia and Prussia. In 1809 Gustavus IV. was deposed. His uncle, who succeeded as Charles XIII., was infirm, and to secure the goodwill of Napoleon the *Riksdag* accepted Napoleon's marshal, Bernadotte, as Crown Prince Charles John. He took over the gov., but did not further Napoleon's ambitions against England and Russia. He became a truly national Swedish king. He made war on Denmark to secure Norway, and then later invaded Norway, whose union with S. was confirmed by the great powers in 1814.

In 1819 Charles XIII. died, and Bernadotte succeeded as Charles XIV., initiating the dynasty which still rules S. His son Oscar I., who reigned from 1844 to 1859, introduced democratic reform, especially in industrial organisation. In the reign of Oscar II. (1872-1907) Norway seceded from S. (1905), a peaceful settlement being made at Karstad. Oscar II. died in 1907, and was succeeded by his son Gustaf (Gustavus) V. (b. 1858) during whose reign democracy has been further extended, social services introduced or expanded, and a universal franchise introduced. The acknowledgment of the growth of party politics dates from the dissolution of the union with Norway. Industrialisation had encouraged the growth of socialism, which, however, has always been of a very moderate nature in S., since much of the Socialist vote is derived from rural areas, attracted to it by its theories of co-operation and social security rather than by its fundamental doctrines. Previous to 1905 cabinets were formed from higher civil servants. The first party administration was Liberal. From 1906 to 1911 a Conservative Cabinet under Lindman introduced universal franchise for men and proportional representation. In Feb. 1914 a coalition cabinet under Hammarskjöld was formed. This directed Swedish policy during most of the First World War, S. maintaining a strict neutrality. In 1917 a Liberal-Socialist Coalition introduced a universal franchise and imposed an eight-hour working day. In 1920 S. entered the League of Nations. In the 1920s party politics were irritated by the prohibition question, which completely split the Liberals and divided many of the left-wing sympathisers. There was a series of different gov's. The problem of unemployment helped to increase the prestige of the Social Democrats. Total prohibition was rejected in 1922 and a liquor control system enforced which had some success in the rural dists. Labour problems became less acute in the 1930s.

By this time defence had become a major political issue. In 1935 the Swedish National Defence Commission recommended the creation of a strong modern air force, besides a replacement

programme for the navy at a cost of 50,000,000 kronor over a period of ten years. The preservation of her neutrality was S.'s dominant problem. In 1939 S. rejected the offer of a pact of non-aggression made by Germany, preferring strict neutrality and a greatly increased expenditure on defence. When Russia threatened Finland S. grew alarmed, and joined with Denmark and Norway in representations to Russia on the subject of Finnish independence; and when Russia invaded Finland S. showed her sympathy by opening her frontiers to Finnish refugees and enrolling volunteers. The gov. had to abandon the idea of a defensive alliance with the other Scandinavian countries owing to the opposition from both Russia and Germany. When the Gers. made a demand for the transit facilities for troops and supplies through S. in 1940 the *Riksdag* secretly complied, but S. really had no choice in the matter. The Swedish Prime Minister, however, rejected Germany's invitation to S. to join its 'New Order' (q.r.). In economic matters S. maintained a close association with Germany, especially in exchanging iron ore for coal. The Swedish Gov., however, continued to reinforce the national defences. Throughout 1943 S. continued to remain on friendly terms with all the belligerents, though public opinion was largely pro-Brit., especially after the occupation of Norway and Denmark by Germany. In 1943 the gov. obtained Germany's consent to the cancellation of the transit agreement, and transport of Ger. material and military personnel through S. ceased. In Sept. 1944 the Swedish Gov. announced that all Swedish Baltic ports and waters would be closed to foreign shipping, owing to the new situation in the Baltic produced by the Russo-Finnish armistice of that year. This meant virtually the stoppage of Swedish-Ger. trade for the duration of the war.

Since the end of the Second World War S. has shown a greater willingness to co-operate with other Scandinavian and W. European countries on subjects of economic and defensive importance; but fear of Russia's attitude, and a general acknowledgment that S. has successfully maintained, with favourable results, a complete neutrality during the last two world wars tends to influence S. against committing herself irrevocably to any W. bloc. In 1946 the coalition gov. which had directed the state during the most dangerous war years resigned. In the elections which followed the Social Democrats were again returned as the largest single party, Liberal gains being made chiefly at the expense of the Conservatives.

Language and Literature.—Swedish is an important member of the group of Scandinavian languages (q.r.). With the exception of about 35,000 Finns, about 10,000 Lapps (inhabiting the extreme N. of the country), and some thousand speakers of other languages, the pop. of S., numbering about 7,000,000, speak Swedish. This language is also spoken, however, in

W. and S. Finland and the Åland is. (by about 375,000 people), by about 100,000 people in Norway, Denmark, and other European countries, about 675,000 in the U.S.A., about 30,000 in Canada, and about 15,000 in other countries; there are thus about 7,700,000 speakers of Swedish. It was formerly spoken in various Baltic provs. (Estonia, Livonia, Courland, etc.), and in some parts of Russia.

There are four periods in the hist. of the Swedish language: archaic or common Scandinavian (800-1225); classic (1225-1375: important literature; the earliest extant document of c. 1250, is a fragment of *Västgötalag*); middle Swedish (1375-1525: mainly religious literature); and modern Swedish, which begins with the Lutheran reform (trans. of the N.T., 1526, and other writings of Olaus Petri (1493-1552): the most important early literary work written in modern Swedish is the Bible of Gustavus I., 1541. The language was partly reformed in 1906. The two prin. forms of Swedish are the *rikspråk*, the written language commonly employed by all Swedes, and its spoken form, the *riksdalspråk*, used by cultured people. A simpler spoken form is the *fälspråk*.

The literature of S. was comparatively late in developing. The *Runes* which have been preserved on the many so-called rune stones from the early Middle Ages have great historic and archaeological interest, but cannot be regarded as literature in the real sense. The greatest medieval figure in both the religious and literary hist. of S. is St. Birgitta or Bridget (1303-73), whose mystical visions (*Revelationes*) were pub. in Lat. The virtual beginnings of Swedish literature can be traced to the period when S. began to take a really active part in European politics. The trans. of the Bible into the vernacular during the Reformation period by, among others, Olaus Petri the Reformer (1493-1552), one of the masters of the Swedish language, and a host of religious works, dramas, and the first critical historical writings in Swedish, and his brother Laurentius Petri (1499-1573), the first Lutheran bishop, fixed the Swedish language for centuries. In the seventeenth century Georg Stiernhielm (1598-1672), the most important author of the time and a versatile and learned man, was the first in S. to make use of the classical verse metres. He wrote works of many different kinds, the best known being the long allegoric and didactic poem *Herkules vid Skiljovägen* ('Hercules at the Crossroads'). A good picture of seventeenth-century life is given in the long anonymous poem *Bröllopsbesvärar inihukommelse* ('Remembrance of Matrimonial Tangles').

In the first half of the eighteenth century the influence of Eng. authors, Steele, Addison, Defoe, Swift, and Pope, was very strong. Steele and Addison, especially, with their moralising jigs, were imitated, notably by Olof von Dalin (1708-63) in his *Then Swanska Argus*. Dalin also pub. many other works, among them historical writings and allegorical poems. A distinct place in the literature of the

eighteenth century is held by the great mystic Emanuel Swedenborg (1688-1772) (*q.v.*). About the middle of the century a group of poets was active, among them Iiedwig Charlotta Nordenflycht (1718-1763), Gustaf Philip Creutz (1731-85), Gustaf Fredrik Gyalenborg (1731-1808), and, a little later, Johan Gabriel Oxenstierna (1750-1818). At the end of the century Fr. influence became very strong in S., as in the rest of Europe, and is shown in the works of poets like Johan Henrik Kellgren (1751-95), editor of the widely read *Stockholms-Posten* and the most influential literary figure of the time; Carl Gustaf Leopold (1756-1829); and many others. This period has been regarded as the golden age of Swedish literature, largely because of the patronage of King Gustaf III. (1746-92, ascending the throne in 1771), who was greatly interested in literature, the theatre, and science. A special position is held by Carl Michael Bellman (1740-95), whose songs with Stockholm motifs are characterised by an incomparable vividness and directness, and are popular even to-day. An interesting personality with original philosophical conceptions was Thomas Thorild (1759-1808). About the beginning of the nineteenth century the Romantic movement was very strong in S. as a result of influence both from England and Germany. Per Daniel Amadeus Atterbom (1790-1855), with his long verse dramas, was prominent among the Romantics. The foremost poet of the period was the mystic Erik Johan Stagnelius (1793-1823), one of the greatest masters of the Swedish language. A reaction against the more metaphysical trend of the Romantic movement was represented by the authors belonging to the so-called Gothic Union (*Gotiska Förbundet*) which had as its purpose the revival of the old hist. of the country and the national spirit after the loss of Finland to Russia. Members of this union were Esaias Tegner (1782-1846), one of the greatest personalities in Swedish cultural hist.; he was univ. prof. in Gk., a bishop, and the author of many poems, among them the well-known epic *Prästförs saga* (1825), to-day remembered also for his letters to his friends; and Erik Gustaf Geijer (1783-1847), poet, thinker, and historian, an intellectual leader of his time. Swedish literature in Finland in the middle of the century had a great poet, Johan Ludvig Runeberg (1804-77), whose influence in S. has been considerable, and whose epic works, such as *Fänrik Ståls Sägner* (1848, 1860), about the Swedish-Russian war 1808-9, became a national treasure in Finland. The novel developed towards the middle of the nineteenth century in all its aspects, historical, social, and romantic, owing a great deal to the Eng. influence of Scott and Dickens. A well-known novelist, remembered also as the pioneer of the Swedish feminist movement, was Frederika Bremer (1801-1865). A certain neo-romanticism in poetry appeared in the sixties, exemplified by Carl Snoilsky (1841-1903), with his *Svenska Bilder* (1886), a collection of

historical poems, and his songs from Italy. A central position in the cultural life of the time was held by Abraham Viktor Rydberg (1828-95), novelist, poet, a protagonist of liberal idealism and modern Bible criticism. Naturalism, not so pronounced in S. as in France, to-day mostly called the literature of 'the eighties,' was also of course characterised by social and moral criticism. Most outstanding representative of this movement was August Strindberg (1849-1912) (q.v.), the greatest genius of Swedish literature. He was also the most versatile of all Swedish authors. He wrote outstanding novels, such as *The Red Room* (1879, trans. 1913), the autobiographical *Son of a Servant* (1886-87, 1909, trans. 1913), short stories such as *Swedish Lives and Adventures*, poems, and above all dramas. He was one of the creators of the modern theatre. Among his naturalistic plays may be noticed *The Father* (1887, trans. 1907) and *Miss Julie* (1888, trans. 1911), and among his symbolic ones the trilogy *To Damascus* (1898-1904, trans. 1933-35) and *The Dream Play* (1902, trans. 1912). In the nineties he changed his naturalistic, socialistic, and Nietzschean attitude, and developed later a kind of individualistic Christianity. The reaction against naturalism set in about 1890 with a group of authors ('the nineties,' a parallel movement to the symbolist one in France), among them being Verner von Heidenstam (1859-1940), poet, and author of historical and romantic novels; and Oscar Levertin (1862-1906), who had, and still has, a great influence as a critic. To the group belonged two of S.'s finest poets, Gustaf Fröding (1860-1911) and Erik Axel Karlfeldt (1864-1931). Also contemporary was Selma Lagerlöf (1858-1940), with her world-famous romantic novels and tales, such as *Gosta Berlings Saga* (1891, trans. 1898), and her book about S. for children, *The Wonderful Adventures of Nils* (1906-7, trans. 1907). During the first decade of this century appeared many representatives of the modern realistic novel. The foremost author is Hjalmar Söderberg (1868-1911), ironical sceptic and a fine stylist. Others include Sigfrid Siwertz (b. 1882), also active as a dramatist, Gustaf Hellström (b. 1882), journalist (foreign correspondent in Great Britain), and author of partially autobiographical novels; and Elin Wagner (1882-1949), the leading woman author. Typically Swedish was the great humorist Albert Engström (1869-1940), important both as author and artist. The great literary genius of this century is Hjalmar Bergman (1883-1951), with his novels characterised by a bizarre fantasy and a profound psychology. Of the later generation, Par Lagerkvist (b. 1891) is of very great importance. Active as novelist, poet, and dramatist, he expresses an original philosophy of life. Among the poets of this century may be mentioned Bo Bergman (b. 1869), Vilhelm Ekelund (b. 1880), Anders Österling (b. 1884), Birger Sjöberg (1885-1929), Hjalmar Gullberg (b. 1898), Karin Boye (1900-41), Gunnar Ekelöf (b. 1907), Karl Vennberg

(b. 1910), Erik Lindegren (b. 1910), and Harry Martinson (b. 1904), who is also important as a prose writer. He belongs to the large group of authors who originate from the working class and are self-taught. Other prominent representatives of this group are Eyvind Johnson (b. 1900), Jan Fridegård (b. 1897), and Vilhelm Moberg (b. 1898). Totally apart from these stands Agnes von Krusenstjerna (1894-1940), with her great novel series of the higher circles of society. Special positions in recent literature are held by Frans G. Bengtsson (b. 1894), with his humorous novels and his biography of Charles XII., also a masterly hand at the essay in its classic Eng. form, and by Tage Aurell (b. 1895), most important among the new authors with his impressive short novels. To the younger generation belong Sivar Arner (b. 1909) and Stig Dagerman (b. 1923).

Art.—The first outstanding Swedish painters appeared in the eighteenth century. These included portrait painters such as Carl Gustaf Pilo (1711-93), Alexander Roslin (1718-93), and Carl Fredrik von Breda (1759-1818), a pupil of Reynolds, best known for his portrait of Gainsborough. A new flowering occurred towards the end of the nineteenth century, when Konstnarsförbundet (the Artists Association) had a strong influence on Swedish art. Its members were Fr.-inspired and strong opponents of the more academic trend of art represented by the Academy of Fine Arts. The most important painters of this generation were Ernst Josephson (1851-1906) and Carl Fredrik Hill (1849-1911). Others included Karl Nordström (1855-1923), the leader of the group, Carl Wilhelmson (1866-1928), Anders Zorn (1860-1920), Prince Eugen (1865-1947), Carl Larsson (1853-1919), Bruno Liljefors (1860-1939), and Helmer Osslund (1866-1938). These painters had studied in France, but they created a national style, some in a more realistic, others in a more romantic way. In the decades before and after the new century three very original painters were active: Olaf Sager-Nelson (1868-96), Ivar Arosenius (1878-1909), and Ivan Aguéli (1869-1912). Painters in this century have also been influenced by France, especially by Matisse, Cézanne, and Gauguin. Here may be mentioned Karl Isakson (1878-1922), Leander Engström (1878-1922), Gosta Sandels (1887-1919), Nils von Dardel (1888-1943), Isaac Grünewald (1899-1946) and his wife Sigrid Hjerten (1895-1948). Most prominent among 'naïvists' influenced by native art are Hilding Linnqvist (b. 1891), Axel Nilsson (b. 1885), and Sven Erixson (b. 1899). Among the free colourists of the Göteborg school may be mentioned Carl Kulberg (b. 1878), Ivan Ivarson (1900-39), Inge Schiöler and Ragnar Sandberg (b. 1902). Anders Zorn and Axel Fridell (1894-1935) have done fine etchings.

S. has only recently produced any sculptors of note, with the exception of Johann Tobias Sergel (1711-93) whose work is well known. Besides Carl Milles (b.

1875) may be mentioned Carl Eldh (b. 1873) and the modern nationalist Bror Hjorth (b. 1894).

Swedish architecture belonging to the Middle Ages has survived in a number of her churches and cathedrals. It is distinguished by its clear-cut lines and richness of sculptured detail. With the advent of the twentieth century came a revival of Swedish architecture based on traditions of the Vasa renaissance. The climax of this movement was the style of Ragnar Östberg (1866-1915), designer of Stockholm's city hall, built in the twenties, also a product of a new Romanticism. A tendency of reviving the neoclassicism from the beginning of the nineteenth century was also strong at this time. Functionalism burst into full bloom with the Stockholm Exhibition of 1930, the architect for which was Gunnar Asplund (1859-1940). Contemporary architecture is still dominated by this trend for the practical as well as the beautiful in homes and industrial and public buildings.

Music.—From medieval church chants and age-old folk melodies, of which a very great number has been preserved, Swedish music progressed rapidly in the seventeenth and eighteenth centuries. In the eighteenth century Johan Helmich Roman (1694-1758), 'the father of Swedish music,' appeared with his choral and orchestral works. Swedish composers are undoubtedly headed by Franz Berwald (1796-1868); the most 'national' composer was August Söderman (1832-76), originator of the romantic style later elaborated by such composers as Hugo Alfvén (b. 1872), Wilhelm Peterson-Berger (1867-1942), and Wilhelm Stenhammar (1871-1927). Chief among present composers of national romantic music are Ture Rangström (1884-1917), Kurt Atterberg (b. 1887), Adolf Wiklund (b. 1879), and Gottfrid Kallstenius (1861-1943). Swedish music took a modern form with Hilding Rosenberg (b. 1892) and Gösta Nystroem (b. 1890), two important and versatile composers. They are followed by Dag Wirén (b. 1905), Gunnar de Frumerie (b. 1908), and Lars-Erik Larsson (b. 1908). Among the younger generation may be mentioned Karl-Birger Blomdahl (b. 1916), Ingvar Lidholm (b. 1921), and Sven-Erik Bäck (b. 1919).

Swedenborg, Emanuel (1688-1772), Swedish scientist, philosopher, and theologian, b. at Stockholm, eldest son of

National Museum, Stockholm

EMANUEL SWEDENBORG

The painting by P. Krafft the Elder

Jesper Swedenborg, Lutheran bishop of Skara. The family was ennobled in 1719 and assumed the name S. in accordance with custom. S. is so generally known as a theologian of heterodox views which have found acceptance by the New Church, sometimes called 'Swedenborgian,' that it is seldom appreciated that he was one of the foremost scientific minds of his day and had gained a European reputation for science and philosophy before he ever turned to theology. Some of his conclusions have a surprisingly modern sound, and the wide range of his mind over all the known branches of science is comparable only with that of da Vinci.

As a young man he was employed by Charles XII. in civil and military engineering works, and was appointed assessor of the Royal College of Mines, in which office he gave valuable service to the metal industries of Sweden during thirty years.

S. declined a professorship of mathematics on the ground that his interests were in the practical applications of science. With the pub. in 1734 of his *Opera philosophica et mineralia*, and in the same year of a smaller work on *The Infinite*, and the *Final Cause of Creation*, his reputation as a philosopher of the first rank was estab. throughout Europe. At about this time he began his researches into the nature of the soul, and applied himself to anatomy and physiology, in which field he is considered the first to point out that the motion of the brain synchronises with that of the lungs rather than of the heart. His prin. pub. in this period were *Economia regni animalis* (1740-41) and *Regnum animale* (1744-45). About this time, however, S. turned away from the active pursuit of scientific interests and began to write in what was, for him, the new field of theology, believing himself to have received a direct revelation. In 1749 he pub. the first vol. of *Arcana Caelestia*, and from then until 1711 when the *True Christian Religion*, a vol. of systematised theology, was pub., his pen was busy with divine themes.

His system of theology presents Christ not as the second person of the Trinity, but as the one God, the whole Trinity being in Him as soul, embodiment, and operation. Redemption consisted in the conquest, in the human, of temptations from all the hells and the subsequent control of the hells by the divine human. S. asserts that the word of God has an internal or spiritual meaning throughout, and the *Arcana Caelestia* consists of a detailed exposition of the 'spiritual sense' of Genesis and Exodus, and incidentally of many other parts of Scripture. The *Apocalypse Revealed* (1766) and the posthumously pub. *Apocalypse Explained* deal similarly with the Book of Revelation. In the former work he declares that the Holy City, New Jerusalem, signifies a new 'Church' or dispensation of truth then being effected through these revelations.

Swedenborgians, term sometimes, but inaccurately, applied to the members of the organisation known as the New Jerusalem Church, or New Church, who believe that the theological works of Emanuel Swedenborg (q.v.) are a divine revelation containing the doctrines of the New Church signified by the New Jerusalem in the Apocalypse. There are two branches of the New Church in Great Britain, the General Conference of the New Church and the General Church of the New Jerusalem. The first public association of New Church people took place in 1788 in Great Eastcheap, London. At the present time there are about 6000 New Church people in Great Britain and over sixty places of worship.

Swedenborg Society (Inc.), The, in London, instituted in the year 1810 and incorporated under the Companies Act in 1925. Its main objects are to print, publish, sell, and distribute the theological works of Emanuel Swedenborg (q.v.), in the original Lat. and trans. into

Eng. and other languages. The society has pub. works in Jap., Hindu, Tamil, Arabic, and Zulu, as well as in all the prin. European languages, and in Braille. It co-operates with the Amer. Swedenborg Scientific Association in publishing Swedenborg's scientific works. The society maintains reference and lending libraries, where all the prin. works are available; the reference library also contains reproductions of all the Swedenborg MSS. extant, and the archives are a valuable collection of some 1600 items. Membership of the society, which is entirely non-sectarian, is open to all those interested in its work.

Swedish Movements, see under GYM-NASTICS.

Sweepstakes, gaming transaction, in which one person wins (sweeps) the stakes of himself and others; or a prize in a horse-race made out of sev. stakes. S. are lotteries, and therefore illegal. See also CALCUTTA SWEEPSTAKE; GAMBLING; LOTTERY.

Sweet Bay, see LAUREL.

Sweetbread, name given to certain glands of animals used as food. The pancreas of the ox or calf is most generally employed; it is palatable and digestible when well cooked, and is more especially suited for invalids. The term S. is also used for testes and for thymus gland.

Sweet Briar, see ROSE.

Sweet Cicely, see MYRRHIS.

Sweet Corn, see under MAIZE.

Sweet Gale, see BOG MYRTLE.

Sweet Marjoram, see MARTORAM.

Sweet Pea (*Lathyrus odoratus*), probably the most popular ann garden plant. It is a typical member of the family Leguminosae, sub-family Papilionaceae. The large petal at the back is the standard, the two wings are lateral, and in front is the keel formed from two partly fused petals. There are ten stamens, nine fused and one separate. The carpel is single, with a row of ovules. It lends itself exceptionally to hybridisation, and indeed was, with the edible pea, the subject of Mendel's invaluable experiments (see MENDELISM; GENETICS). Its original habitat was Sicily. Its numerous varieties cover a very extensive range of colour, though deep blue and most shades of yellow were unknown before 1913. The ground should be well prepared for plants by deep digging, and the seed can be either sown where the plants are to bloom or preferably under glass early in the year, the seedlings being planted out with a good ball of soil and roots about mid April. Support by means of tall sticks or strings should be given early, and when flowering starts liberal supplies of water and liquid manure and also regular picking of the flowers will prolong the blooming period and increase the beauty of the blooms. The National Sweet Pea Society has its offices at Bedford Chambers, Covent Garden, London.

Sweet Potato, species of Convolvulaceae allied to the morning-glory and known as *Ipomoea Batatas* (or *Batatas edulis*). It is a native of warm countries, where its tuberous roots are eaten as potatoes.

Sweet William, or *Dianthus barbatus*, perennial herb of the family Caryophyllaceæ, a native of E. and S. Europe, often grown in Brit. gardens on account of its bright flowers.

Swellendam, cap. of a co. of the same name, in Cape Prov., S. Africa, near the Breede R., 30 m. W. of Heidelberg. The first S. African republic was estab. here, in 1795. Wheat and wool are produced. Pop.; European 2150, coloured 1600.

Swidnica (Ger. *Schweidnitz*), tn. of Polish Silesia, on R. Weistritz, 36 m. S.W. of Breslau. The cap. of a principality, 1278-1386, it was the scene of a Swedish victory, 1642. There are sugar refineries and watch factories. Pop. 34,400.

Swiebodzin, see SCHWETZINGEN.

Swietenia, Mahogany, see MAHOGANY.

Swietochlowica (Ger. *Schwientochowitz*), tn. of Polish Silesia, 2 m. W.S.W. of Królewska Huta (Königsbütte). It has iron foundries and coal-mines. Pop. 23,200.

Swift, Jonathan (1667-1745). Brit. satirist and writer, b. in Dublin, of Eng. origin. He was educated at Trinity College, Dublin, and in 1692 became secretary to Sir Wm. Temple. He hated his subordinate position, and finding that Temple made no effort to procure him advancement, he went to Dublin in 1694, was ordained, and given the prebend of Kilroot. Securing no church preferment, S., two years later, returned to his old duties at Moor Park, where young Esther Johnson ('Stella') was now installed as a member of the household. He remained there until Temple's death (1699), when he went to Ireland, and received some minor clerical appointments. He had read deeply, and already in 1697 had written *The Battle of the Books*, which with the still more famous *The Tale of a Tub* was pub. in 1704. When he came to England in 1705 and 1707 he made the acquaintance of the leading men of letters and statesmen, and gradually became a power with the Tory ministers. His love-affair with Miss Vanhomrigh ('Vanessa') is related in the poem *Cadenus and Vanessa*, but it was 'Stella' who had the first place in his heart, and his *Journal to Stella* makes very delightful reading. Whether he married her or not is unknown. In 1713 he was appointed to the deanery of St. Patrick. He wrote many political pamphlets, the most famous of which are the *Drapier Letters* (1724). *Gulliver's Travels* was pub. in 1726. His last visit to England was paid in the following year, and the rest of his life was spent in Ireland. His brain became overclouded in 1740, and he never recovered. He died in Oct., and was buried beside 'Stella' in his cathedral. The clarity of his prose style and his manipulation of language have been the example for succeeding Eng. writers, and his mastery of irony, which in literature is associated with his name more than any other, has never been surpassed. His satire remains to-day as alive as when it was written, because, although S. played a powerful part in party politics, his indictment of social customs and, in

Gulliver's Travels, of the whole human race was inspired by a sincere moral indignation and a humane desire to work for the betterment of mankind. His fundamental teaching is all to be found in *Gulliver's Travels*. In all four parts of the book the theme is that of man's betrayal of his own reason, his frustration through the folly, vanity, violence, and brutishness which distort his values and cloud his judgment. Among his minor works are *A Meditation upon a Broomstick* (1710); *Predictions for the Year 1708*, by 'Isaac Bickerstaff, Esquire'; *An Essay on Conversation* (c. 1709-10); and *A Complete Collection of Genteel and Ingenious Conversation* (1738). There is an ed. of his works by Sir Walter Scott (1814), and

JONATHAN SWIFT
Engraving by B. Holl

the *Correspondence of Jonathan Swift* (4 vols.) was ed. by F. Elrington Ball (1913). See lives and studies by Sir H. Craik, 1882; Sir L. Stephen, 1925; C. van Doren, 1931; R. V. Jackson, 1939; A. E. Case, 1946; and B. Acworth, 1948; also Lewis Gibbs, *Vanessa and the Dean*, 1938, and Evelyn Hardy, *The Conjured Spirit Swift. A Study in the Relationship of Swift, Stella, and Vanessa*, 1950.

Swift, name of members of the Picarian family *Cypselidae* closely allied to the nightjar, cuckoo, and woodpecker, but not to the swallow, which it resembles superficially. The only Brit. species (*Cypselus apus*) arrives in Britain in May, leaving in Aug. for its winter quarters. It feeds entirely on small winged insects, and in its search for them exhibits remarkable powers of flight. It nests in holes in tall buildings, laying two or three large white eggs. The adult bird is about 7 in. long. The plumage is blackish brown, except for a small greyish white patch under the chin. The tail is long and forked. An occasional visitor to Britain

is the white-bellied or Alpine S. (*C. melba*). A remarkable S. is Salvin's S. (*Panytila sancti-hieronymi*), a native of Guatemala, which builds a huge nest composed entirely of seeds and the bird's own salivary secretion. See also NESTS, EDBLE.

Swilly, Lough, inlet of co. Donegal, Eire, entering from the Atlantic between Fanad Point and Dunaff Head (4 m. in width) and extending inland for 25 m.

Swimming, art of propelling oneself through water without artificial aid. Swimming is for man an acquired art, i.e. certain movements which are not instinctive, at any rate among civilised peoples, have to be learnt and practised before the aspirant can expect to support himself in the water. The density of the human body is approximately 98, which means that in water approximately forty-nine-fiftieths of the human body is immersed and that the water will support one-fiftieth of body in air, i.e. the top and back part of the head, from eye level to the base of the skull. More than one-fiftieth may be supported by inflating the lungs, especially the lower part (diaphragmatic breathing). This allows the arms to be lifted into the air for recovery movements following propulsive movements in the water. Modern swimmers use four prin. strokes: breast, crawl, back crawl, and butterfly. The Eng. backstroke, side, overarm, and trudgeon have been dropped for speed swimming. Modern methods of teaching are not confined to one stroke only. As watermanship and early training are progressing, the fundamentals of each stroke are introduced. If crawl stroke is taught, as having limb movements akin to walking and climbing, it may be difficult to acquire breast stroke, which is essential for life-saving at a later stage.

The Breast Stroke.--Arm, leg, and breathing is taken to four counts from the 'ready' position: body in prone position, arms extended beyond head, thumbs touching; legs extended and together; head lowered so that the water-line crosses face just below eye level; the whole body is relaxed. Count 1: the arms straight and tensed, with hands cupped and turned slightly outwards, are swept downwards and outwards to a position where there is not more than 90° angle between them. The head is raised and breath inhaled through the mouth. Count 2: arm muscles relax, elbows bend slightly, and hands swing towards each other to assume a position, with palms downward, a little in front of the chin. The legs, relaxed, are bent, with heels touching and knees outwards so that there is a diamond shape between them. The head is lowered to eye level in the water. Count 3: the arms, still relaxed, are stretched forward to the 'ready' position. The legs are vigorously straightened and swirled together to the 'ready' position. The breath is exhaled forcibly through the mouth and nose, into the water. Count 4: the whole body is lying horizontally in the water, without strain, and is gliding forward as a further exhalation of the breath takes place, and as a result of the forward

momentum imparted by the leg propulsion movement of count 3.

The Crawl Stroke is the most generally used in free-style S. over all distances. The body lies prone with the lower part of the face in the water, as in the 'ready' position previously described for breast stroke. The legs, relaxed, are worked from the hips, up and down, with slight flexion of knees and with as much ankle play as possible. The heels only break the surface on the up-drive. Toes are turned inwards to increase power of drive. While the number of 'beats' may vary from six to twelve, the commonly accepted rhythm is the 'six beat,' i.e. six movements of legs up and down to one complete cycle of the arms. The legs provide propulsion as they approach each other; the feet sink to a depth of 15-18 in., and the legs pass close to each other on the centre line of the body. The arms propel alternately with regular rhythm, one arm propelling as the other arm is recovering. The hand slightly cupped, fingers together, enters in advance of the head on its own side of centre-line. It presses down on the water with elbow slightly bent and is driven towards the thigh ready for recovery. The elbow is lifted to break the water surface, and the forearm, hanging loose, is carried forward in a half-circle over the water to the starting position. Unilateral (one-sided) breathing is used by most swimmers. The head is turned, once in each complete stroke, to the left or right. If to the right, the head is turned to bring the mouth clear of the water to inhale, as the left arm has commenced its downward drive. The head is turned for the eyes to look forward again, as the recovering right arm has reached head level. Bilateral or two-sided breathing is that employed when the swimmer inhales alternately left and right. It is used by some speed swimmers to preserve body balance in the water. The head is turned to the right to inhale while the left arm pulls, and the head to the front to exhale during the pull of first the right arm and then the left arm. The next intake of air occurs as the head is turned to the left during the pull of the right arm and the head is centred again to exhale. In this way inhalation takes place with each third arm stroke, whereas the swimmer using unilateral breathing inhales with every other arm stroke. In both cases exhalation takes place by forcibly expelling air through mouth and nose, into the water.

The Back Crawl Stroke has a similar leg action to the crawl stroke, with the body in the supine position, hips slightly bent, and head raised so that the swimmer may watch the toes at water level. The legs sink to a depth of 12 to 18 in. The arms execute a cycle of movements, alternately, propelling and recovering on a similar principle to crawl stroke. The arm is flung clear of the water, outwards and backwards until the hand touches the water, ahead of the shoulder line, with cupped hand slightly downward into the water. It is then pulled through the

water, downwards and upwards to the side of the body. Breath is inhaled as one arm is flicked out of the water and exhaled throughout the remainder of the cycle.

The *Butterfly Stroke* is best described as the breast stroke leg action with a simultaneous crawl arm action, i.e. both arms pulling together and recovering together. Since both arms recover out of the water, the body must be riding higher than in the ordinary breast stroke; hence the effect of the leg kick must be felt a fraction of a second earlier. There is no 'glide' as in the breast stroke count four. Remarkable times have been secured with this stroke, which was used by all but one finalist in the 1948 Olympics Games breast stroke (men). There is much to be learned yet about this stroke, as to timing and effective leg drive. To conform to the rules for breast stroke competition S., the legs must bend at the same time and drive outwards and together. Crawl stroke leg action may not be used. It is advisable to learn breast and crawl strokes well before attempting this stroke.

The *Plunge* is no longer a championship event at national or international meetings, but it is very useful to obtain a flying start in a race. The swimmer stands on the edge of the bath with toes gripping the edge; bending forward from the hips and bending the knees, the arms are swung forward and the legs straightened with a vigorous push so that the arms, trunk, and legs are stretched in a straight line and the head between the arms. Thumbs should be touching. Entry into the water is clean and well away from the bath; the plunge is finished with a long glide. In competitions there was a time limit of 60 sec. set as a maximum for breath being held, when the distance travelled from the take-off point was measured.

Diving.—The racing dive is very similar to the plunge, except that the glide is reduced and the leg action of the stroke is taken up on entry into the water, the arm action following to complete the full stroke. There are two types of diving, spring-board and firm-board, with heights for the latter increasing up to 10 metres. Of the firm-board diving, the Eng. 'header' is the most useful accomplishment for the ordinary swimmer, and it may be carried out from the side of the bath. The erect position on the side is taken, toes gripping the edge. The eyes look straight forward, the arms hanging straight and close to the sides with fingers slightly curled, and the weight of body evenly distributed on both feet, which may be slightly apart. When the body is balanced well, the arms are raised forwards and upwards to the level of the shoulders, and kept the width of the shoulders, with palms down. For the take-off, the arms are swung downwards and slightly past the thighs, with the knees bending slightly, and the weight of the body transferred to the balls of the feet. The arms are then swung forward and upwards, and at the same time the knees straighten, and the body, in a straight line from finger-tips to toes, is

directed upwards and outwards, with an angle of about 20° between it and the vertical as the body leaves the bath side. There is no relative movement whatsoever of the body and limbs during the flight through the air. The body rotates on an axis about the base of the chest, due to the effect of gravity, and commences its downward flight. The angle of entry depends on the height of the dive, but should never pass beyond the vertical, and should not be less steep than 30° from the vertical. The whole of the body, from the finger-tips to the toes, passes through the 'hole' in water made by the finger-tips, and is maintained in a straight line until the toes have disappeared beneath the surface. The dive ends, for competitive purposes, at this point, no account being taken of method of returning to the surface or absence of splash. For details of the swallow dive and more complicated movements from the spring-, firm-, and high-boards, reference should be made to the *I.S.I. Manual of Diving* and other books listed below.

LIFE-SAVING.—The standard reference book is the *Handbook of Instruction of the Royal Life-saving Society*. As far as actual S. strokes are concerned, the breast stroke is essential for the final approach to the drowning person, since it allows the rescuer to manoeuvre easily and to watch any movements which the person is making. For actual rescues five methods are employed: the first three entail use of the life-saving back kick, to tow the person in a supine position; the fourth method employs the breast stroke to 'swim in' a person who is passive; and the fifth method is for good side-stroke swimmers who can carry the person under one arm. The first three methods employ holds on the drowning person, viz.: (1) holding on each side of the person's face, over the ears, when not struggling; (2) holding by the arms, above the elbows, when struggling; and (3) passing the rescuer's arms under the armpits of the subject and spreading the hands across the subject's chest. In this way a person whose arms are difficult to hold, or who is violent, has his arms 'locked,' and at the same time feels extra support from the rescuer. There is a further and more recently developed method which employs the life-saving back kick, but allows the rescuer one arm free to assist S., the 'unigrip' method. The rescuer passes the left arm over the subject's left shoulder and holds his chin with the left hand cupped to fit in comfortably. At the same time the rescuer's left arm, bent at the elbow, presses the subject's left shoulder against the rescuer's chest. Two methods of restraint can be applied according to the degree of struggling by the subject. In cases where the subject secures a hold on the rescuer there are three accepted methods of release, when held by (1) the wrists, (2) round the neck, and (3) round the arms and body, and a further development when held round the body from behind. In addition the rescuer should be acquainted with surface diving to raise a body from the bottom of a bath,

riv., or the sea, and various methods to land the rescued person at a shallow beach, steep bank, and into a boat. The essential points in effecting a rescue are to avoid waste of time, and to be ready to swim in clothes; to conserve energy wisely; to keep on top of the subject when effecting a release from a hold, and finally to keep the subject's head above water when towing him to safety, thus ensuring confidence and preventing a desire for renewed struggling. A sound knowledge of artificial respiration (*q.v.*) is essential. In conclusion a brief description of the life-saving back kick is necessary. The legs only are used to propel the rescuer towing his subject, both in the supine position. From the starting position with legs together, the legs are dropped from the knees, so as to make an angle of 60° with the horizontal, and the knees open slightly. The legs are then straightened, kicked outwards, and swirled together vigorously. With this stroke the legs are not fouled by the person being towed, and the hands are free to maintain a hold on the subject, or if only one hand is used thus, the other may be employed to obtain added propulsion.

WORLD'S RECORDS (as at Sept. 4, 1950)

Men. Free style: A. Ford (U.S.A.) 100 yds., 49.7 sec.; 100 metres, 55.4 sec.; J. B. The Eng. Channel has been swum by the following persons:

(1) M. Webb (Great Britain), 21 hrs. 45 min. (1875); T. Burgess (Great Britain), 22 hrs. 35 min. (1911); H. Sullivan (U.S.A.), 26 hrs. 50 min. (1923); E. Tiraboschi (Italy), 16 hrs. 33 min. (1923); C. Toth (U.S.A.), 16 hrs. 58 min. (1923); Gertrude Ederle (U.S.A.), 11 hrs. 39 min. (1926); Milie G. Corson (U.S.A.), 15 hrs. 29 min. (1926); A. Wierkotter (Germany), 12 hrs. 40 min. (1926); E. H. Temme (Great Britain), 14 hrs. 29 min. (1927); Mercedes Glantz (Great Britain), 15 hrs. 15 min. (1927); Ivy Flawke (Great Britain), 19 hrs. 16 min. (1928); Hilda Sharp (Great Britain), 14 hrs. 58 min. (1928); I. Helmy (Egypt) 25 hrs. 40 min. (1928); Margaret M. Duncan (S. Africa), 16 hrs. 17 min. (1930); H. Taylor (Great Britain), 14 hrs. 48 min. (1935); T. Blower (Great Britain), 13 hrs. 31½ min. (1937).

(2) G. Michel (France), 11 hrs. 5 min. (1926); N. L. Denham (Great Britain), 13 hrs. 55 min. (1926); Ivy Gill (Great Britain), 15 hrs. 9 min. (1927); Ethel Lowry (Great Britain), 15 hrs. 45 min. (1933); Emma Faber (Australia), 14 hrs. 8 min. (1931); E. H. Temme (Great Britain), 15 hrs. 54 min. (1931); F. Wheatcroft (Great Britain), 13 hrs. 35 min. (1938).

(3) Bruna W. Plarre (Germany), 15 hrs. 33 min. (1938); Sally Bauer (Sweden), 15 hrs. 23 min. (1939); D. Carpio (Argentina), 14 hrs. 46 min. (1947); T. Blower (Great Britain), 15 hrs. 31 min. (1948); H. Abd El Rehim (Egypt), 17 hrs. 38 min. (1948); 15 hrs. 16 min. (1949); and 10 hrs. 50 min. (1950); M. H. Hamad (Egypt), 16 hrs. 40 min. (1949); and 12 hrs. 5 min. (1950); Z. Zarganos (Greece), 18 hrs. 30 min. (1949); and 16 hrs. 17 min. (1950); F. de Moulin (Belgium) 21 hrs. 59 min. (1949); P. Mickman (Great Britain), 23 hrs. 48 min. (1949); Florence Chadwick (U.S.A.), 13 hrs. 23 min. (1950); R. le Morvan (France), 11 hrs. 3 min. (1950); Eileen Fenton (Great Britain), 15 hrs. 31 min. (1950); W. S. Rockett (Great Britain), 14 hrs. 17 min. (1950); W. Barrie (Great Britain), 16 hrs. 18 min. (1950); Jenny Kammergaard (Denmark) 16 hrs. 27 min. (1950).

The Channel Swimming Association accepted the claims of those in section (1). The claims of those in section (2) were deferred for further evidence to be supplied. From 1939 onwards section (3) no claims were received.

Swimming-bladder, see AIR-BLADDER.
Swinburne, Algernon Charles (1837-1909), Eng. poet, b. in London. He lived as a boy at Capheaton, Northumberland (home of his grandfather, Sir John S. Bt.), and at E. Dene, in the Isle of Wight. In 1852 he went to Eton, and five years later to Balliol College, Oxford, where he remained until 1860. He left without a degree, although in 1858 he won the Taylorian Prize for Fr. and It. While at Oxford he met Rossetti, who had gone there to do some mural paintings and he also met there Burne-Jones and Wm. Morris. It was to Rossetti that S. dedicated his first pub. poetical drama

Press Portrait L.reau
 ALGERNON CHARLES SWINBURNE

The Queen Mother (1860). This, with a similar work, *Rosamond*, was of Shakespearian inspiration, and neither was successful. In 1862, after returning from Italy, where he met Landor, S. took a house in Chelsea with Rossetti, Wm. Rossetti, and George Meredith; three years later S. pub. two much more successful poetic dramas, *Atalanta in Calydon* (1865), and *Chastelard* (1865). In 1866, his *Poems and Ballads* provoked scandal and a storm of abuse from the critics who were repelled by the sensuality which they declared characterised its pages. However, S. had made his name as a writer, and from then on produced a great number of poems and poetic dramas, and also sev. critical essays, the best of which include *William Blake* (1868); *Essays and Studies* (1875); *Erechtheus* (in the form of classical tragedy) (1875); *A Study of Shakespeare* (1880); *Victor Hugo* (1886); *Studies in Prose and Poetry* (1891); and *The Age of Shakespeare* (1908). His life itself was uneventful; he identified him-

self with the Pre-Raphaelite movement, and enthusiastically upheld the cause of lit. independence. In 1879 he moved to Putney, where he took a house with Theodore Watts-Dunton, and there he lived until his death on April 10, 1909. Louis Cazamian writes of him (1927): 'A very considerable poet, Swinburne is yet not the centre of his literary age. He lacked, to be such, the determination and sureness of instinct. Half transformed as it is by the aesthetics of symbolism, his art still remains involved in Romanticism pure and simple. . . . So completely does he surrender to the intoxication of language that his inspiration very often seems to follow no other guidance.' See W. M. Rossetti, *Swinburne's Poems and Ballads*, 1866; and lives and studies by T. Wratistlaw, 1900; E. Thomas, 1912; J. Drinkwater, 1913; and H. Hure, 1919.

Swindling, see FRAUD.

Swindon, municipal bor. of Wiltshire, England, 77 m. W. of London, made up of Old and New S., the latter having grown up around the locomotive dept. and workshops of the former Great W. Railway, which were estab. in 1841, and which provide the chief occupation of the tn. It is an important railway junction. Pop. 68,300.

Swine, see PIG.

Swinemünde, see SWINOUJSKIE.

Swinerton, Frank Arthur (b. 1884), Eng. novelist and critic, b. at Wood Green, London, entered the publishing house of Dent as a boy. Later he became a publisher's reader and literary adviser. His first novel was *The Merry Heart* (1909), while his best work is, perhaps, *Nocturne* (1917). He has pub. critical studies of George Gissing (1912) and R. L. Stevenson (1914). Among his other works are *The Chaste Wife* (1916), *September* (1919), *Coquette* (1921), *Young Felix* (1923), *Summer Storm* (1926), *Tokeliff Papers* (1927), *A Brood of Ducklings* (1928), *A London Bookman* (1928), *Sketch of a Sinner* (1929), *The Georgian House* (1932), *The Georgian Literary Scene* (1935), *Swinerton: an Autobiography* (1937), *The Two Wives* (1939), *The Fortunate Lady* (1941), *Thankless Child* (1942), *English Maiden* (1946), and *Tokeliff Papers Old and New* (1949).

Swinoujskie (Ger. *Swinemünde*), seaport, seaside resort, and spa, near the mouth of the R. Swine, on the coast of Usedom in Polish Pomerania, founded in 1743, and fortified in 1925. Shipbuilding, fishing, and timber industries are carried on. It is a railway junction and has an airport. Pop. 20,500.

Swinton: 1. Tn. of the W. Riding of Yorkshire, England, 10 m. N.N.E. of Sheffield. It has railway works, and manufs. steel, pottery, glass, and iron goods. Pop. 12,000. 2. S. and Pendlebury, municipal bor. of Lancashire, England, 5 m. N.W. of Manchester. There are cotton manufs., collieries, and tile works. Pop. (estimated) 11,250.

Swiss Guards, regiment of Swiss mercenaries, forming the Fr. royal bodyguard constituted in 1616. They were conspicuous for their bravery in the defence of the

Tulleries (1792), which was commemorated in 1821 by the great lion outside one of the gates of Lucerne. The pope's escort is also known as the S. G., being comprised of men recruited from every Swiss canton.

Switch: 1. In electricity, a mechanism for making or breaking a circuit, or for transferring a current from one conductor to another. 2. On a railway, a device for moving a small section of track so that rolling-stock may be run or shunted from one line of track to another.

Swithin, or Swithun, Saint (*d.* 862), *b.* in Wessex, and educated at the Old Abbey at Winchester, though it is not certain that he ever became a monk. He was ordained and became chaplain to Egbert, king of the W. Saxons, and tutor to his son Ethelwulf, who made him bishop of Winchester on his accession (852). The origin of the popular legend that if it rains on his day (July 15) it will do so for forty succeeding days is uncertain.

Switzerland, republic of central Europe, consists of the confederation of twenty-two self-governing cantons (three of them subdivided), bounded on the N. by Germany, W. by France, E. by Austria and Liechtenstein, and south by Italy. It is 220 m. in length from E. to W., about 137 m. from north to south, and is separated from the adjacent countries by the Alpine barriers. While the official language of the Ger. cantons is high Ger. all classes of society retain in speaking the local form of Swiss Ger. The table opposite gives the names of the cantons, the date of their entry into the confederation, and the density of the pop. per square mile, while the initial letters G. (German), F. (French), I. (Italian), or R. (Romansch) indicate the language group to which they belong. S. is a country without seaboard, but has a rich diversity of scenery, including vast snow-capped mts., with abysmal depths and enormous glaciers which form a distinct contrast to the grassy valleys, wooded upland slopes, vineyards, richly cultivated fields, and beautiful lakes and streams. On its pasture land cattle are reared, while ibex and chamois inhabit the rocky crags and woods.

The present formation of the mt. masses of S. is the result of extreme pressure at successive periods from the N.E. and S.W., which has caused the upheaval of the earth's crust, in the course of which the strata have been crumpled, shattered, and even overturned, presenting an endless variety of shapes. The lofty ridges consist principally of crystalline schists in conjunction with granite, the outcrops containing fossiliferous sedimentary rocks. The chief physical feature is the vast Alpine system, known by various names in different localities, *e.g.* the Jura Mts. extend along the W. boundary; the Rhaetian Alps cross the E. frontier into the Tyrol; the Bernese Alps or Oberland occupy the south-central part of the country; the Valais Alps lie on the southern border; the Lepontine Alps, the Rheinwald Alps, and Glarner Alps are situated in the S.E.; while the Urner Alps are in the centre of the country. The highest peak is Monte Rosa, on the It.

frontier, which is 15,217 ft. above sea level, the second highest mt. mass in the Alps, being exceeded in Europe by Mont Blanc only and certain peaks in the Caucasus Mts. The prin. passes over the Alps are Mont Cenis, leading to Savoy; the St. Bernard, leading from the canton of Grisons to the Val d'Aosta; the Simplon, crossing Mt. Simplon and leading to the duchy of Milan; and the St. Gothard, leading to Italy. There are sev. tunnels piercing the Alps, the prin. being the Simplon, the St. Gothard, and the Lotschberg (opened 1913). Light railways ascend many of the peaks, the Jungfrau

Swiss Federal Railways

ABOVE ZERMATT: THE BREITHORN AND THE KLEINER MATTERHORN
In the middle ground is the Gorner glacier

railway running nearly to the summit (11,342 ft.) from a height of 6770 ft. There are upwards of 1000 glaciers in S., the largest being the Aletsch in the Bernese Oberland, 13 m. in extent, which descends from the slopes of the Aletschhorn (13,721 ft.) to about 5450 ft. Of the many beautiful lakes within or partly within, the limits of the country, the following are the most important: Geneva (224 sq. m.); Constance (208 sq. m.); Neuchâtel (92 sq. m.); Lago Maggiore (84 sq. m.); Lucerne (44½ sq. m.); Zurich (34 sq. m.); Lugano, Thun, Bienna, Zug, Brienz, and Morat, the last six being under 20 sq. m. in extent. The prin. rivs. of S. are the Rhône, Rhine, Inn, Arve, Reuss, Limmat, Aar, and the Thur, the Aar being the most important entirely within Swiss ter. The three rivs. first noted have their sources in the Alpine glaciers: the Rhine flowing N.

and N.W. empties into the North Sea, the Rhône takes an E. and then southerly course to the Mediterranean, while the Inn flows N.E. to join the Danube. Among the valleys may be mentioned the famous Val de Travers and the valley of the Inn or the Engadine. There are large waterfalls, e.g. the Staubbach at Lauterbrunnen in the canton of Bern, which drops 980 ft., and at Schaffhausen on the Rhine, which drops over 100 ft. in three leaps. The forests of S. cover 22 per cent of the country. The chief tns., with their pops., are Zurich (400,000); Basel (162,100); Bern, the cap. (130,300); Geneva (124,400); Lausanne (100,000); Winterthur (64,500); St. Gall (62,500); and Lucerne (60,000).

native coal and other minerals greatly hampered industrial development, but the applications of hydro-electric power have had far-reaching results. The machine industry is the most important in the country. Other industries include brewing and distilling, the manuf. of motor cars, silk and cotton goods, clocks and watches (in Geneva, La Chaux de Fonds, and Le Locle), chemicals, aniline dyes, aluminium, chocolate, condensed milk, Gruyère cheese, lace, embroidery, boots and shoes. In 1948 the exports amounted to 3,434,500 francs, and the imports were valued at £4,998,900. Catering for tourists, who bring a large revenue to S., is one of the important occupations

Agriculture and Industry.—S., although basically an agric. country, cannot grow enough crops to support its pop., so that wheat, vegetables, and potatoes are imported. The productive land is owned by some 300,000 peasant proprietors, who raise rye, oats, barley, and potatoes, and manuf. cheese, condensed milk, wine, and tobacco. Stock-raising is extensively engaged in, mainly horses, cattle, sheep, goats, and pigs. Bee-keeping is a thriving industry. Fruit is grown, and there are 50,000 ac. of vines. There are four salt-mining dists., at Schweizerhalle, Rheinfelden, Ryburg, and Bex; iron and manganese ore are mined at St. Gall; asphalt is found in the Val de Travers. With a pop. far in excess of natural resources S. can thrive only by importing raw material and exporting the finished products. Lack of

of its inhab., who are noted for the excellence of their hotels. Swiss winter sports are renowned. There are many sanatoria, especially for pulmonary complaints. The Swiss are not outstanding in the fine arts, but in such crafts as wood-carving they are unexcelled. In machine and engineering they are exceptionally skilled.

Religion.—As regards religion, there is full liberty of conscience and of creed, and no man is required to pay taxes to maintain any religion to which he does not belong. Jesuits and their societies are barred, and the foundation of new religions, orders, or convents is not allowed. The Protestants (58 per cent of the pop.) are in the majority in the cantons of Zurich, Bern, Vaud, Neuchâtel, and Basel, while Catholics (40 per cent of the

pop.) predominate in Lucerne, Fribourg, Valais, Ticino, and the Forest cantons.

Education.—Swiss reformers have played a large part in the evolution of modern educational theories in W. Europe. Rousseau advocated the relaxation of all discipline and compulsion in teaching. Pestalozzi, though a realist, was influenced by Rousseau. He stressed that as the child was the object of education it was of necessity the centre of it, and must be treated with consideration if it was to benefit from its teaching. In all the cantons of S. education is compulsory and free. There are nearly 1100 primary schools, with 13,700 teachers and 433,300

was opened at Geneva. There is also a commercial univ. of St. Gall.

Defence.—The national militia is the defending force of S., and service in it is universal and compulsory. After the outbreak of war in 1939 a total force of 650,000 men was mobilised; but subsequently some of the older classes were demobilised, but the younger classes were called up at an earlier age than hitherto, with the result that a total force of 525,000 men were in 1943 under arms. Mobilisation strength is 720,000. Ordinarily liability to serve in the army extends from the twentieth to the end of the sixtieth year. The gov. decided in

Swiss Federal Railways

A FISHERMAN OF GENEVA (FRENCH TYPE) AND PEASANT OF ST. GALLEN (GERMAN TYPE)

pupils, and over 600 secondary schools and lower mid-schools with 3010 teachers and 75,500 pupils. In addition to these there are commercial schools, industrial schools, improvement schools, technical schools, and schools of agriculture, horticulture, dairy management, hotel management, domestic economy, and viticulture. S. has seven univs., modelled on those of Germany, with four faculties—theology, law, medicine, and philosophy, governed by a rector and a senate. The number of students is over 13,000. The Basel Univ. was founded in 1460, Zurich as an academy in 1523 and as a univ. in 1833, Bern in 1834, Geneva first as an academy in 1559 and then as a univ. in 1892, Fribourg in 1889, Lausanne as an academy in 1537 and as a univ. in 1890, and Neuchâtel as an academy in 1866 and as a univ. in 1909. Fribourg and Neuchâtel Univs. have no faculty of medicine. There is also a Swiss Federal Institute of Technology at Zürich, maintained by the gov. In 1927 a univ. institute for international studies

1947 to maintain a peacetime air force of at least 500 aircraft of the most modern type. There are fortifications at St. Maurice, Martigny, and the St. Gothard Pass.

Finance and Communications.—The revenue in 1945 was 792,500,000 Swiss francs (about £31,448,500), and the expenditure 2,406,800,000 Swiss francs (about £95,349,000), and the public debt stands at 8,795,000,000 francs (about £349,000,000). The national bank (opened 1907) has the sole privilege to issue Swiss bank notes. The main railway lines were nationalised from 1900 onwards. The total mileage is 3245 m. Electrification has been rapid since 1921, and 1745 tn. of the Swiss Federal system's 1804 m. were electrified by 1948. An internal and international air service was developed from 1919 onwards. A merchant marine was estab. in 1941, registered at Basel, and totalling twelve vessels in 1948. There are numerous tramways and funiculars and the roads are excellent. The post,

telegraph, and telephone arrangements are complete and satisfactory.

Law and Administration.—Each canton possesses its own judicial system of civil and criminal procedure; the high court, called the *Bundesgericht* or Federal Tribunal, sits at Lausanne, and is the supreme court and final court of appeal. In 1942 a new Federal penal code replaced the separate cantonal codes. Capital punishment, except for military offences, was abolished in 1942.

Legislative and executive authority are embodied in a Parliament or Federal Assembly consisting of two chambers, a National Council and Council of States, the former consisting of 194 members directly chosen by the people in general election, and the latter composed of 44 members (two for each canton), whose election and term of office depend on the individual canton. All representatives, either of the national or state councils, are remunerated, the national members being elected every four years. Three of the cantons are subdivided, Basel, Appenzell, and Unterwalden, each subdivision being represented by one member in the State Council. Legislative power is vested in a Federal Council of seven members, presided over by the president, which sits at Lausanne, members being elected for four years by the Federal Assembly. The referendum and the initiative are essential features of democracy in S. Every constitutional amendment requires ratification by a popular and a cantonal majority; a referendum on any law can be demanded by 30,000 voters; 50,000 voters can require the submission of any desired law to the usual legislative process. In three cantons direct democracy exists, the citizens of Appenzell, Glarus, and Unterwald meeting annually to elect cantonal officials and pass laws.

History.—Prehistoric research in S. flourished between 1939 and 1945. Particular features of interest are the Alpine Stone Age and Neolithic settlements in the cantons of Grisons and Schaffhausen. Some of the well-known pile buildings are now held to be lake dwellings as the water levels in prehistoric times were lower than at present. Much attention has been given to pile dwellings of the Bronze Age, in the excavation of which the technique of pollen analysis has been brilliantly employed. The La Tène period of the Early Iron Age is well represented in southern S. Settlements and forts have been excavated in the canton of Ticino. In the Bonaduz dist. a settlement was occupied by the Rhatians until the Rom. period. The original inhab. of S. were the Helvetii in the N.W. and the Rhatians in the S.E. The Rom. conquest of these tribes began as early as 107 B.C., in which year they were defeated in southern Gaul. Their subjection dates from 58 B.C., when Julius Cæsar acquired their dominions and organized them as a Rom. prov. Christianity was introduced between A.D. 300 and 400. The ancestors of the modern Swiss are the Germanic tribes who began to overrun the Rom. Empire. The Alemanni settled E. of the Aar about A.D. 406, and the Bur-

gundians in the S.W. in A.D. 443. The Ger. peoples became Christians about 600–650, but the Helvetii were not converted till somewhat later. Between 700 and 1200 S. was under the influence successively of the descendants of Charlemagne, the Ger. emperors, and the Zähringen dynasty. Charlemagne (768–814) included S. in his ter. At his death this realm fell into confusion, and in the subsequent partition of his ters. half of modern S. was allotted to the E. Frankish kingdom and half to Lorraine. In 888 Rudolf the Guelph founded the kingdom of Burgundy, and in 917 Alamannia became an independent duchy. In 1038 Burgundy, Alamannia, and Rhetia fell to the Salic king, Henry III. From 1097 till 1218 the Zähringen dynasty ruled well and justly. A period of anarchy ensued, till in 1273 Rudolf of Hapsburg became emperor. On his death in 1291 the First Perpetual League of the three Forest States (Uri, Schwyz, Unterwalden) was formed, and in 1315 defeated the Austrian forces at Morgarten. In 1332 Lucerne, in 1351 Zurich, in 1352 Zug and Glarus, in 1353 Bern, were added to the league, following on a war with Austria, which was defeated at Sempach. In 1415 war with Austria was renewed, and after a Swiss victory at Nafels, Aargau was added to the confederation. From this period dates the rise of Swiss education, art, and industry. From 1474 to 1477 the confederation was engaged in war with Charles the Bold of Burgundy, defeating him at Granson and Morat (1476). In 1481 Fribourg and Soleure came into the confederation. In 1499 Maximilian attempted to bring Rhetia again under the empire, which as the Grey League (Grisons or Graubünden) had asserted its independence, but he was defeated at Calven. Later during the reformation Austria was more successful, but the leaguers retained their independence until they at last joined the confederation in 1803. The independence of S. really dates from the victory over the Empire at Bomach in 1499, by which S. was released from the imperial tax. The Reformation led to internal dissension, as the N. generally followed the teachings of Zwingli (and later of Calvin), while the Forest States remained Rom. Catholic. The war which broke out in 1531 settled the relative boundaries of the states owning the two creeds. In 1536 Bern took the Vaud from the dukes of Savoy. During the early sixteenth century Swiss mercenaries were widely employed in Europe. In 1648 S. was acknowledged by the powers as an independent state. The hist. of the seventeenth and eighteenth centuries is one of a patriciate in Bern, Fribourg, Soleure, and Lucerne, and of civic oligarchies in Basel, Zurich, and Schaffhausen. During the whole of this period the peasantry were much oppressed, and their attempt in 1653 to secure better conditions was crushed. S. shared, however, in the *éclaircissement* movement in France; but at the time of the Fr. Revolution it was seized by France, which made it the Helvetic republic (1798). In 1815 its independence was restored, and its

permanent neutrality guaranteed by the powers at the Congress of Vienna. During the nineteenth century religious differences led to bitter controversy and to blows. In 1847 a savage war broke out between Protestants and Rom. Catholics on the question of the suppression of the Catholic Sonderbund. In 1848 a new federal constitution was adopted, and the terms of peace signed, giving the Protestants nearly all they had fought for. In 1874 a federal revision was carried, and in 1891 a demand for popular initiative for measures was carried. In 1908 S. entered into an international convention for compulsory arbitration at the court of The Hague. Surrounded by belligerent countries during the First World War, S. nevertheless retained her neutrality, though the Fr. Swiss and Ger. Swiss naturally differed in their sympathies and their opinions as to the desirability of remaining neutral. In a non-military capacity S. rendered useful assistance to both sides in organising Red Cross units, tracing the missing, and permitting incapacitated prisoners of war to be interned within her frontiers. In 1920 S. entered the League of Nations, which made its permanent headquarters at Geneva.

S.'s international position was compromised by the formation of the Axis (*q.v.*) and by the increasing hostility of the Axis to the League of Nations. A movement arose for an initiative on a proposal to make neutrality a component part of the constitution but, as this would have led to S. abandoning the League, it came to nothing. S. had but a qualified neutrality; after difficult negotiations with the League Council S. had induced the Council to release her in the London Declaration of 1920 from the obligation of taking part in the military sanctions of the League or of permitting preparations for them to be made on Swiss ter., but S. had still to join in economic and financial sanctions. This situation came to an end on May 14, 1938, when the League of Nations Assembly released S. from any participation in the sanctions of the League. In 1939 an initiative proposing an alteration in the constitution by which the Bundesrat would have been subordinate to the Federal Court was rejected by a great majority of individual votes and by all the cantons. On the subject of the so-called 'urgency initiative' the people in a referendum supported the Bundesrat's proposal, which made the declaration of urgency dependent on receiving the support of an absolute majority of members of both chambers and not merely a majority of those present at the voting. On Aug. 28 the Bundesrat ordered the mobilisation of the frontier and air defence troops (see under *Defence*). The outbreak of the Second World War found S. morally well prepared, though the conquest of France by Germany made S. economically entirely dependent upon the latter, and on Aug. 11, 1940, a new trade agreement between the two was signed. War had other effects; rationing soon became inevitable, and, again, in June 1940, a dozen bombs fell at

Geneva and Lausanne, killing sev. people. In that year the Federal Council dissolved the Swiss National movement, a totalitarian organisation closely connected with the Nazis, and soon afterwards they dissolved the Communist party.

When the war spread to Russia and the Balkans, the trade agreement S. had made with Russia earlier in 1941 became worthless. Germany then brought pressure on S. to enter into the closest possible economic association, and as a reprisal against this second agreement Great Britain intensified her blockade against S. S.'s position was no doubt hazardous, especially as she also had to protect herself against attempts to disintegrate her from within, through the machinations of the highly organised Ger. Nazi party in S. itself; people supported the gov. in its severe measures. After the Ger. invasion of Russia Germany demanded of S. a participation in the 'fight for Europe' and adherence to the 'New Order.' Only very few Swiss adherents of National Socialism, fought in the ranks of the Wehrmacht and these were condemned in *contumaciam* by the military courts for serving with a foreign power.

S. did not become a member of the United Nations, though she joined U.N.E.S.C.O. and sev. other international organisations, and took part in the Marshall plan, though without seeking any Amer. aid for herself. As regards W. union the Swiss experience of federation and the combination of peoples of different language would be valuable, but the introduction of interchangeable currencies and freedom of trade would almost inevitably cause at least short-term losses. In 1948 old-age pensions were introduced for the first time; social services are little developed on the whole. The prevalent political sentiments are conservative, except for some industrial areas, though Communists won sev. seats in the 1947 elections.

Literature.—Swiss literature, coming as it does from a number of races unconnected in origin and hist., must be regarded as a collection of local literatures rather than as one single thing. The first prominent name in Swiss literary hist. is that of Balbulus Notker (c. 810–912), noted for his composition of *Sequences* and his services to church music. Ekkehard's *Waltharilied* (c. 940) is a poem in Lat. hexameters which deals with Walter of Aquitaine. Of medieval Swiss literature there are Fr. and Ger. 'courtly' romances on 'France, Britain, and Rome the great'; Ger. lyrics; trans. of the Bible into Fr.; miracle and morality plays in Fr.; and vast compilations like Oton de Grandson's *Mirrouir de Monde*. Among the early poets and writers were Ulrich Boner, the fabulist, whose *Edelstein* appeared in 1349, the first book printed in the Ger. language; Johann von Kaisersberg Geiler (1445–1510), the greatest preacher of his age; and Niklaus Manuel (1484–1530), the satirist. François Bonnard (1496–1570), antiquary and historian, was the hero of Byron's *The Prisoner of Chillon*. The Swiss reformers and humanists are re-

sponsible for much valuable work. Zwingli (1484-1531) trans. the Bible into Ger., while the clear and incisive polemical style of Calvin (1509-64) has raised him to a high place among Fr. stylists. Scaliger (1540-1609) is famous as a scholar; Konrad Gesner (1516-65) was a noted naturalist and philologist. Theodore Beza or Beze (1519-1605), though Fr., settled in Lausanne. His eds. of the N.T. influenced the Eng. versions of 1557-1611. He presented the famous *Codex D.* to Cambridge Univ. in 1581. Gilles Tschudi (1505-72), author of *Chronicon helveticum*, long the outstanding authority on early Swiss hist. from 1000 to 1470, was one of the foremost antiquaries of all time. Among Ger. chroniclers of this period were Stumpf (1500-76) and Bullinger (1504-75). The *Zürich Letters*, pub. by the Parker Society, show the latter's influence on the Eng. Reformation. Thomas Erastus (1524-1583), physician and theologian, is remembered for his celebrated work on excommunication, pub. in 1589. With him begins that long literary connection with England, which persists to this day. His posthumous work was trans. into Eng. as the *Nullity of Church Censures*. J. J. Bodmer (*q.v.*) (1698-1783) and J. J. Breitinger (*q.v.*) (1701-76) led the revolt of the moderns against the ancients in Ger. literature. Bodmer wrote learned works on poetry and literature generally, and trans. *Paradise Lost* in 1732. For a time in the seventeenth century Swiss literature declined, but in the eighteenth century came a reawakening. The works of Crouzet and Ruchert, and Muralt's *Lettres sur les anglais et les français*, are signs of this new spirit. The philosopher Albrecht von Haller (1708-77) was a sturdy upholder of England in intellectual matters, and was much influenced by the inductive method of Bacon. He pub., in 1732, in Ger., an *Essay on Swiss Poetry*, and his own poems are full of grace and tenderness. Gotthelb Emmann. von Haller (1755-86), son of Albrecht, wrote the *Bibliothek der Schweizergeschichte*, so indispensable to the historical student. There were also Euler (1707-83) and the Bernouillis, prominent mathematicians; Isaac Iselin, a philosopher, who challenged the popular historical sequence of the origin and evolution of society from hunting, herding, and farming, by adducing contrary evidence from Polynesia; Emeric de Vattel (1714-67), a Fr.-Swiss, wrote *The Law of Nations* (1758), and is numbered among the founders of international law. Sismondi, the art historian, and Besselov of the Swiss Guards, whose memoirs on the Fr. Revolution are still read by students of that period, deserve mention, as also do Johannes von Müller (1752-1809), the universal historian; J. Georg Sulzer, art critic and author of a *General Theory of Beauty in Art*; Benjamin Constant (1767-1830), author of *Adolphe*; Alexandre Vinet (1797-1847), the theologian and 'Protestant Pascal' whose works (in Fr.) are marked by incisiveness and purity of style; Johann Wyss (1781-1830), the writer of the Swiss national anthem, and author,

with his father, of *The Swiss Family Robinson*; Johann L. Burchard (1784-1817), orientalist and ethnographer; and Jeremias Gotthelf (pseudonym of Albrecht Bitzius) (1797-1854), novelist and moralist, and author of *Wealth and Spirit* (1866) and *Uli, the Farm Servant* (1888). But the greatest name perhaps in Swiss literature is that of J. J. Rousseau (*q.v.*) (1712-88). His disciple Heinrich (Johann) Pestalozzi (1746-1827) is one of the greatest educational reformers. Johann Kaspar Bluntschli (1808-81) of Zürich was politician and constitutional jurist, whose work on contracts has served as model for contracts throughout the world. Eduard Zeller (1814-1908), the historian and philosopher, taught at Bern. J. J. Bachofen (1815-87), jurist, exerted great influence on ethnology by his work *Das Mutterrecht* (1861). Philippe C. Bridel (1757-1845), who wrote both in verse and prose, J. H. Merle d'Aubigné (1794-1872), historian of the Reformation, and Jean Grénaud (1823-97), historian of Valais, may also be mentioned. Leading figures in Swiss literature also include Gottfried Keller (1819-90), novelist and poet, and one of the greatest of Swiss humorists, and Conrad Ferdinand Meyer (1825-98), who was perhaps the greatest poet S. has produced. One of his novels, *Der Heilige*, has been trans. into Eng. (*Thomas a Becket, the Saint*). The nineteenth century saw the impressive figures of Jacob Burckhardt (1818-97), the art historian and critic, and author of works on Constantine the Great, the It. Renaissance, and It. art, the first comprehensive works of their kind; V. Cherbuliez (1829-90), who created the cosmopolitan novel in France; Philip Schaff (1819-93), theologian and church historian (who later became Amer.); Carl Spitteler (1845-1924), who was awarded the Nobel prize for literature in 1920 for his epic *Olympian Spring*; Max Huber (*h.* 1874), an expert in international law; and Charles Ferdinand Ramuz (1878-1947), a poet of great power and virtuosity. Among contemporary Swiss poets and novelists are also Ernst Zahn, whose *Herrgottsfaeden* was trans. into Eng. as *Golden Threads* (1908); Jakob Schaffner (1875-1944), a master of the short story and author of *Die Goldene Frotze* (1912), *A History of Switzerland* (1915), and *Johannes* (1922); John Knittel, novelist, and writer on Arab countries; Joseph Widman (1842-1911), poet, dramatist, and critic; Arnold Ott, dramatist, Isabella Kaiser, authoress of *Mein Herz*, who writes in exquisite Ger. and Fr.; Gottfried Strasser; Marc Monnier; Tisot; Combe and Rannez, and the poets Tazan, Cognard, Dalcroze, all of whom write in Fr.; Hermann Kessner and Gottlieb Stockar, modern masters of the historical novel; and Paul Ilg, said to be the greatest living epic poet of S., and author of *Menschlein Matthias*. Mention must also be made of Karl Barth of Bern, prof. of theology in Bonn Univ. (1935), and Emil Brunner, whose influence upon continental Protestantism has been profound. *Art.*—Konrad Witz (1395-1447) is the earliest Swiss painter, whose work

survives in the famous altar panels, especially the Hellspegel altar. His picture of Lake Geneva, done in 1444, is said to be the oldest landscape painting extant in Europe. Urs Graf of Solothurn (1484-1528), Nicolaus Deutsch (1454-1530), and Hans Leu (1490-1531) all specialised in designs for stained-glass panels. Jost Amman (1539-91) was famous for his wood engravings. Stained-glass painting has been a predominantly Swiss art since the Middle Ages. Conrad Meyer and Christoph Maurer have raised the art to a pitch of perfection. Maurer was also a noted draughtsman, as were also Daniel Lindtner (1552-1607), Tobias Stimmer

Swiss Federal Railways

THE BAROQUE MONASTERY CHURCH
AT ST. GALLEN

(1539-84), and Ludwig Ringler (1535-1605). John Henry Fuseli (1741-1825) became in England a Royal Academician. His 'Night Hag' is in the Brit. Museum. Among landscape painters of the eighteenth to the nineteenth centuries are Adrian Zingg (1734-1816), Wilhelm Gmeln (1745-1821), Johann Hartmann (1753-1830), and Johann Bidermann (1762-1828). Angelica Kaufmann and Samuel Grimm, like Fuseli, worked mainly in England. Landscape and water-colour painters known in Europe are Wolfgang Toepffer (1766-1847), Johann Wetzel (1781-1834), Rudolph Toepffer (1794-1846), the caricaturist, Sigmund Freudenberg (1745-1801), and Arnold Boecklin (1827-1902), the last-named famous for his 'Great Pan' and 'Island of the Dead.' The works of Franz Koenig (1760-1832) were an outstanding example of the tinted engravings which were a big industry in his time. Ferdinand Hodler (1853-1918) executed numerous landscapes, portraits, and lithographs; he was the pupil of Barthélemy Menn 1815-93),

the symbolist painter and he became a founder of Ger. Expressionism, and remains the most distinguished of the purely Swiss school. Among modern painters is Paul Klee (*q.v.*) (1879-1940). Klee was associated in his early years with the Expressionist Kaudinsky, but in 1912 joined the 'Blanc Reiter' school and became pre-eminently surrealist. In sculpture Jakob Kuss was one of the best-known religious sculptors of the Middle Ages. Sixteenth-century sculptors of note were Jakob de Malacridis and Hans Geiler, an example of whose work may be seen in Bern in the Justice Fountain. Carlo Moderni, a Swiss architect who worked in Rome, was Francisco Borromini's teacher. He designed the facade of the basilica of St. Peter. Notable in the seventeenth century are the names of Jakob Kluver, the architect of Lucerne Cathedral, and Nikolaus Geissler the sculptor, and Caspar Mosbrugger, who rebuilt the Benedictine monastery of Einsiedeln. Other leaders of architecture in the nineteenth century were Karl Moser, who built Zurich Univ. and Congress House, and Paul Bodmer, the fresco painter. But the outstanding leader in architecture to-day is Le Corbusier (*see* ARCHITECTURE).

Music.—Among musicians of the eighteenth and nineteenth centuries may be mentioned Hans Huber, composer of symphonies, and Joseph Raff (1822-82), who was a pupil of Liszt. Ernst Anseriner of Lausanne (*b.* 1883), regarded as one of the foremost interpreters of orchestral music on the Continent to-day, is a famous conductor and a pioneer of modern music. Arthur Honegger (*b.* 1892) is a Swiss composer, though he was born in France.

Swivels, see **HANDCUFFS**.

Sword (A.-S. *sweard*; Dutch *swaard*; Low Ger. *sweerd*; Dan. *svaerd*; a sword, allied to the Sanskrit *caru*, a spear or dart), offensive weapon, having a long metal blade (usually of steel), either straight and with a sharp point for thrusting, as the rapier; with a sharp point and one or two cutting edges for thrusting and striking, as the broadsword; or curved with a sharp convex edge for striking, as the scimitar; or a broad, short blade with a slightly curved point, as the falchion. Sabres, used by dragoons, were heavy Ss. used chiefly for cutting. Sailors used the cutlass, which is a broad, straight S., about 3 ft. in length. The blade is fitted into a handle or hilt, which is protected by a guard. The hilt has, in various countries and through the ages, assumed a variety of shapes, either bejewelled, ornate, or plain. The blade is carried in a sheath or scabbard to prevent the weapon doing harm when not in use. Ss. were first used in the Bronze Age, and their typology has been much studied by archaeologists, who have also given profound attention to the development of the S. in the Early Iron Age and in the Rom. era. Certain S. in the Saxon period were sufficiently important to be known in literature. A hist. of arms should be consulted for an account of medieval Ss. See G. F. Laking, *European Arms and Armour*, 1900.

Sword-fish, or *Xiphias gladius*, name given to the single species of the mackerel-like family Xiphiidae. Its distribution is practically universal, but it is found most commonly off the shores of N. America, and only occasionally occurs round the Brit. Isles. The average size of the fish is 7 ft., but in some cases it attains a length of from 12 to 15 ft. It is peculiar in possessing an elongated snout formed from the upper jaw, and with this sword-shaped weapon it can pierce through the planks of ships or spear its prey, such as mackerel and herring. A very different fish, *Belone vulgaris*, a member of the family Scombroideae, is also known as the S.

Sword Lily, see **GLADIOLUS**.

Sybaris, Gk. tln. in Lucania, between the Rs. Sybaris and Crathus, at a short distance from the Tarentine Gulf. It was founded 720 B.C. by Achæans and Træzenians, and soon attained an extraordinary degree of prosperity and wealth. Its inhab. became so notorious for the love of luxury and pleasure that the name Sybarite was employed to indicate any voluptuary.

Sybilline Books, see under **SIBYL**.

Sycamore (*Acer pseudo-platanus*), handsome spreading tree (order Aceraceæ), introduced into Britain in medieval times and now thoroughly naturalised. It bears large five-lobed serrate leaves and pendulous racemes of green flowers, followed by reddish-green winged seeds (samaras). The wood is white and fine-grained, and is much used by turners. The tree is often planted on account of its rapid growth to form a screen for valuable fruit trees.

Sydenham of Combe, Sir George Sydenham Clarke, first Baron (1848-1933), Eng. soldier. He was governor of Victoria from 1901 to 1904, when he was made secretary of the Committee of Imperial Defence. He became Lord Sydenham in 1913, on relinquishing the governorship of Bombay, to which he was appointed in 1907. He wrote sev. works on military and naval matters.

Sydenham, Thomas (1624-89), Eng. physician, b. in Dorsetshire, and admitted a commoner of Magdalen Hall, Oxford, in 1642. About 1648 he obtained a fellowship of All Souls College. Subsequently he quitted Oxford, and having taken the degree of doctor of medicine at Cambridge, he became a licentiate of the College of Physicians, and settled in London. In 1666 S. pub. his first work, which consisted of observations upon fevers. An enlarged ed. of this treatise appeared under a new name in the year 1675. Remarks on the epidemic diseases of London from 1675 to 1680, a treatise on dropsy and on the gout, and a tract on the rise of a new fever were his prin. other pub. S. was the founder of clinical medicine, and one of the first to recognise the importance of diet in resistance to illness. His works were trans. from the Lat. by Dr. Swan; the best ed. is that of Dr. Wallis, pub. in 1789.

Sydney, Algernon, see **SIDNEY**.

Sydney, largest city and chief port of Australia, cap. of New S. Wales, situated on the southern side of Port Jackson and the E. shore of Darling Harbour, about 4 m. from the Pacific Ocean. The harbour, extending inland for 13 m. with a water frontage of 188 m., is regarded as one of the most beautiful and perfect harbours in the world. The area of the harbour proper is 22 sq. m., with 75 m. of foreshore, and of this area about 7 sq. m. have a low-water depth of from 35 to 160 ft. Over 1000 ac. are accessible for anchoring the largest ocean-going steamers. With Newcastle, S. carries practically all the overseas trade of New S. Wales, and nearly half that of Australia. It is a naval station of the first class, with dockyards, victualling yards, and coaling depots. On Garden Is. a well-appointed naval estab. has been erected, and between it and the foreshore the Capt. Cook Dock, the largest of its kind in the southern hemisphere, was built and opened in 1940. Other is. in Port Jackson are Shark Is., used as a quarantine station, Spectacle Is., a popular watering-place, and Cockatoo Is., with extensive dockage accommodation. The southern shores are indented by numerous bays, whose waters are filled with shipping from all parts of the world. Over 11,000,000 tons of shipping entered and cleared the port in 1948-49. There is a terminal elevator at S. capable of holding 6,700,000 bushels of wheat, with facilities for cleaning and drying the grain and delivering it into four vessels at once at the rate of 1000 tons an hour. The harbour is crossed, in one span, by a 3770-ft. steel arch bridge, erected in 1932, carrying a roadway, two footways,

and four lines of railroad. The city is well built, containing many imposing edifices and substantial business houses. Among them may be mentioned St. Andrew's Cathedral, St. Mary's Cathedral (Rom. Catholic), the univ., the tn. hall, Gov. House, Parliament House, the hospital, etc. The univ. was founded in 1850, is subsidised by the gov., and was attended in 1948 by 10,618 students. There are affiliated to it denominational colleges. The foundation-stone of the future Univ. of Technology was laid in 1950. The city has sev. fine parks and other open spaces, the prin. being the Domain, Centennial, Moore, Belmore, and Wentworth Parks, and the botanical gardens. There is a fine National Art Gallery, state library, conservatorium of music, museums, and excellent zoological gardens. Within easy journey of the city are beautiful beaches and varied countryside. Boating and yachting in the harbour are additional attractions for pleasure-seekers. The mean seasonal range of S.'s temp. is only 17° from 71° Fahrenheit in summer to 54° in winter; and the normal rainfall is 42.50 in. in a year. The communications of the city are excellent; it is the chief centre and terminus of the New S. Wales railway system, and is served internally by railway, tram, bus, and ferry, all in a highly organised condition. The Kingsford-Smith airport at S. is an international air terminus, and during 1947-48 2,000,000 passengers were accommodated. An underground railway was opened in 1932. S. is the manufacturing as well as the commercial centre of New S. Wales. The industries include, besides minor manufs., the manuf. of woollens and other textiles, steel and iron goods, machinery, coaches, etc. The bulk of Australian wool is sold in S. There are many flour mills and thriving market gardens and poultry farms on the outskirts, and the city is the chief distributing centre for the deep-sea fisheries. Pop. 214,000; with its sixteen suburbs, 1,484,400. S. was founded by Capt. Arthur Phillip, who had been sent to Australia to establish a penal colony. He landed at Botany Bay in 1788, but finding it unsuitable for settlement, he proceeded to Port Jackson, where he formed the nucleus of what is now the premier city of Australia.

Sydney, city and seaport of Cape Breton Is., Nova Scotia, Canada, 18 m. N.W. of Louisburg. It is the centre of a coal-mining region, and is one of Canada's chief coal-shipping ports. Here are the works of the Dominion Iron and Steel Company. The Canadian National Railway has its terminus here. Pop. 28,300.

Syene, anct. name for Aswān (q.v.).

Syenite, see under IGNEOUS ROCK.

Sytktyvkär, formerly Ust-Sysolsk, cap. of the Komi (Zyryan) autonomous republic of the R.S.F.S.R. There is trade in fur and timber.

Sylhet, dist. and tn. of Pakistan, in E. Bengal, on the Surma R., 49 m. S. of Shillong. Rice is grown. The dist. is 5478 sq. m. in area, with a pop. of 3,116,600. Pop. of tn. 19,300.

Syllabus, Papal, name given to two lists

of heresies and errors condemned by papal authority. The better known is the syllabus of Pius IX. (1864) which condemned no less than eighty errors dealing with almost every dept. of modern thought. The syllabus of Pius X., the decree *Lamentabili sane exitu*, was issued in 1907, and condemns the chief tenets of modernism in sixty-five theses. This syllabus is supplemented by the oath against modernism fixed in 1910. Both lists are in H. Denzinger-Bannwart's *Enchiridion Symbolarum* (23rd ed. 1937).

Syllogism (σύν, together, λόγος, thought, i.e. the joining together in thought of two propositions), 'the act of thought by which from two given propositions we proceed to a third proposition, the truth of which necessarily follows from the truth of these given propositions' (Jevons). The first two propositions in the S. are called the *premises* and the last the *conclusion*, e.g. mercury is not solid, mercury is a metal; therefore some metal is not solid. The three propositions of a S. are made up of three ideas or terms, called the *major*, the *minor*, and the *middle*. The subject of the conclusion, which necessarily follows from the premises, is called the *minor term*; its predicate is the *major term*, and the middle term is that which shows the connection between the major and minor terms in the conclusion. S. are sometimes divided into single, complex, conjunctive, etc., and sometimes into categorical, hypothetical, conditional, etc. The special rules of the S. are (1) Every S. has three, and only three, terms. (2) Every S. contains three, and only three, propositions. (3) The middle term must be distributed (i.e. taken universally) once at least, and must not be ambiguous. (4) No term must be distributed in the conclusion which was not distributed in one of the premises. (5) From negative premises nothing can be inferred. (6) If one premise be negative, the conclusion must be negative; and *vice versa*, to prove a negative conclusion one of the premises must be negative; and as corollaries from the above. (7) From two particular premises no conclusion can be drawn. (8) If one premise be particular, the conclusion must be particular (Jevons). A bad S., with one of the premises implied only, is the first source of fallacy.

Sylv, N. Frisian is., forming part of Schleswig-Holstein, Germany. It is the largest of the group, having an area of 38 sq. m., and is connected to the mainland by the Hindenburg dam. Its chief vill. is Westerland, a noted holiday resort on the W. coast. Pop. 5000.

Sylva, Carmen, see ELIZABETH (PAULINE) ELIZABETH OTTILIE LOUISE.

Sylvester (popes), see SILVESTER.

Sylviadae, see WARBLERS.

Sylviculture, see ARBORICULTURE; FORESTRY.

Sylvius Jacobus (the Latinised name of Jacques Dubois) (1478-1555), Fr. anatomist, began to lecture on anatomy at the Royal College, Paris, when he was already over fifty years old. His lectures were mere expositions of his master, Galen.

Symbiosis, or Mutualism, intimate relationship between separate organisms, one of which may have been originally parasitic on the other, but by modification the two have become able to live together and derive mutual benefit from each other's presence. Each lichen is a combination of a fungus and one or more kinds of algae, living in active partnership. *S.* exists between a fungus and certain rye-grasses, the mycelium (mushroom spawn) being vegetatively perpetuated in the seed of the plant and not by spores; infected plants are found to be more vigorous than uninfected ones. Leguminous plants and nodule bacteria are in symbiotic relationship, the latter supplying the roots of the plants with nitrogen, and in return receiving carbon and other necessary food elements. A further example is provided by the symbiotic green alga (*Zoochlorella*) in the endoderm cells of *Hydra viridis* and in the marine worm *Convoluta*. *S.* is a closer association between the two partners than occurs in *commensalism* (*q.v.*), which is exemplified by the hermit crab and the sea anemone living on its shell, though the two terms are often used synonymously.

Symbolism, sign or representation of any moral or spiritual thing by the images or properties of natural or material things; or the assumption in external things of an inner spiritual meaning, *e.g.* the lion is the symbol of courage, the lamb of meekness or patience. Symbols themselves are of various kinds, as types, enigmas, parables, fables, allegories, emblems, hieroglyphics, etc. Some closely approximate to or rather are readily suggestive of the inward significance with which they are invested, or the event of which they are the representation, while others, like the material objects of idolatry, are often either in no way apparently related to such significance or representation, or such connection as there may be is to be sought in some long-forgotten association of ideas, *e.g.* the tree-trunk which assists a savage to meditate on some divine conception merely because thousands of his ancestors having so regarded such symbol it has become sanctified with a halo of reverence. *S.* is also specifically applied to the system which invests the forms of Christian ritual, dogma, and the fabric and architecture of the churches with a symbolical meaning. In Christian theology every sacrament is an outward and visible sign of an inward and spiritual grace. The different churches vary in their views as to the nature of the reality which the *S.* represents. The full Catholic view is that the sacrament actually performs spiritually what it symbolises: at the other extreme are those who regard the sacraments as little more than *S.* See A. N. Whitehead, *Symbolism*, 1928.

Symbolist, l'École, reactionary school of writers which arose against the Parnassians (*q.v.*). Its main object was the reproduction of forms and colours by the logical transcription of the idea. According to its originators poetry should

translate the deepest secrets of the soul by means of symbols connecting the physical with the moral world. The originator was Alfred de Vigny, and its prin. exponents were Mallarmé, Baudelaire, and Verlaine, and among the more recent Laforgue, Kahn, Verhaeren, and Vielé-Griffin. As an offshoot Moréas founded the *Rom. school*. Allied to the literary movement was a group of painters, among them Gustave Moreau and Odilon Redon, whose work, striving to be 'ideational, synthetic, subjective, decorative,' often became overburdened with ingenuity and intellectualism. See A. Symons, *The Symbolist Movement in Literature*, 1899, and P. Quennell, *Baudelaire and the Symbolists*, 1929.

Symbols. A symbol is a conventional or arbitrary sign, by means of which the writing of names in science is much simplified.

Chemical.—Dalton was the first to introduce a reasonable system of chemical *S.* He represented the atoms of substances by means of circles, an atom of one substance being distinguished from that of another by some mark inside this circle. Thus a clear circle \bigcirc represented an atom of oxygen, \cdot an atom of hydrogen, \bullet one of carbon, \oplus an atom of sulphur, and so on. He thought that water was the combination of one atom of oxygen with one of hydrogen; he therefore represented a molecule of water by $\bigcirc \cdot$. His *S.* were entirely superseded by those introduced by Berzelius. The symbol for an atom of an element is usually represented by the first letter of the name of the substance. Thus carbon C, hydrogen H, oxygen O, etc. In some cases, where the names of sev. elements have the same initial letter, two letters are employed, thus chlorine Cl, copper Cu, cobalt Co. In some few cases the initial letter or letters of the Lat. name is used, thus gold (aurum) Au, silver (argentum) Ag, and so on. It is known that two atoms of hydrogen combine with one of oxygen to form water. Thus H_2O represents a molecule of water and conveys the above information. In a similar manner a molecule of hydrogen is written H_2 , because it is known to contain two atoms. NH_3 stands for a molecule of ammonia, and implies that three atoms of hydrogen and one of nitrogen are combined. The symbols H, N, etc., are often used loosely also for the atomic weight in grammes (*q.v.*) of the element (*q.v.*). Thus H_2 represents two grammes of hydrogen, and NH_3 conveys the idea that fourteen grammes of nitrogen are combined with three grammes of hydrogen to form seventeen grammes of ammonia. Similar *S.* can be constructed for all compounds. If the *S.* represent gases then we have also a volume relation, because the molecular weight in grammes of a gas occupies 22.4 litres at $0^\circ C$. and 760 mm. pressure ('N.T.P.'). Thus H_2 , N_2 , NH_3 , can represent 22.4 litres of hydrogen, nitrogen, and ammonia respectively. *S.* are also employed to express chemical reactions, by means of equations. The *S.* of the interacting substances are placed, with a plus sign in between, on the left-hand side of

the equation. On the right-hand side are placed the S. of the substances formed, also with a plus sign in between. The equation

means that a molecule of barium chloride (BaCl_2) reacts with a molecule of sodium sulphate (Na_2SO_4) to give one molecule of barium sulphate (BaSO_4) and two molecules of sodium chloride (NaCl). Or that 208 grammes of barium chloride interact with 142 grammes of sodium sulphate to give 233 grammes of barium sulphate and 117 grammes of sodium chloride. If the interacting substances are gases, we have a relation between the volumes employed in addition to the gravimetric relation above. Thus $\text{H}_2 + \text{Cl}_2 = 2\text{HCl}$ means that one volume (22.4 litres) of hydrogen combines with one volume of chlorine to give two volumes (44.8 litres) of hydrochloric acid gas. In a similar manner interactions between gases and solids or liquids can be expressed either gravimetrically or volumetrically, or as a combination of the two.

Arithmetical. + (plus) means addition; positive; - (minus), subtraction; +ve, positive; -ve, negative; + and - stand for positive and negative in magnetism, electricity, or when referring to a direction; =, equality; three strokes (≡) means identically equal; ×, multiplied by; ÷, divided by; divided by is also expressed thus, $\frac{a}{b}$, i.e. a divided by b ; √, square root; ∛, cube root; √ⁿ, n th root, and so on; a^n means a multiplied by itself n times; $a^{\frac{1}{n}}$ means the n th root of a ; $a^{-n} = \frac{1}{a^n}$; $a^0 = 1$; ∴ = therefore; ∵ = because. The expression $a : b :: c : d$ means that a is to b as c is to d , or $\frac{a}{b} = \frac{c}{d}$; ∝, varies as, e.g. $y \propto x$, y varies as x ; >, greater than; >, not greater than; <, less than; <, not less than, e.g. $a > b$, a is greater than b ; -, the difference of, e.g. $x - y$, difference of x and y ; $x \sim y$, x is similar to y ; ≈, equal and similar; □, square; □, cms., square centimetres, also written sq. cms.; c.c., cubic centimetres; cm., centimetres; mm., millimetres; gm., grammes; £ s. d., pounds, shillings, and pence. Feet and inches are written ' and "; thus 5' 6" = 4' 3" means 5 feet 6 inches by 4 feet 3 inches; ∞, infinity, a quantity greater than any we can name. 0, zero, n! or n (factorial n) means $n(n-1)(n-2) \dots 1$.

nC_r , combinations of n things r at a time; nP_r , permutations of n things r at a time; { } () —, brackets; Σ, the algebraic sum of; a, b, c etc., usually denote constants, and x, y, z variables. **Geometrical.** □, square; □', square inches; □', square feet. Length is denoted usually by l or L , area by A or a , volume by V or v , radius by R or r , diameter by D or d , radius of curvature by ρ , angle \widehat{ABC} by $\angle ABC$ or $\angle ABC$; ⊥, right angles; ⊥_{ts} or ⊥^r, at right angles or perpendicular to; ∥, parallel; ✕, not parallel;

□ rectangle; ○ circle; (parabola;

⊖ ellipse; ✕ hyperbola;

R.H., rectangular hyperbola; |m, or □m, parallelogram; ||pped, parallelepiped.

Calculus. $f(x)$, $F(x)$, $\phi(x)$, $\psi(x)$, etc., functions of x ; $f(x, y)$, $F(x, y)$, etc., functions of x and y ; $f^{-1}(x)$, $F^{-1}(x)$, etc., inverse functions of x and y ; D, differentiation; $\frac{d}{dx}$, differentiation with respect to x . Thus $\frac{dy}{dx}$, differentiation of y with respect to x ; $\frac{d^ny}{dx^n}$, y differentiated n times with respect to x ; δ , increment, thus δx is the increment of x ; $\frac{\partial}{\partial x}$, partial differentiation; \int or \int , integrate. In Newton's fluxional notation \dot{x} means differentiate x with respect to time; \ddot{x} differentiate twice, and so on.

Trigonometrical.—P (x, y), the co-ordinates of point P are x and y . Sin, cos, tan, etc., are abbreviations of the circular functions sine, cosine, tangent, etc. 50° 40' 24" means an angle 50 degrees 10 minutes 24 seconds (see TRIGONOMETRY). $\pi = 3.14159$, approximately ratio of circumference of a circle to its diameter; \sin^{-1} , \cos^{-1} , inverse of sine, cosine, thus if $\theta = \sin^{-1} x$, $\sin \theta = x$. The sides of a triangle ABC are usually denoted by a, b, c , a being opposite A , and so on. An angle is often denoted by $\theta, \phi, \psi, \alpha, \beta$, etc. log., logarithm; e , the base of the napierian or hyperbolic logarithms.

Mechanical.—C. G. S., centimetre-gramme-second system; F.P.S. or ft. lb. sec., foot-pound-second system; g , value of gravitational acceleration; M, m , mass; V, v , velocity; a, f , acceleration; V , volume; $A, area$; W , weight; w , weight of unit mass; $K.E.$ or T , kinetic energy; V , potential energy; ft. lbs., foot-pounds in work; lb.-feet, pound-feet in momentum; T, t , time; F , force; T , tension; p , pressure; ω , angular velocity; ρ , volume density; σ , surface density; λ , line density; E , Young's modulus; N , rigidity modulus; n , number of; I , moment of inertia; $T.M.$, twisting moment; $B.M.$, bending moment; Q , quantity; H.P., horse-power.

Physical.— $^{\circ}$, temp. in degrees; J , Joules's equivalent; $^{\circ}\text{F}$, $^{\circ}\text{C}$, degrees Fahrenheit and centigrade respectively. **Electrical.**— x, y, z , etc., current, C , continuous current in amperes; C_e, C_a , external and armature current; R , resistance in ohms; R_a, R_s , resistance of armature and shunt; ρ , specific resistance; E.M.F., electromotive force, or simply E , also in volts; I , maximum alternating current; i , effective alternating current. L, M , coefficients of self and mutual inductions; ω , impedance; ω , ohm; Ω , megohm; K, k , capacity or specific inductive capacity; mfd , microfarad; Q, q , quantity of electricity; z , electrochemical equivalent; il ,

cell; |||||, battery of three cells in series; F.M., field magnet.

 inductive resistance

 non-inductive resistance;

 alternating current transformer;

 condenser, or

 glow lamp;

— — arc-lamp.

P., power in watts; WJ, work in Joules; G., galvanometer; s, shunt; A, ammeter; V, voltmeter; n, number of turns of wire; —, alternations per second; B.T.U., Board of Trade units; B.Th.U., Brit. thermal units.

Magnetic.—N, S, north and south poles of a magnet; m, strength of pole; l, distance between poles; M, magnetic moment; H, strength of magnetic field; I, intensity of magnetisation; B, magnetic induction; K, magnetic susceptibility; μ , magnetic permeability; M.M.F., magnetomotive force.

Astronomical.—Conjunction, δ ; opposition, δ ; new moon, \bullet ; first quarter, \smile ; last quarter, \frown ; full moon, \circ ; longitude of ascending node, Ω ; longitude of descending node, ω ; inclination of orbit to ecliptic, i ; argument of latitude, ω ; perihelion distance, q ; time of perihelion passage, T ; period of revolution, P ; zenith distance, z ; azimuth, A ; right ascension, α ; declination, δ ; celestial longitude, l ; celestial latitude, b ; magnitude of a heavenly body, m ; hour angle, h . The S. of the planets are Mercury, ξ ; Venus, ζ ; the Earth, \oplus ; Mars, δ ; Ceres, ρ or (1); Eros, [433]; Jupiter, Υ ; Saturn, ♄ ; Uranus, ♅ ; Neptune, ♆ ; Pluto, ♇ . For the signs of the Zodiac, see ZODIAC.

Symeon of Durham, see SIMEON.

Symonds, John Addington (1840–93), Eng. man of letters, b. at Bristol, was educated at Harrow and Balliol College, Oxford. His critical lives of Shelley (1878), Sir Philip Sidney (1886), and Michelangelo (1893) are of great merit, and his *Autobiography of Benvenuto Cellini* (1887), and his versions of the sonnets of Michelangelo and Campanella, exhibit his admirable gifts as a translator. See life by H. F. Brown, 1895; and M. Symonds, *Last Days of J. A. Symonds*, 1906, and *Out of the Past*, 1925.

Symons, Arthur (1865–1945), Brit. poet and critic, b. in Wales. Influenced by the Fr. symbolists, in 1889 he pub. a book of verses, *Days and Nights*. His next two vols. of poetry, *Silhouettes* (1892, 1896) and *London Nights* (1895, 1897), showed the influence of Verlaine, but the decisive influence upon his work was the æsthetic doctrine of Walter Pater. Though S. never succeeded in constructing a system

of æsthetics he deserves to be remembered as a critic by such works as *Introduction to the Study of Browning* (1886, 1906); *Studies in Two Literatures* (1897); *Aubrey Beardsley* (1898, 1905); *The Symbolist Movement in Literature* (1899), a pioneer work in which he introduced to England the Fr. poets of the later nineteenth century; *Studies in Seven Arts* (1906), and his *Confessions: a Study in Pathology* (1930), in which he analysed his own mental collapse of 1908 and numerous others. The work he pub. after 1908, except for occasional gleams of his old vision, falls far below the level of his books prior to that date. See lives and studies by T. E. Welby, 1925, and M. Wildi, 1929; A. Waugh, *Tradition and Change*, 1919, and W. B. Yeats, *Autobiographies*, 1926.

Sympathetic Inks, see INK.

Sympathetic Nerves, see NERVOUS SYSTEM.

Sympathy (from Gk. *syn* together, *pathos*, feeling), or **Fellow-feeling**, in a human is an emotional state caused by intense consciousness of the sufferings, feelings, hopes, and pleasures of another living creature. See EMOTIONS; FEELINGS.

Symphonic Poem, type of orchestral work categorised as programme music. A descriptive programme is supplied in a literary form, or outlined by a literary quotation. The term was invented by Liszt, who wrote thirteen S. Ps. See also under MUSIC.

Symphony, musical composition for orchestra. The S. was evolved in the Mannheim school, perfected by Haydn, and extended by Mozart. Beethoven expanded the S. without fundamentally changing it, and Schubert impressed his own personality on the purely classical form. Berlioz and Spohr introduced programmatic elements. The S. began to disintegrate with Schumann and Franck, but was reconstituted by Brahms. Dvořák, Tchaikovsky, and Elgar. Bruckner introduced Wagnerian elements. Mahler added voices (as in Beethoven's ninth S.) and a literary element. Vaughan Williams also began with words and a pictorial element, but returned to pure music in the fourth and fifth S. There are many departures from the normal form of S., which is that of the sonata (q.v.), but on a larger scale and usually with four movements, i.e. retaining the minuet or scherzo.

Symposium (Gk. *συνέσιον*, a drinking party). The title was used by both Plato and Xenophon for books describing the conversations of Socrates and others, and hence the term has changed its meaning to that of a conference or general discussion; also used to signify a collection of opinions on a given subject by various contributors.

Synagogue (Gk. *συναγωγή*, an assembly), Jewish place of worship. Some scholars suggest a pre-exilic origin for the S., others, with more probability, date its origin in the period of the Babylonian exile at the very earliest. It is also a matter of dispute whether the first S. are to be sought in Palestine or in the Diaspora. However their institution may be traced through archaeological finds in

Egypt to the third century B.C., and Greece (Is. of Delos) to the second century B.C. Although there is no doubt that there were Ss. in Palestine at a much earlier date, the oldest archeological trace of a S. there, is an inscription from Jerusalem, which mentions the existence of a S. in the first century B.C. Ss. began as rooms in private houses, but in Palestine we find only the later and more formal basilica style, in which the main hall contains a nave and two side isles, separated by two rows of columns. The best preserved S. in Palestine is that of Capernaum (late second century A.D.), which is orientated southward, i.e. towards Jerusalem. Another famous S. is that of Dura Europos (on the upper Euphrates), constructed in A.D. 244, which was found almost intact, and was excavated in 1932-33. Its richly painted walls suggest the dependence of early Christian art upon Jewish art.

Synaptase, see EMLIN.

Synchromesh Gears, see under MOTOR CARS, Transmission.

Synchroscope see under ELECTRIC SUPPLY, Alternating Current.

Syncope, displacement of the musical accent to the weak beats or off-beats in the bar, the effect being that of a syncope or missing heart-beat. S. is found in anct. folk-song, in classical and in serious romantic and modern music, and is thus not the sole property of jazz or swing.

Syncope (from the Gk. *συνκοπή*, cutting short, from *κόπτω*, I cut): 1. grammatical term denoting the elision or non-pronunciation of a letter in the middle of a word, as, for example, of the 'e' in 'heav'n' and of the 'v' in 'e'er.' 2. Alternative term for fainting (q.v.).

Syndic (Gk. *σύν*, together, and *δικη*, justice), in anct. Greece, an advocate in a court of justice. In the Rom. digest it means an attorney or agent for a *universitas* or corporate body; in which sense Galus uses it as a synonym for *actor*. In the Middle Ages, *syndicus* meant the agent or factor appointed by corporations to manage their common affairs, though more especially to represent them in law courts. In Europe S. meant a gov. official invested with different powers in different countries, or a kind of magistrate entrusted with the affairs of a city or community. In Geneva the S. was the chief magistrate. Almost all the companies in Paris had their Ss. Ss. still exist in Cambridge Univ., one of their functions being the supervision of the Univ. press.

Syndicalism. The word is derived from the Fr. *Syndical*. In France, where S. originated, a syndicate did not mean, as in Eng., a trading company, but an organisation of working men. The fundamental difference between S. and Socialism lies in their attitude to the State (see SOCIALISM and LABOUR PARTY). The syndicalist, like the anarchist, is in active hostility towards the state, which he repudiates. He sees social organisation as purely industrial, and aims at organising all the workers in a trade into one union, and then to federate these unions into a

national, and eventually into an international, organisation.

S. made its appearance in Britain towards the end of the first decade of this century, but the general public was first made aware of its existence by the series of widespread strikes in the year 1911. (See LABOUR DISPUTES, INDUSTRIAL COURT, and INDUSTRIAL RELATIONS.) In 1912 a number of prosecutions and convictions of Eng. syndicalists took place. Tom Mann, Guy Bowman, and Gaylord Wilshire were leading Eng. syndicalists. The first international syndicalist conference was held in London in the autumn of 1913 (see also TRADE UNIONS).

The intellectuals of the S. movement in France were Sorel, Berth, and Lagardelle, and other chief exponents were the Its. Labriola, Leone, and Malatesta, the Spaniard Durutti, and Leon of the U.S.A.

The progress of S. was stopped by the First World War, and many syndicalists transferred their allegiance to the Communists. Syndicalist ideas, however, have not been without some influence on the conception of the corporate state (q.v.) and on the Labour movements in some of the S. European republics. See A. Clay, *Syndicalism and Labour*, 1911; L. Levine, *The Labour Movement in France*, 1912; L. Jonhauz, *Le Syndicalisme et la C. G. T.*, 1920; and L. Valiani, *Storia del Socialismo nell secolo xx.*, 1945.

Syndicate, economic partnership of persons or companies formed to carry out a financial or industrial project or enterprise. The legal basis of the partnership may vary, but usually, in the absence of express stipulation to the contrary, such a partnership legally continues only up to the termination of the adventure which is the subject of the partnership. Similarly in the case of joint-stock companies under the Companies Act 1948 (consolidating preceding statutes) if the main object of a company is gone, the company must be wound up. In connection with joint-stock companies, the formation of a S. is a common mode of settling about the flotation of a company; and it is further to be noted that a S. is generally itself an incorporated company which, having acquired a certain undertaking, sells it to another company at a profit, taking either cash or shares or both in exchange, the directors and promoters of the preliminary company or Ss. as a rule, becoming large shareholders and directors of the new company. One of the most important kinds of S. is that of Lloyds Underwriter (q.v.). These Ss. are not usually partnerships; each name takes only his share of the risk.

A different form of S. is the newspaper S. through which articles, stories, cartoons, etc., are distributed among a large number of newspapers over a wide area.

Synesius (c. 370-c. 414), Gk. philosopher, b. at Cyrene. At first a neo-platonist, he became a Christian and was appointed bishop of Ptolemais in 411. See study by J. Hermelin, 1934.

Synge, John Millington (1871-1909), Irish dramatist, b. at Rathfarnham, co. Galway, and educated at Trinity College,

Dublin. He studied music in Germany (1893) and literary criticism in Paris (1895), where he was 'discovered' by Yeats (1899) and persuaded to identify himself with the so-called 'Celtic Renaissance' movement. He had an exceptionally clear insight into the character of the Irish peasantry, having on Yeats's advice studied the life of the fishermen of the Isle of Aran, and wrote a number of remarkable plays illustrative of their way of life and feelings. In 1904 he helped to found the Abbey Theatre, Dublin. His writings include *Shadow of the Glen* (1903); *Riders to the Sea* (1904); *Well of the Saints* (1905); *Playboy of the Western World* (1907); *Tinker's Wedding* (1907); and *Deirdre of the Sorrows* (1910) (plays); *The Aran Islands* (1907); *In Wicklour, West Kerry*, and *Connemara* (1911) (prose); and *Poems and Translations* (1909). A collected ed. of his plays was pub. in 1949. See study by L. A. G. Strong, 1941.

Synonym (Lat. *synonymum*; Gk. *σύν*, together, *νόμος*, name), term applied to a word which has the same or almost the same meaning as another word, or to a pair of words with the same meaning, e.g. 'begin' and 'commence.'

Synoptic Reporting Stations, see under METEOROLOGY.

Synovial Membrane, membrane covering the articular extremities of bones and the inner surface of ligaments entering into the formation of a joint. It secretes a clear lubricating fluid with an alkaline reaction. Synovitis is inflammation of the S. M.; it may lead to ankylosis (q.v.) or stiffening of the joint. See JOINTS.

Syntesis, see under J. A. HILLS.

Synthetic Materials, preparations simulating a natural product. See CHEMISTRY; PLASTICS; RUBBER.

Synthetic Rubber, see under RUBBER.

Syphilis, chronic infectious disease generally contracted during sexual intercourse. It is contagious until the tertiary stage is reached. The origin of this disease is rather uncertain, but there are grounds for believing that it was introduced into Europe by Columbus's sailors who had contracted it at St. Domingo. Other names under which it has been known are the 'Neapolitan disease' and the 'Fr. disease.' At the end of the fifteenth century it spread through Europe in the form of a great epidemic. The name S. was first applied to the disease in a poem by Fracastorius, 1536. It was for long confused with gonorrhoea, even by the great John Hunter. It is characterised by various structural lesions, the most distinctive of which are the chancre, the mucous patch, and the gumma. A parasite (*Spirochaeta pallida*), present in the lesions, was shown by Schaudinn and Hoffmann in 1905 to be the cause. Being generally a sexual matter, the most common situation for its appearance is the genital organs, but the germ may enter any abraded surface on the body. An abraded surface, however, is not essential, as the virus can easily penetrate the delicate, soft, and moist mucous surfaces upon which chancres are commonly found. The earliest manifestation of acquired S.

is the chancre or primary sore which appears between two and six weeks after the disease is first contracted. It usually takes the form of a reddish-brown pimple with an ulcerated summit and an indurated base which, when pressed between the finger and thumb, has a cartilaginous feeling. Following the appearance of the chancre, the nearest lymphatic glands swell and become hard. The mucous patches are formed upon mucous membranes, often in the mouth or throat, or in situations where two skin surfaces are constantly in contact. They are slightly elevated patches usually covered by a thin whitish membrane. The gumma is a rounded tumour of varying size. Its usual situations are the periosteum of flat bones, the membranes of the brain, the testicle, liver, and spleen. It contains a gummy material and is generally soft to the touch.

There are three stages in the course of the disease: (1) the primary (*primary S.*), distinguished by the presence of the chancre; (2) the secondary (*secondary S.*), by the mucous patches, sore throat, and swelling of the glands; often there is a faint mottled rash on the skin, or the rash may assume other forms, so that S. has well been called the 'great imitator'; and (3) the tertiary (*tertiary S.*), by the gumma and skin lesions. A period of six to nine weeks intervenes between the appearance of primary S. and that of secondary S. No definite time can be fixed for tertiary S., as it is extremely variable. After seven years (ten to twenty) there may appear a fourth stage, when the disease may attack the central nervous system, causing locomotor ataxia, insanity, and paralysis; or there may be disease of the aorta (e.g. aneurysm) or of the heart. S., other than that acquired through sexual connection, is known as *non-venereal* or *S. insontium* (S. of the innocent). Forms of non-venereal S. may be *congenital*, *economic* (i.e. that form contracted by using contaminated materials, e.g. a towel formerly used by an affected person, though many authorities deny that S. can be so transmitted, and also by casual contact with a syphilitic), or *technica* (i.e. that form acquired by those attending on syphilitics, e.g. doctors, nurses, and midwives). The proportion of those suffering from S. and gonorrhoea has been estimated as high as 10 per cent of the total pop. in industrial dists.

As a cure for S. mercury and iodides have been used, but these have been to a large extent superseded by a marvellous chemical compound discovered by Ehrlich with the assistance of S. Hata (of Tokyo) and at one time known as *Ehrlich's Hata*. This is dioxidydiaminoarsenobenzenesulphohydrochloride, registered as *Salvarsan*, and commonly called '606.' Neo-salvarsan, known as 914, is easier to administer than salvarsan, and is now commonly used in conjunction with either mercury or bismuth preparations and with penicillin. General paralysis of the insane, due to S., is treated by the introduction into the system of benign malarial parasites. After sev. attacks of fever the malaria

is treated by quinine. High temp. treatment without malaria can also be used. Treatment is controlled by the Wassermann reaction (W. R.) carried out on the blood or cerebro-spinal fluid. It may be added that treatment other than by a registered medical practitioner is generally useless and indeed illegal.

Candour on this question, and serious, intelligent study, will undoubtedly lessen its danger; and, more important still, may result in the uplifting of the general moral tone of future generations of young people, with a consequent growth of cleanliness of mind and body. In the period between the two world wars centres were estab. at local hospitals where free and confidential treatment was provided. Useful publicity was provided by the Brit. Social Hygiene Council. As always during wartime, S. increased between 1939 and 1945, and in the subsequent occupation of Germany, despite a nation-wide campaign by the gov. and prophylactic treatment by the military authorities. *See also* GONORRHOEA; VENEREAL DISEASES. *See* R. H. Kampmeier, *Essentials of Syphilology*, 1944; J. H. Stokes, *Modern Clinical Syphilology* (3rd ed.), 1941; and S. Lornholt, *Veneral Diseases in General Practice*, 1946.

Syra, or **Syros** (anc. Συρος), is. of the Gk. Cyclades in the Aegean Sea, having an area of 55 sq. m. Since the loss of its forests it has had a bare and rocky soil, with a sparse aromatic shrub suitable for pasturing sheep and goats. After the settlement of Gk. refugees the is. rapidly became populous. In spite of the competition of Pireus, Hermaipolis (q.v.) is an important port. Pop. about 20,000.

Syracuse: 1. (It., **Siracusa**.) Fortified city and seaport, cap. of the prov. of S., Sicily, situated on the peninsula (formerly an is.) of Ortygia, 81 m. S.W. of Messina. It has a cathedral and other eccles. edifices, the ruins of Gk. and Rom. temples, catacombs, aqueducts, an amphitheatre, and quarries which were formerly used as prisons. There are also the remains of a Gk. theatre and a museum of antiquities. There is trade in salt, wine, chemicals, pottery, olive oil, asphalt, almonds, oranges, and lemons. Pop. 56,000.

In anc. times it was the wealthiest and most populous city in Sicily. It was founded c. 734 B.C. by a colony of Corinthians and other Dorians, led by Archias the Corinthian. During its greatest prosperity S. had two harbours. There were sev. stone quarries in S. The gov. was originally an aristocracy and afterwards a democracy until Gelon made himself tyrant of S. in 485 B.C. Under his rule and that of his brother Hieron, S. was raised to an unexampled degree of wealth and prosperity. Hieron was succeeded by his brother Thrasybulus in 467, but the rapacity and cruelty of the latter soon provoked a revolt, which led to his deposition and the estab. of a democratic form of government. The next important event was the siege of the city by the Athenians, which ended in the total destruction of the great Athenian

armament in 413. The democracy existed in S. until 406, when the elder Dionysius made himself tyrant. In the next two hundred years S. was ruled mainly by tyrants and then by kings. Hieronymus, who became king in 216 B.C. supported the Carthaginians against the Roms. A Rom. army under Marcellus besieged S. for two years (during which Archimedes constructed various engines of war) and captured it in 212. From this time S. became a tn. of the Rom. prov. of Sicily. In A.D. 878 the Saracens captured and looted the city, afterwards burning it to the ground. Although rebuilt the city never recovered its former importance. It suffered severely from earthquake in 1170 and 1693. In the Second World War sev. churches were damaged. S. was taken by the Brit. Eighth Army on the evening of the first day of the landing in Sicily, July 10, 1943.

2. City and port of New York State, U.S.A., cap. of Onondaga co., on the south shore of the lake of Onondaga, 147 m. W. of Albany. The Erie and Oswego canals connect it with the Great Lakes, the Hudson, and the St. Lawrence. It is the seat of a univ., and is a commercial centre of great importance. The chief manufs. include machine-shop products, soda ash and kindred products, farm tools, furniture, typewriters, motors, machinery, and woollen goods; minor industries are connected with chemicals, salt, and pottery. S. was formerly a great salt-producing centre. Pop. (1940) 206,000.

Syr-Darya, riv. of Turkestan, rises in the Tian Shan Range and flows in a N.W. direction for some 1500 m. through the Kirghiz, Uzbek, and Kazakh S.S.Rs., emptying itself in the Aral Sea. The riv. has a large drainage area, its main tribs. being on the r. b. The tribs. are used for irrigation and the S.-D. flows through the very fertile Ferghana depression. With the Angren-Darya the S.-D. is of importance since the two rivs. supply water to one half of the cultivated lands of the central Asiatic republics.

Syria, republic of Asia Minor, having the Mediterranean and Lebanon on the W., and bounded on the N. by Turkey, on the E. by Iraq, and on the south by Jordan and Israel. It was the Aram (or 'the highlands') of the ancients, and in a narrower sense implied only the region N. and N.E. of Palestine. Its surface is mainly plateau, gently dipping from the Lebanon and Anti-Lebanon ranges (6000-10,000 ft.) towards the Arabian Desert. The Orontes flows northwards from the Lebanon range across the N. boundary to Antioch (Turkey), the Euphrates crosses the N. boundary near Jerablus and flows through N.E. S. to the frontier of Iraq. In 1925 two of the original five ters., Damascus and Aleppo, were united to form the single state, now republic, of S. (comprising the sanjaks of Hama, Hems, Damascus, Houran, Aleppo, Deir ez Zor, and the autonomous sanjak of Alexandretta). In 1939 the sanjak of Alexandretta was ceded to Turkey. The ters. of Alawiyya (formerly the sanjaks of Latakia and Tartus) and of Jebel Druse

(S.E. of Hauran) became part of the Syrian Republic in 1942, the ter. of the Lebanon (sanjaks of N. Lebanon, Mt. Lebanon, S. Lebanon, and Bekaa) forming a separate independent republic. S. is divided into the mahafazets or administrative dists. of Damascus, Hama, Hems (Homs), Hauran, Aleppo, Euphrates, Druse, Latakia, and Jezirch.

S. is a member of the United Nations and of the Arab League. The constitution provides for a single-chamber legislative Assembly, elected by direct vote. The president of the republic is elected by the Assembly and the executive power is exercised by a ministry formed from the predominant party in the Assembly. The area of S. is estimated at 55,700 sq. m., and the pop. numbers 2,860,400 (including Latakia, 432,500, and Jebel Druse, 80,000). The people are mainly Moslem, two-thirds being of the Sunni sect. The Druses number about 89,800, the Alawiyya 335,500, and Ismailians 29,900. Christians number over 419,500, of whom 14,000 are Maronites, 143,000 Gk. Orthodox, and the rest Gk. Catholics, Armenian Orthodox, Syrian Orthodox, etc. There were also 30,600 Jews in 1916. After the Second World War some 34,000 Armenians left S. and the Lebanon for Soviet Armenia. There are over 820 state schools and a number of private and foreign schools, the number of pupils being about 165,000. At Damascus there is a Syrian univ. (founded 1923) and a teachers' training college. There are also two univs. in Beirut, one Fr. and one Amer., each containing a faculty of medicine. A college of engineering was estab. in Aleppo in 1916-47. There are also an Arab academy and an agric. college at Selenmyeh.

S. is primarily agric., most of the pop. working on the production of cereals (wheat, barley, maize) sorghum, sesame, and cotton; olives, fruits, etc., are also grown, and cattle breeding is also a leading activity. Tobacco (*tatakich*) is grown in Sahel and in the Sahyoun and Diebleh dists. The industries are few, including silk thread, flour, olive oil, soap, tanning, textiles, and tobacco. The centres of the silk industry are Beirut (Lebanon), Aleppo, Tripoli, and Latakia. Skins and hides, leather goods, and copper and brass utensils are locally produced. Mineral wealth is small, but there are indications of sev. deposits. Oil boring was begun near Tripoli; manganese ore, bitumen, and sodium chloride are produced. The chief exports are fruit and vegetables, textiles, animal products, and tobacco. Owing to the closely linked economic interests of S. and the Lebanon, a Council of Common Interests was estab. in 1920 and reconstituted in 1943. The chief tns. of S. are Damascus (the cap.), pop. 250,000; Aleppo, 255,000; Hems, 100,000; Hama, 50,000; Latakia (Lattakieh), 35,000. The chief tn. of Jebel Druse is Souaida, built a century ago by Lebanese refugees from the stones of the ruined Nabataean city of Soada, together with local basalt. The chief tns. of Lebanon are Beirut (the cap. and prin. port of the whole area), 134,700; Tripoli, 72,000; Sidon, 20,000; Zahlah, 20,000;

and Tyre, 6000. There is a narrow-gauge railway from Beirut to Damascus connecting at Rayak with the standard-gauge line which runs from Tripoli (Lebanon) through Homs, Hama, and Aleppo to the Turkish border and from Nusaybin to the Iraqi border. From Damascus the Hejaz railway runs south to Jordan. Air services, mainly to Damascus, are operated by Brit. Overseas Airways, Pan-Amer., Middle East Air Lines (Lebanese), the Egyptian Mitr Air Lines, and the Fr. Compagnie Générale Transatlantique.

The Syrian Army in 1949 numbered 10,300; there was also a desert force of 800, a police force of 1500, and a gendarmerie of 5200. A small air force also exists.

Archæology and Art.—S. possesses a large number of important archæological remains which have thrown much light

Syrian Legation

SYRIA: THE ANCIENT TOWN OF SAIDNAYAA

on the prehistory of W. Asia. The Neolithic culture represented in some early sites of S. (i.e. in the lowest levels of Tell er-Judeidch in the plain of Antioch) must be at least as early as 5000 B.C. and probably is even much earlier. The following Chalcolithic (or 'Copper-Stone') Age is represented by the culture of Tell Halaf (on the Khabur), the first truly great culture of auct. times. Remains of this culture have been found also at Carchemish (over 100 m. W. of Tell Halaf). The most distinctive product of this culture was its superb polychrome pottery, for which a genuine glaze paint was used. Parrot's excavations (1933-38) at Mari (modern Tell Harri on the Middle Euphrates, near the Iraq frontier), where over 20,000 cuneiform tablets of the Amorite kingdom were recovered (eighteenth century B.C.), constitute a discovery of the greatest importance. M. P. Montet's excavations at Byblos (Jebail) have disclosed relics of the same epoch (actually the appearance of this culture goes back to c. 1900 B.C.), but of definite Egyptian inspiration. From the point of view of hist. W. S. holds a unique place: at Byblos Dunand has discovered (since 1929) about a dozen inscriptions written in a hitherto

unknown syllabic script (*see under* Writing) of the early second millennium B.C.; at Ras Shamra (anct. Ugarit), also N. Syria, since 1929, hundreds of tablets have been discovered, written in a previously unknown cuneiform alphabet (*see under* ALPHABET) of the fifteenth-fourteenth century B.C. Finally, the earliest known examples of the N. Semitic alphabet (q.r.), the prototype of all the alphabets, were discovered at Byblos: they belong to the end of the second millennium B.C. Of the early first millennium B.C. are the Hittite remains of Carchemish, Senjirli, Hamath, and other places, each a milestone in anct. hist., containing buildings, carvings, and bas-reliefs springing from Hittite and Mesopotamian influences. The old Aramaic inscriptions from Tell Halaf, Ahs (S.W. of Aleppo), Sujin (S.E. of Aleppo), and Senjirli of the same period are milestones in the hist. of Semitic epigraphy. The Greco-Rom. period is represented by the famous Baalbek or Heliopolis, with its gigantic temples, and the synagogue discovered at Dura Duropus (*see under* SYNAGOGUE). S. is rich in examples of early Christian eccles. buildings such as the impressive ruins of the Sergius cathedral in Rnsafa. An important monument is the church of St. Simcon Stylites at Qalat Siman, built a few years after his death.

History.—The inhab. of S. were of Semitic origin, of the same stock as the Hebs. At the beginning of the Heb. monarchy S. was divided into a number of petty kingdoms, frequently at war with Israel. As the great Assyrian kingdom developed S. weakened, and Damascus was destroyed by Tiglath-Pileser, king of Assyria, who conquered all S. about the middle of the eighth century B.C. After having successively been a part of the Assyrian, Babylonian, Persian, and Macedonian empires, S. once more became powerful under the rule of Seleucus Nicator (312 B.C.), with Antioch for its cap. Its strength was further increased by Antiochus the Great; it was then that Palestine became a Syrian prov. In 66 B.C. (after the destruction of the kingdom of S. by Tigranes), S. was added by Pompey to the possessions of the republic, and became a Rom. prov., and as such it is mentioned in the N.T. Much later Zenobia, queen of Palmyra, endeavoured to make S. the seat of empire. The Rom. emperors had a difficult task to defend S. from Persian incursions. When the Rom. Empire was divided S. was included in the Byzantine Empire until 636, when it was conquered by the Saracens, who held it during the crusades. S. later fell into the hands of the Egyptians, was overrun by the Mongol hordes in 1290, and its destruction was consummated by the Turks, who overthrew the Egyptians in 1516, from which time it remained a Turkish prov. During the First World War S. was taken from Turkey by allied troops under Allenby. In 1919 an independent state was (stab.), and the Emir Feisal, son of King Hussein of the Hedjaz, was proclaimed king of S. Hostilities between

the Fr. and the Arabs overthrew this independence, and compelled recognition of the mandate which had been assigned to France by the Allied Council at San Remo (April 1920), and confirmed by the League of Nations (1922).

The mandate did not come into full force until Sept. 1923. Great Lebanon, which had been proclaimed a state since Sept. 1920, was reorganised as the Lebancese Republic. In 1925 the Fr. united the provs. of Damascus and Aleppo to form the Syrian Republic. By a statute of 1930 S. was made a republic with a Parliament elected for four years and a president with certain specified powers. The Jebel Druse had been in revolt from Aug. 1925 to March 1927, and was now made a component part of the republic of S., but continued under a separate administration. The same applied to Alawiyya (Latakia).

British Invasion (1941).—The fall of Crete involved a threat to S., and it was generally expected that the next Ger. move would be an attack on Cyprus as a preparation for the eventual subjugation of S. as part of a pincer movement by way of S. and Egypt against India, via Iraq. By mid 1941 there had long ceased to be a large Fr. Army in S., while such Fr. troops as then garrisoned the country were pro-Vichy and not unlikely to oppose a Brit. attack.

The avowed purpose of the Brit. invasion of S. was to put an end to the infiltration of Ger. agents, with the connivance of the Vichy Gov., and to prevent the estab. of Axis bases. Operations began on June 8, 1941, and allied mechanised columns were soon advancing towards Damascus. By June 12 Free Fr. forces reached the southern outskirts of Damascus, while allied troops advancing on Beirut along the coastal road occupied Sidon. It was soon evident that Vichy's hold on Gen. Dentz, Fr. high commissioner in S., and the latter's hold on his troops, were too tight to allow of temporising methods, and a raid on the Brit. communications at Kuneitra and Merj Ayoun showed that serious opposition was to be expected. But on June 21 the allied troops were beginning to march into Damascus, while Brit. motorised forces from Iraq were entering Palmyra, on the oil pipe-line running through S. to Tripolis. The occupation of Damascus, however, was potentially less important than the reoccupation on June 24 of Merj Ayoun, a place of great strategic importance. At the beginning of July the allied coastal drive N. towards Beirut was impeded by the giant gorge running south of the Vichy stronghold of Damour. Beirut, however, was surrendered on July 12. The strategical results of the capitulation were appreciable: the Gers. were deprived of a valuable base of operations against the Iraqi oilfields; Cyprus and Turkey were no longer isolated; Russia's flank in the Caucasus and their great oilfields there were covered; and allied prestige among the Arabs rose sharply while that of Vichy suffered a severe blow. In accordance with the undertaking given by the Brit. and Free Fr. forces S. and

Lebanon were declared independent. But the conclusion of the war in 1945 brought a repetition of the trouble which arose at the end of the First World War. Early in that year the Fr. claimed that their rights in S. were 'predominant,' and a Fr. general went to Beirut to present Fr. proposals to the two states. A Fr. cruiser and additional Fr. troops also arrived, with the result that the Lebanese and Syrian Govs. refused to negotiate, and fighting broke out between the Fr. troops and the Syrian and Lebanese gendarmerie. Britain intervened to prevent further bloodshed and to safeguard security in the Middle E., and soon afterwards the Fr. commander ordered the cease fire. The evacuation of the whole country by all foreign troops in April 1946 marked the complete independence of S. and Lebanon.

S. and the Lebanon joined in the general Arab attack on Israel, but the Transjordan-Israel agreement of Dec. 1948 paralysed what little initiative still remained to them, and they joined the general armistice of Feb. 1949. There was widespread popular discontent over the mismanagement of the war, the neglect of promised reforms, and the continuance of the visa restrictions and customs barriers against other Arab states, and on March 30 the army, under Marshal Husni Zaim, carried out a bloodless revolution, arresting the president and his ministers, and holding a plebiscite under which, without pressure, Husni Zaim was elected president. Far-reaching reforms were initiated, involving the transfer of power from the feudal families to the middle classes, the div. of large estates, the reduction of the bureaucracy, and a limited enfranchisement of women. Husni Zaim, however, antagonised the neighbouring states, as well as the Syrian commercial classes and the army, and two groups of the last rose against him. He was shot on Aug. 14 by a group of officers under Col. Sami Hanawi. The military junta, headed by Hanawi, immediately disclaimed any idea of retaining power, and called a meeting of political leaders. A provisional gov. was then formed with Hashem Bey Atassi, a notable of Hems, as Prime Minister. In this new gov. four ministries were assigned to members of the Popular party, which has always been in opposition. The Ministry of Finance and three seats without portfolio were given to members of the National party, which had been in power since 1941. The other ministries were divided among independents. See also DEAD SEA; JORDAN; LEBANON; PALMYRA; PALESTINE.

Syriac Language and Literature. Syria and Syrians were the Gk. terms for biblical Aram and Aramaeans. From the philological point of view Syriac is Aramaic, in its later stage, as spoken by the Christian pop. of SYRIA (see under SEMITES and SEMITIC-LAMTIC LANGUAGES). Syriac was then the language and script of the extensive Syriac literature, which is a Christian literature in a very special sense, all original documents dealing exclusively with Christian matter. Syriac script was an offshoot of a cursive Aramaic writing, perhaps of the Palmyrene cursive in its early stage (see under ALPHABET).

The grammar of Syriac is in general fairly simple. The syntax of Syriac resembles in general characteristics that of Heb. As regards phonology, Syriac tends to shorten Heb. long vowels and to substitute dentals for sibilants.

Edessa (in Syriac Ur-hai, now named Urfa), in N.W. Mesopotamia, was the only centre of the early Christian period where the language of the Christian community was other than Gk. Christianity was preached there in the second century; the city became the Christian metropolis of E. Syria, and from here the Christian faith spread to Persia (*q.v.*), where it adopted the Edessan Syriac as the language of the Church, of literature, and of cultivated intercourse. The same dialect was also adopted in the valley of Euphrates as a *lingua franca*, was used far and wide, and became after Gk. the most important language in the E. Rom. Empire. One of the earliest trans. of the Bible, the *Peshito* or *Peshittā* (pure, simple) was made in Syriac about A.D. 200.

The splitting up of the S. I. and L. into the various branches was a direct result of the religious and political situation of the whole E. Christianity, which was riddled with sects, heresies, and schisms.

Bardaisān, or Bardasanes (*d.* 222), a philosopher, may be considered as the first great Syriac writer. Aphrahat or Aphraates (*f.* 336-45), a great theologian, of Persian origin, wrote numerous *memré* or dogmatic and theological homilies. The greatest of the early Syrian fathers was St. Ephrem (Ephraim), known as Ephrem Syrus, who lived before, and shortly after, 393. He was a voluminous writer of commentaries, homilies, and poetical treatises of various sorts. In the fifth century begins the vernacular Syriac historical literature. It was about this time that the pure Syriac language began to be corrupted by the importation of Gk. loan words, while Hebraisms also began to creep in. Isaac the Great of Antioch (*d.* c. 460), like Ephraim, wrote a very large

number of works, all of a religious tendency, and also like him wrote much verse. Also the contemporaneous Bālay wrote hymns and other poems. St. Simeon Stylites, the Older (c. 388-459), is remembered chiefly on account of Tennyson's poem. Meanwhile, the Syriac Church was torn with internal conflicts, which are reflected in the writings of the sixth and seventh centuries. Rabbūlā and Hībūh or Ibas (bishops of Edessa), Bābhōy or Barsawmā, Narsay and his disciple Joseph Hūzāyā, of Nisibi, the *catholikos* Mār Abhū (d. 552), Jacob of Serūgh, Filoxenus of Mabbūgh, Joshua Stylites, Sergius of Ras'ain (fl. sixth century), John of Asia (b. c. 505), and Jacob Baradaeus of Edessa (b. c. 640), the Monophysite, are important names of the great age of Syriac literature. But with the great schism in the seventh century between the Nestorians and the Jacobites a separation took place, which implied a severance of tradition in the literature which emanated from the two sects. Ishō'yahb II. and Ishō'yahb III. (d. 657), Simeon of Rēwardāshir, Ishō'bōkt of Rēwardāshir, the monastic historian, and Thomas of Margā, however, deserve mention here. But Syriac literature never regained its former glory. From the seventh century onwards Arabic everywhere put a speedy end to Syriac, which, however, has remained in use for liturgical purposes, and until recently was still spoken in a few vils. near Damascus and in Lebanon, as well as near Lake Urmia (Persian Azerbaijan). Bar-Hiebreus (fl. thirteenth century) tried to revive the Syriac language.

About 1840 Amer. Protestant missionaries, using the old Nestorian script, reduced to writing the E. Syriac or neo-Aramaic dialect of Urmia, where they founded the first printing press. Over thirty-five years ago two Catholic missions (of the Lazarists and of the Dominicans) reduced to writing the Syriac dialects still spoken in the plain of Salamas and of Mosul. Still more recently a periodical paper in 'Assyrian' was pub. in Tūtis.

Syringa, genus of Oleaceae, contains ten species which grow in Europe and Asia. The best known of these is *S. vulgaris*, the common lilac, often grown in Britain. The name of *S.* is also popularly given to sev. shrubby plants in the saxifragaceous genus *Philadelphus*, particularly the mock orange (q.v.).

Syrinx, see PANDEAN PIPE.

Syros, see SYRA.

Syrtis, or Syrtēs, classical name of two dangerous gulfs, the S. Major and the S. Minor, in the Mediterranean, off the shores of N. Africa. S. Major (gulf of Sidra) is a wide and deep gulf on the Libyan and Tripolitanian shores facing the Adriatic between Sicily and the Peloponnesus. S. Minor (gulf of Khabs) lies in the angle between the E. coast of Zeugitana and Byzacena (Tunis) and the N. coast of Tripolitana (Tripoli).

Syrup (from Arabic *sharab*, drink) indicates primarily a saturated solution of

sugar. For fruit *S.* see under PRESERVING.

Systole, see under HEART, Cardiac Cycle and the Circulation.

Szyzgy (from Gk. *συνγυρία*, a yoking together, astronomical term denoting either of the two positions of the moon when it appears to be in a line with the sun, i.e. the new or the full moon.

Szabadka, see SUBOTICA.

Szatmar-Nemethy, or Satu Mare, cathedral city of Rumania on the Szamos, 68 m. N.E. of Debreczen. It trades in pottery, linen, and wine. Pop. 53,000.

Szczecin, see STETTIN.

Szoezinek, see NEUSTETTIN.

Szechwan, or Szechuan ('four rivs.'), prov. of China, lying in the W. The highlands in the W. rise to 19,000 ft. and the N. is also mountainous, but over the E. and centre stretches a broad and fertile plateau, where cereals, sugar, tea, rice, oranges, rhubarb, and tobacco are grown. The prov. is well watered by the Yangtze in the south and elsewhere by its large tribs., the Fusing-ho, Minkiang, and Kialingkiang, which all rise in the N.W. There is considerable commerce in salt, timber, copper, coal, and white wax. Gold, lead, silver, antimony, and iron are mined, and the mineral wealth is potentially large. Lubricating oils are produced from the tung-nut tree which grows abundantly in the prov. Chengtu is the cap., and, like Tungchwan, is an important trade centre. Chungking stands on the Yangtze. A motor road to the N.W., connecting S. with Sinkiang and running through the latter prov. to the Turkestan-Siberian railway, is under construction. Wanhien is another river port. Area 144,959 sq. m. Pop. 47,108,000.

Szegedin, or Szeged, second largest city of Hungary, and chief centre of the Alföld, at the junction of the Theiss with the Maros, about 100 m. S.E. of Budapest on the Yugoslav frontier. After the disastrous flood of 1879 the tn. was rebuilt. It has a univ., technical high school, museum, theatre, and court of appeal. In the industrial suburb on the l. b. of the Theiss are manufs. of cloth, salami, hemp, wood, leather, tobacco, and cement. There is trade in cattle and grain. The city has an airport. Pop. 136,800.

Szent-Györgyi, Albert (b. 1893), Hungarian biochemist, b. in Budapest, from 1930 prof. at the univ. of Szegedin. He discovered vitamin C in paprika, and received the 1937 Nobel prize for chem. His work on cells and in other fields is also of great importance.

Szymanowski, Karol (1883-1937), Polish composer, b. at Tymoszwowska in the Ukraine. He studied at the Warsaw conservatory, where he was conductor from 1919 to 1930. He is regarded as the most distinguished Polish composer since Chopin. At first influenced by Debussy, he arrived at a mastery which showed itself in skill of form and clarity as well as in his love of folk-music. He wrote three symphonies, two violin concertos, two operas, many songs, seven settings of poems, and other works.

T

T, twentieth letter of the Eng. alphabet, was the nineteenth letter of the Gk. and the Lat. alphabets. It was the twenty-second and last letter of the N. Semitic (including Phœnician) alphabets, as it is in modern Heb. It is a voiceless dental explosive. The earliest form of the letter was X or +, and the Semitic name for it is *tau*, which means 'mark' or 'sign.' In early Gk. MSS. it is written τ, which came to be written T, its final form. In science T usually represents temp. on the Centigrade scale, and *t* temp. on the Fahrenheit scale. In chem. Ta, Tb, Tc, Th, Tl, and Tm are the atomic symbols for tantalum, terbium, tellurium, thorium, thallium, and thulium respectively.

Taal, tn. in the prov. of Batangas, Luzon, Philippine Is., on the strip of land between Lake Bombon and the gulf of Balayan. It is the centre of an agric. region which produces rice, Indian corn, cocoa, and cotton. Pop. 35,000.

Tabard (Fr. *tabarre*, from Low Lat. *tabardum*), garment worn by knights over their armour until about the mid sixteenth century, which fitted closely to the body, was open at the sides, had wide sleeves or flaps reaching to the elbow, and displayed the armorial ensigns of the wearer on the back and front. It is also the term used for a herald's coat blazoned with the arms of his sovereign, and for a similar cloak worn by the trumpeters of the Household Cavalry.

Tabariyeh, see TIBERIAS.

Tabasco, S. state of Mexico, bounded on the N. by the gulf of Mexico, on the E. by Campeachy and Guatemala, on the S. by Chiapas, and on the W. by Ver. Cruz. The surface is flat and the soil fertile, yielding cacao, sugar, coffee, tobacco, rice, and fruit. Oil is found. The chief tns. are Villa Hermosa (cap.) and the port of Puerto Alvaro Obregón. Area 9782 sq. m. Pop. 285,600.

Tabernacles, Feast of (Heb. *Sukkoth*, huts, or *hag ha'asiph*, feast of Ingathering), Jewish festival, celebrated from the fifteenth to the twenty-third of Tishri (q.v.), and commemorating on one hand the dwelling of the Israelites in the wilderness, and on the other hand the anct. custom of living in improvised huts, especially during the grape harvest.

Tabernacle, The (Lat. *tabernaculum*, diminutive of *taberna*, booth, hut, temporary dwelling, etc.), term generally applied in the Scriptures to the portable sanctuary of the Jews, which was erected by Moses, and which is described fully in Exod. xxv. xxvii. and xxxvi.-xxxviii. It was a tent constructed with extraordinary magnificence in every part, and it measured 150 ft. by 75 ft. It contained two main chambers, an outer and an inner. The latter, called the Holy of Holies, contained the Ark of the Covenant

and the mercy seat. The altar of incense, the table of shewbread, and the golden candlestick stood in the outer chamber. An altar of burnt offerings and a laver for the washing of hands stood in the outer yard. The tents of the priests and Levites surrounded it in appointed order. The Israelites carried the T. with them throughout their wanderings in the wilderness.

Tabes Dorsalis, see LOCOMOTOR ATAXIA.

Tabes Mesenterica, tuberculous disease of the mesenteric glands, lymphatic glands of the mesentery, a fold of the peritoneum connecting the intestine with the posterior abdominal wall. The disease usually occurs in children, and is characterised by progressive wasting, while the abdomen may become much enlarged through the glands being filled with masses of caseous tubercular matter. Surgical treatment and attention to hygienic conditions may result in a cure.

Tablat, see ST. GALL.

Tablature, various old systems of writing down music, especially for organ and for lute, without notes, but by means of letters, numbers, or other signs. Only the ukelele and similar guitar types still use a T. notation, though the tonic sol-fa notation may be said to be a kind of T.

Table Bay, inlet of the Atlantic in the S.W. coast of the Cape of Good Hope. It was formerly called Saldanha Bay from Antonio de Saldanha, the first European to land there (1503). Cape Town lies on the S. side.

Tableland, see PLATEAU.

Table Mountain: 1. Or Tafelberg, mt. of the Cape Peninsula, overlooking Cape Town and Table Bay. The level top gives it the appearance of a table and it is often covered with a dense white cloud called 'The Tablecloth.' Its height is 3582 ft. 2. Mt. in Natal between the Inanda and Umgeni Rs., E. of Pietermaritzburg.

Table Tennis, or Ping-pong, form of indoor lawn tennis. The standard table measures 9 ft. by 5 ft., with a 6-in. high net. The bats may be of any weight or size, provided they are not white and do not reflect; rubber-covered wood is generally used. The balls weigh between 2.4 and 2.53 gm., and are of celluloid. The game is for two or four players; each serves five times successively, and no volleying is allowed. The game of 'ping-pong' was very popular from 1899 to 1904, and was revived in 1921. International tournaments are held, twenty-eight countries competing in 1948 at Wembley. See J. Carrington, *Table Tennis*, 1950.

'Tablet, The', official organ of the Rom. Catholic Church in England. It was founded by Frederick Lucas in 1840.

Tabley, John Byrne Leicester Warren, Baron de, see DE TABLEY.

Taboo, see TABU.

Tabor: 1. Tn. of Bohemia, Czechoslovakia, on the Luznica, 65 m. S. of Prague. It was founded by and long formed a stronghold of the Hussites. There are spinning mills, machine shops, and tobacco factories. Pop. 16,000. 2. Arabic *Jebel-el-Tor*, mt. in Galilee (1843 ft.), 7 m. E. of Nazareth, a dome-shaped mass rising abruptly from the plain. It is the traditional scene of the Transfiguration. The summit is divided between the Orthodox and the Franciscans, each possessing a church and conventual buildings, and the latter a hospice. The Franciscan church is a magnificent modern basilica on the site of the medieval church built in the N. Syrian style of the sixth century by Barluzzi, the architect of the Franciscan basilica of Gethsemane.

Tabor (O.F. *tabour*), small drum used to accompany a pipe or fife. It is somewhat larger than a tambourine, and is carried on the wrist of the player, and beaten with a single drum stick.

Tabora, tn. in the centre of Tanganyika, 210 m. E. of Ujiji, the headquarters of the W. Prov. In addition to gov. buildings there are European and native hospitals, and gov. and mission schools. There is an aerodrome 1 m. E. of T., and also large railway workshops. T., founded by Arabs about 1820, was formerly a great centre of trade in slaves and ivory; to-day it is important as a trade centre for native produce. From T. a branch line runs to Mwanza, the chief S. port on Lake Victoria. Pop. (dist.) 530,000 native; (tn.) 30,000 native, 160 European, 4800 Asiatic.

Taborites, see under HUSSITES, WARS OF THE.

Tabriz, anct. city, cap. of Azerbaijan, and a commercial centre of Persia, on a small riv. called Aji Chay running into Lake Rezaïyeh. T. is situated 350 m. N.W. of Teheran, and is one of the main industrial centres of Persia. The carpets manufactured here are of fine designs and quality and are well known all over the world. There are two match and two leather factories and a few engaged in weaving and spinning. A univ. was estab. in 1946. Because of its strategic importance, it has been repeatedly invaded and occupied by other nations, mostly by Ottomans, Russians, and Turks. Earthquakes have ruined the city sev. times and its historical buildings have been wiped out. It was the cap. of Persia in the time of Shah Ismail I. and Ghazan Khan. There are many mosques and many caravansaries which indicate its hist. as a commercial centre. T. is connected by rail with Julfa (85 m.) on the Russian border, and a new line is under construction from Teheran to T. Pop. 214,000.

Tabu, Taboo, Tambu, or Kabu, word of Polynesian origin, meaning very marked, marked off, severely prohibited, reported by Capt. Cook, who says that it 'has a very comprehensive meaning; but, in general, signifies that a thing is forbidden' (*Voyage to the Pacific Ocean*). In Polynesia the word T. was applied in all cases where things were not to be touched,

because they were regarded as dangerous in a magic-religious (supernatural) sense, and so must not be lightly approached, but should be marked off from common use or contacts. T. is not confined to Polynesia, but is found in America, Africa, and elsewhere, even among civilised peoples. T. may refer to persons (kings, priests, chiefs), places, things and animals, events, time (day of the week, season of the year; time for hunting, fishing, or war; feasts), illness or death, sex, totem, etc., having 'dangerous' supernatural qualities. Such experiences as birth, initiation, marriage, and sexual practice are brought under its operations with the aim of protecting them against hostile influences. For this reason the anct. Israelites, for instance, regarded dead bodies as 'unclean' (Num. xix. 11, 13 ff.). A specially comprehensive system of T. is enforced against women during menstrual periods, and women who are pregnant are similarly protected. The meaning of T. is similar to that of Lat. *sacer* or Gk. *ἅγιος*. Some words may not be spoken; they are 'sacred' or 'tabooed'. The word has passed into Eng., but without the notion of awe. Thus we may 'taboo' politics or teaching on sex in schools. See G. Turner, *Samoa a Hundred Years Ago and Long Before*, 1884; W. W. Skeat, *Malay Magic*, 1900; A. von Gennep, *Tabou et totémisme à Madagascar*, 1904; J. G. Frazer, *The Golden Bough*, vol. iii. (*Taboo and the Perils of the Soul*), 1911; S. Freud, *Totem and Tabu*, 1913; R. Marett, *The Threshold of Religion*, 1914; H. Webster, *Rest Days*, 1916; and F. R. Lehmann, *Die polynesischen Tabusitten*, 1930.

Tabuco, see CARUBUS.

Tabular and Non-Tabular Deposits, see under MINING.

Tabulating Machines, see HOLLERITH
Tacheometry, see under SURVEYING AND LEVELLING.

Tachira, state of Venezuela, with Colombia to the W. and S., Zulia to the N., and Merida and Barinas to the E. The Uribante R. rises in and flows through the state. Agric. products include coffee and cocoa, petroleum is produced, and silver, iron, coal, and copper are mined. San Cristóbal is the cap. Area 4284 sq. m. Pop. 246,000.

Tachygraphy, see under SHORTHAND.

Tachylite, see under LIGNEOUS ROCKS.

Tacitus (c. A.D. 55-120), Rom. historian, b. perhaps at Terni, whose full name was either Publius or Gaius Cornelius T. He studied rhetoric, and became an eminent pleader, being first promoted by Vespasian and receiving further marks of favour from that emperor's sons, Titus and Domitian. In 78 he married the daughter of Agricola, governor of Britain. He was quaestor c. 80, praetor in 88, senator under the terror of Domitian, consul in 97-8 under Nerva or Trajan. He served as colleague of the younger Pliny in the prosecution of Marius Priscus in 100, and as proconsul of Asia c. 112-13, after which our information fails. Among Pliny's letters are eleven addressed to T., who was his intimate friend. T.'s extant works include *Dialogus de Oratoribus* (c.

80), a pessimistic treatise on the decline of rhetoric; *Agricola* (98), a biography of his father-in-law; *Germania* or *De origine et situ Germanorum*, a valuable ethnographical work; *Historiae*, a hist. of the empire from Galba to Domitian (69-96), in twelve or fourteen books, of which only i-iv. and part of v. remain; *Annales* (115-17), a hist. of the empire from the death of Augustus to that of Nero, of which books vii.-x. are lost, also parts of v., xi. and xvi.

His style is splendidly forceful, condensed, and epigrammatic, and has been compared to that of Sallust, but its art goes far deeper. The moral dignity of T. is impressed upon his works; his power derives largely from his knowledge of the human mind and its motives; and for this study he found abundant materials in the hist. of the emperors, particularly Tiberius. Later his style becomes more gloomy, while his use of rhetorical devices increases. He remains the most trustworthy witness of the great age from the death of Augustus to Domitian.

Bibliography. — EDITIONS: *Opera Minora*, H. Furneaux, 1900. *Dialogus*, W. Peterson, 1893; A. Gudeman, 1914. *Agricola*, H. Furneaux and J. G. C. Anderson, 1922. *Germania*, W. Reeb, 1930; J. G. C. Anderson, 1938. *Agricola and Germania*, A. Gudeman, 1928. *Historiae*, W. A. Spooner, 1891; E. Wölff and G. Andresen, 1914-26. *Annals*, H. Furneaux, H. F. Pelham, and C. D. Fisher, 1896 - 1907. Boissier, *Tacite*, 1923 (Eng. trans. by W. G. Hutchinson, 1906).

Tack, in Scots law, the technical name for (1) a lease whether of land or offices; (2) any contract under which something is let for hire.

Tack, rope, wire, etc., used to secure the windward clews or corners of the courses to the ship's side, and the windward lower end of a fore-and-aft sail amidships. Also in all triangular sails and in those four-sided sails where the head is not parallel to the foot, the foremost corner at the foot is called a T. A ship is said to T. when the Ts. are shifted and the yards braced, and the ship's head turned to the wind, so that she shall sail at the same angle to the wind on the other side; thus by alternate Ts. a ship proceeds against the wind in an oblique direction, or 'beats to windward.'

Tacna: 1. Southernmost dept. of Peru, in the angle between the Pacific coast and the Chilean frontier. It is generally a wilderness, cultivated only in the valleys. T. was retained by Chile in 1883, this leading to the long-drawn-out T.-Arica dispute (see under PERU). Area 4930 sq. m. Pop. 37,000. 2. Cap. of the above on the T. R., 39 m. N. of Arica in Chile. Tobacco and sulphur are produced. Pop. 11,400.

Tacoma, cap. of Pierce co., Washington, U.S.A., at the head of Puget Sound. It

has an excellent harbour, and is one of the prin. ports on the Pacific coast. There is an important export trade in lumber, flour, fish, etc., and there are foundries, railway workshops, meat-packing establs., etc. It is the chief W. terminus of the N. Pacific Railway. T. was estab. in 1868 as Commencement City. Pop. 109,000.

Tacoma, Mount, see RAINIER.

Tacsonia, genus of climbing plants (family Passifloraceae), with deeply lobed leaves and an elongated tubular calyx, a feature which distinguishes them from the genus *Passiflora*.

Tactics, see STRATEGY AND TACTICS.

Tacuarembó: 1. Dept. of Uruguay, with Salto and Paysandu on the W., Rivera on the N.E., and the Rio Negro as the S. border, watered by sev. tribs. of that riv. Cattle are reared. Area 8110 sq. m. Pop. 106,000. 2. Cap. of the above, on the railway into Brazil, trades in hides, skins, and wool. Pop. 30,000.

Tadcaster (Rom. *Calcaria*), tn in the W. Riding of Yorkshire, England, on the R. Wharfe, 9 m. W.S.W. of York, on the site of a Rom. encampment. There are building-stone quarries near by. About 2 m. away is the battlefield of Towton. Pop. 6000.

Taddeo di Bartolo, see BARTOLI, TADDEO.

Tadema, see ALMA-TADEMA.

Tadmor, see PALMYRA.

Tadoussac, see SAGUENAY.

Tadpole, see FROGS.

• **Tadzhik S.S.R.**, see TAJIKISTAN.

Taeju, or **Taekyu**, one of the prin. tns of S. Korea, about 65 m. N.W. of Pusan. Pop. 111,000.

Tael, old E. Asian, particularly Chinese, silver unit of weight, still used in sev. places, equivalent to 1.28 to 2.13 oz.

Tænia, see TAPEWORM.

Tænia, name given in architecture to the projecting fillet on top of the architrave (*q.v.*). The T. of a Doric entablature is plain, but in the Ionic, Corinthian, and Composite orders it is decorated in various styles of moulding.

Tae-Pings, followers of Hsün Hsün-Chwan, who rose against the Manchu emperor in 1851. By 1853 the rebels occupied all S. China, and their leader proclaimed himself emperor in Nanking. In 1858 the war with France and England came to an end, and the two powers assisted in the suppression of the rebels, owing to the threat to Shanghai.

Tafelberg, see TABLE MOUNTAIN.

Taffeta, or **Taffety** (Persian *Atfa*) plain woven silk fabric, introduced into England about the fourteenth century.

Taflet, or **Taflelt**, oasis on the S.E. of the Atlas Mts., Morocco, noted for its dates and leather. It contains some 300 vils., and is a caravan centre. It is the home of the reigning Moroccan dynasty. Bou Am is the chief place. Pop. 150,000.

Taff Vale Judgment, see under TRADE UNIONS.

Taft, William Howard (1857-1930), Amer. president and chief justice, born in Cincinnati, Ohio. He graduated from Yale Univ. in 1878, and from Cincinnati Law School in 1880. In 1887 he was a

judge of the supreme court of Ohio, and in 1890 was appointed solicitor-general of the U.S.A. He estab. a great reputation as judge of appeal (1892-1900). In 1900 President McKinley made him president of the Philippines Commission, and in 1904 appointed him governor-general, and T. did much to pacify the is. As war minister (1904-8) he furthered the building of the Panama Canal. He was elected president by a large majority, taking up office in 1909. T. improved the financial position of the country, and sought peace agreements with sev. foreign powers. Though nominated by Theodore Roosevelt T. did not, however, carry on his predecessor's policy to the satisfaction of its originator, and the 1910 tariff Acts were particularly unpopular. Roosevelt accused T. of suffering the party to slip back again into the pockets of the trusts, and in 1912 stood once more as presidential candidate. Largely by the hostility to Roosevelt of the bosses and trusts T. was chosen, but the resultant split in the party permitted the return of the Democratic Woodrow Wilson. T. then became a law prof. at Yale, and from 1921 to 1930 was chief justice. His pub. works include *Popular Government* (1913); *The Anti-Trust Act and the Supreme Court* (1914), and *The Presidency* (1916). See lives by H. C. Pringle, 1929; H. S. Duffy, 1930; E. H. Cotton, 1930; and F. C. Hicks, 1946.

Taganrog, seaport in the Rostov Region of the R.S.F.S.R., on a bay of the sea of Azov, 50 m. W. of Rostov, on the railway to Stalino. Its importance as a port has declined. Since the revolution it has become a metallurgical centre, while other industries are iron mining and machine building, the iron and steel works, etc., deriving valuable oolitic ores from the Kerch Peninsula. T. was taken by the Gers. in 1941, but was soon threatened by the Russians in their return offensive in the Donetz bend in Feb. 1943, and was retaken on Aug. 30. Pop. 188,900. See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGN IN SECOND WORLD WAR.

Tagetes, see MARIGOLD.

Tagliamento, riv. in Venetia, N.E. Italy, rises in the Carnic Alps and flows S. for 100 m. to the gulf of Venice. It was the scene of heavy fighting in the First World War after the It. defeat at Caporetto.

Taglioni, Maria (1804-84), It. ballet dancer, b. at Stockholm, where her father, Philippe T. (1771-1871), was *maître de ballet*. She was trained by her father, and he composed the ballet, *La Réception d'une jeune nymphe à la cour de Terpsichore*, in which she made her début in Vienna (1822). She was at once acclaimed the greatest ballerina of the age, and she enhanced her reputation still further when she danced in Paris for the first time in 1827. A visit to St. Petersburg from 1837 to 1842 was also highly successful and influenced the future development of the Russian ballet. Technically she elevated the ballerina to the premier role, and was the first to dance *sur les pointes*. In 1832 she was married to Comte Gilbert

de Voisins, but did not retire from the ballet until 1847. Her later years were marred by poverty, and she supported herself as a teacher of deportment in London.

Tagore, Sir Rabindranath (1861-1941), Indian poet and author, son of Maharshi Devendranath, b. in Calcutta. In his youth he wrote verse imitative of the old Vaishnava poets of Bengal, and first produced original work when he was eighteen. After his marriage in 1923 he spent seventeen years managing the family estate at Shiloidah, and gaining a great insight into the life and needs of the Bengali villagers, whose legends and customs inspired so much of his writing.

SIR RABINDRANATH TAGOR

Between 1900 and 1901 he established a self-governing, experimental school at Santiniketan, which flourished and expanded in spite of financial difficulties so that twenty years later he was able to found an international univ., *Visva Bharati*, and realise his belief that men of different races and civilisations should study together in an atmosphere of peace, brotherhood, and joy in life and work. As the result of a visit to England in 1912, a vol. called *Gitanjali* (Song-Offerings) was pub., trans. by T., who had learnt Eng. in India and had previously lived in England as a schoolboy and a law student. He was the first Indian to be awarded the Nobel prize (1913) and accepted a knighthood two years later, which he disowned in 1919 as a protest against an incident in which Brit. troops were ordered to fire on Punjab rioters. He travelled widely, lecturing in most countries in the world; after 1930 he took up painting and exhibited in New York and sev. European cities.

Some thirty-five vols. of T.'s poems,

plays, essays, and short stories have been trans. into Eng., many by the author, who also wrote a large number of works in his native Bengali, in which he used the spoken dialect, thus giving it a new status in literature. He set over three hundred of his poems to music. His poem, *Lord of the Heart of the People*, was chosen in 1950 (with music by Herbert Murrill) as the national anthem of the republic. T. brought new life to Indian literary art by turning for inspiration to Bengali folklore and everyday life. He always actively supported the Indian national movement, especially through social reforms, and believed that India's task was to show the world the way to peace by setting an example of brotherly co-operation between her various races and creeds. The core of his philosophy was an intense faith in the power of love as the key to man's fulfillment and freedom. His works include *Gitanjali* (1913); *The Gardener* (1913); *Chitra* (1914); *The Post Office* (1914); *My Reminiscences* (1917); *The Home and the World* (1919); *Gora* (1921); *Red Oleanders* (1925); and *Collected Poems and Plays* (1936). See lives by E. Rhys, 1915; R. Sastri, 1917; M. Sikes, 1943; and E. Thompson, 1926, 1949.

Tagus, chief riv. of the Iberian Peninsula, rises in the Sierra Albarracín, in 40° 38' N. and 1° 35' W. It flows W.S.W. in Spain through New Castile and Estremadura, and then takes a more southerly course through Portugal. Above Lisbon it widens out from 3 to 8 m., and empties its waters by two arms into the bay of Lisbon. The chief tribs. are the Alberche, Tietar, Jarama, Alagón, and Zizere, all on the r. b., and the chief tribs. on its banks are Toledo in Spain and Lisbon in Portugal. It is navigable to Santarém, but the rapids impede its utility. Length 566 m.

Tahiti, or **Otaheite**, largest of the Society Is. (q.v.), a Fr. possession of the E. Pacific. It is a picturesque is. of volcanic origin, composed of two almost regular mountainous areas joined by a low and narrow isthmus; the area to the N.W. is the larger and more lofty, rising to a height of 7688 ft., whereas the S.E. area, Tairapu Peninsula, is nowhere more than 4119 ft. A narrow but very fertile coastal plain surrounds the mountainous interior. The climate is, for the tropics, very healthy; there is an abundant rainfall, and the is. is rich in vegetation, though not greatly cultivated. The chief agric. products are coffee, sugar-cane, coco-nuts, bread-fruit, yams, bananas, oranges, vanilla, and other tropical fruits. The preparation of copra, sugar, and rum are the chief industries, and copra, vanilla, coco-nuts, phosphates, and mother-of-pearl form the chief exports. The export trade in 1947 was valued at 131,600,000 francs, the import trade at 368,900,000 francs. The cap. is Papeete, on the N.W. coast, and here resides the governor of the Fr. South Sea possessions, who is assisted by a director and a privy council. The inhab. of T. are a Polynesian race of tall stature, well formed, and frequently of considerable beauty. T. was discovered in 1606 by Quiros. Capt. Wallis, R.N.,

commanding the *Dolphin*, who landed in the group of Is. in 1767, named the largest King George III. Is. The following year Bougainville (q.v.), evidently unaware of Wallis's visit, took possession of T. in the name of the Fr. king. A scientific expedition in the *Endeavour* under Capt. (then Lt.) James Cook was sent to T. in 1769 by the Royal Society of London. Cook named the is. the Society Is., and explored T. again in 1777. In 1787 a staff of missionaries of the London Missionary Society was estab. in T. as a centre for the work of evangelisation throughout E. Polynesia. In 1788 T. was visited by the mutineers of the *Bounty* (see BOUNTY, MUTINY OF THE), and in 1791 by Vancouver (q.v.). Following the expulsion by the pop. in 1838 of a Rom. Catholic mission, and the Fr. arrest of Pritchard, the Brit. consul, trouble arose between France and England, in the course of which Louis Philippe lost much popular approval in France. The reigning queen, Pomare IV., died in 1872 after a troubled reign of fifty years. Her son, fifth of the Pomare line, was forced to cede his kingdom to France in 1880. The is. supported the Free Fr. movement in the Second World War. Area 600 sq. m. Pop. 8600. See G. Robertson, *The Discovery of Tahiti: a Journal of the Voyage of the 'Dolphin', 1766-68* (ed. by H. Carrington, 1949); G. Calderon, *Tahiti*, 1921; H. MacQuarrie, *Tahiti Days*, 1921; R. Keable, *Tahiti, Isle of Dreams*, 1925; P. I. Nardmann, *Tahiti*, 1938; F. Keesing, *The South Seas in the Modern World*, 1942; and Sir H. Luke, *Britain and the South Seas*, 1945.

Tahlequah, see under CHEROKEES.

Taiaha, Maori weapon, see under MAORIS.

Taichu, or **Taiwan**, tn. in the W. of Formosa. Pop. 182,000.

Taiga, sub-arctic coniferous forest region, lying S. of the tundra. Spruce, fir, pine, and larch are the chief trees. The T. exists in N. America, Europe, and Asia, and forms about one-third of the area of the U.S.S.R., and there are also fur-bearing animals.

Taihoku, or **Taipei**, chief tn. of Formosa, situated in the N. on the R. Tamsui. Tea, rice, and jute are grown. Pop. 230,000.

Taijutsu, see JU-JITSU.

Tail, formation of hills, see CRAG AND TAIL.

Taille, in anct. Fr. jurisprudence a tax, tallage, or subsidy; any imposition levied by the king or any other lord on his subjects. The term was particularly applied to the tax levied by the former in the *poings d'élection*.

Tailoring, cutting and making of clothes. The modern designer-cutter in the bespoke T. business measures, cuts and fits the customer; the tailor and his assistants make up the garment. Tailored garments such as coats are specially treated. Inter-linings of canvas, wadding, holland, etc., are inserted, pad-stitched into position, and tapes fixed at crease-points, over which linings are sewn. This is done to preserve the shape and fit of the garment.

Until the nineteenth century tailored garments were always made to individual measurements, with the exception of certain stocks of standard sizes kept by tailors at large seaports for seafarers who could not wait for the finishing of bespoke garments. During the Industrial Revolution a steady demand for ready-made clothing began, but ranges were limited and garments rather shapeless, and were therefore only worn by those who could not afford bespoke garments. Since 1900 the demand has greatly increased among all income groups, and most clothing is now mass-produced, but of a better cut and fit than the ready-made garments of the past. See M. E. Popkin, *Organisation, Management, and Technology in the Manufacture of Men's Clothing*, 1929; H. Simons, *Science of Human Proportions*, 1933; M. E. D. Galbraith, *Ladies' Tailoring Simplified*, 1937; W. H. Hulme, *The Theory of Garment-Pattern Making*, 1945, and *Women and Children's Garment Design*, 1948; and J. K. Wilson, *The Art of Cutting and Fitting*, 1948.

Tailteann Games, Irish national games. They were popular if informal events in the Middle Ages, when they were held in many places. They were revived in 1924, and held again in Dublin in 1928. They include competitions, not only in athletic events, but in poetry, drama, and prose, and also in art, music, and dancing.

Tain, royal burgh of Scotland, in the co. of Ross and Cromarty, on Dornoch Firth, 25½ m. N.E. of Dingwall. 3½ m. S.E. of the tn. are the remains of the Early Eng. abbey of Fearn, founded in 1230. T. has a collegiate church, founded in 1471 and restored in 1871-76. T. is a mkt. tn., and the industries are distilling and aerated waters. Pop. 1300.

Taine, Hippolyte Adolphe (1828-93), Fr. historian and critic, born at Vouziers, and educated at the Collège Bourbon and École Normale. After serving in the provs. under the Ministry of Public Education, he returned to Paris (1852) and won his literary degree (1853) with a critique on La Fontaine. The following year his essay on Livy gained the academy prize, and he decided on literature as a profession. In 1865 he began a series of articles on Eng. literature, pub. in 1864. In 1858 appeared a first collection of *Essais de critique et d'histoire*. The originality of his critical theories, as first expressed in the preface to his *Histoire de la littérature anglaise* (1863) lies in the application of the scientific and naturalistic method to literature. The defect in his principles is that he makes too little allowance for the individual's deviation from type and tends to regard literary genius too much as the mechanical outcome of known and defined productive forces. T. became prof. of aesthetics and the hist. of art at the École des Beaux Arts in 1864, a post he held for twenty years. *L'Intelligence* (1870) was a return to philosophy. The last twenty years of his life were mostly devoted to the series on *Les Origines de la France contemporaine* (1876-93). He became a member of the Fr. Academy in 1878. T. was a follower of Hegel, and, more indirectly, of

Spinoza. His determinist and materialist outlook had a great influence upon contemporaries, though it was later challenged by Croce, as in the latter's *History as the Story of Liberty* (1941). See study by M. Leroy, 1933; and V. Giraud, *Essai sur Taine*, 1901; A. Chevrillon, *Taine: formation de sa pensée*, 1932; and K. de Schaedryver, *Taine: essai sur l'unité de sa pensée*, 1938.

Tairen, see DAIREN.

Tait, Archibald Campbell (1811-82), archbishop of Canterbury, b. in Edinburgh. He was educated at Glasgow Univ. and Balliol College, Oxford. In 1842 he succeeded Dr. Arnold as headmaster of Rugby; in 1849 he became dean of Carlisle. In 1856 he was made bishop of London, and twelve years later was raised to the primacy.

Tait, Peter Guthrie (1831-1901), Scottish mathematician and physicist, born at Dalkeith, and educated at Edinburgh Academy, Edinburgh Univ., and Peterhouse, Cambridge. He became senior wrangler and first Smith's prizeman in 1852. In 1854 he was appointed to the professorship of mathematics in Queen's College, Belfast, and removed to Edinburgh in 1860 to occupy the chair of natural philosophy. In mathematics he is well known for his development of the theory of quaternions. His physical researches and experiments were mainly in connection with thermo-dynamics and thermo-electricity. He collaborated with Prof. Thomson (Lord Kelvin) in the production of their *Treatise on Natural Philosophy* (1867), with Balfour Stewart in writing *The Unseen Universe, or Physical Speculation on a Future State* (1875), and *Paradoxical Philosophy* (1878) and with W. J. Steele in *A Treatise on the Dynamics of a Particle* (1856). Besides numerous mathematical and physical papers he pub. treatises on *Heat, Light, Properties of Matter, Dynamics, and Quaternions*. His scientific papers were pub., with a life by C. G. Knott (1898-1911).

Taiwan, see FORMOSA.

Tajik, or **Parsiwan**, Persian-speaking race of Afghanistan, representing the serving class of that country and of the country N. of the Oxus. The Ts. ('strangers') are an athletic race, fine fighters, and skilled farmers. They have assimilated the manners and customs of the Afghans, but are not nomadic. Ts. form 0.6 per cent of the pop. of Soviet Russia.

Tajikistan, republic of the U.S.S.R., on the frontier between Russia, Afghanistan, and W. China at the junction of the Pamir and Tianshan Mts. The country became an autonomous republic in 1924, and a union republic in 1929. Three-quarters of the pop. are Tajik (q.v.), and the remainder are Uzbeks, in the N.W. Kirghiz, and Russians. Administratively the republic comprises the Garm, Kulyab, Leninabad, and Stalinabad Regions; on the slopes of the Pamirs lies the Gorno-Badakhshan autonomous region (cap. Khorog), affiliated to the republic and inhabited by Kirghiz and Tajik. The country has the appearance of vast terraces, formed of

deep valleys, semi-desert steppe, high table-land, and mts. The Tianshan Mts. contain Mt. Stalin (24,590 ft.), Mt. Lenin, and the Fedchenko Glacier, 50 m. in length. The mt. glaciers are the source of many rapid rivs., tribs. of the Amu-Darya, which flows from E. to W. as the S. frontier of T., one of the largest being the Vakhsh. Large irrigation systems have been built in the valleys of W. T. and the nearby mts., the total irrigated area being 725,000 ac. in 1938. Extensive rice and cotton plantations are estab. in the irrigated valleys and foothills. Cotton

education has progressed, and by 1939 72 per cent of the pop. were literate. There are some seventy newspapers in the Tajik, Uzbek, and Kirghiz languages. The pop., which increased by 44 per cent between the 1917 and 1939 censuses, numbers 1,485,000. The area is 55,000 sq. m. Stalinabad (pop. 83,000) is the cap. See also CENTRAL ASIA. See V. M. Bardie, *Tadzhikistan*, 1940, and R. A. Davies and A. J. Steiger, *Soviet Asia*, 1943.

Taj Mahal, mausoleum at Agra, India, built by Shah Jehan about 1629-50 as a tomb for his favourite wife, Mumtaz

THE TAJ MAHAL, AGRA

E.N.A.

has long been grown in the N.W., and long-fibre Egyptian cotton has been introduced in the midlands and S. of Tianshan, and the area is the chief centre for the product in the Soviet Union. Apricots, grapes, apples, pomegranates, almonds, walnuts, and pistachios are grown, and sugar in the extreme S. On the non-irrigated areas barley and wheat are grown, and cereals and grapes are produced on the Pamir table-lands. Horses, cattle, goats, and sheep are reared in the mt. pastures. Mineral production has been developed, coal, oil, gold, non-ferrous metals, and rare elements being found. Industrial output includes cotton and silk goods, leather goods, footwear, cotton-seed oil, and canned meat. Vegetables, and fruit. Hydro-electric power is used at Stalinabad and Leninabad. Motor roads have been developed, and Stalinabad is linked by rail to Termez. As in the other central Asian republics,

Mahal. He too lies buried there. The building is mainly of white marble, with a centre dome and four smaller domes at the corners, and four minarets. A marble terrace surrounds it. The mausoleum was constructed in the Persian style by Ustad Isa, a Turkish architect.

Takahe, or **Notornis**, flightless bird of New Zealand. A species of moorhen belonging to the Ralliformes, it weighs 5 lb. and is about 18 in. in height. The tail and back are bronze-green in colour, the head and breast bluish-black, and the bill red and short. Its fossil remains were found in the 1840s, and the T. was thought to be extinct, but living specimens were later caught, and specimens were observed and photographed in 1948.

Takelma Language, see under NORTH AMERICAN NATIVE LANGUAGES, *Pacific Areas*.

Takla-makan Desert, desert of E. Turkestan, forming part of the Gobi

Desert. It is bounded on the E. by Lob Nor. on the W. and N. by the Yarkand Daria (R. Tarim), and on the S. by the Kuenlun Mts. It extends E. and W. for 600 m., and from N. to S. for about 200 m. It is traversed by the R. Khotan, whose course Carey, in 1885, followed to its junction with the Tarim. Sven Hedin explored the buried tn. of T. in 1896, and Sir Aurel Stein crossed the desert in 1907-8.

Takoradi, port of the Gold Coast, Africa, opened in 1928. It is the only complete shelter, between Nigeria and Sierra Leone, for ships of over 30-ft. draught. The main line of the Gold Coast runs from T. to Kumasi, thence to Accra. It is a wireless station. The chief exports are gold, manganese ore, cocoa, palm oil and kernels, kola, hides, and mahogany. T. was an allied supply base for the Middle E. during the Second World War, when the Mediterranean route was closed.

Talavera de la Reina, tn. of Spain, in the prov. of Toledo, on the Tagus, 75 m. S.W. of Madrid, in a fertile wine-growing dist. It possesses very fine squares and streets, with Rom., Moorish, and Gothic remains, and has manufs. of silk and earthenware. Wellington here defeated a Fr. force under Joseph Bonaparte, Jourdan, and Victor on July 27 and 28, 1809. Pop. 14,500.

Talbot, John and Charles, see SHREWSBURY, EARLS OF.

Talbot, Richard, see TYRCONNEL, EARL OF.

Talbot, William Henry Fox (1800-77). Eng. inventor, b. at Laycock Abbey, Wiltshire, educated at Harrow and Trinity College, Cambridge. He worked chiefly in mathematics and optics, and chemical changes of colour. He discovered the calotype process on which modern photography is built, for which he received the medal of the Royal Society, 1842. T. was also a botanist, chemist, and philologist, and one of the first translators of the Assyrian cuneiform inscriptions. He wrote *Pencil of Nature* (1844) on his photographic discoveries.

Talc, hydrous bi-silicate of magnesia, which crystallises in the rhombic system (hardness 1, sp. gr. 2.8). Crystals are rare and the massive form 'stearite' or 'soap-stone' is more common. Fr. chalk, pot-stone, and figure-stone are all varieties of T. It is used as a filter for paints and paper, a toilet powder, for insulation and acid resistance, in soap as a lubricant, and for making ornaments.

Talca: 1. Prov. of central Chile, with Curicó to the N. and Maule and Linares to the S. Wheat, wine, and cattle are produced. Area 3721 sq. n. Pop. 157,100. 2. Cap. of the above, 150 m. S. of Santiago. An important trade centre on the Claro and Piduco Rs. It is a railway junction. The prin. industry is the manuf. of woollen 'ponchos.' Shoes, biscuits, paper, tobacco, and flour are also made, and there are foundries and distilleries. Pop. 57,000.

Talcahuano, see CONCEPCION.

Taldy-Kurgan, region of the Kazakh S.S.R., E. of Lake Balkhash, beyond the Alma-Ata Region, bordering on Sinkiang.

The region is traversed from N.E. to S.W. by the railway from Semipalatinsk to Alma-Ata. The cap. is Taldy-Kurgan.

Talegallus, see BRUSH TURKEY.

Talent (Lat. *talentum*, Gk. *τάλαντον*, from *τα* or *ταλ*, to lift, to bear), unit of weight in use among the ancients. Gks. It was probably based on the Babylonian unit (called *gin* in Sumerian and *biltu* in Accadian). According to Herodotus, the T. was divided into 70 Enboic mines. The Attic T. weighed 26.20 kg., and was divided into 60 *minæ* (of 436.6 gr.) or 6000 *drachmæ*. The Egyptian *kerker* (of 300 *kite*) of the Ptolemaic age corresponded to the Gk. T., but in later times various Ts. were current in Egypt. The Heb. *kikkar* of the Hellenistic period corresponded to 10,000 Attic *drachmæ* = 125 Rom. lb. = 43.6 kg., but the weight of the pre-Hellenistic *kikkar* is uncertain. As gold and silver were not coined before the seventh century B.C., the use of the balance for weighing out precious metals led to the employment of the unit of weight as a unit of value. Hence the term T. persisted as applied to money throughout the E. Mediterranean dists. Its use to denote intellectual gift is derived from the parable of the Ts. (Matt. xxv.)

Talien-Wan, see DAIREN.

Talisman, object with magical powers, often worn on the body, and credited with more positive effects than the amulet (q.v.).

Talking Machines include the gramophone (q.v.) and the 'Dictaphone,' which records speech on a wax cylinder for subsequent reproduction (e.g. dictation of letters for a typist). Some models employ electrical recording, and various types are adapted to record telephone conversations, etc.

Talking Pictures, see CINEMATOGRAPH.

Tallage, tax of the Anglo-Norman and Plantagenet periods, imposed on the royal tns., bors., and demesne lands. By the statute *de tallagio non concedendo*, 1297 (an unconfirmed draft of the *Confirmatio Cartarum*, which latter document makes no mention of T.), it was provided that no T. should be taken without the consent of the Commons. Notwithstanding the strict legality of imposition, the levy was resisted until Parliament abolished the tax in 1340.

Tallahassee, city, co. seat of Leon co., and cap. of Florida, U.S.A., 26 m. N. of the gulf of Mexico; it has cotton factories. There is a state college for women (founded 1906) and a college for Negroes. Pop. 19,000.

Tallasi, see TETRA.

Talleyrand-Périgord, Charles Maurice de (1754-1838), Fr. statesman, born in Paris. The effects of a fall when about a year old rendered him lame for life, and he was early destined for the Church. He was sent to the Collège d'Harcourt, and thence to the seminary of St. Sulpice and to the Sorbonne. In 1780 he was appointed general agent of the clergy of France. In 1788 he was appointed bishop of Autun, became a member of the States-General convoked in 1789, and having accepted the civil constitution of the clergy, was ex-

communicated in 1791. In 1792 he went on a mission to England, and in 1794 was banned from France for supposed dealings with Louis XVI. He spent two years in England and America, returning to Paris in 1796. T. was appointed foreign minister by the Directory in 1797. He supported the foreign and domestic policy of Napoleon until he grew convinced that this policy could only lead to disaster for France, and at Erfurt and afterwards worked against the emperor and for the restoration of the Bourbons in the name of 'legitimacy.' He became foreign minister to Louis XVIII. in 1814.

At the Congress of Vienna T. played a leading part, obtaining favourable terms for France, and securing her readmission to the concert of European powers, by playing off the victorious allies against each other. He supported Louis Philippe in 1830, and until 1834 was envoy in London, where he played an important part in the estab. of a neutral Belgium, and concluded the Quadruple Alliance of 1830 with England, Spain, and Portugal. A man of considerable ability and intellect, his services to France under a succession of rulers were very great. His *Mémoires* were ed. by the Duc de Broglie (1892, Eng. ed. trans., 1892). See lives by A. Duff Cooper, 1932, 1949, and L. Madelin, 1948.

Tallinn, formerly **Reval**, cap. of the Estonian S.S.R., a fortified seaport on the S. coast of the gulf of Finland, 249 in. W.S.W. of Leningrad. The port is kept open by ice-breakers through the greater part of the winter months. T. consists of two tns., the upper and lower, the latter containing many remains of medieval times. The prin. buildings are the fifteenth-century cathedral, the tn. hall, guild house, and castle, and the churches of St. Nicholas, Holy Ghost, and St. Olaf, the last-named having one of the loftiest spires in the world. In 1936 the former technical faculty at the univ. of Tartu (Dorpat) was made an independent technical univ., situated in T. The numerous industries include textiles, paper, cellulose, machinery, and leather, and timber, flax and linen goods, and agric. produce are exported. T. has an excellent harbour, and is one of the chief ports of the Baltic. It was founded in 1219 as a Dan. tn. in 1284 became a Hanseatic tn., and later was a stronghold of the Livonian knights. It became Swedish in 1561, and was annexed to Russia in 1710. T. was developed after the estab. of Estonia. Pop. 145,000.

Tallis, Thomas (c. 1515-85), Eng. church-music composer, b. probably in Leicestershire, was organist at Waltham Abbey until 1540, and for the next twenty-seven years gentleman of the Chapel Royal, besides being with his pupil, Byrd, joint-organist there. In 1575 they were granted the monopoly of music-publishing for twenty-one years. The second Prayer Book of Edward VI., issued in 1552, created the demand for new church music, which T. was one of the chief to supply, a notable work being the service in the Dorian mode, pub. in 1641.

Tallow, composed chiefly of the triglycerides of palmitic, stearic, and oleic acid, is derived mainly from beef and mutton suet, the fat therefrom being 'rendered' or separated by steaming under pressure in steel cylinders. The top layer is drawn off and allowed to solidify. The quality depends on skill in rendering and the part of the animal used. Best quality T. is edible; other grades are used largely for soap manuf., candles, and lubricants.

Tallow Tree (*Elaeocaria sebifera*), Chinese tree of the family Euphorbiaceae which bears yellow flowers followed by small fruits, the seeds of which yield a wax used for making candles. The wood of the tree is very hard and is used in printing. Another tree (*Pentadesma butyracea*), of the family Guttiferae, bears large red flowers followed by edible berries. A thick, yellow, greasy juice exudes from the tree when cut.

Tally (Fr. *tallier*, to cut), stick or rod of well-seasoned hazel, willow, box, or other suitable wood, squared with a knife, and marked on one side with transverse notches of different size, indicating, for example, £, s., and d. The notched stick, a primitive mnemonic device or memory aid for recording numbers, was employed by some primitive peoples of Australia, N. America, W. Africa, and Asia, as an aid in conveying messages (see under WRITING). It was used also in anct. Scandinavia, England, Italy, Russia, and other countries, but mainly to express numbers. In England exchequer T's, for recording payments between the Crown or gov. were introduced shortly after the Norman conquest; they had the advantage of providing a perfect check for both parties, and of being understood by illiterate people. The amount of the transaction (loan to the sovereign, or tax, 'tallage,' etc.) was cut (*tallied*) by the 'talliator,' who also split the T. into two unequal parts: the chamberlain retained the smaller part (leaf, foil, or T.), the larger part (stalk, counterfoil, or countertally) being held by the other party. T's were used officially (notwithstanding Burke's Act for their abolition, 1782) until the death of the last chamberlain of the exchequer in 1826. The verb 'to tally,' i.e. to agree, derives from the T.

Talma, François Joseph (1763-1826), Fr. actor, b. in Paris, introduced naturalism into acting, and made Shakespeare known in France. His memoirs were ed. by A. Dumas (1849-50).

Talmud, The ('Study'; an abbreviation of *Talmud Torah*, 'Study of the Torah'), collection of Jewish books, containing traditions, laws, rules, and institutions, by which, in addition to the Heb. Bible, the conduct of Jewry is regulated. The fall of Jerusalem, the destruction of the temple, the dissolution of the Jewish state, and the dispersion of its inhab. (see under JEWS) did not annihilate Judaism. To avert extinction the great rabbis planned that the *Torah* of Moses ('the Pentateuch') was to become the dominating factor in Judaism, its supreme authority, the guide of its actions, the source of its knowledge of the divine will,

both for the community as a whole and for each individual. The process of applying the teaching contained in the *Torah* involved of necessity directions for religious action not expressly contained in the written text of the *Torah*. Indeed, the *Torah* as points were left to the Jew at many points where specific directions, gave him no nation, or no intimation at all, of the divine will was in some part. The *Torah* needed an interpretation. The T. was the outcome of this process, which went on in the Jewish academies, having as their aim the application of the *Torah*. The T. was the work of the scribes, known as *sopherim* (scribes), who were called *tannaim* (see below). The first author of the T. was Hillel, b. in Babylonia, is the first author of the *Mishnah* (see below), as not reduced to writing. The T. of Jerusalem in A.D. 70, was completed by Zaccabai (see under Jews), a scribe, reorganised a Jewish academy at Jamnia. Akiba b. Joseph was a martyr in the Bar Kochba revolt (2-35). He was a great expositor of the *Torah*, as well as a collector of the multitude of rules and traditions which had accumulated down to his time and reduced them to order. The achievement of the compilation of the *Mishnah* was accomplished by Rabbi Judah, 'the Prince,' 'the head of the community in Palestine, which he led for fifty years, until his death, c. 135. The *Mishnah* (from the root *shana*, 'to repeat,' namely oral teaching, what is learnt by repetition, or 'to learn by heart') contains nearly 4000 rules, under the six heads, called *sedarim* (orders), of seeds, festivals, women, injuries (civil and criminal law), sacred things (sacrificial laws), and laws of cleanliness; each order consists of a number of *massichot* (tractates); the total being sixty-three; each tractate is divided into chapters (523 in all; later another chapter was added), which are subdivided into paragraphs. Seven *massichot* were afterwards added to the Babylonian T. (see below), and four small tractates were added later. The language of the *Mishnah* is Heb., known as *Mishnaic* Heb., which is of a more recent and more colloquial form than Biblical Heb. The *Mishnah* became the standard text-book for the study of the *Torah*, and was adopted throughout the Jewish academies in Palestine and Babylonia. Mention may be made of another preserved collection of laws, known as *Tosifot* ('Supplement'), attributed to the fifth century A.D., parallel to the *Mishnah*, but containing additional matter: its exact relationship to the official codification is uncertain.

The *Mishnah* in its turn became the subject of study and explanation in the academies of Palestine and Babylonia. The teachers and exponents of the *Torah* were then called not *tannaim*, but *amoraim* (from the root *amar*, 'speakers,' 'expounders.' The main object of such

study was to verify the *halachah* (this is derived from the root *halach*, 'to walk,' meaning the way of life to tread in conformity with the precepts of the *Torah*, i.e. a 'rule of right conduct') by establishing its connection with *Torah*, elucidating its meaning, and, in certain respects, bringing it up to date by showing how it was to be applied to the circumstances of the time. Thus, the *Gemara* (from the root *gamar*, 'to complete'), or 'completion' was formed. The *Mishnah*, together with its *Gemara*, makes up the T. There is only one *Mishnah*, but there are two Ts., known as the Palestinian (or Jerusalem) and the Babylonian respectively, from the countries where the *Gemara* was completed. The Palestinian T. proceeded from the academy of Tiberias; it is attributed to Jochanan b. Nappacha (199-279), but it was probably completed in the late fourth century. The Babylonian T. was compiled by R. Ashé (d. 427), and completed by Rabina and R. Jose in 499. Neither T. has a complete *Gemara*; the Palestinian *Gemara* covers thirty-nine tractates; the Babylonian *Gemara* only thirty-seven, but the Babylonian T. is seven to eight times the size of the other. The Palestinian *Gemara* is written in W. Aramaic; the other one, in E. Aramaic, the two dialects being quite distinct.

The T. is the product of Rabbinic Judaism, and unlike the Heb. Bible, which is the Holy Scripture not only of the Jews but also of the Christians and Muslims. In the main, and with very few exceptions, it has only been studied by Jews, who have always valued it highly. Taken as a whole it presents the appearance of a disorderly mass of the most heterogeneous material, relating to religion, ethics, hist., legend, folklore, astronomy, mathematics, law, physical life, botany, etc. The material of the T. may be divided into two main categories, the *halachah* and the *haggadah* ('narration'). The latter word, originally applied to all the results of the interpretation of scripture, later (when the *halachah* was recognised and studied as a special dept.) denoted the non-*halachic* sections of the T., i.e. the interpretation of the *Torah* for edification and not directly for the regulation of conduct. The *haggadic* teaching in the ant. academies and in the medieval synagogues created a new branch of Rabbinic literature known as *midrashim* (from the root *darash*, 'to seek, deduce, interpret'), the system of 'interpretation' of scripture employed by Rabbinic Judaism. The T. has moulded the Jewish nation, influencing their opinion, stimulating their spiritual and religious life, promoting their intellectual activity, and regulating their conduct: in short, it helped to preserve the existence of Jewry.

The Babylonian T. was first pub. by Daniel Bomberg in Venice (1520-23) in twelve folio vols., and has been frequently reprinted. The Palestinian (Jerusalem) T. was first pub. by Daniel Bomberg (c. 1523-24) in one folio vol., then reprinted at Cracow (1609), at Krotoshin (1866), at Piotrków (1898-1902), and at Wilno (1922). The first unabridged and authori-

tative Eng. version, in thirty-four vols., was completed and pub. in 1949 (editor, Dr. I. Epstein). An excellent comprehensive selection of the T. has been made by Dr. A. Cohen (*Everyman's Talmud*, 1932, 1949). An admirable Eng. version of the *Mishnah* has been pub. by the Canon Dr. H. Danby. Regius prof. of Hebrew at Oxford (1933).

Talpa Europaea, see MOLE.

Tamar, riv. of England, the boundary between the cos. of Devon and Cornwall, forms the estuary of the Hamoaze at Devonport and flows into Plymouth Sound. It is navigable to Launceston. Length 60 m.

Tamarind (*Tamarindus indica*), leguminous evergreen tree cultivated in India and other tropical countries for its hard, close-grained, heavy wood. It bears pinnate leaves and racemes of yellow, red-streaked flowers followed by legumes, the pulp of which is preserved in syrup; it is a gentle laxative.

Tamarisk (*Tamarix*), genus of shrubs, a native of India, W. Asia, and S.W. Europe. The common T. (*T. gallica*) has become naturalised on the S. and E. coasts of Britain, where it has been extensively planted to bind and cover sand-dunes. It is evergreen, and the bright green, minute, scale-like leaves and spikes of rose-pink blooms are borne on drooping reddish or purple branches. *T. pentandra* (or *T. hispida australis*) flowers in Aug. and Sept., *T. anglica* in late summer and thrive by the sea. *T. mannifera* exudes manna.

Tamatave, port of Madagascar, faces the Indian Ocean, 140 m. N.E. of Antananarivo. Coral reefs nearly encircle the harbour. The tn. is connected with Antananarivo by railway. Pop. 24,900.

Tamate, see under MELANESIA.

Tamaulipas, maritime state of Mexico, with Texas to the N. Inland the surface is mountainous, dipping towards its lagoon-fringed shore on the gulf of Mexico. There are large cattle ranches, and cattle and their products are exported, as well as cotton, rice, and sugar-cane. Oil is produced in the S. Cap. Ciudad Victoria. Area 30,731 sq. m. Pop. 458,900.

Tambour, see EMBROIDERY.

Tambourine, percussion instrument consisting of a vellum head over a circular wooden frame in which 'jingles', i.e. small cymbals loosely working on a centre-pin are inserted. It is played by rapping or rubbing with the hand, or by shaking.

Tambov: 1. Region of the R.S.F.S.R., bounded on the N. and W. by Ryazan, on the E. by Penza and Saratov, and on the S. by Voronezh. It is a fertile black-earth region of wide valleys and plains, cut by deep ravines, while there is much forest-land in the W. The rivs. are the Moksha and the Tsna, tribs. of the Oka, and the Voronezh and Khoper, tribs. of the Don. Coal, iron, phosphorus, limestone, gypsum, and clay are found. The crops are wheat, millet, oats, rye, barley, potatoes, etc.; hemp and flax, tobacco and beetroot, are grown. The chief tns. are T. (cap.), Michurinsk, and Kirsanov. Area 12,467 sq. m. Pop. 1,882,000. 2. Cap. of the above, on the Tsna, a railway junction,

300 m. S.E. of Moscow. There are metal industries, mills, breweries, and manufs. of synthetic rubber. The tn. trades in agric. produce. Pop. 121,200.

Tamburlane, or **Tamerlane**, see TIMÛR BEG.

Tamil, Dravidian language, spoken by over 18,000,000 people in the S.E. portion of S. India (i.e. the great plain of the Carnatic, from Madras to Cape Comorin, and S. Travancore), and in N. Ceylon. Malayâlam is closely akin to T., while Kanarese is more akin to Telugu (q.v.) than to T. T. is the oldest, richest, and most thoroughly organised of the Dravidian languages. The earliest records of T. date from the eighth century A.D. On the Ts. in Ceylon see under CEYLON.

Tammany Hall and Society. New York party organisation estab. in 1789 as the Columbian Society, soon after Washington's installation as president, by an Irish-Amer., Wm. Mooney, for social and charitable purposes. In 1805 it adopted the title of Tammany Society (apparently from the name of an Indian chief, Tammamena). With the rapid increase of its membership, twenty-five years after its foundation it espoused politics, and allied itself with the Democratic party of New York, and from 1834 estab. its nominees in the New York mayoral office in the majority of cases. T. H. rapidly became an instrument of corruption in public life, and suffered a severe blow in 1871 when its leaders were brought to trial. Its later hist. is associated mainly with the names of Richard Croker, one-time keeper of a liquor saloon, and Charles F. Murphy. Croker held no civic office, but as chairman of the Tammany sub-committee controlled all the city officials, and indeed inspired all the city legislative proposals at Albany.

Its organisation is held together by about 1000 voting dists., each under a 'captain' nominated by the Tammany committee, who nurses the voters, while the committee members of the society are annually elected by the different 'assembly districts' in the city bors. In more recent years it has been claimed that Tammany is a great reformed organisation, but state committees and similar bodies in 1890, 1894, 1899, and 1931 criticised it severely. See S. J. Tilden, *The New York City 'Ring'*, 1873; J. Bryce, *American Commonwealth*, 1888, 1910; and M. R. Werner, *Tammany Hall*, 1929.

Tammerfors, or **Tampere**, tn. of Finland, 102 m. N.W. by N. of Helsinki, on both sides of the Tammerkoski, whose rapids are utilised for industry. It is the chief industrial tn. of Finland, and has manufs. of cotton, linen, paper, footwear, and woollens. Lumbering is also carried on. Pop. 87,100.

Tammuz, or **Thammuz**, Babylonian and Assyrian god identified with the GK. Adonis. He represents the decay and growth of natural life, descending part of the year into the nether world, and being rescued from there by his sister, the heaven goddess, Innini (Inanna), or Ish-tar, the Phenician Astarte (q.v.). Another version of the myth of T. in association

with that of Ishtar is that the latter slew him after he had become her husband, and for his sake she descended into Hades. The fourth month of the Babylonian year was named after him, and the Hebs. used the same title for theirs.

Tampa, city of Florida, U.S.A., co. seat of Hillsborough co., 240 m. S.W. by S. of Jacksonville. On T. Bay, it is a popular winter resort. There is a large trade in phosphates and other products, through Port T. (*q.v.*), 9 m. S.W. Of its many manufs., including engineering goods, furniture, bricks, etc., that of Havana cigars takes first place. Pop. 124,000.

Tampico, port of Tamaulipas, Mexico, on the R. Panuco, which runs into the gulf of Mexico, situated some 7 m. from the bar, 206 m. N.N.E. of Mexico city, with which it is linked by rail, road, and air. Surrounded by lagoons, T. lies in the midst of an oil-bearing dist. The chief N. Mexican port, it exports oil, silver, sugar, rubber, asphalt, and maize. Pop. 81,300.

Tamsui, fort and treaty port of Formosa, on the N.W. of the is. The port for Taihoku, it trades in rice, tea, sugar, and coal. Pop. 18,600.

Tamus (Black Bryony), genus of perennial climbing plants (family Dioscoreaceæ) with a large black tuber and a slender twining stem bearing numerous heart-shaped leaves and clusters of small green flowers followed by scarlet berries.

Tamworth: 1. Municipal bor. and mrkt. tn. of Staffordshire, England, at the junction of the Tame and Anker R's. Birmingham, 15 m. N.N.E. of T., was once the cap. of Mercia. T. was one of the places where King Athelstan held councils. It has a castle with a Norman tower and keep. The mound was built by Ethelfleda, daughter of Alfred the Great. The par. church was reconstructed in the fourteenth century. Industries include engineering, paper making, and the manuf. of asbestos goods, sanitary ware, clothing, and small wares. In the vicinity are large market gardens and the N. Warwickshire coal-field. Pop. 13,000. 2. City in the N.W. slopes of New S. Wales, Australia, on the R. Peel, 282 m. N. of Sydney, incorporated in 1876 and proclaimed a city in 1946. T. was the first tn. in Australia to use electricity for street lighting, in 1888. It stands in an agric. and sheep-rearing dist., where diamonds and gold are found. Pop. 12,000.

Tan, or **Tan Waste**, spent bark from T. pits, used in gardening for making hotbeds and as a material in which pots are plunged, and on riding tracks.

Tanacetum, see **TANSY**.

Tanager, name for any bird of the family Tanagridæ, allied to the finches. They are natives of Central America, and nearly all of them have very brilliant plumage. One of the finest is the superb genus *Calliste fastuosa*; its plumage has a remarkable metallic lustre; the head is sea-green in colour, the breast is violet, and there is a flame-coloured patch on the lower part of the back. It feeds on fruit and insects, and is sometimes kept in an indoor aviary. *Tanagra rubra*, the scarlet T., or summer

red bird, has brilliant scarlet plumage, with black wings and tail. In autumn its plumage changes to a dull green, like that of the female bird.

Tanais, see **DON**.

Tananarivo, see **ANTANANARIVO**.

Tancred (1078–1112), leader of the first crusade, nephew of Bohemond and a grandson of Robert Guiscard. He accompanied his uncle to Constantinople in 1096 and after the capture of Nicea took service with the Emperor Alexis. He took Tarsus, but was evicted by Baldwin of Lorraine. He played a prominent part in the sieges of Antioch and Jerusalem, and became prince of Galilee in 1099. When Baldwin became king of Jerusalem T. took over the regency of Antioch (1100–1103), and later became prince of Edessa and Antioch. He fought chiefly against the rulers of N. Syria.

Tanda, tn. of United Provs., India, near the R. Gogra, 86 m. N.W. of Benares. Pop. 19,400.

Tanderagee, mrkt. tn. of N. Ireland in co. Armagh, situated on the Cashier, 5 m. S. of Portadown, with manufs. of linen, yarn, and oatmeal. Pop. 1500.

Tandy, James Napper (1740–1803), Irish patriot, *b.* in Dublin, was the first secretary of the Society of United Irishmen. He estab. an armed force on the pattern of the Paris National Guard. He was obliged to take refuge in America, and in 1798 went to Paris, and in conjunction with Wolfe Tone and others planned an invasion of Ireland. They were assisted by the Fr., and landed in Ireland in Sept. 1798. This failed, and T. was sentenced to death, but reprieved. He died in France.

Tanfield, part of urb. dist. of Stanley in Durham, England, 12 m. N.W. of Durham, with coal-mines, brick and tile works. Pop. 10,000.

Tanga, bay and seaport on the E. coast of Africa, 75 m. N. of Zanzibar. It is the chief port of Tanganyika Ter., with an excellent harbour sheltered by the is. of Pemba, and is the coastal terminus of the N. Railway to Moshi and Arusha (272 m.), and has railway workshops. Pop. 18,000.

Tanganyika, Lake, lake of E. Central Africa, situated between 3° and 9° S. lat. It is about 450 m. in length (the longest lake in the world), with an average breadth of from 30 to 45 m., and an area of 12,700 sq. m. With the exception of Lake Baikal, it is the deepest fresh-water lake in the world, soundings of over 4000 ft. having been taken.

Tanganyika Territory, area in E. Central Africa, bounded on the N. by Kenya Colony and Protectorate, Lake Victoria, and Uganda; on the W. by Belgian ter., Lake Tanganyika, Rhodesia, Nyasaland, and Lake Nyasa; on the S. by Portuguese Africa; and on the E. by the Indian Ocean, with a coastline of 450 m. Great Britain administers T. T. under United Nations trusteeship, replacing the former League of Nations mandate. The ter. is administered by a governor, aided by a nominated executive council and a legislative council of (since 1945) fifteen official and up to fourteen unofficial

members. T. T. corresponds in part to what, prior to the First World War, was Ger. E. Africa, the rest of which ter., namely the dists. of Ruanda and Urundi in the N.W. and the Kionga area in the S., being entrusted to Belgian and Portuguese administration respectively. T. T. extends from the Umba R. in the N. to the Rovuma in the S. Along the coast lies a plain, varying in width from 10 to 40 m., behind which the country rises gradually to a plateau constituting the greater part of the hinterland. This plateau falls sharply to a general level of 4000 ft. to the level of the lakes—Tanganyika (2500 ft.), Nyasa (1607 ft.), which mark the great Rift valley extending northwards to Lake Naivasha. The area is about 360,000 sq. m., which includes about 20,000 sq. m. of water.

Physical Features.—The highest points in the ter. are in the N.E., where are the extinct volcanoes, Kilima Njaro (19,720 ft.) and Mt. Meru (14,960 ft.). In the S.W. are the Livingstone or Kipengere Mts., where the highest peak is over 9000 ft. Portions of the great lakes of Central Africa are included in the ter., viz. the S. portion of Lake Victoria, the E. shores of the lower part of Lake Tanganyika, and the N. and N.E. shores of Lake Nyasa. There are four smaller lakes and numerous rivers. The ls. of Zanzibar (an independent protectorate), Pemba, and Mafia lie off the coast.

Government and Provinces.—The ter. is divided into eight provs.: Central (cap. Dodoma), native pop. 556,500; Eastern (Dar-es-Salaam), 650,000; Iringa (Mbeya), 544,500; Lake (Mwanza), 1,600,000; Southern (Lindi), 591,000; Northern (Arusha), 408,000; Tanga (Tanga), 382,300; Western (Tabora), 705,000. The form of native administration is a system of local self-government commonly known as 'indirect rule,' under which the tribal units in the various dists. are constituted native authorities by a Native Authority Ordinance. In addition to the general obligation to assist the central gov. in maintaining order and preventing crime, they act as agencies of the gov. in the discharge of a number of its social activities. The native courts form an integral part of the system of local government. They have limited jurisdiction in cases in which both parties are natives, trial being according to native law and custom. The Brit. Gov. is stimulating the natives to take a greater interest in both local and territorial government, by the estab. of representative native institutions. In 1948 the native membership on the Legislative Council was four, and Indian three.

Climate and Health.—The rainfall, generally speaking, is low for a tropical country and sometimes there are great droughts. There are three types of climate: the Indian or trade wind type, which prevails over the greater part of the ter., with a rainy season from Dec. to April and its hottest period in Nov.; the monsoon type prevailing in the N.E., with rainy seasons between March and May and in Nov., and its hottest period in Feb.; and the equatorial type prevailing in the N.W., having

two warmer and two cooler seasons, the warmer being in Oct. and Feb.—March, and the cooler in July and Nov.—Dec., and its rainy season in Oct.—May (Nyanza) or Nov.—April (Tanganyika). The average yearly temp. in the coast region is 78° F. Malaria is prevalent, especially during and after the rainy season; but in the ins. public health depts. maintain sanitation at a high level for tropical Africa. Sleeping sickness occurs on the S. and W. boundaries, and relapsing fever is widespread. Yaws, a common native disease, receives mass treatment. Ankylostomiasis (q.v.) and bilharziasis (q.v.) occur in low-lying dists.

Religion.—The majority of the inhab. are pagans. Common features among many tribal beliefs are a belief in a supreme being and in the possibility of communion with the spirits of the departed. There is a large African Muslim pop. of the Sunni sect, to be found chiefly in the coastal areas and in the up-country trading settlements. It is estimated that Christian Africans now number 650,000, of whom 433,000 are Rom. Catholic.

Production, Communications, etc.—Sisal hemp is the chief product, over 105,000 tons (one-third of the world supply) being exported in 1947. Coffee of excellent quality is grown, especially the Robusta variety, which is grown in the Bukoba dist. and on the slopes of Mt. Kilima Njaro near Arusha and Moshi. Rice is cultivated around Mwanza. Potatoes, European cereals, fruits, and vegetables can be cultivated, and cotton and tea are produced. Timber forests occur from the rain areas of the mt. ranges to the mangrove swamps of the creeks and riv. mouths, and cover 107,000 sq. m. Forestry exports include beeswax, copal, gums, and resins, rubber, mangrove poles and bark, fine woods, ebony, and palm kernels, the most important being beeswax, gums (copal and arabic), and mangrove bark. There is a wealth of mineral deposits, output in order of value being gold, diamonds (the largest mine, at Mwadui, being discovered in 1940), tin ore, salt, mica, silver, building materials, tungsten ore, lead, and kaolin. Eight coal-fields are known, three being probably extensive, and N. of the largest, Kikulu, are large deposits of iron ore. Mineral production was valued at £1,250,907 in 1947. The prin. exports are sisal, coffee, cotton, diamonds, gold, rubber, beeswax, hides and skins, papain, wood and timber, tobacco, and gum arabic and copal. Imports comprise cotton-piece goods, foodstuffs, cigarettes, kerosene and motor spirits, machinery, building materials, iron and steel goods, spirits, and sugar. In 1947 exports were valued at £11,580,197 and imports at £13,723,925. Over 60 per cent of trade is done with the United Kingdom. In 1947 the Brit. Gov. began development of ground-nuts, planning the cleaning and cultivation of 5000 sq. m., the estab. of a deep-water harbour at Mikindani, and of a railway thence to Nachingwea (135 m. inland). The Great North Road from N. Rhodesia to Nairobi (Kenya) runs for 800 m. of its total length of 928 m. through T. Light motor traffic

is now possible over nearly 23,000 m. of road during the dry season.

Communication is maintained by ocean-going and coastal vessels, and by dhows. The chief ports are Bagamoyo, Kilwa, Mikindani, and Pangani; besides a number of lake ports for steamers, such as Mwanza, Bukoba, and Musoma on Lake Victoria, Kigoma on Lake Tanganyika, and Mwaya on Lake Nyasa. In 1949 plans were announced to develop Dar-es-Salaam into a major port. The Tanganyika Central Railway runs from Dar-es-Salaam to Kigoma (782 m.) with a branch to Mwanza and from Hogoro to Msagili (40 m.); Kaliwva to Mpanda (148 m.); and Tanga to Arusha (272 m.), this line linking up with the Uganda line via Kahe and Voi. The gauge is one metre. T. T. railways were amalgamated with those of Kenya and Uganda in 1948. Air transport is assisting the development of the ter. Postal and telegraphic facilities exist at all the prin. centres, and there are sev. research stations.

Although this vast country, containing large areas of uninhabited, tsetse-infested, and waterless land, with a scattered pop. of 120 diverse tribes, has only been under Brit. administration for thirty years, there has already been a great advance in the social services. If, however, the ter. is ever to attain a position of economic independence, it would be undesirable to develop these services by subsidies under the Colonial Development and Welfare Act to a scale which it would be beyond the capacity of the local revenue to support. In extensive areas of the ter. there is no European settlement or it is so limited in extent as to have no effect on the availability of land for the use of the indigenous pop. Yet white farming has made, and must continue to make, an important contribution to the economic development of the ter. and to its revenues. There are in fact large areas in T. which are capable of development within measurable time only by non-indigenous effort. There are plans afoot for improving the railway communications with Dar-es-Salaam—a long overdue project. A recent conference on the future of game animals in T. proposed inviolable national parks (*q.v.*), with the suggestion of a 5-m.-wide 'buffer' strip between them and settled areas to replace the present system of game reserves. It was agreed that there should, in principle, be no human settlement or domestic stock inside the parks—a policy which will involve the removal, as a long-term plan, of the 8000 Masai (*q.v.*), with their 300,000 head of stock, now in the Serengeti National Park. In closely settled areas, however, game will not be protected, for the needs of man should be paramount, though the hunting of game by natives will, in general, be limited to the needs of the hunter and his family and will not include hunting for sale.

Population.—There are about 120 native tribes, mostly of Bantu origin, with in the N. a marked Hamitic strain. Swahili is the lingua franca. In 1947 the native pop. was 5,838,000; Asiatic 61,900; Euro-

pean 16,900 (including 6000 Polish refugees).

Education.—Three schools are maintained by the gov. for the primary education of European children, at Dar-es-Salaam, Arusha, and Mbeya. Assistance is given to eight privately maintained schools. For secondary education European children go to schools in Kenya, and bursaries are awarded for secondary education in Kenya and S. Africa. There are eighty-three Indian schools with a total enrolment of 9800 pupils. Schools for Africans are provided by the gov., the native administrations, and voluntary societies, the two latter being subsidised by a grant-in-aid system controlled by the Education Dept. Some 289 schools are maintained by the gov. or the native authorities. Primary schools are usually co-educational. The total enrolment is approximately 32,000 pupils. Assistance is given to 704 schools, including secondary schools, teacher training centres, and girls' schools run by voluntary agencies. The total roll is approximately 80,800 pupils. There are schemes of secondary and technical education. In the primary schools stress is placed on the improvement of rural economy. Industrial sections at the secondary schools teach carpentry, masonry, smithing, and tailoring. The gov. publishes a monthly journal in Swahili.

History.—Arab traders visited the ter. for sev. centuries and opened up the great slave route from Bagamoyo on the Indian Ocean to Ujiji on Lake Tanganyika. The Brit. explorer, Burton, first entered the ter. in 1856, and was soon followed by Speke, Livingstone, and Stanley. The ter. was visited in 1884 by Karl Peters, who concluded sev. treaties with the native chiefs and so paved the way for the estab. in 1885, of a Ger. protectorate. In 1889, an Arab revolt having been suppressed, the first Ger. steamer was launched on Lake Nyasa. A more serious rising took place in 1905 and was only crushed after some 120,000 natives had died either during the conflict or from its immediate results. After the First World War (for details of the campaign see AFRICA, GERMAN EAST, FIRST WORLD WAR, CAMPAIGN IN) an order in council was issued in Jan. 1919, appointing an administrator. The Tanganyika Order in Council, 1920, constituted the office of governor and commander-in-chief. In March 1921 the dist. of Ujiji and portions of the dists. of Bukoba and Ufipa, which had formerly been administered by the Belgians, were taken over. In 1920 the draft mandate for Ger. E. Africa was submitted to the Council of the League of Nations in favour of Great Britain and Belgium and approved in 1922. In 1926, by an order in council, provision was made for the constitution of a Legislative Council. In Feb. 1950 the Trusteeship Council of the United Nations, in adopting its report on T. as the outcome of long discussions on the ann. review submitted by Britain, congratulated Britain on its administration of the ter. On constitutional matters the Trusteeship Council recommended the

adoption of measures by which the people could be consulted and the views of tribal councils, political associations, and trade unions obtained and the consideration of a possible increase in African representation in the executive and legislative councils. See Sir D. Cameron, *My Tanganyika Service and some Nigeria*, 1939; R. Coupland, *East Africa and its Invaders*, 1939, and *The Exploitation of East Africa*, 1939; Charlotte Leubuscher, *Tanganyika Territory: a Study of Economic Policy under the Mandate*, 1941; *Tanganyika Guide*, 1936, 1948; and *Report on the Administration of Tanganyika*, 1947 (H.M.S.O.), 1948.

Tangent to a curve is the straight line which passes through two coincident points on the curve. In trigonometry the T. of an angle in a right-angled triangle is the ratio of the side opposite the angle to the adjacent shorter side.

Tangent Sailing, see GREAT CIRCLE.

Tangerine (*Citrus nobilis*), small variety of orange with a loose-fitting skin which is allied to the mandarin (*q.v.*). The fruit is pulpy, but the juice is sweet and fragrant.

Tanghinin, deadly poison extracted from a kernel of *Tanghinia venenifera*.

Tangie, see KELPIE.

Tangier, or **Tangiers** (Lat. Tingis, Arabian **Tanja**), seaport of Morocco on a bay of the strait of Gibraltar, 36 m. S.W. of Gibraltar, the diplomatic headquarters and the largest commercial city of Morocco. Lying on the picturesque bank overlooking the Atlantic, the town is surrounded by old walls and dominated by a ruined *kashah* (fort). Most of the streets are impracticable for vehicles, and goods are carried by donkeys. The 'Great Sâk' (market-place) is the end of the Saharan and Sudan caravan routes. Exports comprise eggs, skins, and tinned fish. In 1944 exports were valued at 14,630,000 francs and imports at 181,357,339 francs. Cigarette manuf. is the most important industry, and there are fisheries, market gardens, and preserving industries. It is the N. terminus of the Tangier-Fez Railway.

T. was the cap. of a Rom. prov. It was taken by the Portuguese in 1471, and held by England, to whom it came as the dowry of Catherine of Braganza, from 1661 to 1684. It then came into possession of the Moors. By the treaty of Madrid (Nov. 1912) it was to become the centre of an international zone. For the hist. of T. as an international zone see Morocco, *Spheres of Influence and Government*. The police are of sev. nationalities with Belgian officers. The zone has an administrator, with assistant administrators for health, justice, finance, etc. There is an important Brit. colony of about 1200 people, and many Europeans have settled there. The education of Muslims is mainly confined to elementary Koranic schools, with sev. schools maintained by the Fr. and Sp. Govs. Native justice is administered by religious courts, and by the Mendoub, who tries a large number of civil and criminal cases, and as the sultan's representative supervises native affairs. A mixed tribunal is provided for cases involving

foreigners (except Amers.). The revenue comes mainly from customs and consumption duties. The ordinary budget estimates for the T. zone in 1946 were: receipts, 313,000,000 francs; expenditure, 305,000,000 francs. Actually receipts were about 600,000,000 francs and expenditure 325,000,000. Area 225 sq. m. Pop. 100,000 (16,500 Europeans, 7000 native Jews, and 36,500 native Muslims).

Tango, dance in 2-4 time, slightly faster than the Sp. habanera, originating in S. America. Introduced into Europe, it has become a standard ballroom dance.

Tanguts, tribe which inhabits parts of Kansu, in China, and the Kuku-Nor and Khan dists. in N.E. Tibet. They are of Mongolian origin and nomadic in character, their only wealth consisting of their flocks.

Tanistry, Pictish law of succession, see under PICTS.

Tanjore, **Tanjur**, or **Tanjâvûr**, tn., cap. of T. dist. of Madras, India, 170 m. S.W. of Madras. It has a famous, Hindu temple, the old palace of the rajahs and a dismantled fort. The chief manufs. are carpets, silks, jewels, and metal work. Pop. 68,700. The dist., which includes the delta of the Cauvery R., is very fertile. Area 3727 sq. m. Pop. 2,563,000.

Tankersley, tn. in the W. Riding of Yorkshire, England, 4½ m. S. of Haraslev. It has coal-mines. Pop. 2475.

Tanks (and Anti-Tank Weapons).

Tanks and Self-propelled Artillery. During the First World War the opposing armies occupied strongly entrenched positions opposite each other, and the ground between them and in the vicinity was ploughed up by incessant shell-fire, any roads being quite impassable for ordinary vehicular traffic. Consequently, owing to this difficulty of movement, coupled with the terrific machine-gun and artillery fire, it was almost impossible to develop an attack of any magnitude without enormous loss. To overcome this, the Brit. began experimenting with a kind of mobile fort consisting of a mechanically propelled vehicle capable of crossing very rough country by the use of caterpillar tracks, which was armoured and carried machine guns and six-pounders. The name tank was given to disguise the true nature of the machine being secretly constructed, and has stuck to it ever since. The first tank was designed in 1915, being produced in two types, 'male' and 'female.' The general shape was rhomboidal, all round the periphery of which ran the caterpillar-type track, and projections from the sides—'sponsons'—housed the guns. In the Mark I. class, the male carried two six-pounder guns and the female four Vickers machine guns. The tracks were driven by a specially designed six-cylinder petrol engine developing 150 h.p., through a two-speed gear-box under the control of the driver, from which the drive led through a differential to a pair of gear-boxes placed one on each side of the machine. Each of the latter gear-boxes, manipulated by a gearsman, controlled its own particular track by a chain-drive to the rear

sprockets. Manned by a crew of eight, these tanks were very ponderous and slow, having a maximum speed of only 4 m.p.h. In addition, this model had two steel wheels mounted by a hinge at the rear and pressed on to the ground by stout springs. Operated by the driver, these wheels assisted in the steering of the tank, but as experience proved them to be cumbersome and not worth the added complication due to their fitment, subsequent models were built without them. After their first use in actual battle, on the Somme in Sept. 1916, the Gers. began to use armour-piercing bullets, which necessitated stronger armour being fitted to the tanks subsequently constructed. Towards the end of 1916 new and lighter tanks were being experimented with which were capable of increased speed and manoeuvrability, each being controlled by one man. They were designed to be used beyond the main system of trenches, and as they had not to negotiate any very wide trenches they were made shorter in length. These came to be known as 'whippets,' and later officially as medium tanks. By the beginning of 1918 the ordinary tanks had been much improved by being fitted with a bigger, better engine of 225 h.p., one-man control, and able to attain a maximum speed of 12 m.p.h. A short time before the end of the war, designs were prepared for a very much improved type of tank which would be able to travel 20 m.p.h., propel itself, floating, across water, and carry enough fuel to enable a journey of 200 m. across country to be made. One of these was completed after the Armistice, but although its speed was above expectations, the many new devices incorporated in its design were unreliable and proved a source of weakness.

Tank design now crystallised into three types: *Light*, for reconnaissance, *Medium* or *Cruiser* to engage hostile armour; and *Heavy* or *Infantry* to accompany infantry in the attack. In general this classification can still be applied to-day. In 1940 Brit. armour still consisted largely of Vickers Mark VI. light tanks, armed solely with a water-cooled machine gun of rifle calibre. These tanks bore the brunt of Wavell's first Libyan campaign, where they were opposed chiefly by It. light tanks L-3 and L-6 (Fiat-Ansaldo). The shortcomings of these It. models had already been exposed in the Sp. civil war but not remedied afterwards. To this class belonged also the Ger. Pz. Kw. I. and II. and the Fr. Chars. 3511 (otchkiss) and 35R (enault). In the Brit. service the Amer. Stuart, fast and with relatively heavy armament, was adopted as the standard light tank in 1943.

Cruiser tanks became the decisive arm in the W. Desert, where the war resolved itself most nearly into a tank *versus* tank duel, and the Gers. brought all their ingenuity and skill to bear in the design of this class. Their Pz. Kw. III., IV., and IV. (Special) could outrun and outshoot the Brit. Matilda and Valentine 'I.' tanks and Covenantar and Crusader cruisers, all of which mounted two-pounders. Ger. hull armour (and turrets) were better sloped to

cause ricochets; on Brit. 'I.' tanks it was too vertical, on Brit. cruisers too thin. Pz. Kw. III. mounted a 50-mm. anti-tank gun, Pz. Kw. IV. a short 75-mm. field gun, and Pz. Kw. IV. (Special) a long 75-mm. anti-tank gun. The whole series Pz. Kw. I.-IV. had the same general low silhouette with wedge-shaped turret. Ger. cruiser design culminated in the Panther, which mounted a 75-mm. gun and owed its pyramidal shape to the Russian T. 34. Its nearest Brit. equivalent was the Centaur, employed in 1945 and capable of being transported by air.

Until 1943 the Gers. cannot be said to have competed in the 'I.' tank class. Their theory of armoured warfare demanded that the Infantry support the tank and consolidate its gains, not vice versa, and they were content to observe the failure of the Brit. Matildas and Valentines (many of which were supplied to Russia) to support the infantry. Brit. 'I.' tanks were slow-moving and under-gunned though mechanically reliable. Nevertheless having given the 'I.' tank to the world in 1916, the Brit. persisted with this class and produced the Churchill (with only a 2-pounder—later 6-pounder—gun for its great weight of 39 tons), the Comet, and after the war the Centurion, which mount 17-pounders: 1913 saw the first true Ger. 'I.' tank, the Tiger, in action in Tunisia with its 88-mm. gun. The Brit. from 1942 onwards used Amer. Grant and Sherman cruisers as 'I.' tanks, also Canadian Rams. All these mounted a 75-mm. gun, but in the Grant this was mounted in the hull with consequently limited traverse. Other 'I.' tanks employed were the Fr. Char B (32 tons, 47-mm. gun) and the Russian K.V.I. (44 tons, 76-mm. gun).

An important invention of the inter-war years was the (Amer.) Christy suspension system, in which the track ran round a single tier of large bogey-wheels, the object being to make every tank convertible to an armoured car by simply removing the track and fitting tyres. Crusaders, Covenanters, T34s, and Panthers all had this feature. The Jap. had a Christy-suspension tank which could also run, with flanged bogies, on railway tracks. In the event the problem of moving tanks long distances by road was solved by the invention of the tank-transporter, whose broad-tyred wheels did less damage to the surface-metal.

Assault guns (*Sturmgeschütze*) were first used in May 1940 by the Ger. (notably 150-mm. field-pieces) for close support against defended buildings. The gun was mounted in a fixed armoured box on a tank-chassis (usually Pz. Kw. III. or IV., but also on chassis of Fr. or Czech tanks) with the ordinary traversing gear of a field carriage. Pieces varying in calibre from 75 mm. to 210 mm. were so mounted (including 88s.), and the series designated Hornet, Bison, Grizzly Bear, etc. Eventually they formed about half the artillery regiment of a Ger. armoured div. The Brit. adapted similar mountings from cut-down tanks for the 25-pounder (Priest, Deacon, etc.), and the Amers. used

75-mm. cannon on half-track chassis for regimental support companies. Such weapons are generically called 'self propelled' (Ger. *Selbstfahrlafette*). A thick frontal shield and a short-range piece, as in the Brit. Armoured Vehicle R.E. (an armoured mortar for point-blank use) characterise the assault gun proper. A similar development is the armoured flame-thrower, such as the Brit. Crocodile and the Ger. Pz Kw. 11. Flammenwerfer. Other adaptations of the tank chassis for special purposes are the armoured bulldozer and the 'Scorpion' flail tank for clearing minefields (see MINES).

Anti-Tank Weapons.—Since the armour-plating of the tank from its inception was designed to protect, and did so protect, its crew and its own vital parts from small-arm bullets, shrapnel bullets, and the splinters from high-explosive shells, these projectiles and the weapons which could project no other kind were useless against T. The development of special weapons and the special employment of other weapons for anti-tank purposes began after the battle of Cambrai in 1916. The Gers. brought into use a heavier type of rifle firing an armour-piercing bullet, and began to mount single field pieces which were dug in in the infantry positions with the sole task of engaging enemy T.

A specialised piece of ordnance for engaging T. requires a high muzzle velocity to ensure that the impact of the projectile on the armour shall be as violent as possible, and a flat trajectory, i.e. the path of the shell in flight must be as nearly as possible horizontal in order to ensure that the shell strikes the armour at right angles. These conditions are fulfilled to some extent by anti-aircraft guns, but few of them are designed to fire directly off the travelling carriage, and they thus take too long to bring into action in emergency. Further, their recoil mechanism and carriages are generally designed to absorb a downward recoil and are more or less difficult to modify for horizontal shooting. Some models, however, notably the Ger. Flak 88, the prototype of which was already in use in 1918, lent themselves well to such adaptation and could in emergency be used with armour-piercing ammunition in their anti-aircraft form.

Field-guns of all types (as opposed to howitzers) were used with varying degrees of success against T., either with high-explosive shell or armour-piercing shot and the largest possible propelling charge. Of these weapons the Fr. 75-mm. field-gun, which fires 'fixed' ammunition (propellant and projectile in one case), combined accuracy with a relatively rapid rate of fire. The Brit. 25-pounder gun-howitzer with breech-loading ammunition was not so quick, but equally accurate and delivered a heavier 'punch.' The Ger. 105 mm. as used by ordinary divisional artillery was not so effective as the 25-pounder, owing to its relatively short traverse and clumsy mechanism. But the introduction of hollow-charge ammunition (*Hohlladung*) gave the Ger. field

gunner a great advantage in this sphere. Hollow-charge ammunition consists of a metal shell filled like an ordinary high-explosive shell, but the cone at the front end of the shell is left empty and the forward service of the explosive filling is concave; as the force of an explosion is directed at right angles to the surface of the explosive substance, the whole force of the explosion is concentrated at the centre of the sphere of which the concave surface forms a segment, and a high velocity was no longer needed since it was not necessary for the shell itself to pierce the armour; nor need hollow-charge shells strike the armour at a right angle.

Apart from the necessity for a special carriage and special sights, there were other limitations on the use of field and anti-aircraft artillery against T. Battery positions could not in practice be sited so as to fulfill the requirements both of their primary and of their anti-tank role, and a time-consuming procedure was necessary whereby on the approach of T. control of the guns passed from the forward observation officer who normally directed their fire, to the gun-position officer who could see the T. and order salvoes against them by voice, or to the commanders of individual guns. If guns were detached and sited purely to engage T., then so much greater was the loss in normal artillery strength.

These factors had been appreciated by all armies by 1939 and special units, usually under divisional control, and armed with anti-tank guns proper, had been formed. At the outbreak of war the Brit. Army was armed with 25-mm. Hotchkiss and 2-pounder Vickers guns for this purpose, while the Gers. had 37-mm. and 50-mm. guns. The Brit. 6-pounder, introduced in 1941, matched the performance of the 50 mm., and was in turn outclassed by the Ger. 75-mm. Pak, to counter which the Brit. 17-pounder was brought into service in 1942. But all the time the Ger. 88-mm. anti-aircraft gun had been undergoing successive modifications, culminating in the 88-mm. Pak, which was specialised as an anti-tank gun as opposed to earlier models which could be used in an anti-aircraft or medium role. All these guns as well as the Amer. 75 mm. and the Ger. 120 mm. could also be mounted in T.

A special kind of ordnance incorporating the Gehrlich bore was developed by the Gers. and produced in 37-mm. and 50-mm. calibres. In addition to the semi-automatic breech, long barrel, and relatively large propellant for a small projectile which distinguish this type of gun, the Gehrlich guns had a bore which tapered slightly from breech to muzzle so that the shell was 'squeezed' out of the gun and flew with a pronounced boring motion.

Anti-tank guns accompanying infantry in the attack or on reconnaissance in force were vulnerable to attack by T., since on the move they were not only hitched to the towing vehicle but pointing the wrong way, and seconds lost in bringing them into action gave the enemy tank an overwhelming advantage. Smaller

types up to 6-pounder or 50-mm. calibre could be carried pointing forward and more or less ready to fire in special lorries, which were, however, conspicuous and formed an unsatisfactory fire platform. As the war progressed various forms of self-propelled carriage (usually converted from obsolescent types of tank), which allowed the gunner to fire forward from behind armour, were developed. The Allies, for instance, used the M10 (3-in. gun on Sherman chassis), and 17-pounders on Valentine chassis. A wide arc of traverse was not so necessary for these mountings, as the tracked carriage could readily be manoeuvred to bring the gun to bear. These armoured fire-platforms were a logical development of the assault mountings used for field-guns.

Anti-tank weapons for use by infantry of rifle companies (apart from special sub-units of battalions, etc., armed with anti-tank guns) were numerous and diverse. The experience of the Sp. civil war, the defence of Warsaw, and the Russo-Finnish war in 1939 showed that those which could be most readily and effectively improvised were grenades (*q.v.*), either incendiaries such as the 'Molotov cocktail,' ranging from a simple beer-bottle full of petrol to factory-made phosphorus bombs with time or percussion fuses, or high-explosive bombs. To engage beyond the range of a strong thrower, anti-tank rifles of about 1-in. calibre firing hardened steel bullets were used (*e.g.* the Brit. Boys rifle). These usually had a magazine of five rounds capacity, though the long Russian model was single-shot and had to be reloaded by hand. The Itals. used an automatic anti-tank rifle, the Solothurn, of Swiss origin. All these weapons were about 5 ft. long and made a heavy and cumbersome load for one man. From about 1942 onwards they tended to be replaced by various types of rocket projector, effective at about 100 yds. range and consisting of a simple tube with electrical detonating gear. Such were the Amer. Bazooka and the Ger. *Panzerschreck* or *Ofenrohr*, both of which were aimed by resting on the shoulder and loaded by a second man standing behind the firer. A smaller and simpler version of this weapon, called the *Panzerfaust*, was fired at some risk to the firer from under the arm-pit. The Brit. PIAT (projector, infantry, anti-tank) threw a similar rocket-propelled hollow-charge bomb, but was fired from the shoulder like a rifle and could be loaded by the firer. For anti-tank mines see under MINES.

Tannenberg, Battle of: 1. Fought from Aug. 26 to 30, 1914, in the neighbourhood of T. and the Masurian Lakes, resulting in a Ger. victory over the Russian armies invading E. Prussia. The Russians had planned to deal a counter-blow on the E. front while the Ger. armies on the W. front were marching on Paris, and the position was critical for the Ger. armies on the E. front. The victory estab. Hindenburg's fame as the greatest of the Ger. leaders, besides disposing for the rest of the war of any serious threat to E.

Prussia from the Russian quarter. After the Ger. defeat at Gumbinnen on Aug. 20, they fell back on Osterode, confronted by Samsonov's army of the Narew and Rennenkampff's First Army (of the Niemen). Hindenburg, with Ludendorff as chief of staff, took over the command, faced with the problem of driving the enemy out of E. Prussia. It was decided to leave only a cavalry div. to hold Rennenkampff's forces and to concentrate all the available Ger. forces for a lightning assault on Samsonov's army. A position was rapidly taken up from a point near Soldau on the S. to Osterode on the N. The Russians came up against the position and were thrown back. Seeben and Gross Koschlau were taken by the Gers. on the 26th, Usdau on the 27th, and Soldau on the 28th. Von François (1st Corps) then rushed his troops to Neidenburg and through it to hold the main road through Grunflüss and Muschaken to Willenberg. The whole road was picketed by the 29th, and the retreat of three Russian corps cut off. The centre of the Russian forces was disposed in a close and wooded country, which impeded progress, and it was only on the 28th that Samsonov heard of the defeat of the flanking 6th Corps and realised that his own forces were caught as in a vice. The 13th Corps had actually reached Allenstein on the evening of the 27th, but on the 28th it was ordered southwards again towards Hohenstein, where the 15th Corps, terribly battered, was endeavouring to hold out against von Scholtz's corps. Still further S. the 23rd Corps was retreating to Lahna. Samsonov realised that his only hope was to turn the 15th and 13th Corps southwards to flank the 2nd Div. in an effort to break through at Neidenburg. But it was too late. Already the rout had begun; disorganised bodies of troops were hurrying eastwards, making helplessly for the shelter of the extensive forest dists. of Kaltenborr and Grunflüss. Some 20,000 men of the 13th Corps, trapped near Hohenstein in marshy country, surrendered, but the rest of the corps succeeded in reaching the forest land—where all the exits were covered by Ger. artillery. Altogether only about 60,000 Russians escaped by one device or another. The Gers. took 90,000 prisoners. 2. Fought in 1410, between the Teutonic Knights of Prussia on one side, and the Poles and Lithuanians on the other. It resulted in a great victory for the latter, marking the emergence of Poland as a great power.

Tannhäuser, legendary Ger. knight, popularly identified with a wandering minnesinger of the thirteenth century. The legendary T. was also a wanderer, and finally came to the Venusberg or Hirselsberg, near Eisenach, where he abandoned himself to sensual pleasures. Later he repented and went to Rome to beg pardon from the pope. Pope Urban said the forgiveness of his sins was as impossible as for his staff to blossom. T. left Rome, and in three days the pope's rod began to sprout. T. was sought for, but could not be found; he had returned to the

Venusberg. Wagner has treated the story in his well-known opera of this name.

Tannin, or **Tannic Acid**, $C_{14}H_{10}O_8$, occurs in gall nuts and all kinds of bark. It is extracted by boiling water and is an almost colourless substance readily soluble in water, and difficult to purify and crystallise. Its solutions possess a very astringent taste and with ferric chloride give a dark blue solution, and hence tannin is used in the manuf. of inks. T. is a glucoside of gallic acid and glucose, since it is converted into this acid by boiling with dilute sulphuric acid. Owing to its property of forming insoluble coloured compounds with many dyes, T. is used largely as a mordant and is also extensively employed in 'tanning' (see **LEATHER**). In medicine T. is employed in cases of diarrhoea, hæmorrhage, etc. T. is actually the name of a large class of related substances, the chief being Turkish T., Chinese T., and Hamameli T. In recent years some synthetic Ts. have been obtained.

Tanning, see **LEATHER**.

Tannu-Tuva (formerly **Oryanthai**), see under **MONGOLIA**.

Tantalite, see under **TANTALUM**.

Tantalum, metallic chemical element, symbol Ta, atomic number 73, atomic weight 181.3. It occurs associated with niobium in the mineral 'tantalite' or 'columbite.' It is white in colour (sp. gr. 16.8) and can be drawn into wire of great tenacity and high fusing point (2850° C.). It was formerly used in constructing the filaments of electric lamps, but has now been replaced for this purpose by tungsten (q.v.). It is, however, used in the manuf. of acid-resisting chemical apparatus, and in electrical rectifiers. The pentoxide is obtained when the metal is burned in air.

Tantalus, legendary Gk. hero, son of Zeus and Pluto, and king of Sipylus, father of Pelops and Niobe. He was admitted to the table of the gods, but abused this privilege and was cast into the lower world, where he stood in water which ebbed away when he stooped to drink it. Above his head hung huge branches of fruits which swung out of his reach whenever he tried to grasp them.

Tantalus, or **Wood-ibis**, genus of wading birds of the Stork family (Ciconiidae).

Tao, Maori weapon, see under **MAORIS**.

Taöism, see **LAO-TSZE**.

Taormina (ancient **Tauromenium**), tn. and winter resort of Messina prov., Sicily, 30 m. S.W. of Messina. It was founded by the Gks. (c. 398 B.C.), and has the ruins of a magnificent theatre, remains of Rom. buildings, and a fourteenth-century Gothic cathedral and a palace. Pop. 4300.

Tapestry (Fr. *tapis*, carpet or table-cloth; Lat. *tapetum*, carpet), textile wall-hanging in which a design, often of a pictorial character, is woven on a loom by the use of different coloured threads in the woof. There is a distinction between high-warp and low-warp T. according as the warp is set vertically or horizontally. The weaver works from a full-scale cartoon. The word T. is sometimes less accurately used to describe an embroidered wall-

hanging, such as the Bayeux T. The word is also sometimes used of coverings of furniture or carpets, and a type of woollen embroidery on canvas is called T. work.

In antiquity woven and embroidered wall-hangings were widely used both in the E. kingdoms and in the Gk. and Rom. world, and are frequently mentioned in classical literature. Fragments of Ts. of the Hellenistic and Rom. imperial periods have been found in Egypt. In the Middle Ages Ts. were widely used to decorate domestic and eccles. buildings, and the art of weaving them is specially associated with France. The oldest surviving Fr. Ts. are the series of scenes from the Apocalypse from the cathedral at Angers, woven at the end of the fourteenth century at Paris. Later the centre of manuf. shifted N. to Arras, which became so famous for this work as to give its name to the product. In the sixteenth century the main centre shifted N. again, out of France to Flanders, and the famous Vatican Ts. of the lives of St. Peter and St. Paul were woven in Brussels between 1516 and 1519 after cartoons by Raphael which are now in the Victoria and Albert Museum, London. In the seventeenth century France again became an important centre with the estab. of the state factory of the Hôtel Royal des Gobelins by Louis XIV. in 1662. Other important Fr. factories were at Beauvais and Aubusson. Fine work continued to be produced during the eighteenth century, but in the nineteenth, while the technical skill remained, the artistic standard declined. In recent years there has been a remarkable revival of Fr. tapestry at the Gobelins and Aubusson factories, fine and original works being woven after the cartoons of contemporary artists. England, though famous for its medieval embroidery, called *Opus Anglicanum*, plays no great part in the hist. of T. weaving. Ts. were woven at the Sheldon works in the sixteenth century and at Mortlake in the seventeenth, and at Solihull in the eighteenth. The art was revived in the nineteenth century by Wm. Morris at the Merton Abbey works, where sev. fine Ts. were woven after the cartoons of Burne-Jones.

Tape Worm, see **CESTODA**.

Taphros, see **PEREKOP**.

Tapioca, see **CASSAVA**.

Tapir (*Tapirus*), genus of ungulates of the order *Perissodactyla* allied to the rhinoceros, but with a short, movable trunk, four front toes, and no horns, forming one of the oldest mammalian types. The skin is hairy and very thick, and the tail is rudimentary. They frequent forests and are nocturnal in habit, living chiefly on vegetable matter, though probably omnivorous. Of the five or six living species, one, the largest, is Malayan, and the rest occur in central and S. America, where they are often hunted. These are black in colour (though the young are striped in yellow and white), but the Malayan species has dirty white hindquarters. Though powerful they are shy and inoffensive and are easily tamed, and their use in suitable countries as

beasts of burden has been suggested. The thick hide is, however, of great value.

Tapotement, or Percussion, mode of diagnosis in medicine which, as its name implies, involves tapping and the eliciting of sounds. It was used by Corvisart for examining cases of heart disease, and was developed until it was of great value in the investigation of chest diseases by Laennec. Other physicians have made it of great value in diagnosing lung, heart, and abdominal diseases. In diagnosis by *direct* or *immediate* percussion the affected part is tapped with the three first fingers, or with a small rubber-tipped hammer, while in *mediate* percussion a *pleximeter* or flat ivory body is laid on the part and struck with the fingers or the hammer.

Taprobane, see CEYLON.

Tapuya Language, see under SOUTH AMERICAN NATIVE LANGUAGE, Caribbean Area.

Tar, dark brown or blackish viscous liquid obtained by the destructive distillation of coal, shale, peat, lignite, or wood. The prin. kind of T. is coal T. About 10 to 20 gallons are obtained from one ton of coal, the quantity depending on the source of coal and type of furnace used, e.g. vertical, horizontal, low temp., etc. The chief products obtained from coal T. are T. acids, creosote oils, naphthalene, anthracene, etc., from which a large number of important drugs, dyes, perfumes, disinfectants, and insecticides are made. Wood T. is obtained from fir, pine, and larch trees and is collected in cavities beneath the smouldering wood heaps or 'meilers' in which charcoal is prepared. It is a thick, harsh-smelling liquid. The watery portion (pyroligneous acid) contains acetic acid, methyl alcohol, and acetone. The tarry portion consists of creosote, resin, and pitch and finds a use in the preservation of timber and rope. Stockholm T., obtained from the pinewood, is used medicinally in the preparation of ointments for skin diseases.

Tara: 1. Vil. of Meath, Eire, on the Boyne, 6 m. S. of Navan. The Hill of T. (507 ft.) is famed in anct. Irish hist.: upon its summit is a stone, regarded as the stone of destiny, upon which the kings of Ireland were crowned. It was a royal residence until 560 and national assemblies were held, and in 980 the Danes were overthrown here. It was the scene of a battle during the rising of 1798.

Taranaki, dist. in the S.W. of the North Is., New Zealand, with an area of 3732 sq. m. and a pop. of 81,700 (Maoris 6200). Formerly forest-clad, most of the ground has now been cleared and is utilised for stock-raising, sheep-rearing, and dairy-farming, meat, wool, butter, and cheese being produced. New Plymouth is the cap. and port. It was in the T. dist. in 1860 that a war broke out with the Maoris (see under NEW ZEALAND, History).

Tarantism, or Tarantulum, epidemic dancing mania which spread over Europe in the thirteenth and fourteenth centuries, and persisted into the seventeenth century. The symptoms originated with a great dread of the bite of the tarantula, which, though sufficient to pierce the skin,

is found to be incapable of giving rise to the hysteria and other symptoms of the mania.

Taranto (the anct. Tarentum), fort. tn. and seaport of S. Italy, in the prov. of Lecce, on the N. extremity of the gulf of T. It has a fine eleventh-century cathedral, castle, bishop's palace, museum, hospitals, etc. Fishing and oil-refining are carried on, and there is a trade in olive oil, grain, oysters, mussels, etc. The is. St. Peter and St. Paul, each having a lighthouse, protect the harbour, which is fortified. It is a naval headquarters. After the fall of the Ostrogoths T. became part of the Byzantine Empire. The Normans took it in 1063, and it became a feudal principality dependent on Naples. In the harbour on Nov. 11, 1940, the Brit. Fleet Air Arm crippled three It. battleships and two cruisers (see further under NAVAL OPERATIONS IN SECOND WORLD WAR). A Brit. force sailed into T. Sept. 9, 1943, to capture the naval base. Pop. 138,000. See TARENTUM for anct. hist., etc.

Taranto, Gulf of, gulf of the Mediterranean Sea, bordered by the provs. of Cosenza, Potenza, and Lecce. It has a length of 70 m. and an average breadth of 20 m.

Tarantula, name for various large, formidable-looking spiders, European and Amer., but correctly applied to a few

TARANTULA

relatively small species of the genus *Lycosa*, found near Taranto in Italy. It is not more poisonous than other spiders of similar size. It burrows in the ground and catches its prey by pouncing on it and not by means of a web. See SPIDER.

Tarare (anct. Taratrum), tn. in the dept. of the Rhône, France, 22 m. N.W. of Lyons. The chief industry is the manu. of muslins (introduced in the nineteenth century); silk, plush, and velvet fabrics are also made. Pop. 10,000.

Tarascon, tn. in the dept. of Bouches-du-Rhône, France, on the l. b. of the Rhône, 50 m. N.N.W. of Marseilles. The church of St. Martha, heavily damaged in the Second World War, is the chief building; there is a castle and a seventeenth-century tn. hall. The manu. include iron smelting and olive oil, and there is

trade in grain and fodder, etc. It is perhaps best known by Daudet's *Tartarin de Tarascon*. Pop. 8000.

Tarawa, colony headquarters of the Gilbert Is. (q.v.), W. Pacific. In the Second World War Betio Is. in the T. atoll was the site of a Jap. airfield and stronghold occupied by most of the 6000 Jap. troops in the Gilbert Is. The Amer. marines landed in Nov. 1943, with tanks and artillery, but only captured the stronghold after a fierce three-day struggle which cost them 3800 casualties.

Tarawera Mt., peak of New Zealand, situated in the Hot Lakes dist. of the North Is., 90 m. N.N.W. of Napier. On June 10, 1886, an eruption destroyed the famous pink and white terraces of Rotomahana.

Tarbert, fishing vil. of Argyllshire, Scotland situated on T. Bay, 38 m. N.N.E. of Campbeltown, with an anct. castle, erected by Robert the Bruce. There is a good harbour. Pop. 2000.

Tarbes, cap. of the dept. of Hautes-Pyrénées, France, on the Adour R., 12 m. N.N.W. of Bagnères-de-Bigorre. There is a twelfth- to fourteenth-century cathedral. Originally a Rom. station, T. later was the cap. of Bigorre and a Protestant centre. It has saw-mills, tanneries, and potteries, an arsenal and noted markets, especially for horses. Pop. 41,900.

Tarbolton, tn. of Ayrshire, Scotland, on Fail Water, 6 m. E.N.E. of Ayr. Pop. 5100.

Tarbrush, see FEZ.

Tardigrada, **Bear Animalcules**, or **Sloth Animalcules**, order of Arachnida. They are microscopic animals living amongst damp moss. There are four pairs of short stumpy legs, each ending in a pair of claws; the body is covered by a thin cuticle. Some authorities regard the T. as related to *Peripatus* (q.v.).

Tardiveau, René, see ROYLESQUE.

Tare, or **Vetch** (*Vicia sativa*), leguminous plant with trailing or climbing stems and compound pinnate leaves and reddish-purple flowers. The Ts. of the parable (Matt. xiii.) are probably darnel.

Tarentum: 1. (Gk. *Tarás*); modern

Taranto, Gk. colony in Italy, on the W. coast of the peninsula of Calabria. Its greatness dates from 708 B.C., when the original inhab. were expelled by a body of Lacedæmonian Parthenon under the guidance of Phalaris. After being autonomous until the fourth century B.C., T. was occupied by the Gks., and in 272 B.C. was captured by the Romans. It revolted during the second Punic war, but was retaken in 207 B.C., and was subsequently an ally and (in 123) a colony of Rome. It was taken by the Saracens in 830. 2. Bor. of Allegheny co., Pennsylvania, U.S.A., 21 m. N.E. of Pittsburgh. It has manufs. of glass. Pop. 10,000.

Tar Heel State, see NORTH CAROLINA.

Tarifa (Rom. *Julia Jozza* or *Julia Transducta*), seaport in the prov. of Cadiz, Spain, 20 m. W.S.W. of Gibraltar, a former Moorish tn. On the is. of T., to the S., Punta de Marroqui is the most southerly point in Europe. There is anchovy fishing. Pop. 13,000.

Tariff Reform. In the nineteenth century the United Kingdom had shed her protective tariffs under the influence of the dominant *laissez faire* principle as applied to international trade, the repeal of the Corn Laws in 1846 chiefly marking the transition. *Laissez faire* principles were, however, in retreat in the latter part of the century, with increasing state intervention in industry, combination of employees and of employers, price agreements, etc. In 1903 Joseph Chamberlain made his proposal to abandon *laissez faire* in international trade by reforming the customs tariff so as to include duties whose primary purpose should again be protection rather than revenue. T. R. proposed an average 10 per cent on manufactured goods, 5 per cent on meat, dairy produce, etc., and 2s. a quarter on corn. These tentative proposals were later modified, but preference to colonial products was a feature throughout. T. R. was unsuccessful at the polls until the First World War swept this and other domestic issues aside. It was the great slump of 1931-32 that brought a general 10 per cent *ad valorem* tariff plus increased Imperial Preference (q.v.). Meanwhile the wartime McKenna duties had been followed by the Safeguarding of Industries Act (1921) and other measures of protection and preference. After the Second World War tariffs and preference (discrimination) are the subject of international conference. See also PROTECTION; CUSTOMS DUTIES; FREE TRADE, with bibliographies. See J. S. Nicholson, *A Project of Empire*, 1909, and H. G. Williams, *Through Tariffs to Prosperity*, 1931.

Tariffs. **Tariff** comes from the Arabic *tarif* (notification) via the It. *tarifa* (arithmetical, ratobook), and means (a list of) duties or customs to be paid on imports (usually) or exports; or the law imposing them. T. are imposed for protection or revenue purposes. Although the United Kingdom abolished protective T. in the nineteenth century a number of T. were retained for purely revenue purposes (on tea, coffee, wine, spirits, etc.), excise duties being imposed as necessary to offset any protective effect. T. may be levied on weight or value, percentage duties on value being known as *ad valorem* duties.

The article on customs duties (q.v.) discusses early Eng. T. and cites the consolidating enactments of 1787, 1853, and 1876. The same article, together with Free Trade (q.v.), gives an outline of United Kingdom T. since the Free Trade era. The latter article, with economics (q.v.), discusses developments since the 1930s and refers to the General Agreement on Tariffs and Trade (G.A.T.T.) of 1947. In the U.S.A. the first Congress, in 1789, enacted a tariff which served not only to provide revenue but also gave useful protection. After the 1812-15 war with Great Britain, T. were raised to stem the flood of Brit. goods, with further measures of protection up to early in the 1830s, when a tendency towards lower T. prevailed generally up to the civil war of 1861-65. After the

war the Republicans passed a number of high duty T. up to and including the Hawley-Smoot tariff of 1930, interrupted from time to time by lower T., such as the Wilson-Underwood tariff of 1913, promoted by the Democrats. The effect of the 1930 Act has been much reduced, following its amendment in 1934 by the Reciprocal Trade Agreements Act empowering the president to reduce duties by 50 per cent. By 1939 agreements had been made with twenty-one countries. Further powers were given later, and further reductions negotiated at Geneva in 1947 under G.A.T.T.

In his *Introduction to World Economics* (1947), E. M. Patterson cites figures giving some indication of tariff levels before and after the spate of protectionism that was associated with the great slump of 1931-32:

Tariff Levels: 1925

Over 40 %	Spain
Over 25 %	U.S.A.
20-25 %	Argentina, Hungary, Poland, Yugoslavia
15-20 %	Australia, Canada, Czechoslovakia, Italy
10-15 %	Austria, France, Germany, India, Sweden, Switzerland
5-10 %	Belgium, Denmark
Under 5 %	Netherlands, United Kingdom

From report, *Tariff Level Indices*, prepared for International Economic Conference, 1927:

Comparative Tariff Levels: 1937

465	Spain	118.3	United Kingdom
359.6	Turkey		
279	Germany	110	Argentina
239.4	Brazil	100	U.S. (base)
166	Greece	98	Japan
160	Hungary	96.8	Belgium
150.5	Italy	85	France
149	Mexico	76.3	Canada
130	Egypt	37.4	Netherlands
128	Switzerland	32.8	Sweden

From *How High are U.S. Tariffs?* (Amer. Tariff League, Inc., 1942).

Tarn: 1. Dept. in the S. of France, once forming part of Languedoc, bounded on the N. by Aveyron. The chief rivs. are the Tarn, Agout, and Aveyron. There are two arrons., Albi and Castres. The cap. is Albi. Area 2231 sq. m. Pop. 297,900. 2. Riv. of France, rising in the Cévennes and flowing into the Garonne. The chief tns. on its banks are Albi and Montauban. Length 225 m.

Tarn-et-Garonne, dept. in the S. of France, formed from parts of Guienne (Bas-Quercy), Rouergue, Armagnac, and Languedoc. The chief products are cereals, fruit, and wine, and the chief manufs. woollen and silk goods. There are two arrons., Montauban and Castelsarrasin. The cap. is Montauban. Area 1440 sq. m. Pop. 164,300.

Tarnopol: 1. Region of the Ukrainian S.S.R. 2. Cap. of the above, 78 m. E.S.E. of Lvov. Pop. 35,900.

Taro, see COCCO.

Tarots, see CARDS, PLAYING.

Tarpon (*Megalops atlanticus*), giant herring plentiful in warm Amer. seas. It grows to a length of 7 ft. or more, and to a weight of over 200 lb., the scales, which are tough like thin horn and are made into ornaments, sometimes being as much as 5 in. in diameter.

Tarquinius, name of a family in early Rom. hist., to which the fifth and seventh kings of Rome belonged: *Lucius Tarquinius Priscus* (616-579 B.C.), fifth king of Rome, was beloved by his people on account of his wisdom and courage. He defeated the Latins and Sabines, and tradition relates that he also defeated the Etruscans. He is reputed to have modified the constitution and to have begun the building of the sewers and the Circus Maximus. He was murdered after a reign of thirty-eight years. *Lucius Tarquinius Superbus* (534-510 B.C.), the seventh and last king of Rome. His cruelty and tyranny obtained for him the surname of 'Superbus,' but, though a tyrant at home, he raised Rome to great influence and power among the surrounding nations. He defeated the Volscians and took Gabii. Owing to his son Sextus's rape of Lucretia, the wife of his cousin, T. Collatinus, T. Superbus and his family were exiled in 510 B.C. The people of Tarquinii and Veii took up his cause and marched against Rome, but they were unsuccessful. T. next obtained the help of Lars Porsenna, king of Clusium, who marched against Rome, but was induced to make peace with the Romans. Thereupon T. took refuge with his son-in-law, Octavius Mamilius, who induced the Lat. states to declare war against Rome, but they were defeated in the battle of Lake Regillus. T. then fled to Aristobulus at Cumæ, where he died.

Tarragona: 1. Maritime prov. in the N.E. of Spain, bordering on the Mediterranean. On its fertile mt. slopes are vineyards and orchards, producing excellent wine and fruit. Olive oil, silk, wheat, and hemp are produced. There is much forest land, yielding valuable timber, whilst copper, lead, silver, limestone, and marble are found. Area 2426 sq. m. Pop. 360,900. 2. (Anct. **Tarraeo**), seaport and cap. of the above, at the mouth of the Francoli, 45 m. W.S.W. of Barcelona. Pop. 33,700.

Tarshish, in sacred geography a far-distant locality, rich in silver, iron, tin, and lead (Ezek. xxvii. 12). The largest ships of those days were called 'ships of Tarshish' (e.g. Ezek. xxvii. 25). It is commonly identified with the anct. Tartessus (*ῥαψαρσος*), situated in the S. of Spain, which in the eighth and seventh centuries B.C. was under Phœnician hegemony. Less probable is the identification of T. with Tarsus (*ῥαρός*), an anct. city in the plain of Cilicia, nearly 20 m. W.S.W. from Adana. c. 2 m. from Tarsus cavi (the anct. *Cydneus*).

Tarsier (*Tarsius spectrum*), small lemur-

oid primate, a native of the E. Indies. They are about the size of a small rat, have very large eyes, very long ankle bones, sucker-like disks on the fingers and toes. The T. lives in trees, is nocturnal in habit, and feeds mainly on insects. Its skull closely resembles the ape type.

Tarsus, city of Cilicia in Asia Minor, near the R. Cydnus, represented to-day by the modern Tersous. It was the bp. of St. Paul.

Tartans. The brilliant striped and checked material known in Gaelic as *breacan* (checked material) is said to have been noticed, even by the Romans, as characteristic of the Celtic peoples. From the earliest medieval times it had become distinctively Scottish, and in primitive times, at any rate, the number of colours in the *breacan* indicated the wearer's rank. Bright though the colours of the T. are in themselves, those formed with vegetable dyes were at a distance and amongst the heather much less noticeable than would be imagined, though for rough wear the heavier and darker cloth (*cuth dath*), of soberer hue, was worn, and from this has evolved what are known as hunting T., often found in cases where the clan sett is particularly brilliant. Whilst the use of *feileadh-beag* or *breacan feile* are noticed by almost the earliest chroniclers, chiefs and chieftains who required to ride appear to have frequently worn the plaid and trews (*truabhos*), viz. tight hose and breeches of *breacan* cut on the cross, and accounts of these occur in documents regarding both the Lord of the Isles and King James V.

The use of T. of different patterns or setts as a clan or family distinction is a feature peculiar to Scotland, and of the great social system of clanship in which the essential link is a theory of kinship between the chief and the people of the clan, though in the large clans subdivisions into chieftains and setts have arisen for historical reasons. The 'clan tartan' was prized not so much for its distinction as because it was the accustomed and ancestral sett peculiar to the race. In many cases, however, the sett had evidently a local or 'district' origin. Some of these from long tenure came to be associated with the dominant clan, others have to this day remained 'district setts' appropriate for wear by any one connected therewith, irrespective of name. Other setts appear to have been from quite an early period associated with a certain clan or family, rather than with a dist. These are the clan T. It was, of course, not until late in hist. that such distinctions were consciously recognised, for an anct. system of dress or identification is seldom deliberately invented, but grows through centuries of custom. The colours of the T. were originally chosen because they pleased their wearers, and it was probably by no deliberate intent, but by continued repetition and sustained connection with successive generations, that these became indolibly associated with clan or dist., as the case might be.

The use of clan T. by border and lowland houses has sometimes been criticised,

but by the early eighteenth century, and at the date of the Union, 1707, the tartan garb of the old kingdom of Alban had come to be recognised as the national garb of Scotland, and, as such, was freely worn in the cap, and adopted in 1715 for the uniform of the Royal Company of Archers, whilst the border clans also adopted T. about this period. After the Jacobite rising of 1745 the use of T. and highland dress was suppressed by an Act of Parliament, which was not repealed until 1782, and this unhappy suppression not only involved the loss of many of the old clan setts, but has rendered it difficult to determine with certainty the antiquity of many patterns, a number of which date only from those which were hurriedly devised to meet the demand which arose when the Act was repealed. In recent years many scraps of older clans and dist. designs have come to light, and many of these are being again called into use. It has to be recollected that accuracy in detail was not a feature of medieval life, and that often a general hue was what mattered, rather than the detail of a sett, which might depend upon the fortuitous presence or absence of some particular dye.

The dyes used by the highlanders in colouring their T. were produced from lichen roots and highland plants, the colours so produced being mellow and more lasting than the somewhat harsh tints of nineteenth-century aniline dyes. Moreover the texture of the old T. was much harder, and examples of these old materials, from one to two hundred years old, are still in existence with their colours as bright as on the day they were made.

See Wm. Anderson & Sons Ltd., kilt-makers, Edinburgh, *The Scottish National Dress* (6th ed.), from which the above article is reprinted, with permission. See also R. Bain, *The Clans and Tartans of Scotland*, 1938, and Sir Thomas Innes of Learney, *The Tartans of the Clans and Families of Scotland*, 1938, 1947.

Tartar, see CAUCASUS; TATAR REPUBLIC.
Tartar Emetic, or **Potassium Antimonyl Tartrate** ($C_4H_4O_6K(SbO) + 4H_2O$), prepared by boiling potassium hydrogen tartrate with antimonious oxide and water. It is readily soluble in water, and is used in dyeing as a mordant and in medicine as an emetic.

Tartaric Acid, or **Dihydroxysuccinic Acid** ($C_4H_4O_6$), commonly occurring vegetable acid, contained in grapes and other fruits. During the later stages of the fermentation of grape-juice, impure potassium hydrogen tartrate or argol is deposited. From this salt the commercial acid is prepared.

Tartar Republic, see TATAR REPUBLIC.
Tartars and Tartary, see TATARS.

Tartarus, son of Æther and Gæa, and by his mother Gæa the father of the Gigantes, Typhoeus and Echidna. In the *Iliad* T. is a place beneath the earth reserved for the rebel Titans, as far below Hades as heaven is above the earth. Later poets use the name as synonymous with Hades.

Tartu, see YWRICKFF.

Tashi, or **Tesho Lama**, see under LAMAISM.

Tashkent: 1. Region of the Uzbek S.S.R., with the Kazakh S.S.R. to the N., the Kirghiz S.S.R. to the N.E., and the Tadzhik S.S.R. to the E. and S. 2. Cap. of the Uzbek S.S.R., the largest city and the cultural and economic centre of central Asia, on a trib. of the Syr-Daria. 160 m. N. of Samarkand. Pop. 590,000.

Tasman, **Abel Janszoon** (1603-59), Dutch navigator and explorer, b. at Lutjegast. After journeys in China and India, he was sent by the Dutch East India Company to investigate the extent of Australia. He discovered Van Diemen's Land, later renamed Tasmania, in 1642, and also New Zealand, the Fiji and Friendly Is., and the gulf of Carpentaria. His jour. appeared in an Eng. ed. in 1898.

Tasman Glacier, in the S. of the South Is. of New Zealand, discovered in 1862 by Julius von Haast. It has a total area of just over 20 sq. m., and lies practically at the base of the mt. heights of the Southern (New Zealand) Alps.

Tasmania, one of the seven states of the Commonwealth of Australia, an is. separated from Victoria by the Bass Strait, which is about 140 m. wide. It lies between the parallels of 40° 40' and 43° 38' S. lat., and 144° 30' and 148° 30' E. long. A little smaller than Scotland, it is the smallest of all the Australian states as well as the most temperate and pleasant. The N. coast forms a concave curve flanked by the is. groups of Furneaux (E.) and the Hunter and King Is. (W.). The N. and W. coasts are not greatly indented, but have some good harbours. The E. coast is much more indented, whilst the S. and S.E. coasts are formed of a series of curiously shaped peninsulas. Area, including dependent is., 26,263 sq. m. Pop. 257,100.

Physical Features.—It is conjectured that T. was once part of the mainland, the is. in the strait being, it is supposed, part of a mt. range that connected the two lands. T. is a beautiful, well-watered is., rich in harbours and inlets, crossed by high mt. chains, full of crags, glens, and ravines of bold appearance, the basaltic cliffs of some being sev. hundred feet in height. On the coast there are good anch. orages, and many excellent harbours.

The prin. is. belonging to T. are over fifty in number, the Furneaux group, at the E. end of Bass Strait, and off the N.E. corner of T., including Flinders Is., with an area of 800 sq. m.; Cape Barren Is., 170 sq. m., and Clark Is., 30 sq. m.; beside these are Chappell Is. and Kent's Group, aggregating about 40 sq. m. On these is. live a number of so-called half-castes, descended from the offspring of sealers and native women. Strictly, however, they are of mixed and almost untr. acceable ancestry.

T. has two mt. chains, separated by the cen. tal dist., through which is the communication between the N. and S. of the is. That to the E., or the dividing

range, has an average height of 3750 ft., and runs nearly N. and S., parallel with the E. coast. Among the peaks are Row Tor, or Mt. Arthur, 3895 ft.; Mt. Barrow, 4664 ft.; Mt. Victoria, 3900 ft.; Ben Nevis, 3900 ft.; and Ben Lomond, 5160 ft. The W. chain is an elevated table-land, averaging 3000 ft. in height, in the centre of the is., which contains all the large lakes and from which branch many ranges in all directions except eastward. From this table-land spring the peaks, Table Mt., 3600 ft.; Barn Bluff, 5115 ft.; Mt. Field West, 4700 ft.; Cradle Mt., 5069 ft., and a number of others over 4000 ft. In the S. is Mt. Wellington (4166 ft.), at the foot of which is Hobart.

The is. is well watered, and abounds in rivs., rivulets, and creeks, many of them rising from the lakes of the table-land, the average fall to the sea being estimated at 93 ft. per m. The prin. rivs. are the Derwent, about 130 m. long (on the estuary of which is Hobart, with a deep and sheltered harbour accommodating the largest vessels afloat), which issues from Lake St. Clair, receiving in its course the Rs. Nive, Dee, and Jordan from the N., and the Florentine and Russell from the S.; the Huon, about 100 m. in length, issuing from Lake Edgar, along whose shores the great apple orchards of the state are situated, and which receives the Cracroft and L'etion from the S., and the Weld and Russell from the N., and falls into D'Entrecasteaux Channel; the Coal R., rising in the E. chain of mts., and running S. into Pittwater. The mouths of these three rivs. are to the S.E. of T. To the S.W. and W. are the Davey R., the Spring, the Gordon, with tribs. the Wedge, Denison, Serpentine, and Franklin Rs., falling into Macquarie Harbour; King R., with its tribs. the Queen and Eden, also falling into Macquarie Harbour; the Pieman R., consisting of the Rs. Mackintosh, Marchison, Huskisson, and Donaldson; and the Arthur R.—these two last falling into the Southern Ocean. On the N., flowing into Bass Strait, are the Montagu, the Duck, the Inghis, the Mersey, and the Tamar (the last-named being navigable up to Launceston by inter-state steamers, or 40 m. from its mouth). The R. Gordon and King R. on the W. coast are of remarkable beauty. To the N.E. are the Piper, Little Forester, and Trent, rising in the W. slopes of Mt. Victoria and debouching into Ringarooma Bay. Flowing to the E. are the Anson, emptying into Anson Bay, the George, into George's Bay, Seamander, and Swan.

The W. coast of T. is bold, rocky, and inhospitable, but there are sev. accessible ports. The chief harbours are: on the W. coast, Port Davey (formerly much frequented by whaling vessels), Pieman R., and Macquarie Harbour; on the N. coast, Stanley, at Circular Head, Emu Bay, and Port Frederick, at the mouth of the Mersey; on the E. coast, George's Bay, Oyster Bay, Prosser Bay, Spring Bay, and Fortescue Bay. The S. and S.E. of the is. is studded with safe bays and harbours, the prin. being Port Arthur, Storm Bay, Norfolk Bay, Frederick

Henry Bay, D'Entrecasteaux Channel, Port Espérance, and Southport.

There are numerous extensive freshwater lakes on the elevated table-lands, the largest being the Great Lake, in the co. of Westmorland (3822 ft. above sea level), covering an area of upwards of 40 sq. m.; Lake Sorell, in the co. of Somerset, about 20 sq. m.; Lake St. Clair; Arthur Lake, and Lake Echo. These lakes form the head-waters of the prin. streams flowing S., W., and N.

Production, Manufactures, etc.—The vegetation of T. is practically identical with that of Australia; the eucalyptus is the most predominant feature. Of the 16,500,000 ac. comprised in the state, over 10,000,000 ac., mostly mt. land, are malicinated, of this area some 2,750,000 ac. being leased. The chief farm crops are wheat, oats, peas, turnips, potatoes, hay, and apples. Cereals of all kinds and root crops thrive in most parts of the is., the soil of decomposed basalt situated in the N.W. and N.E. being especially fertile. Hops grow well in the S. and the Tasmanian fruits—particularly apples—are well known. Apple production exceeds 7,000,000 bushels. Potatoes and mixed farming are accountable for much of the prosperity of the state. Wool production has reached an ann. value of nearly £3,000,000, butter production was nearly 11,000,000 lb. in 1947-48, and cheese over 1,000,000 lb. The chief minerals are copper, tin, silver, lead, zinc, gold, coal, and osmiridium. The total value of mineral output in 1947 was over £1,200,000. A rich copper-mining industry exists at Queenstown on the W. coast, that part of the is. being the chief source of minerals. Forestry is a great feature of T. The chief timber is the hardwood variety (eucalyptus), and the chief export timbers are the stringy-bark and blackwood, the former being used for bridges, railway sleepers, etc. and the latter for furniture and cabinet work. Other woods are huon, celery-top, and King William—all species of pine. Industries include woollen mills, jam and fruit-preserving factories, butter and cheese factories, tanneries, bricks and pottery, saw-mills, joinery and furniture, engineering, railway works, flour mills, boot and shoe factories, printing, and paper-pulp making. In 1947-48 exports were valued at £426,815,841, the prin. items being butter and cheese, fruit, preserves, copper, peas, potatoes, wool and woollen manufs., zinc, timber, and hides and skins. Imports were valued at £426,281,591. The two important manufs. for export are metal extraction and fruit preserving. Cheap electric power is a strong factor in the prosperous industrial hist. of the state, the Great Lake being a chief source. The chief tns. and centres are linked up with the railway system, which comprises 800 m. of track (614 being state-owned). Chief tns.: Hobart (cap.) city (pop. 57,000; with suburbs, 77,000), Launceston with suburbs (41,000), Devonport (8000), Burnie (8000), Deloraine, Latrobe, Lilydale, Scottsdale, Oatlands, Ross, New Norfolk, Geevestown,

Sorell. There is a univ. of T., estab. in 1890. Most of the primary teaching is at state schools. Secondary education is about equally divided between state high schools and the older endowed schools. There are also sev. technical schools. There are a supreme court, courts of petty sessions and general sessions.

History and Government.—T. was originally called Van Diemen's Land and was discovered by Tasman on Nov. 24, 1642. In 1777 it was visited by Cook, who thought it formed part of the mainland. Lt. Wm. Bligh planted Eng. fruit trees at Adventure Bay on Aug. 17, 1788, on the outward voyage of the *Bounty* to Pitcairn Is. It was proved an is. by circumnavigation by Bass and Flinders in 1798. Other notable explorers who visited the is. were Du Roesne (1772) Furneaux (1775), D'Entrecasteaux (1792-1793), and Hayes (1794). The earliest settlement, mostly of convicts, was estab. under Lt. Bowen at Risdon, on the R. Derwent, by Governor King of New S. Wales, in 1803. In 1804 another expedition reached Port Dalrymple (Tanna R.) and formed a settlement at George Town. The is. was used as a penal settlement, and increasing numbers of convicts were sent there after transportation to Australia had ended. The system ceased in 1853. In 1825 the is., which had previously formed part of New S. Wales, was proclaimed a separate colony, and in 1856 the name of Van Diemen's Land was changed to T. and responsible gov. granted. In 1901 T. united with the states of the mainland in establishing the Commonwealth of Australia. Parliament is bicameral, the House of Assembly (thirty members) being elected by adult suffrage by proportional representation by single-member votes in six-member constituencies, and the Legislative Council (nineteen members), with limited adult suffrage. The king is directly represented by the governor, who presides over the Executive Council. T. elects five members of the Commonwealth Lower House and six of the Upper House.

Aborigines.—These numbered in 1803 about 5000, but the pure aboriginal is now wholly extinct.

See H. L. Roth, *The Aborigines of Tasmania* (2nd ed.), 1914; J. B. Walker, *Early Tasmania*, 1914; G. Whitman, *Western Tasmania*, 1914; R. W. Giblin, *The Early History of Tasmania*, 1928; 39: State Development Board, *Tasmania: its People and Possibilities*, 1929; G. L. Wood, *The Tasmanian Environment* (2nd ed.), 1930; C. Barrett, *Isle of Mountains*, 1948; and *Tasmanian Almanack* (ann. pub.).

Tassigny, Jean de Lattre de (b. 1889), Fr. soldier, b. at Mouillereau-Pareds. He served in the First World War, and in 1940 was a general of div. In 1943 he escaped from imprisonment and joined Gen. de Gaulle. T. commanded the invasion force at Elba and the Fr. contingent in the allied landings near Marseilles in 1944. His First Fr. Army took part in the subsequent defeat of Germany. From 1945 to 1948 he was inspector-general of the Fr. Army, and in the latter

year became commander of the land forces of W. Europe.

Tasso, Torquato (1544-95). It. poet, son of Bernardo T., also a poet, b. at Sorrento. *See under ITALY, Language and Literature.*

Taste, in physiology, sensation caused by the application of certain substances in solution to organs situated on the tongue, and to a lesser degree on the soft palate, the uvula, and adjacent structures. Four Ts. are usually identified—sweet, bitter, acid, and saline. All the other delicately differentiated sensations usually referred to the sense of T. are really smell sensations.

Tatar, or Tartar, Autonomous Soviet Socialist Republic, autonomous republic of the R.S.F.S.R., formed May 27, 1920. It is bounded on the N. by Marish, Vyatka, and Votyak, on the E. by Molotov and Bashir, on the S. by Samara and Ulianev, and on the W. by Chivash. The R. Volga runs through it from N. to S., and its trib., the Kama, from E. to W., joining the Volga at Spask. The cap. is Kazan, since the revolution an important manufacturing centre, on the Volga. Pop. 402,000. There is a univ. at Kazan. Much of the area of the republic is covered with forests of oak, pine, fir, and other trees, and timber is an important industry. There are also extensive pastures which support sheep, from whose wool good cloth is manufactured. There are large iron-works and a powerful regional electric power station in Kazan, and cotton materials are made. Candles and soap are manufactured, and the T. republic is the source of the famous Russian leather. Area 25,950 sq. m. Pop. about 3,000,000. In the fifteenth century a T. kingdom was formed, with Kazan as its cap.; later Ivan III. made it a vice-regency. In the middle of the sixteenth century Ivan the Terrible incorporated Kazan with his own dominions, and the prov. of Kazan was formed in 1708.

Tatars, peoples of mixed ethnic linguistic, and cultural origin, nowadays speaking Turki languages, professing the Islamic religion with Shamanist influences, and inhabiting the steppe region of E. European Russia, Central Asia, and Siberia. The meaning of the term T. is unknown. The word T. appears in the Orkhon inscriptions (q.v.) of the eighth century A.D., and in later Chinese and Arabic sources, and refers to peoples speaking Mongolian languages and inhabiting the border regions of China, the ter. of present Mongolia and some neighbouring dists. It was later applied to Mongols of Genghis Khan, and particularly to Turki peoples, such as Bulgars, Qipchaks, Turkomans, and others, who preceded and followed the Mongolian invasion of Europe. In the fourteenth century the name Tartary was applied in W. European languages to a vast ter. (corresponding partly to S. Russia, and Central Asia) inhabited by T.

Tatary, *see under* TATARS.

Tate, Nahum (1652-1715), Irish poet, b. in Dublin, where he studied at Trinity College. He issued sev. vols. of poems, and was the author of some indifferent

plays, including an adaptation of *Icar*, which was defended by Dr. Johnson and kept the stage till late in the nineteenth century. His poem, *Panacea, a Poem on Tea*, is his best original work; the hymn, *While Shepherds watched their Flocks by Night*, is attributed to him. In 1692 he became poet laureate, and ten years later was made historiographer-royal. He is best remembered as the Tate of Tate and Brady's metrical version of the Psalms (pub. 1696).

Tate Gallery, The, at Millbank, London, S.W.1, contains the national collection of Brit. painting from the sixteenth century to the present day, of modern foreign painting from approximately 1800, and of modern sculpture. The T. G. contains unique collections of work of Turner and Blake, also one of the best collections in Europe of French Impressionists. Sir Henry Tate (1819-99), Brit. merchant and art patron, financed the building of the gallery on the site of Jeremy Bentham's 'Model' Penitentiary, and it was opened by King Edward VII. as Prince of Wales in 1897. This housed the Tate gift of sixty-five Brit. paintings, the collection purchased under the terms of the Chantry Bequest (q.v.) the Vernon Collection, bequeathed in 1847, and the Watts gift. Sir Henry Tate made possible the addition in 1899, of eight further galleries, and in 1910, through the generosity of Sir Joseph Duveen senior, the wing to house the Turner bequest of 1856, which had been in the possession of the National Gallery, was opened, while his son, Lord Duveen, gave an immense sculpture hall, opened in 1937. The nucleus of the collection of modern foreign art was estab. by the bequest of Sir Hugh Lane (q.v.) in 1915, and the endowment by Samuel Courtauld (q.v.) in 1923. The T. G.'s collections have been greatly enriched by many other bequests and gifts. During the Second World War the gallery was severely damaged, but repairs were carried out; the T. was partially reopened in 1946 and by 1949 all repairs had been completed. A series of important exhibitions have been held since 1946, including those of the works of Blake, Van Gogh, Chagall, Rouault, and Matisse, Richard Wilson, Alexander Cozens, and others.

Tatius, Achilles, *see* ACHILLES TATIUS. **'Tatler, The'**, weekly jour. pub. in London dealing with contemporary events in the social and theatrical worlds. Though largely pictorial it has a high literary content in continuation of the traditions of its founder, Sir Richard Steele (q.v.) who first pub. this jour. in 1709, writing for it 'The Lucubrations of Isaac Bickerstaff.' Addison (q.v.) who discovered the identity of the author at the eighteenth ed., became a contributor thereafter.

Tatra Mountains, *see under* CARPATHIANS.

Tatsienlu, Tibetan name of Kangtrung, cap. of Sikiang prov., China.

Tattersall's, name of the firm estab. in 1766 by Richard Tattersall for the purpose of selling horses by public auction. It transferred from Hyde Park Corner to

Knightsbridge Green in 1865, where the London offices still remain. To-day large bloodstock auctions are held at Park Paddocks, Newmarket, and at Glasgow Paddocks, Doncaster, at fixed times annually.

Tattershall, vil. of Lincolnshire, England, 8 m. S. of Horncastle. It has a famous castle, built about 1440, which is one of the finest and earliest examples of E. Anglian brick-work in England. It was bequeathed to the National Trust in 1926 by Lord Curzon, who had restored it. Pop. 400.

Tattooing (Tahitian *ta* = mark), custom of marking the skin with incisions which are filled with a colouring matter to produce an indelible stain. It is practised mostly by primitive peoples of light skin colour, the Polynesians, the Maori (*q.r.*), the Amer. Indians, and, to a limited extent, the Jap. The darker-skinned people, such as the Australian aborigines, practise scarifying, *i.e.* raising scars by rubbing an irritant into incisions instead of a coloured pigment, as the colour would not be so effective a decoration on their dark skins. T. was practised by Palaeolithic man, and figurines from the S.E. European Neolithic cultures have been found which are covered all over with spiral decorations. Among the Thracians it was a sign of rank. Caesar mentions the painted bodies of the Britons, and the Picts may have received their name from their practice of painting or T. The custom must have been widespread in prehistoric times. In later periods it was used mostly for identifying convicts and slaves. In the Brit. Army, until 1876, the letters B.C. = bad conduct, and D. = deserter, were still tattooed on soldiers. Now in civilised communities it survives among only certain sections of the pop., mostly sailors, as ornament, but it can be used to disguise birth-marks, or even to remove them, a neutral-coloured pigment being injected to obliterate any discoloration of the skin. Its origin lies in the desire to heighten personal attractions or else to make the individual look more terrifying in war. Among primitive people it is part of the initiation ceremonies at the time of puberty, boys and girls being tattooed between the ages of twelve and sixteen. Some peoples tattoo only on the face, others on the back, chest, arms, and thighs also, usually in a curvilinear decoration. The Amer. Indians tattoo the sign of their totem on those being initiated. In Polynesia it has been brought to a fine art. It is done with a sharp bone with the end cut into teeth, which is dipped in a solution of charcoal or cinnabar to produce black or red markings respectively. The tattoo lines follow and accent the features. The practice is now declining under the influence of the missionaries. See A. Lacasagne, *Les Tatouages*, 1881; H. G. Robley, *Moko or Maori Tattooing*, 1896; G. B. Sanson, *Japan*, 1946; and F. V. Scholes and R. L. Ross, *The Maya Chontal Indians of Acalan-Tixchel*, 1948.

Tau, see under CROSS.

Tauber, Richard (1892-1948), Austrian-

born Brit. singer and composer, b. at Linz. He studied music at Frankfurt-on-the-Main and Freiburg, and trained as a conductor for about two years. In 1913 he made his first appearance as a singer in opera, in Mozart's *Magic Flute*. He rapidly became a favourite on the European operatic stage, but later turned to operetta. He appeared in *The Land of Smiles* in London in 1931. T.'s compositions included the music for *Paganini* (1937) and *Old Chelsea* (1943). Critics frequently regretted his desertion of opera for operetta, since he was one of the outstanding tenors of his age. He became a Brit. subject in 1940. See life by Diana Napier Taulor, 1949.

Taucha, tn. in Saxony, Germany, 5½ m. E.N.E. of Leipzig. Pop. 6575.

Taunton: 1. Municipal bor., mrkt. tn., co. and assize tn. of Somerset, England, 30 m. N.E. of Exeter, 45 m. S.W. of Bristol. It is situated in the heart of the fertile valley of T. Deane and is sheltered on the N. and S. by the Quantock and Blackdown Hills. St. Mary Magdalene par. church is a stately Perpendicular fifteenth-century building, noted for its double aisles and monuments and for its fine tower. Other buildings of note are a twelfth-thirteenth-century leper house or leper hospital; Priory Barn, sole relic of an important twelfth-century Augustinian priory; and Gray's Almshouses (1635). T. castle is a Norman and Edwardian building and stands on the site of a Saxon fort. It contains the Great Hall in which Judge Jeffreys held his 'Bloody Assize.' Part of the municipal buildings originally housed the sixteenth-century grammar school, now known as King's College. T. is an agric. centre. Manufs. include shirts and collars and other textiles; leather goods; gloves; aeronautical instruments; agric., mining and other machinery; and cider. It is the seat of a suffragan bishop. T. existed in Saxon times, and had a market before the Conquest, though its last charter of incorporation was not granted until 1877. During the Civil war T. was held for Parliament, and later in the same century it witnessed the proclamation of Monmouth as king, and the brutalities of Judge Jeffreys and Kirke's 'lambs' (it was from the signboard of the White Hart Inn, now a shop, that Col. Kirke hanged Monmouth's rebels). The bor. is part of a co. constituency which returns one member to Parliament. Pop. 33,700. 2. City of Massachusetts, in Bristol co., of which it is the co. seat. It manufs. cotton goods, machinery, jewellery, stoves, and silver articles. It is about 30 m. from Boston. Pop. 37,400.

Taurica Chersonesus, **Tauric Chersonese**, or **Tauric Peninsula**, see CRIMEA.

Taurine ($C_4H_7NSO_3$), amidoethylsulphonic acid, a crystalline substance produced in the decomposition of bile.

Tauromenium, see TAORMINA.

Taurus, or the Bull, second sign of the zodiac (symbol ♉), contains the two well-known clusters, the Pleiades and the Hyades, the former being embedded in nebulous matter. The well-known Crab

nebula is also in this constellation, and the bright star Aldebaran (*q.v.*). Amongst other interesting objects in T. are the stars ζ and λ , the former a spectroscopic binary with a period of 138 days and the latter an eclipsing binary like Algol, the period being 3.9 days. Boss studied the Hyades cluster and showed that the motion of its stars was convergent. The average distance from the earth of the stars in this cluster is 120 light-years.

Taus, see DOMAZLICE.

Tautog, or **Black Fish** (*Tautoga onitis*), food fish which occurs off the Atlantic coast of N. America. It averages from 12 to 14 lb. and is much valued in Amer. fish markets.

Tautomerism, or **Dynamic Isomerism**, in chem., the phenomenon exhibited by various substances that appear to have two different constitutions. Thus ethyl acetoacetate in some of its reactions appears to have the constitution $\text{CH}_3\text{CO}\cdot\text{CH}_2\text{COOC}_2\text{H}_5$, while in others its behaviour corresponds to the formula $\text{CH}_3\text{C}(\text{OH})\cdot\text{CH}(\text{COOC}_2\text{H}_5)$. It has been shown that substances exhibiting T. are usually equilibrium mixtures of the two tautomeric forms. Both forms of ethyl acetoacetate have been isolated by Knorr.

Tavastehus, or **Hämeenlinna**, cap. of the dept. of Häme, Finland, 60 m. N.N.W. of Helsinki. Its castle, dating from the Middle Ages, was formerly used as a prison. Sibelius was b. in T. Pop. 6500.

Tavern. For the law of Ts. see INNS AND INNKEEPERS; LICENCES AND LICENSING LAW.

Tavernier, Jean Baptiste, Baron D'Aubonne (1605-89), Fr. traveller, b. in Paris of Protestant parents, and commenced his career as a traveller in 1631, when he went to Turkey and Persia. During succeeding years he travelled much in the E., visiting many places in Persia, Syria, and India. Finally he travelled through Batavia, and returned via the Cape. He pub. his famous *Six Voyages* in 1676. See study by Foret, 1886.

Tavilah, see KISHM.

Tavistock, mkt. tn. and urb. dist. of Devonshire, England, 15 m. N. of Plymouth, on the R. Tavy. It forms one of the gateways to Dartmoor. It is connected with the Tamar by canal. Known as the 'Gothic Town of the West' it has sev. fine buildings, chief amongst which are the par. church of St. Eustachius (fourteenth century), and the guildhall. There are also the remains of an abbey, founded in the tenth century, which was granted to the Russell family at the time of the Dissolution by Henry VIII. Part of this now constitutes a public library. T. is an agric. centre. The dist. around T. contains a number of fine Tudor manor-houses. T. forms part of a co. constituency. Pop. 6100.

Taxation, term applied to the method of raising the revenue required for public services through compulsory levies.

General Principles of Taxation.—There are two schools of thought as to the purpose of T. The older school, basing itself on Adam Smith and Ricardo, and flourishing during the free-trade era of the

nineteenth century, believed that T. should be designed solely to raise the revenue required by the expenditure authorised in the Budget. The newer school thinks that T. should also be used to promote social justice and equality. This was first taught in Germany by Adolf Wagner towards the end of the last century; but later this doctrine was generally accepted. In Britain, Lloyd George was the first to use T. as an instrument of social reform. The two wars, with the necessity for raising higher revenue and need for 'equality of sacrifice' by the whole pop. left no other choice but to design T. in conformity with the prevailing ideas of social equality. The Second World War especially brought a redistribution of incomes and through income tax and surtax extinguished very high incomes considered as unsocial. With the increase of public expenditure (and the consequent need for permanent high T.), a third aim of T. became generally accepted. It is now also used as an instrument of general economic policy in order to contribute to general stability (in addition to the traditional means of monetary policy) or to achieve specific aims. Examples are maintenance of high rates of income tax at periods when inflation is threatened and levy of higher rates of purchase tax on goods which would be particularly suitable for exports.

In addition to these general principles of T., economists are still discussing the four canons or maxims set out by Adam Smith on the standards by which the quality of a tax should be judged. These maxims are (1) Equality. The subjects of the State should contribute to the support of the State as nearly as possible according to their ability. (2) Certainty, not arbitrariness. (3) Convenience of payment. (4) Economy of collection. It is clear that these principles cannot always be realised and are incomplete in the light of present conditions; but there have been no generally accepted canons evolved by the modern theory of public finance.

Classification of Taxation.—Taxes can be classified according to a number of different principles, e.g., the tax base (land tax, income tax, etc.), the media of payment (money, payment in kind, payment in labour—the last two of no significance in modern times), the regularity of levy (income tax to be paid annually, special contribution from capital only once). The distinction of direct and indirect taxes is based on the assumptions regarding shifting, as Mills says: 'A direct tax is one which is demanded from the very persons who it is intended or desired should pay it. Indirect are those which are demanded from one person in the expectation and intention that he shall indemnify himself at the expense of another, such as excise or customs.' In some cases, the classification is arbitrary, and relates in practice rather to the method of collection than to incidence.

A second problem, which occupies the theory of T., is that of *shifting* and

incidence. It is clear that if the gov. collects a tax on cigarettes from the manufacturer, the amount of the tax is passed on to the consumer in the price of the cigarettes. This transfer of the burden of the tax from the original payer to someone else is called *shifting*. This may take place from the original payer to someone else only once (e.g. the rates from the landlord to the tenant of a dwelling), or through a whole chain of economic relationships (from the tobacco manufacturer to the wholesaler to the retailer to the consumer). *Incidence* of the tax is on that group which cannot shift it any further. Taxes which are levied on large classes of the pop., e.g., income tax, cannot be shifted.

A further problem is the economic effect of T. Too high profit and income tax may act as a discouragement to enterprise. Too high rates of income tax on wages or a sudden steep rise after a certain amount of income may act as a discouragement to the worker, who does not feel it worth while to work overtime if he has to pay to the state a large part of his additional earnings.

Licence revenue obtained as the result of an ann. tax on the right to use a certain commodity (e.g. a wireless receiving set) may be classed as a direct tax, whereas a tax on enjoyment or consumption may be classed as indirect if the impact and incidence fall on different parties. Taxes such as the Brit. entertainment tax imposed in 1916 or the purchase tax on certain articles imposed in 1910 fall in this second class, but there is no distinction in kind between a periodical tax on the continued enjoyment of a commodity while it remains in use and a tax on its enjoyment in the form of a once-for-all tax paid at the time of its purchase. Modern economists therefore make a truer distinction between (1) income and capital taxes on the one hand and (2) outlay taxes on the other. T. in the first category includes (1) taxes on net incomes which are progressive as they allow liability to be adjusted in accordance with ability to pay; (2) taxes on profits, and (3) capital taxes, strictly a levy on capital, but estate and succession duties are also included under this head. The second category—outlay taxes—includes taxes on commodities. An outlay tax is a tax on consumption assessed either on the value of the commodity or in the form of a licence. When assessed on the value of the goods, the tax is either *ad valorem*, i.e. related to the selling price, or specific, i.e. reckoned in accordance with quantity. Outlay taxes in the United Kingdom are generally specific in character. The 'property tax' or tax on the ownership of real estate, although allied to income tax, is strictly an outlay tax, and similarly when assessed on the occupier or tenant in the form of rates, the tax is analogous to the licence for the use of a commodity.

According to a calculation made by the Economic Co-operation Administration Mission to the United Kingdom, the total tax burden rose by 235 per cent in the United Kingdom, and by 290 per cent in

the U.S.A. from 1938 to 1948. Total T. accounted for 26 per cent of the national income in Britain and for 19 per cent in the U.S.A. in 1938; in 1948 the proportion was 43 per cent in the United Kingdom and 27 per cent in the U.S.A.

Taxidermy, art of preparing the skins of vertebrate animals so as to give them the appearance of life and preserve their characteristics as nearly as possible. The art began to be practised in the sixteenth century, and the Sloane collection, which formed the nucleus of the natural hist. collection at St. Kensington, was made in the early eighteenth century.

Taxing Master, see COSTS.

Taxus, see YEW.

Tay, riv. and firth of Scotland. It rises on the borders of Argyllshire in the Grampians, and flows first of all in a N.E. direction and then at the confluence of the Tummel in a S.E. direction. It flows through Perthshire and its estuary forms the div. between the cos. of Forfar and Fife. Its chief tribs. are the Tummel, the Braan, the Almond, and the Earn. The Earn joins it at its estuary. The total length of the riv., including the firth, is 115 m. It is crossed at Dundee by the famous T. Bridge. Part of the first bridge, opened in 1878, was blown, together with a train passing over it, into the riv. in 1879. The present T. Bridge was completed in 1887. The chief port is Dundee, but shoals prevent navigation to this port being very good. The riv., however, is navigable as far as the tn. of Perth. The total area of the T. basin is nearly 2500 sq. m. It is famous as Scotland's most important salmon riv.

Tay, Loch, one of the lochs which are found in the course of the R. Tay. It is situated in Perthshire, not very far from the source of the riv. and before the riv. joins the Tummel. There is good fishing in the loch.

Taylor, Jeremy (1613-67), Eng. divine, b. at Cambridge and educated at Gonville and Caius College, Cambridge, and Univ. College, Oxford. He took holy orders in 1634. His sermons attracted the attention of Laud, who interested himself in T., and sent him to Oxford, where he was elected to a fellowship at All Souls in 1636. He became chaplain to Laud and shortly afterwards was appointed one of the king's chaplains. In 1643 he was made rector of Overstone, and two years later was

taken prisoner by the Parliamentary forces at Cardigan Castle. He settled at Gordon Grove, Carmarthenshire, and wrote his well-known works, *The Liberty of Prophesying* (1646), a noble and comprehensive plea for toleration; *The Rule and Exercises of Holy Living* (1650); and *The Rule and Exercises of Holy Dying* (1651). His more formal treatises include *An Apology for Authorised and Set Forms of Liturgy* (1646); *The Worthy Communicant* (1660); *The Rite of Confirmation* (1663); and *Ductor Dubitantium, or the Rule of Conscience* (1660), the subtlest of his works, and intended as a handbook of Christian ethic. After the Restoration he was appointed bishop of Down and Connor and made vice-chancellor of Dublin Univ., and was also made 'administrator' of the diocese of Dromore; but his desire for an Eng. bishopric was never gratified, though his claims for such preferment were incontestable. T. was also appointed a member of the Irish Privy Council. His tenure of the Irish bishopric was apparently unhappy: T.'s strict episcopalianism and extremely High Church views made him unpopular among his clergy and his Irish Protestant congregations. T. was one of the most literary of churchmen, and his books are still regarded as among the masterpieces of theological literature. His prose style had a nobility and passion which invites comparison with that of Bossuet. He was a brilliant scholar of the late Renaissance period, but his writing is distinguished not only by its logic, but by its imagination, purity, and complete sincerity. His works were first collected by Bishop Reginald Heber in 1822 and these were revised by C. P. Eden (1847-52). The *Poems and Verse Translations* were edited by A. B. Grosart (1870). See lives by T. S. Hughes, 1831; E. Gosse, 1904; and W. J. Brown, 1925.

Taylor, Zachary (1784-1850), twelfth President of the U.S.A., b. in Orange co., Virginia. He entered the army in 1808, and distinguished himself in sev. engagements against the Indians. After the annexation of Texas he resisted the Mexican invasion, winning the battles of Palo Alto and Resaca de la Palma and seizing Matamoros and Monterey, and later gained the memorable victory over Santa Anna at Buena Vista in 1847. On his return he was elected President (1848) as a Whig, just at the time when the struggle over the extension of slavery had begun, but he died during the compromise of 1850. Though a Southerner and slave owner, he declared in favour of the admission of California as a state where slavery would be forbidden.

Tayport, or Ferry-Port-on-Craig, tn. in the co. of Fife, Scotland, on the shore of the frith of Tay, 3½ m. E.S.E. of Dundee. It has foundries, engine works, and timber yards, and linen and jute are manufactured. Pop. 3400.

Tchekov, see under **G.P.U.**

Tchekov, or **Chekhov**, **Anton** (1860-1904), Russian novelist, short-story writer, and dramatist, b. at Taganrog. He came of peasant stock. His father was a clerk and later a shopkeeper at Taganrog. T. was brought up in an atmosphere of dismal religious strictness which resulted in his having no religion later, though the discipline inspired in him his characteristic knowledge of and sensitiveness to the Russian language. Educated first at a par. school and then at a grammar school, he developed into a lively, witty youth, the life and soul of his schoolfellows, even then writing farces. At the age of sixteen he began to earn his living as a tutor, and then went to Moscow Univ. as a medical student, where very soon he began literary hackwork to keep his father's family from starvation. In 1882 he wrote humorous articles for a paper called *Fragments*, meeting with no success with serious efforts. Ten years later he set up as a doctor near Voskressensk, his experiences in that capacity serving later as a theme for much of his work, especially *The Three Sisters*. His stories *A Horselike Name* and *Huntsman in the St. Petersburg Gazette* attracted the notice of literary celebrities and secured for him an opening in the *Noroye Vremya*, where his work took on a serious turn. His fame began to spread. In 1888 *The Steppe* appeared in *Sverny Vestnik*, the leading magazine, and soon after his *In Twilight* and *Gloomy People* brought him the Pushkin prize. Generally, however, impecunious, he worked harder than ever, his health broke down, and he developed signs of consumption. This notwithstanding, he now began writing plays, his first, *Ivanov*, appearing with success in 1887; this was followed by *The Wood Demon*, later produced at Moscow as *Uncle Fanga*. This latter play was not successful, and apart from vaudevilles he wrote no more plays for some years. In 1890-91 he went to Sakhalin for his health, returning to Melikhovo for medical practice. In the next few years appeared his best stories: *The House with the Mezzanine*; *The Black Monk*; *Murder*; and *Mouchiks*, etc. Many of these concern peasant life, which, contrary to convention, he handled realistically, and it is from this type of his stories that a vast Russian literature has arisen. He resumed playwriting in 1895 with *The Seagull*, produced at St. Petersburg. In 1900 T. was elected a member of the Academy of Sciences. In 1904 was performed *The Cherry Orchard*, his most famous play. In this year his health so declined that he again went abroad, dying in Germany, his body being removed to Moscow for burial. T.'s interpretation of modern culture has been compared not inaptly with the religion of H. G. Wells, for he also has it that God is the spirit in the world, that, like transcendental imagination, contrives to make good use of opportunities offered by ever-changing nature. He manifested an increasing interest in subjects of the social order in

his works, as in *The Fil* (the problem of prostitution) and in his peasant studies; but he never posed political problems. Among his other works are *My Life*, a long story with scenes from Taguurog (1896), and *The Duel* (1891). His influence on the form of modern drama and the short story is incalculable. He made both the setting for the release and analysis of emotion: through a nondescript Russian prov. family he attempted to portray universal aspirations and emotions. This aspect of T. has had lasting effect upon Eng. and Fr. literature: traces of his influence are especially apparent in the work of Lawrence. Katherine Mansfield, and Elizabeth Bowen. In his own country his vivid impressions of bourgeois and peasant 'futilities' were to have social repercussions; Gorky acknowledged his debt to T.'s realism, but his literary influence in Russia has been less direct than in W. Europe. See W. Gerhardt, *Anton Chekhov: A Critical Study*, 1923; L. S. Friedland (ed.), *Letters on the Short Story, the Drama, and other Literary Topics by Anton Chekhov*, 1924; S. S. Kotchansky and P. Tomlinson (trans. and ed.), *The Life and Letters of Anton Tchekhov* (bibliography), 1925; M. Gorky, *Reminiscences of Tolstoy, Chekhov, and Andreyev*, 1934; Nina A. Tea, beverage used since a remote period in China, but unknown in England until 1657. Though it at once attracted great interest it was obtainable only by wealthy people until about 1750. At first it was infused and kept in barrels, being drawn like beer, and warmed for use. In 1660 a tax of 1s. 6d. was imposed per gallon of liquid tea, but in 1680 a tax of 5s. per lb. was substituted. Since 1852, when the tax was 2s. 2½d. per lb., it has been down to 4d. in 1890, and was 5d. just before the First World War. In 1929 the duty of 4d. on foreign and of 3½d. on empire T., was repealed. The duty was reimposed in April 1932, the rates for foreign and empire teas being 4d. and 2d. respectively. These have since been altered from time to time. Consumption in Britain in 1949 was just over 400,000,000 lb., or just under 9 lb. per head of the pop.; of this about two-thirds is Indian T. The first shipment of Indian T. was made from Assam in 1839. T. is derived from *Camellia Sinensis*, which is indigenous to Assam and China. The young leaves and shoots (the 'flush') are picked from the bushes by women. After gathering they are taken to the factory, spread thinly over wire or bamboo trays, and placed on wire or hessian racks to wither, after which

they can be rolled without breaking. The length of time required for withering depends on climatic conditions, the shortest time being about twelve hours, and the average, twenty-four hours. During the wet seasons, and in specially humid areas, the leaves are withered by artificial heat. The next process, that of rolling, is done entirely by machine so far as general commercial production is concerned. It causes the juice to be exuded, and it imparts to the leaf the twist characteristic of its manufactured state. The leaf is then spread out thinly in the fermenting room, where the air is kept moist, and there in a few hours it changes from green to copper colour. It is then 'fired' by being spread on trays which pass through a hot-air chamber. After being sorted or classified, a process carried on in modern factories by machinery, the T. is then packed for export.

In making T. the water should be fresh and freshly boiled, and after pouring over the T., should be allowed to stand for three to five min., when the T. should be poured off the leaves. More than half the T. exported from T.-producing countries is consumed in Great Britain and N. Ireland. In relation to imports the next largest consumers—outside the producing countries—are the U.S.A., Australia, and Canada. After the outbreak of the First World War, internal troubles and national poverty greatly changed the ability of Russia to purchase this beverage, but in theory, at all events, Russia remains one of the great T.-drinking nations. During recent years T. has gained increased popularity in the U.S.A. Until the beginning of the Second World War, London was the chief T. market of the world, and the prices at the London sale-rooms estab. values in every country, with the possible exception of China. This results from the fact that Chinese T. is marketed in a different way from the T. of other lands, the purchases being usually made in China on behalf of importers instead of the T. being exported to London and elsewhere for sale by auction. But even in the case of China, prices were largely influenced by results in the London sale-rooms. The Eng. T. trade was, however, temporarily disrupted by the impact of war. T.-producing areas of the world are India and Pakistan, Ceylon, Indonesia, and E. Africa. There are over 840,000 ac. of T. in India and Pakistan, and in 1950 their production was about 600,000,000 lb., with exports of more than 350,000,000 lb. Ceylon, the next most important T.-growing area, has over 550,000 ac. under cultivation, and exports for 1950 were about 300,000,000 lb., of which about one-third reached the United Kingdom. Before Japan's occupation of Indonesia in 1942, Sumatra and Java had some 500,000 ac. under cultivation, with an ann. production of about 160,000,000 lb. of T. In E. Africa the prin. T. growing countries are Nyasaland, Kenya, Uganda, and Tanganyika. They grow over 50,000 ac. of T. with an output of 30,000,000 lb. per year. India, Ceylon, and Indonesia gradually

supplanted China as the world's chief source of T., and by 1939, together with E. Africa, they supplied some 83 per cent of the world's T., while China supplied less than 10 per cent. To regulate the exports of T. from these four T.-producing areas, the International Tea Agreement was signed in April 1933, and it was renewed in 1938. Japan and Formosa have endeavoured to increase their trade in T. during recent years, and by the outbreak of the Second World War they were exporting nearly 66,000,000 lb. of T. per annum. T. trade has always interested the Brit. merchant and investor, and many of the best tea gardens of the E., particularly in India and Ceylon, are controlled by Brit. companies. Much also of the continental T. trade is Brit. For maté or Paraguay T., see MATE. See O. Lancaster, *The Story of Tea* (new ed.), 1947, and R. D. Morrison, *Tea—Its Production and Marketing* (revised), 1948; and *Tea: a Progressive Industry*, 1950, all pub. by the Tea Centre.

Teaching, see under EDUCATION.

Teak, Asiatic timber tree growing in various countries, though the wood is provided chiefly by the true teak, *Tectona grandis*, a species of the family Verbenaceae. It reaches a great height and bears panicles of small white flowers. The wood is deep yellow to dark brown or almost black, in colour. Its primary use is in shipbuilding, where the essential oil contained in it has the desirable quality of non-corrosion of the metal fittings, the metal decks on which it lies, and the bolts that stay it down.

Teal (*Querquedula crecca*), kinds of small fresh-water duck. The male, in general colour, is dusky grey; tail-feathers ashy grey; crown of head deep cinnamon or chestnut; the eye is surrounded by a black band, glossed with green or purple, which unites on the nape; wing markings black and white; bill black and resembling that of the widgeon. Total length 14–15 in.

Teallach, An, picturesque and dominating twin-peaked mt. in W. Ross, Scotland, giving its name to range rising on S. side of Little Loch Broom. Bidean a' Ghlas Thuill, 3483 ft. is the higher. 'A.T.' means 'The Forge' because of the smoke-like mists around its peaks.

Tea, Paraguay, see MATE.

Tea Rose, see under ROSE.

Tears, secretion of the lachrymal gland. See also EYE.

Teasel, or **Teazel** (*Dipsacus sylvestris*), common Brit. biennial herb, of the order Dipsacaceae, found on roadsides and under hedges. In the first year it forms a large rosette, flat upon the ground, of oblong, lance-shaped leaves, with prickly midribs. The flower stems in the second year reach a height of 5 or 6 ft. They are rough and spiny, and have cylindrical flower-heads of small tubular purple flowers.

Teheassa (anct. Theveste), tn in Algiers, in the dept. of Constantine, famous for its Rom. ruins.

Tebeth (Esther ii. 16), tenth month of the Jewish calendar (or fourth month from Tishri (q.v.), corresponding to Dec.-Jan.

Technical Education, system of instruction the aim of which is directly utilitarian, especially in relation to productive industries. In the wider sense of the term, any branch of knowledge which is a necessary preliminary to any particular profession or trade is technical, such as the instruction received by medical students, law in connection with the legal profession, the principles of art as studied by artists with a view to their application, etc. For administrative purposes, however, the term is practically restricted to instruction in industrial and commercial processes, art and handicrafts, etc. It is directed towards those wishing to enter industry or commerce, and as such embraces every aspect of industrial organisation, as well as including specialised training in certain trades, e.g. engineering. See further under EDUCATION, *Technical Education*; IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY.

Technicolor, leading colour process employed in modern cinematography. The first T. films were made about 1926: a special lens and filters were used to obtain a two-colour image, which was based upon the principles known as the additive process. This was later abandoned when the two-colour subtractive process was introduced, which was followed by the three-colour subtractive process, the system now employed. The T. three-colour camera photographs the three primary aspects of a scene (red, green, and blue) upon three separate film strips, simultaneously, at normal speed, without fringe or parallax, in balance, and in proper register with each other. These separate strips are developed to negatives of equal contrast and are always considered and handled as a group. From these colour-separation negatives, printing is carried out by projection through the celluloid upon a specially prepared stock, which is then developed and processed to produce positive relief images in hardened gelatin. These three reliefs are then used as printing matrices which absorb dye. The dye is then transferred by imbibition printing to another film strip which, when it has received all three transfers, becomes the completed print ready for projection. This process is designed to reproduce whatever is placed in front of the camera, not only as to colour, but also as to light and shade.

The T. process reproduces a full scale of contrasts and effects of light and shade, and consequently the designer of settings has to bear in mind the cameraman's problem of achieving the necessary light-levels with a minimum number of sources of illumination. T. adds few complications to sound recording, but the 'whistle' from the arcs caused by high-frequency ripples in the electric current coming from the commutators of direct-current generators must be eliminated. This is done by the combination of an alternating-current filter at the generator and additional choke-coils at the individual arc units. Modern film production, Amer. and Brit., has proved that used imaginatively, colour heightens dramatic effect.

Some experts believe that T. will eventually supersede black-and-white photography altogether in film-making.

Technology, Imperial College of Science and, see IMPERIAL COLLEGE.

Tedder, Arthur William, first Baron of Glenguin (b. 1890). Brit. airman, educated at Whitgift School and Magdalene College, Cambridge. He entered the colonial service in 1914. Commissioned in 1914 in the Dorset Regiment, he went to France in 1914 and was seconded to the Royal Flying Corps in 1916. He was given a permanent commission in the R.A.F. in 1919. He held sev. important posts and became air officer, commanding-in-chief Middle East, 1941-1943. He became vice-chief of the air staff, and air commander-in-chief, Mediterranean air command in 1943. T., appointed deputy supreme commander under Gen. Eisenhower for the Anglo-Amer. expeditionary force, was the first Brit. airman to assume so important a military post. He was a specialist in strategy, moulding to his own shape the current ideas on air co-operation with armies. He relinquished the post of chief of the air staff at the end of 1949 at his own request in order to facilitate the advancement of younger officers. T. was promoted marshal of the R.A.F. in 1945. He was knighted in 1942 and created a peer in 1945.

Teddington, tn. of Middlesex, England, on the L. b. of the R. Thames, forming, since 1937, part of the bor. of Twickenham for municipal purposes. The records of the tn. go back to Saxon times, when it was associated with the Benedictine monastery at Staines. The manor of T., with this monastery, was granted by King Edgar to the abbot and monastery of Westminster. The National Physical Laboratory, is situated in T., overlooking the park in Queen's Road. Close by is the Chemical Research Laboratory. T. is the highest tidal point on the riv., and its famous lock is also the largest on the Thames, 650 ft. long by 25 ft. wide. T. is the point where the discharge is gauged. Pop. 24,000.

Te Deum Laudamus, well-known non-metrical Lat. hymn, found in the Rom. breviary at the end of Matins, and also used by the Rom. Catholic Church on occasions of rejoicing. There has been much discussion on its origin, and modern scholars have shown that it consists largely of borrowings from older sources. Its present form is probably due to Niceta, bishop of Remesiana (d. c. 414). There are twenty to thirty Eng. versions, including one by Dryden.

Tees, riv. of England, which rises in Cross Fell, Cumberland and flows S.E. and then N.E. through Teesdale, forming the boundary between Yorkshire and Durham. After a course of 70 m. it flows into the North Sea.

Teeth, calcareous structures occupying the alveolar processes of the upper and lower jaw, and serving to tear, cut, or grind food.

In man there are thirty-two permanent T., sixteen in each jaw. They are divided

as follows: two incisors, one canine, two premolars or bicuspid, and three molars in each lateral half of each jaw. The incisors have chisel-shaped crowns, and are therefore adapted for dividing food by cutting. In the upper jaw they are socketed in the pre-maxillary bone. The canine T. are conical in shape, and are therefore adapted for piercing. In carnivorous animals they are developed as sharply pointed T., which serve to tear the prey. The canines are borne behind the junction of the maxillary and pre-maxillary bones. The premolars have somewhat flattened crowns and bear two cusps, one external and one internal. The first premolar has sometimes two roots, though, like the canines and incisors, it usually has a single root. The molars, the largest and firmest T., are placed behind the bicuspid. Those of the upper jaw have three or four cusps, while the lower-jaw molars have four or five. The upper molars have usually three roots each, and the lower molars two roots each. The last and smallest molar is known as the 'wisdom tooth.' The arrangement of the T. of any mammalian species is best summed up in a dental formula. Thus the formula for

man, 2.1.2.3. indicates that there are 2

incisors, 1 canine, 2 premolars, and 3 molars in each lateral half of the upper and of the lower jaw. In man the structure of all the T. is essentially the same. The outer layer is composed of enamel, a hard substance consisting principally of calcium phosphate and smaller amounts of calcium carbonate, magnesium phosphate, and calcium fluoride. The next layer is composed of dentine which contains the same mineral substances as the enamel with the addition of organic matter. Dentine is hard, though not so hard as enamel; it forms the greater part of the bulk of the tooth, and is furnished with a series of fine channels by which communication is estab. between its substance, the enamel and the dental pulp. The dental pulp is contained in a cavity within the dentine. It consists of blood-vessels and nervous matter. The root of the tooth is devoid of enamel, but possesses a coating of 'dental cement,' a bony layer which is adjacent to the periosteum of the alveolar cavity. The permanent T. in man are preceded by temporary or 'milk' T. These are fewer in number, smaller in size, and whiter in colour than the permanent T., and they are also somewhat different in shape, the roots of the molars, in particular, being more divergent than corresponding structures in permanent T. The process of their development is usually over by the end of the second year. The permanent T. develop from the fifth year to the twentieth year.

Dental caries is a common disease affecting the human race. The cause of the disease is the presence of bacteria in the mouth which bring about fermentative changes in starchy or carbohydrate food by which lactic acid is produced. The acid disintegrates the enamel coating,

after which other bacteria cause putrefactive changes in the organic matter of the dentine, leading to a breaking down of the tooth structure, inflammation of the pulp, and the consequent distressing pain known as toothache. The baneful effects upon general health resulting from defective T. can be successfully obviated only by recourse to the methods of dental surgery. Pyorrhoea (*q.v.*) also has markedly ill effects on general health. T. should be cleaned before retiring, on rising, and after every meal, by brushing up and down, and to and fro.

Dentistry.—This is the dept. of medical science which treats of the care of the mouth, particularly of the T. The work that falls to the dentist is mainly comprised under the heads of dental surgery, mechanical dentistry, and dental prophylaxis, or the general prevention of T. diseases. Dental surgery includes all measures for the treatment of unsound T. and the correction of deformities and irregularities of the T.; mechanical dentistry deals with the manuf. and adjustment of artificial substitutes for T.; while the dentist is also often called upon to treat neuralgic pains associated with the T., and to inspect and cleanse T. as a routine precautionary measure. The art of dentistry has been practised from very early times. In the nineteenth century much progress in dental science is particularly associated with the names of Blake, Fox, and Bell in England; Fonzi, Cuvier, and Berlin in France; and many able scientists and practitioners in America. In 1878 the profession was regularised in England by an Act which estab. a register, the conditions for registration being put in the hands of the General Medical Council. The position was further regularised by the Act of 1921, according to which all persons practising dentistry have to be registered, the penalty for an unregistered person practising being a fine not exceeding £100. The term dental surgeon is strictly reserved to those who possess the qualification of L.D.S. or are otherwise professionally qualified. Registration is still supervised by the General Medical Council. The licensing corporations are the Royal Colleges of Surgeons in England, Scotland, and Ireland, and the Royal Faculty of Physicians and Surgeons of Glasgow.

Common dental faults are misplaced or diseased T. Where the tooth has been actually attacked by decay, filling aims at arresting this and repairing the structure by filling or stopping. Extraction has been rendered safer by the introduction of new instruments and the increased knowledge of the anatomical relationships of the T. Extractions are rendered painless by the use of suitable anesthetics.

In the fitting of artificial T., single T. are sometimes fitted on old stumps, or are fixed to neighbouring sound T. by metal fastenings. Where a number of T. have to be supplied the dentist first makes a mould of the jaw and palate by fitting wax closely over it. From this a plaster model is made, from which two metallic

dies are prepared, one made to fit into the other. A thin gold plate is then swaged between the male and female dies to the exact shape of the palate. To this base-plate porcelain T. are fitted by means of platinum pins baked into the T. and fused to gold stay-pieces, which in turn are fused to the base-plate. Where it is impossible to arrange for the support of the plate by fitting it to sound T., a vacuum chamber is made in the base-plate, which is exhausted by the wearer and serves to make the plate adhere to the palate. In cases where most or all of the T. have to be extracted before the artificial T. are made a mould of both jaws is taken. By this means the set may be prepared in exactly the same shape as the natural T.

Teheran, or Tehran, city and cap. of Persia, and cap. of a prov. of the same name. It stands in the centre of an exceedingly fertile plain about 60 m. S. of the Caspian Sea. The climate is extremely hot during the summer, but mild and pleasant during the rest of the year. The old city is typically eastern, surrounded by pleasant and well-kept gardens. Inside the ark, or citadel, is the old royal palace, and there are numerous mosques, in one of which Shah Nasr-od-Din was assassinated in 1896. Old T. is surrounded by a bastioned wall. Under Shah Riza Pahlevi (1921–41) T. was to some extent rebuilt and extended on W. lines. It is a commercial centre, and has match, tobacco, textile, cement, machinery, and munitions manufs., and large sugar refineries. A new royal palace was erected to the N.W. during his reign, and a univ. founded (1935). There are sev. secondary schools and a number of museums. T. became cap. of Persia, in place of Isfahan, in the eighteenth century. Pop. (city and suburbs) 699,000.

Tehri-Garhwal, see under GARHWAL.

Tehuantepec, tin. of Mexico, in Oaxaca State, on the lt. Tehuantepec, 13 m. from Salina Cruz on the N. coast. Pop. 12,000.

Tehuantepec Winds, or Papagayos, strong cold winds due to the same influence as the 'nortes' or 'northerlies' of the regions round the gulf of Mexico. They are cold, dry winds from the continent, allied to the mistral or bora of the Mediterranean. They are strong on the Mexican W. coast, but weaker on the Pacific, in Nicaragua and Guatemala, where they are known as T. W. from their direction.

Teignmouth, John Shore, first Baron (1751–1834), Brit. statesman. He entered the service of the East India Company as a cadet at the age of eighteen. He rose rapidly and was finally made a member of the Supreme Council. In 1793 he succeeded Cornwallis as governor-general of India. He retired from this office in 1797 and received his peerage on his return to England.

Teignmouth, seaport and mkt. tn., urb. dist., and holiday resort of Devonshire, England, situated at the mouth of the Teign, 15 m. S.E. of Exeter, in the Tiverton parl. div. of Devon. Its seawall is 2 m. in length. It is built partly on a tongue of land between the Teign

and the sea, and partly on rising wooded ground enclosing the valley which rises to the high moors below Haytor. Pipe-clay and china clay are shipped here for the Staffordshire potteries, and fishing is carried on, salmon, whiting, and mackerel being taken from the Teign. Salt was formerly an important industry. Pop. 11,000.

Teinds. The T. of a Scottish par. like the tithes of Eng. law, are that proportion of rents or goods which goes to the maintenance of the clergy. The clergy, however, have now no right to T. beyond a suitable provision or stipend.

Tefuco, *see* DIAMANTINA.

Tekir Dag, *see* under ROPOSTO.

Tel al-Amarna or **Tell el-Amarna**, site of Akhetaton, cap. of Akhnaton (*q.v.*) is situated about 170 m. S. of Cairo, on the E. bank of the Nile. In the limestone cliffs surrounding the plain of T. al-A., are cut a series of tombs of Akhnaton's nobles. Inscriptions in them contain the beautiful hymns of the Aton faith; there are also lovely natural designs of animals, birds, reeds, and plants. A group of clay tablets found accidentally in the winter of 1887-88 at T. al-A. by an Egyptian peasant woman (who sold her rights in the discovery for about 3s.) opened an entirely unknown vista in the hist. of Palestine and the surrounding countries. Most of the tablets are diplomatic communications from Egyptian vassal kings in Palestine and Syria to their lord the Pharaoh, Amenhotep III., and Amenhotep IV. (Akhnaton). About 150 of the T. al-A. letters were written from Palestine, some by Abdi-Hiba, king of Jerusalem, giving us a glimpse of that city more than 350 years before David; some 200 other tablets were written elsewhere, mostly in Syria and Phœnicia. They are in Babylonian language and cuneiform characters.

Tel-Aviv, tn. of Israel, situated N. of Jaffa. Although the largest tn., as far as the number of inhab. is concerned, its area before the Second World War was smaller than that of Jerusalem or Haifa. During the war and under the Israeli Gov. the municipal boundaries were extended, so that the area is now some 10,000 sq. ac., four times as great as in 1939. For this area, the pop. goal is 500,000. In 1950 it was proposed to join Jaffa to T.-A. by Act of the Knesset (Parliament) in the near future. The scope of its municipal social and educational services and free medical aid to the poor, etc., were outstanding in Israel in 1950. T.-A. had estab. itself by 1930 as the prin. economic centre of the country. Two large textile factories were erected in 1924, this marked the beginning of steady industrial expansion in T.-A. It became famous for its sugar and chemical and pharmaceutical industries. The largest number of banks are situated here, as well as most commercial firms, newspaper offices, etc. T.-A. is also a cultural centre. All the Heb. daily newspapers are pub. in T.-A., as well as numerous periodicals. It contains the two best-known Jewish theatres. Other municipal buildings include a museum and an art gallery. Its main exports before 1939 were oranges. T.-A. presents, in its

European modernity of style and life, a striking contrast to the Oriental character of Jaffa. The Palestine Electric Corporation has built a power-house at T.-A., and the transmission lines have been extended beyond the tn. boundaries to colonies N., S., and E., and thus provide energy for lighting, industry, water supply, and irrigation.

T.-A. was founded in 1900 by a group of residents of Jaffa, who decided to build for themselves a modern garden-suburb on the N. outskirts of Jaffa, and in 1910 this received its present name which means 'The Hill of Spring.' By 1914 the pop. of T.-A. was 1500, or one-fifth of the total Jewish pop. of Palestine. In addition to the constant migration of Jews from Jaffa to T.-A., the waves of Jewish immigration into Palestine, largely absorbed by T.-A., contributed to a rapid and constant increase of its pop. By May 1921, it was given the status of an independent township gov., and after the disturbances of 1929, the last official links binding T.-A. subordinately to Jaffa were removed. No other place in Palestine has seen so rapid a development. The original quiet streets, with the first sixty small villas, soon developed into broad and busy streets, lined with large modern concrete buildings. By the outbreak of the disturbances of 1936 T.-A. had become the largest tn. of Palestine, and its industrial and commercial centre. As a result of the disturbances the business community could not use the port facilities of Jaffa, and this led to the building of the T.-A. Lighter Port, which made a substantial contribution to its economic expansion. The municipality of T.-A. in 1950, with gov. approval, planned to expand this into a large permanent port. In 1948 T.-A. was made the provisional cap. of Israel. Pop. 250,000 (with Jaffa, 300,000).

Tel Basta, *see* BUBASTIS.

Telecommunications, name given to the science of communication by electrical means. It embraces such methods of communication as telephony (*q.v.*), whether by line or radio, telegraphy (*q.v.*), including teleprinters or coding systems, and facsimile picture transmission as well as television. *See* RADIO, TELEVISION, etc.

Telephony, *see* under HEREDITY.

Telegraphy, system for conveying information between two points. The first serviceable telegraphic device, invented by Chappe (France) in 1792, was a form of semaphore. In 1816 Ronald (England) produced his pith ball telegraph, where an electric current to line caused two pith balls to diverge and their movement exposed a character. In 1819 Oersted discovered that the magnetic field produced by an electric current deflected or attracted a neighbouring magnetic needle, the direction of movement depending on the direction of current flow. Cooke and Wheatstone, applying this principle, produced the first practical electric telegraph system in 1837. Their first system was a five-needle telegraph requiring five lines. This was followed by the double-needle

and then the single-needle system. Fig. 1 shows the system in its simplest form. When a message is to be transmitted from A to B, the key is depressed as shown and line current flows through the recorder at B to earth and deflects the

FIG. 1. PRINCIPLE OF COOKE AND WHEATSTONE ELECTRIC TELEGRAPH

recorder needle. Similarly a message may be passed from B to A.

Karl Steinheil was the originator of acoustic and recording T. In 1836 he devised an acoustic telegraph with two gongs of different notes. Line current deflected one of two needles depending on the current direction. Attachments to

FIG. 2. THE MORSE CODE

these needles struck the gongs and thus gave a code of audible signals. Alternatively the needles were equipped with ink-holders in contact with a moving tape and recorded dots in two parallel lines to give the message according to a dot code. In 1837 Morse produced his electro-magnetic telegraph. The Morse

code consists of two distinct signals in groups to define the various characters. One signal is a 'dot' and the other a 'dash': the dash being three times the duration of the dot. There are intervals between the letters and a longer interval between words. Fig. 2 shows the Morse code now used. The dot-and-dash movements of the armature of a sounder are read by the ear of the operator, and this sounder principle became popular in all parts of the world. The elementary Morse

FIG. 3. MORSE SOUNDER

system is much the same as Fig. 1, except that the recorder at each end is replaced by a sounder. The essential features of the Morse sounder are shown in Fig. 3. It consists of a U-shaped electromagnet M and a soft iron bar A attached to a brass bar B. The brass bar is pivoted so that its free end can move up or down; this end is normally kept up by spring S. When the signal current flows through the electro-magnet, the iron bar A is attracted, the brass bar is pulled down and the screw C strikes the frame. When the

FIG. 4. DOUBLE-CURRENT WORKING

current ceases the spring pulls the bar up again and its end strikes the screw D. The receiving operator hears the two taps; if the interval between them is short the signal is a dot; if long, a dash. Later a number of systems were produced where the dots and dashes were ink recorded on a paper tape. In practice galvanometers are included at each direct sounder station to enable the operator to verify that the key operation is actually causing current to flow to line.

The direct-sounder system can only be used over relatively short lines. On longer lines the sounder is replaced by

a relay which requires a much smaller operating current. The relay contacts complete a local circuit to operate the sounder.

The signalling circuits so far described are single-current working. This method

method is used extensively on long submarine cables. In this use the code (cable code) is similar to the Morse code, except that the dots and dashes are distinguished by direction of current flow and not on a time basis. They appear as punched holes in a paper tape and the two signals are readily distinguished by their relative positions on the tape. This method permits a greater signalling speed.

Double-current working requires a receiving relay of the polarised type, operating in one direction to the mark, and in the reverse direction to the space currents. Polarised relays are much used in T., and Fig. 5 shows a typical modern type used by the Brit. Post Office. The yoke, armature, and pole pieces are made of permalloy. The yoke is in two pieces, clamped together over the end of the armature, the magnetic circuit between the armature and the pole pieces being broken by non-magnetic spacers. The pole pieces are two permalloy screws. The armature contacts play between two contact screws. The relay is polarised by a permanent magnet, the poles of which are in contact with the yoke at the point where the pole pieces pass through it. The coil is wound on a bobbin which is slipped over the armature, but does not touch it. The permanent magnet produces two poles in each half of the yoke, at the pole pieces and at the spacers. The coil magnetises the armature. The paths of the polarising and operating magnetic fields are shown by the solid and dotted lines respectively. These fields aid and oppose each other at the respective pole piece and spacer gaps. With the direction of the fields shown the armature operates to the right (mark position); reversal of the coil current would cause the armature top to move L-N (space position).

FIG. 5. POLARISED RELAY

involves signal distortion and requires a slow signalling speed to prevent interference between consecutive signals. Double-current working minimises this difficulty. Here the interval between the signal (mark) currents are filled by

The arrangements so far described are simplex working, as operation in one direction only is possible at a time. This is sometimes wasteful in the use of the line, and to increase the traffic-carrying capacity of telegraph circuits duplex

FIG. 6. SIMPLEX WORKING

currents (space) flowing in the reverse direction instead of no current. The effect of the reverse-space current is to accelerate the discharge of the line. Fig. 4 shows the principle, the two batteries having opposite poles to line. This

working is sometimes used. This permits the simultaneous transmission of signal in both directions on the one line. Two simplex circuits, one in each direction, are sometimes combined to give duplex facilities (two-way simplex).

Differential duplex is often used on inland networks and Bridge duplex is extensively used for submarine cable circuits. Simplex working is illustrated in Fig. 6, and only one station can transmit at a time under the control of the send-receive switch which is normally on the receive contact.

The Bridge duplex is based on the principle of the Wheatstone's Bridge, and depends for its action upon the balance of potentials across a relay connected in the diagonal of the bridge. The line-signal conditions give potential balance and unbalance conditions to operate the relay.

An extension of the duplex principle gives quadruplex working, which is a duplex system in which simultaneous transmission of two messages in each direction is possible over a single circuit. One message is given by the direction of current flow and the other by the actual current value.

High-speed Automatic Systems.—In automatic systems the signals are transmitted by mechanical means instead of by manually operated keys. A much greater speed is obtained and the signals are more accurately formed. Most telegraph systems operated to-day are automatic. The Creed system enables an operator to operate a keyboard to tap out the message, which is delivered in printed form. This system had its origin in the Wheatstone automatic system. The Baudot multiplex system is another form. Automatic Wheatstone and Baudot systems are still used in certain applications, but the Brit. Post Office have abandoned both for inland telegraph working in favour of the start-stop teleprinter system.

The Wheatstone automatic system was first produced in 1867, and in a modified form is still in extensive use to day on submarine cables, because of its speed superiority over teleprinter working. It is a development of the Morse system and can work at some 300 words a minute. Three instruments are required: (1) a perforator by means of which holes representing the Morse code are punched in a paper tape; (2) a transmitter which sends out mark and space currents to line in accordance with the punched holes; (3) a receiver for recording the transmitted Morse signals. The system may be worked simplex or duplex. The message is prepared on a paper tape, perforated according to the long and short signals of the Morse code, the disposition of the punched holes about central guiding holes in the tape giving the dot or dash. The perforated strip is run through an automatic transmitter, which results in corresponding currents (mark or space) being transmitted to line. The receiver consists of a polarised relay with a tongue carrying an inked wheel which writes on a moving strip of paper; the message is translated by operators. In modern forms of the system a reperforator is used to produce a perforated tape at the receiving end, precisely similar to that at the transmitting end. This tape may be used to retransmit the message by passing it through an automatic transmitter con-

nected to another circuit; or, by passing it through a suitably designed printing instrument, the message is recorded in Rom. characters.

The Creed keyboard perforator eliminates the perforation of the punched holes as a separate operation. The mechanism incorporates a keyboard similar to a typewriter, and operation of the keys causes a tape to be perforated in accordance with the Morse code. Sixty words a minute can be obtained with the keyboard perforator.

The Baudot system, first produced in 1874, is a multiplex printing system worked double current. It uses a five-unit code in which each character is made up of a combination of five currents, each current being positive or negative. The duration of each current is equal, and thus each character has equal transmission time. A multiplex system may be defined as a multiple-way arrangement of sending two or more messages over the same line by the allocation of the exclusive use of the line in rapid succession. A number of operators are given the exclusive use of the line for a time sufficient to transmit one character. This principle is sometimes referred to as 'time-division multiplex.' Multiplex working clearly permits line-plant economy as a greater utilisation of one line is obtained.

Signals are transmitted and received by means of segmented distributors with contacting brushes rotated in synchronism at each end of the line. The distributors enable up to six operators to use the line during one revolution of the brushes around the distributors. Assuming six operators, the distributor periphery is divided into six sections, each serving one operator. Each section is further sub-divided into five segments. The rotating brushes make contact with the corresponding segments in the respective sections at the same time. Each successive segment at each end is thus in circuit with the line for the short time the brushes rest on them and, during this time, information may be passed between the two segments. One character is transmitted during the passage of the brushes over the five segments of a section. Thus six operators may transmit one character each, and be received by six separate receiving mechanisms, during one revolution of the brushes.

The transmitter consists of five keys, and their operation to transmit a character results in a positive or negative battery being applied to each of the five segments of the particular distributor serving that operator. These five respective currents (positive or negative) are successively transmitted to the receiving end when the transmitting brush moves over the five successive segments. On further rotation over the five segments of the next section a character from another operator is transmitted. At the receiving end the five successive currents forming a character cause the operation of five receive electro-magnets, via the corresponding receive distributor segments. In this manner the position of the five keys at the

transmit end is reproduced in the position of the five receive magnet armatures, the operation of which controls the printing of the character.

The five-unit code, with keys having two positions, allows thirty-two possible combinations, and thus characters, and provides a signal alphabet which is much shorter in transmission time than the Morse code.

Start-stop Teleprinter Working.—Modern inland telegraphic communication is now carried out by teleprinters, and this method has almost entirely superseded other means such as keys and sounders, Wheatstone and multiplex systems. The teleprinter consists of two main parts: (1) the transmitter and (2) the receiver, which are mounted upon the one base and are driven by a small electric motor. The transmitter consists of (a) a typewriter type keyboard and (b) a transmitting unit, controlled by the keyboard, which transmits signals in the form of electrical impulses. The receiver part consists of (a) an electro-magnet, operated by the line signals, and (b) a mechanism which causes the character corresponding to the signals to be printed on a moving paper tape.

The Morse code is an unequal length code as the characters are represented by varying numbers of dots and dashes. This varying signal time complicates machine T. and for this reason modern teleprinter working uses the Murray five-unit signal code. Here the signal time for each character is the same. The code derives its name from the fact that five electrical impulses of equal duration are transmitted for each character. Various formations of these impulses make up the different characters. In double-current working space signals are positive battery and the mark negative battery. The maximum number of different characters that can be obtained is thirty-two and since it is necessary to transmit numerals and other characters as well as the alphabet, the machine is arranged to use the same combinations for figures as for letters. The change is accomplished by means of figure and letter shift signals, and two keys to give these appear on the keyboard. Start and stop pulses accompany every character combination. The motors run continuously, but when no signals are passing the transmitting and receiving mechanisms are at rest. When a key is depressed both mechanisms make one revolution, during which time the start pulse, character combination, and stop pulse are sent. At the receiving end the start pulse sets the receiving mechanism in motion for one revolution. The character combination is received while the mechanism is in motion and finally the stop pulse is received, which stops the receiver mechanism. Both the transmitting and receiving mechanisms make one revolution for each character signalled and then stop, hence the term 'start-stop.' The start and stop signals obviate maintaining continuously correct phase relationship between the teleprinters at each end of the line such as is required

in multiplex systems. The time for one revolution is approximately one-sixth of a second, and the system is capable of working at approximately sixty words a minute. At the receiving end the five code pulses of a character operate a single electromagnet, and the successive resulting movements of the armature govern the mechanical selection and printing of the character. For inland telegraph work the characters are printed on a tape. For press work the message may be page printed.

In circumstances where the traffic is too heavy for direct key board operation automatic tape transmission may be used. Instead of transmitting the signals direct to line as each key is depressed, the operator prepares the message, to the five-unit code, on perforated tape. This is then fed through an automatic tape transmitter which transmits signals to line in accordance with the information on the tape.

Repeaters.—With direct-current signalling the speed at which long circuits, having large values of capacitance and resistance, can be worked is limited. A repeater inserted in the line permits a greater speed, as the repeater effectively breaks the line up into a number of shorter links. The simple type of repeater consists of the reception on a relay, of a signal and its retransmission from the contacts of the relay to the receiving station. Any signal distortion on the first link is carried forward to the second link. A regenerative repeater is one which accepts distorted signals and retransmits them as reshaped signals free from distortion. This type has application in repeating Wheatstone signals to enable long submarine cable circuits to be extended via land lines.

Telegraph Signalling.—Direct-current signals are subject to considerable distortion and the signal may become unreadable. This may be overcome by the insertion of repeaters, but on inland networks the modern method is to signal by means of alternating currents in the voice-frequency range. Such signals can be passed over standard telephone trunk lines, which are amplified with thermionic valve amplifiers. A.C. signals retain their shape in transmission with sufficient accuracy almost without distance limit, and the distortion is small. The Brit. Post Office and many other administrations use a multi-channel voice-frequency signalling method for inland networks. In this system eighteen telegraph channels are obtained on one line. Each channel has its own signalling frequency, which is transmitted within a narrow frequency band. The eighteen signalling bands are contained within the normal frequency band of a four-wire telephone circuit.

Facsimile, or picture T., which is a system for transmitting still pictures, or printed matter, over an electrical circuit, is now finding increasing application, particularly for press work. A typical technique incorporates a sender, which is arranged to scan the picture in a regular manner by means of a light-spot. The

variations in tone of the picture are interpreted into variations in amplitude of alternating currents passed to line to a receiver. Here a light from a constant source is arranged to fall on a piece of photographic material and scan this at exactly the same rate as the sender light-spot. The variation of incoming current from the line operates a light-valve, which controls the intensity of the light falling on the photographic material to reproduce the original picture. For T. systems see also under POST OFFICE; for submarine cables see CABLES; also under SIGNALING, MILITARY. See W. T. Perkins, *Telecommunications* (3rd ed.), 1948.

Telemark, fylke of Norway, on the S. coast. It is a mountainous region, with vast reserves of timber. Skien, bp. of Ibsen (his *Peer Gynt* has its setting in T.), is the cap. Industries include timber, paper, and salt-petre. T. contains some of Norway's wildest and most picturesque scenery. Of particular interest is Rjukanfoss (415 ft.), one of Europe's finest waterfalls, providing power for nitric acid works, etc. Pop. exceeds 130,000.

Telepathy, name given by F. W. H. Myers to the transference of knowledge from one mind to another without the use of any normal sensory channel of communication. The reality of this power was proved in the early days of the Society for Psychical Research, but it was generally supposed to be restricted to a few exceptional individuals. The more recent work of Prof. Rhine at Duke Univ. has shown that it is much more widespread than was at first supposed, and that the paranormal acquisition of knowledge is not restricted to what is in another person's mind, since a fact not known to any other person may also be known without the use of any normal sense channel. T. is thus only one example of a more general paranormal power of obtaining knowledge often now referred to as extra-sensory perception (or the *psi* capacity). Experimental work in extra-sensory perception is commonly done by a method of guessing the order of a pack of twenty-five cards containing five each of five symbols, and performing a statistical analysis of the results to discover whether more have been guessed right than can be accounted for by chance. Explanations of T. by unknown radiations acting on an unknown sense organ are now generally rejected. It seems necessary to make a more radical reorientation of the theory of the way in which knowledge is obtained.

From time to time performances of alleged T. are shown on the variety stage. It would be rash to assert that none of

these performers has T. powers, or that they never use them on the stage. On the other hand, most of these performances depend on the use of codes or other means known to conjurers. In all cases the conditions of a stage performance are altogether unfavourable to critical determination of whether genuine T. has been used. See Prof. J. B. Rhine, *The Reach of the Mind*, 1948, and R. Huxford and S. G. Soul, *Telepathy and Allied Phenomena*, 1948.

Telephony, system of reproducing sounds at a distance by the agency of electricity. The possibility of T. originated with Faraday's discovery of electro-magnetism (see ELECTRICITY AND MAGNETISM). Bourseul (France, 1854) and Reis (Germany, 1861) conducted experiments which had the rudiments of electric T., but credit for the production of the first practical telephone is due to Alexander Graham Bell (*q.v.*) (U.S.A., 1876). In Bell's original electro-magnetic telephone the receiver and transmitter were similar in construction and consisted of an electro-magnet with a pivoted armature connected to the centre of a flexible diaphragm. The two instruments were connected together with a battery in circuit. The current, flowing round the electro-magnet windings, produced a magnetic field (or flux) of magnitude dependent on the reluctance (or magnetic resistance) of the air-gap between the end of the electro-magnet and the armature. Sound-waves created by speech vibrated the diaphragm which varied the air-gap, varied the reluctance, and thus the magnitude of the magnetic field. The varying field, cutting the turns of the electro-magnet winding, induced a varying e.m.f. which resulted in a flow of fluctuating current round the circuit, the current fluctuations corresponding to the speech. At the distant end the battery current, magnetising the electro-magnet, produced a steady pull on the armature. The addition of the fluctuating speech current resulted in a varying magnetic pull on the armature which vibrated the receiver diaphragm in a manner similar to that of the transmitter and thus reproduced the speech. The disadvantage of this system was the insensitivity of the electro-magnetic transmitter. The initial energy of speech is small, and, with losses, the received electrical energy was insufficient to give adequate volume except on short lines. This has been overcome in modern T. by using a transmitter functioning as a variable resistance. Here the weak energy of speech is used merely to control a much greater energy given by a battery. The modern transmitter is of the form shown in Fig. 1 and is based on the carbon-granule principle suggested by Himmings in 1881. Two carbon electrodes, connected to a source of steady current, are immersed in a chamber filled with carbon granules. The rear electrode is fixed and the front electrode attached to the centre of a light cone-shaped duralumin diaphragm clamped round its periphery. Normally the current flows between the two electrodes, and the

carbon granule path presents a steady resistance. Vibration of the diaphragm due to speech moves the front electrode, and this causes a greater or less area of contact between the granules, which varies the electrical resistance between the two electrodes. The current normally flowing is thus varied, and in this manner the speech energy controls the battery current.

The modern receiver, shown in Fig. 2, is based on the principle of the original

ponents of the fluctuating direct current in the transformer primary (P) circuit induce an alternating e.m.f. into the secondary (S) circuit, which includes both receivers and the line. The diaphragm of the receiver at B is therefore set vibrating to reproduce the speech. Similarly speech at A causes the receiver at A to vibrate to reproduce the speech. Local battery telephones are not widely used to-day.

The first telephones installed were for the purpose of communication between

CARBON ELECTRODES

FIG. 2. MODERN INSET RECEIVER

ELECTRO-MAGNETS

Bell receiver. Two small electro-magnets are attached to a bar magnet, the permanent field of which exerts a steady pull on a diaphragm of magnetic material (stalloy). The alternating speech currents, flowing through the electro-magnets, set up magnetic fields which alternately aid and oppose the permanent field. The pull on the diaphragm is thus varied and the diaphragm vibrates to reproduce the speech.

two fixed points. It was soon realised, however, that the utility of the telephone would be greatly enhanced if a means could be devised whereby any telephone could be connected at will with any other telephone in the neighbourhood. For this to be possible it is necessary either to run wires between each and every telephone in the dist., which is obviously impracticable, or alternatively to connect all the telephones to some common point at which the necessary connections can be made. The building or office used for the interconnection (or switching) of the telephones naturally became known as a telephone exchange. The users of the telephones connected to an exchange paid a periodical subscription for the service they received and hence became known as subscribers. Equipment is necessary at the exchange for terminating all the lines and for the interconnection of the lines as required. Originally, and indeed to a considerable extent to-day, oral instructions were given as to the connection to be made and the required switching was effected by hand. Such exchanges are known as manual exchanges to distinguish them from automatic exchanges, where the switching of one telephone to another is done by machines without human aid at the exchange.

TRANSMITTER

FIG. 3. LOCAL BATTERY TELEPHONE CIRCUIT

Early telephone systems were based on the principle shown in Fig. 3. Batteries at the premises of the telephone subscriber, known as local batteries, supply current to each transmitter around local circuits, as the transformers prevent the steady battery current from flowing in the external line. Sound-waves, falling on the transmitter at A, vary the pressure on the carbon granules, vary the transmitter resistance, and the transmitter current fluctuates. The alternating com-

ponents of the fluctuating direct current in the transformer primary (P) circuit induce an alternating e.m.f. into the secondary (S) circuit, which includes both receivers and the line. The diaphragm of the receiver at B is therefore set vibrating to reproduce the speech. Similarly speech at A causes the receiver at A to vibrate to reproduce the speech. Local battery telephones are not widely used to-day.

position. With the introduction of the telephone exchange, in addition to the fundamental requirement to transmit speech, telephone systems were required to incorporate signalling arrangements to inform the operator, or the automatic equipment, when a call is originated, answered, and completed.

MANUAL TELEPHONE EXCHANGE SYSTEMS.—The differences between the various manual systems are centred in the signalling arrangements and the location of the batteries supplying the speech and signalling currents.

Magneto System.—Here the speech current is supplied by local batteries at

of C.B. manual working. While a number of battery points are shown, all are the one battery. When the receiver is on its rest a bell and a capacitor are bridged across the line. The capacitor permits the flow of alternating current, which is applied to ring the subscriber's bell, but prevents the flow of direct current from the exchange. When the receiver is lifted, however, the line is bridged with a circuit of low resistance which includes the transmitter, and direct current flows from the exchange. The removal of the receiver at A operates relay L around the line circuit and contact L 1 lights his calling lamp at the exchange. The operator inserts the

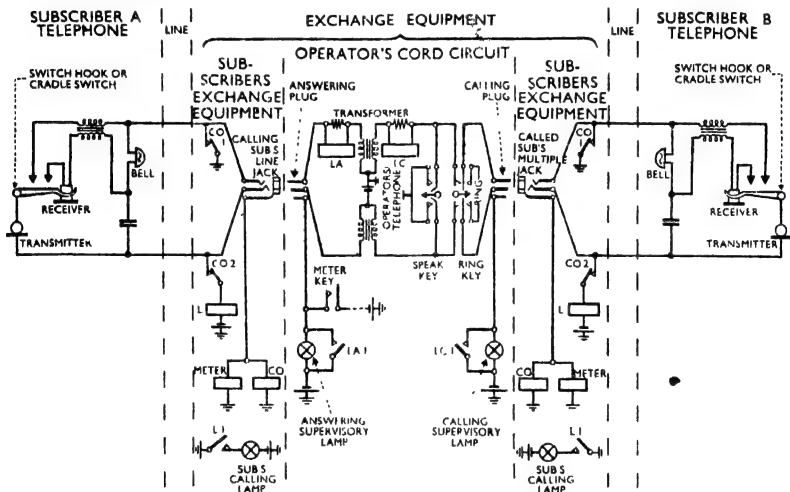

FIG. 4. CENTRAL BATTERY MANUAL EXCHANGE SYSTEM

the subscriber's premises and the signalling by currents generated by the subscriber operating a small electric generator (magneto generator) incorporated in the telephone instrument. The signalling currents operate electro-magnetic indicators on the operator's switchboard.

Central Battery Signalling (C.B.S.) System.—Here the speech current is supplied by local batteries at the subscriber's premises, but the signalling current for all the subscribers on the exchange is supplied by a central battery at the exchange. The operator receives the signals by lamps on the switchboard. The signalling is automatic, being controlled by the removal or replacement of the receiver.

Central Battery (C.B.) System.—This is the more modern manual system. No local batteries are required at the subscriber's premises. A central battery at the exchange supplies current for both speech and signalling for all the subscribers on the exchange. The signalling is automatic. Fig. 4 shows the principle

answering plug of a cord circuit into the calling subscriber's jack. This operates relay CO which disconnects relay L, and L 1 darkens the calling lamp. Current is now fed to subscriber A from the exchange battery via the transformer. This current operates relay LA and contact LA 1 short circuits the cord circuit answering supervisory lamp to prevent it glowing. The operator throws the speak key which connects her telephone to the subscriber's line and ascertains the required number. If the subscriber is free the operator inserts the calling plug of the cord circuit into the required subscriber's jack and rings B by throwing a ring key which connects ringing current to line. When B answers the removal of his receiver permits a current to flow from the exchange battery around subscriber B's line. Relay LC operates to this current and LC 1 darkens the calling supervisory lamp which informs the operator that B has answered. She then releases the ring key to cease the ringing. At this stage the two subscribers are supplied with

transmitter current from the exchange battery via the transformer, and the subscribers may speak to each other. The transformer permits independent subscriber signalling on each side of the cord circuit. The varying speech currents from one side are induced across the transformer to vary the direct current on the other and thus transmit the speech. When A replaces the receiver the exchange current path is broken, relay LA releases, and LA 1 releasing allows the answering supervisory lamp to glow. This signals the operator that subscriber A has released. Similarly when B replaces the receiver the current flow in the calling side of the cord circuit is disconnected, relay LC releases and LC 1 causes the calling supervisory lamp to glow, which signals the operator that B has released. The operator depresses a meter key which records the call on the calling subscriber's meter. She then removes the plugs from the jacks to clear the connection.

Many operators are required in large exchanges, and to permit each operator to plug into any line all the subscribers' lines on the exchange are multipled. The load on the exchange is divided equally among the operators and each attends to a certain number of subscribers. The line jacks and calling lamps of each group of subscribers appear in the home section of the switchboard in front of the respective operators. The operators answer the subscribers at the home section. As each subscriber must have access to any other subscriber on the exchange, all the subscribers' lines are multipled round the multiple section of the switchboard, so that they appear a number of times. Each appearance of all the lines in the multiple is arranged to be within arm's reach of each operator. This allows each operator to connect any subscriber on her home section to any other subscriber on the exchange without moving from her seat. The size of an exchange is controlled by the size of the multiple appearance accessible to each operator, and for this reason exchanges are limited to 10,000 subscribers. An operator ascertains that the required line is free or not by tapping the end of the calling plug on the required subscriber's multiple jack. If the subscriber is engaged the operator hears a click in her telephone; if free no click is given.

While many manual exchanges are in service, modern practice is to fit automatic exchanges.

AUTOMATIC TELEPHONE EXCHANGES.—In automatic working machine equipment at the exchange completes the call without the aid of an operator. The subscriber controls the exchange equipment by the operation of a dial which is part of the telephone instrument although a certain number of operators are still required to assist the subscriber in case of difficulty, trunk calls, etc. All automatic systems are based on the central battery system, in that a main battery at the exchange supplies the current for both speech and signalling.

The first patent for an automatic system

was granted to Connelly and McTigue (U.S.A., 1879). While crude and impracticable, it disclosed a device employing some of the principles used in modern systems, among them that of step-by-step switches in an exchange moved by a succession of current impulses from the subscriber's premises. Later, Strowger (U.S.A.) made a number of inventions which marked the realisation of the ideas advanced by Connelly and McTigue. One of his patents (1891) is now generally regarded as the origin of practical step-by-step systems. The first public automatic exchange, based on the Strowger system, was installed at La Porte, Indiana, in 1892, and a demonstration model for 200 lines was installed in London in 1897. For a considerable time the main development of automatic T. took place in the U.S.A., and a number of exchanges were opened in that country. In 1912 the first public automatic exchange in Great Britain was opened at Epsom. This exchange was based on the Strowger step-by-step principle.

In recent years the development of automatic systems has proceeded at a rapid rate, and there are now five principal systems in use throughout the world: (1) step-by-step (Strowger) system; (2) panel system; (3) crossbar system; (4) rotary system; and (5) relay system. Of these the step-by-step system is most widely used and is the present standard system of the Brit. Post Office.

Step-by-step (Strowger) System.—The exchange equipment in this system consists of three fundamental units: (1) line switches; (2) group selectors; and (3) final selectors. The operation of the equipment is controlled by the subscriber's dial, which interrupts the current from the

FIG. 5. DIAL

A, numbered dial, B, numbered and letter dial. (One-third actual size.)

exchange at regular intervals, depending on the digit dialled. These electrical impulses operate the group and final selectors which seek out the called line and connect the calling line to it. The general appearance of a dial is shown in Fig. 5. Forward rotation by the finger winds a main spring, which subsequently returns the dial to normal. On the return a gear mechanism drives a small governor to control the speed of return, and a

toothed wheel operates spring sets, which break and make the electrical circuit at a speed of ten interruptions per second. This interrupts the current flowing from the exchange, and these current pulses operate the exchange equipment. The number of impulses corresponds to the digit dialled. The selector switch used in step-by-step systems is a two-motion type in that it is actuated first vertically and then horizontally. The switch consists of three main units: (1) relays; (2) contact bank; and (3) switching mechanism, including wipers, shaft, and controlling magnets. A relay is an electro-magnetic device used for making or breaking connections in an electric circuit. Fig. 6 shows a typical telephone relay.

FIG. 6. MODERN TELEPHONE RELAY

The magnetic circuit consists of the coil core, the heel-piece, and the armature, all of good magnetic material. When a current flows in the coil the armature pivots on the knife-edge, and is attracted to the core face. The spring assembly is actuated by the armature and is arranged, by the making or breaking of the contacts, to provide the desired electrical circuit conditions.

The two-motion switch bank is somewhat comparable to the subscribers' multiple jacks in a manual exchange. The assembly consists of two banks (private and line) mounted at the bottom of the mechanism. The top (private) bank consists of 100 contacts arranged in ten horizontal rows of ten contacts each, arranged in a semi-cylindrical form so that a pair of wiper springs on the selector shaft may make connection with any contact in the 100 group. The shaft raises the wipers to the horizontal level and then rotates the wipers over the level to the desired contact. The lower (line) bank contains 200 contacts arranged in ten horizontal levels, each having ten sets of two contacts each. In some cases the selector has 200, instead of 100, circuits wired to the bank, and there are three banks, one private and two line.

The corresponding bank contacts of a group of Strowger switches are multiplied

together to provide the same basic arrangement found in manual multiple switchboards. The subscriber's line is thus accessible from a number of switches.

The basic two-motion switch mechanism consists of an electro-magnetic device that is capable of raising, rotating, and releasing a wiper-carrying shaft. The Strowger two-motion selector consists of a central shaft carrying flexible spring wipers at the lower end. These springs make contact with the required bank contact by wiping over the level to which the shaft is raised—hence the name 'wipers.' Two notched ratchets, the vertical and rotary ratchets, are attached to the shaft. Two electro-magnets, the vertical and rotary magnets, by attracting their respective armatures control the motion of the wiper-carrying shaft. When the vertical magnet is impulsed a pawl engages with the vertical ratchet, and the shaft (and wipers) is stopped vertically to the bank level corresponding to the digit dialled. When the rotary magnet is impulsed a pawl engages with the rotary ratchet and the wipers are rotated horizontally over the level to the desired contact. To release the selector the rotary action is continued until the wipers disengage from the bank. In this position the shaft falls, and when clear of the bank it is turned back to its normal position by a spring.

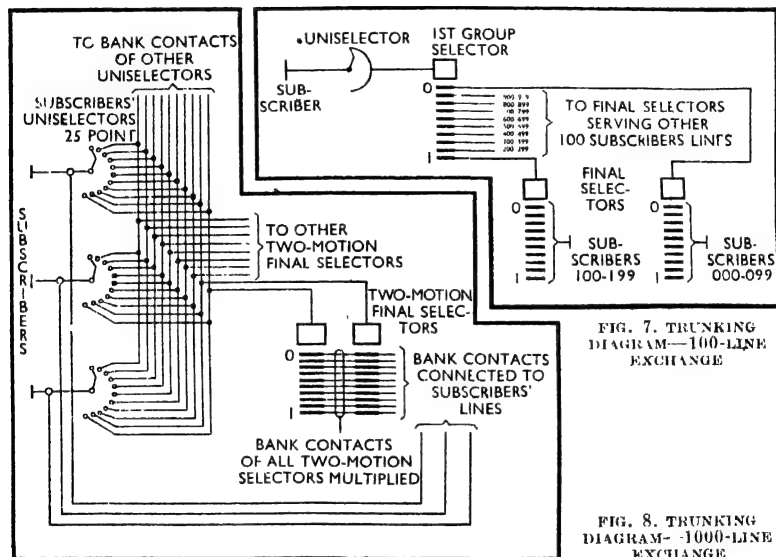

Line Switch. The line switch mechanism is self-actuated and is independent of dialled impulses. The wipers move round a bank of contacts in one direction only, and for this reason the switch is called a uniselector. It searches for a subscriber switch wired to its contact bank. This subscriber's uniselector automatically connects the calling line, wired to its wipers, to an idle two-motion selector wired to its bank, when a call is initiated and before the subscriber commences to dial. The switch overcomes the fitting of the more expensive two-motion selectors to each subscriber's line, by multiplying the bank contacts of a number of uniselectors, access from the subscribers' lines concerned is given to a relatively small number of two-motion selectors, and the latter are thus made available to any one of the lines. The uniselector consists of a number of levels, each of which is provided with twenty-five contacts and a wiper. When the electro-magnet is operated a pawl rotates a ratchet wheel which carries the wipers, and these are moved over the contact bank. Contact springs, operated by the armature, make and break the circuit of the electro-magnet to give the self-drive feature. In certain cases it is more economical to adopt line-finder instead of subscriber uniselector working. Here the subscriber lines are multiplied to the banks of the line-finder switches, the wipers of which are permanently connected to the wipers of a two-motion selector. The line-finder hunts to find the calling line, whereas the subscriber's uniselector hunts to find a two-motion selector. Unlike the uniselector system, a line-finder switch

is not fitted individually to each subscriber's line.

Exchange Trunking. A feature of the step-by-step system is the straight-forward decimal selection. The number of selector stages required depends on the number of subscribers on the exchange. Fig. 7 shows the trunking of a 100-line exchange. As all the subscribers on the exchange can appear on the bank of a two-motion switch only one selector stage, the final selector, is required. A number of selectors are multiplied together, the actual number depending on the traffic.

lines. The size of automatic exchanges is usually limited to 10,000 lines. Extension of this selector switch stage principle permits calls to be routed from exchange to exchange and the ultimate objective of telephone administrations is to permit any subscriber, national or international, to be called by a system of long-distance dialling.

Basic Working.—When the receiver is removed the subscriber's unselector searches for and connects a 1st group selector to the calling subscriber's line. A dial tone is now transmitted to the

The first (tens) dialled digit steps the final selector vertically, and the second (units) digit steps it rotary to the called line. The capacity of the exchange may be extended by additional switching stages known as group selectors, and Fig. 8 shows the trunking of a 1000-line exchange, which is regarded as consisting of ten 100-line groups. Access to a group is obtained by the additional switching stage, and three digits are dialled by the subscriber. The additional stage (1st group selector) steps vertically to the first (hundreds) dialled digit, and then hunts automatically over the level to find a free final selector in the particular hundreds group. The final selector responds vertically to the second (tens) dialled digit and rotary to the (units) digit. If ten similar arrangements of the group and final selectors shown in Fig. 8 are provided, and a bank of 1st group selectors added so that the 1st group selectors in Fig. 8 now become 2nd group selectors, the capacity of the exchange is 10,000

subscriber, informing him that he may now dial. The dialled digits route the call through the sev. switching stages, and the wipers of the final selector are positioned on contacts to which the called line is connected. If the line is engaged a busy tone is returned to the calling subscriber. If the line is free the bell is rung by ringing current applied to the required subscriber's line from the final selector. At the same time a ring tone is transmitted to the calling subscriber to inform him that the required number is being rung. When the call is answered, ring and ring tone are ceased, the call is automatically metered against the caller and a speaking circuit is completed by the exchange equipment. The connection is held under the control of the calling party. When the receivers are replaced the exchange equipment is released for use on other calls.

Multi-exchange Areas. In an area where the total number of subscribers does not exceed 10,000 and these are

served by a number of exchanges, the traffic can be routed to the various exchanges from the 1st group selector levels. As a typical case, assume subscribers 2000-4999 are served by exchange A, 5000-6999 by exchange B, and 7000-8999 by exchange C. The 1st group selector levels can then be so arranged that levels 2-4 serve exchange A, levels 5-6 exchange B, and levels 7-8 exchange C. Larger areas would contain a number of 10,000 line exchanges, and here the subscriber is required to dial routing digits in addition to the numerical number. Assuming an area of up to ten such exchanges, the subscriber would dial five digits, the first of which would route the call to the required exchange. This digit is received by a bank of routing group selectors in each exchange, the levels of which are connected to the 1st numerical group selectors in the respective exchanges. This first digit may be a number or a letter, and in the latter case the dial has both numbers and letters. In very large areas the number of routing digits is increased, and a system of 'director' working is usually adopted. It is usually desirable, though not necessary, that direct trunks be provided from each exchange to all others in the area. Sometimes, for reasons of line-plant economy, traffic is circulated to the objective exchange via intermediate exchanges. This is known as tandem working, and this method is usually adopted for large city areas.

Step-by-step System. Director Working. The director method of working is used for the large cities in Great Britain, in a number of areas in the U.S.A., and in other countries. In such areas the number of junction groups to give each exchange direct access to all others becomes very large and, to economise in line plant, 'tandem' working is adopted. The extent of tandem working must be flexible, but, irrespective of the routing necessary to complete a call, each exchange must be obtained by dialling a fixed code to permit a common directory to be used throughout the area. This involves the use of equipment which will automatically change the dialled code digits into other digits appropriate to the particular routings. This feature is known as 'translation.' Each exchange must have a dialling code containing the same number of digits. As the area may have 100 exchanges or more, it is necessary for each code to consist of three digits to obtain a sufficient number of code digits. In director areas, therefore, subscribers dial a total of seven digits, three code and four numerical. The three code digits for any exchange are the first three letters of the exchange name and the dial used is of the type shown in Fig. 5(B), having letters as well as figures. The directory is so printed that the first three letters of the exchange name stand out in heavy type capitals (CENTRAL 2345). Each letter, of course, has a numerical equivalent, letters A, B, and C being two impulses, and so on. Director equipment is provided at each exchange in a director area and, as the

name suggests, the equipment is used to direct the call to the required exchange. The director receives all the digits dialled by the subscriber, translates the three code digits into two to six digits as necessary to route the call to the required exchange, and transmits these digits followed by the four non-translated numerical digits. The trans. code digits step code selectors (1st, 2nd, etc.) to route the call, the numerical digits from the director then step the group and final selectors in the required exchange in the usual way. Director equipment is only required during the setting up of a call; it releases after the numerical digits have been sent and becomes available for other calls.

The Panel Automatic Telephone System.—The panel system is a development of the Western Electric Company Ltd. (Bell Laboratories), U.S.A., and is primarily for use in large areas. It is fitted in many areas in the U.S.A., including New York. The system differs from the Strowger in the basic design of its switch and bank, and in the fact that the switching functions are established largely by motor-driven units rather than by electro-magnetic armature operation type of units. The use of a motor drive requires indirect control of the switching equipment by register senders. The motor-driven switch mechanism carries contacting brushes vertically upward to establish a connection with the desired vertical bank contact field. The elevating members are under the control of electro-magnetically operated clutches whose action is controlled by relays.

When the caller removes his receiver a line-finder motor-driven contacting brush is set in operation, and moves upwards into a bank of contacts to find the calling line. At the same time auxiliary equipment selects a sender and connects it temporarily to the calling line. The subscriber now receives the dial tone and dials. The dialled impulses are received by the sender and are trans. into pulses which control the operation of various selector mechanisms (called dist., office, incoming, and final selectors) to establish a circuit through to the called line. A sender is in operation only for the setting up of the call, and then releases for use on other calls. A group of senders is common to the whole exchange. The selector frames are so arranged that as many as 500 sets of terminals can be made available to each selector.

The register sender is thus a device for translating the digits dialled by the subscriber into information to control selection through the switching stages. The device is necessary, as the panel system is not a direct-action decimal selection system under the control of the dial like the Strowger step-by-step system. The code routing digits are trans. to facilitate flexible tandem routing through the network.

The Crossbar Automatic Telephone System.—The Bell Laboratories developed the crossbar system to supersede the panel system. New exchanges in large cities (U.S.A.) will be crossbar, and a

number are already fitted. The crossbar system is not step by step; it is similar to the panel system in that it makes use of a sender. Whereas the panel system employs motor-driven, line-finder, and selector mechanisms, the crossbar system consists wholly of relay type crossbar switches and multi-contact relays, and no motor drive is required. Connections between the subscriber's lines are accomplished by the operation, controlled by senders and markers, of the cross bar units.

In the Strowger step-by-step system apparatus used to set up the call is held engaged during the speech period, although not required during this period. It is sometimes argued that this is wasteful in apparatus: the crossbar system has a sender-marker method of control to overcome this. This method permits apparatus common to all the subscribers, to be used to set up the call to the required subscriber. This apparatus is then released prior to the speech period, and is then available to set up calls from other subscribers.

The crossbar switch is the basic switching unit, and consists of three major parts: (1) twenty separate vertical circuit paths; (2) ten separate horizontal circuit paths; and (3) a mechanical means for connecting any one of the twenty vertical paths to any one of the ten horizontal paths by the operation of electro-magnets.

FROM TWENTY LINES

FIG. 9. PRINCIPLE OF THE CROSSBAR SWITCH

Fig. 9 shows the schematic arrangement of the switch and ten simultaneous connections can be established, one on each horizontal path. The number of lines that can be connected to the same ten trunks may be increased by adding other switches wired to different groups of twenty lines and connecting the horizontal contacts in multiple to other switches. The assembly of switches is called a link frame.

The Rotary Automatic Telephone System. This is used in some European and S. Amer. countries, and in some centres in the U.S.A. The switches are uniselectors. The operating mechanism consists of a motor-driven shaft to which the wipers of the sev. switches in a group are geared. The driving mechanism is placed in operation by means of an electro-magnetic clutch which brings a flexible gear into temporary contact with the shaft driving gear. The register in the rotary system operates in much the same manner as the sender in the panel system. Power-driven rotary line-finder switches

locate the calling line and extend it temporarily to the register. The register receives all the dialled impulses from the calling subscriber, stores and translates them, and then transmits pulses to control the operation of the subsequent power-driven numerical selecting switches to find the required subscriber's line. The selectors have a bank capacity of 200 or 300 circuits, arranged in ten levels of twenty or thirty circuits each. They have one set of wipers for each level, and an auxiliary shaft to select one of the ten sets of wipers. By this means the operation of the switch is limited to a rotary action. There are many other types of automatic telephone systems, but they are not fitted in sufficient quantity to be regarded as prin. systems.

Automatic Trunk and Toll Working.—The usual present method of trunk and toll working on automatic networks is for an outgoing controlling operator to dial the required subscriber over the network, and record particulars of the call on a ticket which is then used for costing purposes. In recent years considerable attention has been given to the problem of eliminating the controlling operator and allow direct subscriber to subscriber dialling of trunk and toll calls. Direct subscriber dialling requires other means than operators' tickets for costing the calls, which cost varies with distance and duration. Increasing use is being made by some telephone administrations of equipment for automatic ticketing of calls to permit direct trunk subscriber-to-subscriber dialling. This facility requires equipment to identify the calling line and an automatic ticketing machine which may produce a printed ticket, or a punched tape, recording all particulars of the call, including the charge.

Other telephone administrations, particularly in Europe, have adopted a repeat metering process whereby the normal subscriber's meter is automatically operated a number of times for each call. The number of operations depends on the distance and duration of the call, and is automatically determined by equipment. One meter operation is regarded as the unit charge for a local call.

LINE PLANT.—Telephone lines may be overhead or underground. Overhead lines are bare copper wire, supported by porcelain or glass insulators mounted on poles. In general, modern practice is to lay underground cables which are of the paper-insulated or coaxial type. Paper-insulated cables consist of many copper conductors, each separated by paper, and all contained within a lead sheaf. In certain cables, inductance, in the form of loading coils inserted at regular intervals, is added to improve the transmission characteristic. Long-distance circuits are invariably four-wire, one pair to carry speech in one direction and the other pair for the reverse direction. The four-wire circuit is converted to two-wire at each end. On long-distance circuits, thermionic valve amplifiers, inserted at appropriate points, amplify the speech to compensate for the transmission loss.

Line plant is expensive, and often a system of carrier working is adopted to increase the circuit-carrying capacity of a single line. Carrier working permits a better utilisation of the frequency band which a line is capable of transmitting.

Country	Total Number of Telephones	Per 100 Pop.
U.S.A.	31,866,800	21.2
Sweden	1,450,500	21.2
Canada	2,213,400	17.4
New Zealand	300,550	16.5
Switzerland	745,000	16.3
Denmark	617,600	14.8
Norway	376,500	12.0
Australia	905,000	11.9
United Kingdom	4,654,500	9.3
Belgium	534,780	6.3
Holland	576,000	5.9
France	2,108,200	5.2
Argentina	651,080	4.0
Germany	1,753,000	3.3
Czechoslovakia	350,700	2.9
Italy	958,800	2.1
Spain	510,000	1.8
Japan	1,195,210	1.5
Portugal	114,820	1.4
Brazil	468,500	1.0
World	60,610,000	2.5

A line may transmit a frequency band which is many times that required for commercial speech, and it is possible to form a number of speech circuits on the one line. This is done by shifting the speech frequencies of each subscriber to another band (modulation, *q.v.*), respective subscribers being in respective bands, and restoring the respective speech frequencies to their original position in the frequency spectrum at the receiving end of the line (demodulation). Each channel so formed is called a carrier channel and up to twenty-four channels per line may be obtained on ordinary underground cable circuits. The separation of the various carrier channels at each end of the line is performed by electric wave-filters.

Recent development in thermionic valve (see VALVES) amplifier design has made it possible to use wide-band transmission systems, where hundreds of carrier channels may be carried on one line, so permitting hundreds of simultaneous conversations on the line. Wide-band systems require a special type of cable known as coaxial. The outer conductor is a copper tube or copper tape wound in that form. The inner conductor is a bare copper wire positioned in the centre of the tube by insulating spacers. The two conductors so formed constitute the pair of a circuit, and two such tubes are required to form a four-wire circuit. At the high frequencies used in wide-band systems the current concentrates near the surface of the central conductor and inner surface of the tube, and the energy is transmitted as electro-magnetic waves in the space between the centre conductor and the tube. In submarine coaxial

cables the insulation is solid, usually paraggutta, on account of the great pressures.

STATISTICS.—The table opposite shows the total number of telephones in the prin. countries as at Jan. 1948, together with the telephones per 100 pop. The U.S.A. is by far the greatest telephone user in the world, having 57.5 per cent of the total world telephones.

Teleprinters, see under **TELEGRAPHY**.

Telescope. The first T. was probably made by the Dutchman Lippershey in 1608, although Galileo in 1609 constructed the first of his famous Ts. and commenced astronomical observations at the beginning of the year 1610. Roger Bacon, who lived during the thirteenth century, is often credited with the invention of the T.; while this statement is probably erroneous, it is remarkable to notice that the germ of the function of a T. is contained in his writings. The apparent size of an object depends solely on the angle it subtends at the eye; thus a sixpence may appear as large as or larger than the sun if it is held at such a distance that it subtends an angle at the eye as great as or greater than does the sun. The function of a T. is then, to increase the angle subtended by an object at the eye, and as a result two things are judged to occur: (1) the object seems magnified, (2) the object seems to be brought nearer. The effect is, of course, a subjective one, for if we view a man 1 m. away through a T. and find that he appears to be six times as tall as when viewed by the naked eye, we estimate his distance as $\frac{1}{6}$ m.

Magnifying Power.—The magnifying power of a T. is defined as the ratio of the angle subtended at the eye by the image viewed through the T. to the angle subtended at the naked eye by the object. Field-glasses commonly have a magnifying power of eight, while some of the finest astronomical Ts. have magnifying powers of the order of 1000. The principle of the simple astronomical T. can be seen by referring to Fig. 1. It consists of a convex lens (*C*) of long focal length, called the objective, and a convex lens of short focal length called the eyepiece. In order to show quite plainly how it works, a parallel beam is shown entering the objective in a direction inclined to the axis of the T.; such a beam would, for instance, fall on the T. from the edge of the sun when the axis of the T. was pointing at the centre of the sun. The objective forms a real, inverted image at *P*, below *B'*, its prin. focus, and the eyepiece is moved so that *P* is at a slightly smaller distance from it than the focal length of the eyepiece, the focus of which is *f*, in order to form a virtual image at *X*, 25 cm. away from the eye, *i.e.* at the least distance of distinct vision. Without the instrument the angle subtended

at the eye by the radius of the sun would be \widehat{SCO} , but with the instrument, the angle subtended by the radius of the image of the sun is increased to \widehat{CEX} , hence the sun appears to be greatly enlarged. The objective and eyepiece are mounted in a tube whose walls are blackened on the inside to prevent confusion arising from light reflected by the walls of the tube. The instrument described above has two serious defects, viz.

piece (E) is a concave lens of short focal length. The rays from the objective fall on E , and the final image formed by this concave lens is at XY , a virtual and erect image. The eye has, of course, been enlarged in the diagram for convenience. This instrument requires correction for spherical and chromatic aberration in a similar way to the simple astronomical T. *Reflecting Telescopes.*—Newton despaired of making a refracting T. free from chromatic aberration, and he

FIG. 1. PRINCIPLE OF SIMPLE ASTRONOMICAL TELESCOPE

the image suffers from *spherical aberration* (q.v.) and *chromatic aberration* (q.v.). Spherical aberration arises from the fact that a point object does not give rise to a point image when a single lens is used. The defect can be remedied by using stops and by using a compound lens. Chromatic aberration is due to the fact that the focal length of a simple lens is different for each of the coloured components of white light. The image produced is tinged with colours at its edges. The attempts to remedy this defect were completely unsuccessful until 1758, when Dolland discovered an achromatic combination consisting of a convex lens of crown glass placed in contact with a weaker concave lens of flint glass that partially corrected the dispersion produced by the convex lens, the combination behaving as a weaker convex lens. Since that time, the study of achromatic combinations has made so much progress that the Yerkes T., the largest refracting T. in the world, is constructed on the essential principles of the simple astronomical or refracting T. Various forms of eyepieces are used instead of the single convex lens in order to obtain greater magnification without the defects of aberration.

Galileo's T. is the prototype of modern opera-glasses. The astronomical T. produces an inverted image; this is immaterial for astronomical observations, but it renders the instrument useless for terrestrial work. The simple pattern of the Galilean T. is shown in Fig. 2. The objective (O) is a convex lens of comparatively long focal length, and the eye-

designed the first reflecting T. on the lines shown in Fig. 3. M is a concave mirror of large radius of curvature; its principal focus is at F' . Light from a distant star is reflected at M and the reflected beam converges towards I , a point vertically below F' . A plane mirror m inclined at 45° to the axis of the instrument intercepts this beam and the real image is formed at f . This image is viewed by the eyepiece and the final image seen by the observer is a virtual one at I' .

All subsequent reflecting Ts. were modifications of Newton's, a famous one being

FIG. 2. PRINCIPLE OF GALILEAN TELESCOPE

that of Herschel, the great Brit. astronomer of the eighteenth century. The 100-in. T. of the Mt. Wilson Observatory, the second largest instrument to-day, is a reflecting T. The mirror instead of being truly spherical is 'parabolised' in order to avoid the aberration of a spherical mirror and it is silvered on its front surface by a process of chemical deposition. In this way the silver can be renewed whenever desired. Within comparatively recent times the mirrors of reflecting Ts. have been aluminised instead of silvered, and better results have been obtained.

A still larger T. with a mirror of diameter 200 in. is now in operation at Mt. Palomar, California.

FIG. 3.
PRINCIPLE OF NEWTON'S
REFLECTING TELESCOPE

Brightness of Objects.—In no case can objects such as the moon or sun appear brighter through a T. than they do when viewed by the naked eye, and if the losses of light by reflection or refraction are taken into account, the apparent brightness of such objects is actually diminished when viewed through a T. But this statement does not apply to the case of stars, whose apparent size is so small that diffraction effects are produced (see below). Under the best conditions the apparent brightness of stars viewed through a T. varies directly as the square of the diameter of the objective, and with the largest modern Ts. stars appear about 100,000 times as bright when viewed through the instrument. As the brightness of the sky is not increased it is possible to view stars in daylight.

Resolving Power.—A star seen through a T. appears as a central bright disk of light which is surrounded by alternate dark and bright diffraction rings. Two stars can be recognised as distinct stars, provided that the centre of the bright disk of one falls on the first dark ring of the other. If the stars are closer than this they cannot be distinguished as separate stars; if further apart, they are the more easily distinguished. The limit mentioned is known as the limit of resolution. It can be shown that the angle subtended at the centre of the objective by two stars that can just be resolved is $1.22 \frac{\lambda}{D}$, where λ is the wave-length of the

light and D is the diameter of the objective. Hence the greater D is, the greater the resolving power of the T.; in point of fact, the above fraction is adopted as the quantitative measurement of the resolving power of a T. The Yerkes T. can resolve two stars that subtend an angle of only $\frac{1}{2}$ sec. of arc at the centre of its objective. Michelson (q.v.) invented a form of interferometer (q.v.) attachment

to the Mt. Wilson T. that increased the resolving power of the instrument severally times and made it possible to measure directly the angular diameters of some of the larger stars.

In astrophysical research a spectrometer attachment replaces the ordinary eyepiece, while permanent records are obtained by means of a spectrograph attachment, whereby the spectra are photographed. Cameras are fitted to Ts. in all observatories, as it is possible to obtain prolonged exposures of any part of the heavens by means of a clockwork arrangement that keeps the instrument directed to a given area of the sky. Photographic records taken in this way reveal much more information than may be obtained by ordinary visual observation.

Cooper (ed.), *Scientific Instruments* (chap. ix.), 1946; also T. E. R. Phillips and W. H. Steavenson, *Splendour of the Heavens*, 1923 (chapters xx. and xxi.), and most textbooks on astronomy.

Television is the name given to the science which enables pictures or scenes to be transmitted by line or radio (q.v.), and to reproduce them in pictorial form at some point remote from that at which transmission took place.

History.—The earliest practical demonstration of T. was given by J. L. Baird before the Royal Institution in 1926. In 1928 the Brit. Broadcasting Corporation experimented with the transmission of still pictures, using the 'fultograph,' and in the same year Baird transmitted a low-definition picture by radio to the U.S.A. In 1929 Baird commenced an experimental low-definition service from the Crystal Palace, and in Aug. 1932 the B.B.C. conducted tests in conjunction with the Baird Company, using a thirty-line system radiated from the Brookman's Park station. The postmaster-general appointed a Television Advisory Committee in 1934 to determine and advise which system should be followed for a public service. They recommended the abandoning of low-definition T., and accordingly, in Sept. 1935, the B.B.C. transmissions ceased.

The first high-definition T. service in the world began in Nov. 1936 with the opening of the B.B.C.'s station at Alexandra Palace. Two separate systems were first tried on alternate weeks: the Baird system of 240 lines and the Marconi E.M.I. system of 405 lines, and these continued until Feb. 1937, when the Baird system was discontinued in favour of the other which is still used. Improvement of this system continued steadily until 1939, when the service was discontinued at the outbreak of the Second World War. In Sept. 1943 the Hankey Committee recommended the restarting of the pre-war service, and in Oct. 1945 the gov. accepted this recommendation so that the Alexandra Palace service restarted on

June 7, 1946. No immediate extension of this service took place until Dec. 17, 1949, when the first relay station at Sutton Coldfield, near Birmingham, was completed. Programmes were still originated in the London studios at Alexandra Palace and were transmitted to Sutton Coldfield either on ultra high frequency radio link or by coaxial cable. Future plans involve the construction of additional relay transmitters, first at Holme Moss near Huddersfield, then in Scotland, and followed eventually by a further station to cover the S.W. of the country. The limited studio space in London was supplemented by the acquisition of the Lime Grove studios at Shepherd's Bush, transmissions from which began on May 21, 1950.

Service in Great Britain.—The Alexandra Palace T. transmitter radiates a vision signal on a frequency of 45 Mc./s. (6.67 metres) and sound on 41.5 Mc./s. (7.23 metres), which have an average range of 50 m. The power used is 17 Kw. for vision and 3 Kw. for sound, using double side-band amplitude modulation (g.v.), and the aerials are mounted on a 300-ft.-high tower at Alexandra Palace, which is itself 306 ft. above sea level. In this way the maximum ground-wave range is attained. Sutton Coldfield employs 61.75 Mc./s. (4.86 metres) for vision, using a type of single side-band (vestigial side-band) modulation which confines transmission to the carrier wave and lower side-band, thus keeping to a minimum the band width required. Sound is transmitted on 58.25 Mc./s. (5.15 metres) with amplitude modulation. The vision transmitter has a power of 35 Kw. with 12 Kw. for sound, the aerials being carried on a mast 750 ft. high. The station itself is situated on high ground (550 ft. above sea level), so that an appreciably larger service area than that of Alexandra Palace is obtained. Good signals are received up to 70 m., and in certain directions this range is exceeded. Tests by the radio industry and retailers will show which station gives the better signal, and as only one programme is radiated, no switching facilities from one to the other are required.

Scanning.—Just as it is impossible for the human eye to transmit the substance from a page of print instantaneously, so is it impossible instantaneously to transmit a T. image. In the first case the reader must, with his eye, break up the page into words and letters, transmitting these to his brain in a continuous flow. The eye, starting at the left of the page on the top line, travels smoothly to the right, from where it jumps quickly to the left again at the beginning of the next line, and so on until the end of the page is reached. The subject-matter to be 'televised' is treated in much the same way; that is to say, it is scanned electrically, the resulting signals being transmitted for subsequent reconstitution at the receiver into an image which can be seen by the human eye. The scanning process takes place first at the transmitter where the image is broken down,

and second at the receiver where the cycle follows that at the transmitter and is synchronised with it. This is accomplished by means of special synchronising signals which are transmitted with the picture.

Scanning for Transmission.—The scene to be transmitted is projected by means of a suitable lens arrangement in the T. camera on a flat rectangular plate suspended within the camera tube itself (see VALVES). The surface of this plate is composed of a mosaic of photo-electric silver-caesium cells, each of which is microscopic in size and separated by an insulating film from a metal back plate. When the image is projected on this mosaic, each cell takes up an electric charge proportional to the light intensity falling upon it, so that the surface carries an electrical 'picture' of the image focused upon it. An electron gun assembly, similar to that of a cathode-ray tube (see VALVES), projects a stream of electrons towards the mosaic. This stream is deflected by suitable time bases (see OSCILLOGRAPH), so that it scans the whole surface of the plate in the manner discussed earlier. As the beam passes over each cell it is discharged, transmitting to the back plate an impulse equivalent to the charge on the cell. In this way the output from the camera tube is an electrically varying current which represents, line by line and frame by frame, the make-up of light and shade in the picture.

Scanning at the Receiver.—The early thirty-line receivers employed a rotating Nipkow disk, with holes punched in the periphery so that they formed a spiral in one revolution of the disk. They were so arranged that each adjacent hole scanned a separate line of the picture, but with the advent of high-definition T. such an arrangement became impossible. Scanning at the receiver is carried out by the moving electron beam in the cathode-ray tube, which is deflected in

FIG. 1. 'RASTER' FORMATION SHOWING INTERLACE

Typical fly-back lines are shown dotted.

synchronism with that in the camera tube. Two time bases are used, the horizontal one being called the 'line time base,' and the other, which causes vertical

deflection, 'the frame time base.' These time bases operate in exactly the same manner as those in an oscillograph (*q.v.*). The frequency of the line time base for the Brit. T. system is 10,125 cycles per sec., which means that 405 oscillations are completed each $\frac{1}{40}$ sec. While this is taking place the frame time base applies its deflecting voltage at right angles to the horizontal lines drawn on the tube by the line time base. The frequency of the frame time base is 50 cycles per sec., so that during one complete oscillation the line time base only completes 202½ lines. At the centre of the 203rd line the downward motion of the beam ceases and the

the end of a line, the lines composing the second half frame will fall between those of the first half frame so that the full frame is made up of two interlaced halves. This is done in preference to a single frame of 405 lines sequentially scanned, as it reduces the apparent flicker of the repeating frames with no corresponding increase in channel width. The completed rectangle so reproduced on the face of the cathode-ray tube is called the *Raster*.

The B.B.C. Television Wave Form.—The transmitted T. signal must contain all the elements necessary to enable the picture to be reconstituted at the receiver.

FIG. 2. B.B.C. TELEVISION TRANSMITTED WAVE FORM

A, 10 μ sec. ; B, 5 μ sec. ; C, 0.5 μ sec.

frame time base cycle starts again, so that a further 202½ lines are completed, but interlaced with the first 202½. This gives a completed picture of 405 lines in $\frac{1}{40}$ sec., which is the present Brit. standard. Reference to Fig. 1 will enable this process to be understood more easily. The fluorescent spot caused by the electron beam starts at A and travels to A¹, when the line synchronising signal returns it quickly to B, whence it draws the second line to B¹. Simultaneously the frame time base is causing it to travel down the screen so that each successive line is parallel to the one before. At C (the beginning of the 203rd line) only half the line is drawn, for at D the frame synchronising signal returns it to E, from where the remainder of the 203rd line is finished at F, and line 204 starts at G. The 405th line is finished at H, when another frame synchronising pulse returns the beam once more to A. It can be seen that, because the frame time base is re-started at E in the middle, instead of at

Both line and frame synchronising signals are essential to ensure that the receiver time bases are in step with those of the camera tube. The actual picture signal accompanying these must be capable of transmitting all the details of light and shade present in the camera, and in practice frequencies up to 3 Mc./s. must be transmitted to give approximately equal definition in the horizontal and vertical directions. Positive modulation is used such that peak 'white' in the picture is represented by a 100 per cent modulation of the carrier, 'black' by 30 per cent \pm 3 per cent, with the intermediate shades in between. Between zero and 30 per cent is used for transmitting the synchronising signals (often called sync pulses), which, being 'blacker than black,' do not appear on the *Raster*. Reference to Fig. 2 will show, in graphical form, how these signals are disposed, relative to each other, in the final wave form.

The line pulses are of 10 microseconds duration, separated from the picture

wave form itself by a blank period of 5 microseconds in front and 0.5 microseconds behind. Frame pulses are 40 microseconds long, such that the frame and half-frame synchronising signals are made up of eight such pulses separated by 10 microsecond intervals. To accommodate the frame and half-frame signals described, at least ten lines of the *Raster* are suppressed at each half-frame, so that a 405-line picture possesses 385 active lines of picture material, i.e. lines 1 to 4 are occupied by eight frame pulses, the following six to ten lines being 'black,' separated simply by the usual line pulses, and then the picture lines begin. At

the lines of the *Raster* appear on the tube screen, but these are focused on the film in the gate behind which a photo-cell picks up the light passing through the film as the flying spot on the scanning tube builds up the *Raster*.

Other Television Systems.—It is clear that a number of conditions must be specified in order to define the wave form used in a T. system. Although Great Britain was the first country to inaugurate a public high-definition service, there are now others with projected and existing T. stations, chief among the latter being the U.S.A., where many are on daily schedules. The Amer. wave

Emtron Television
Ltd.

202½ lines the frame pulses are repeated, interlace is effected, and the remainder of the *Raster* is built up to give the completed picture. The ratio of height to width is 3:4.

Film Scanners.—Increasing use of cinematograph film is being made in compiling T. programmes to-day. For this purpose special film projectors known as 'scanners' are used. Early models consisted merely of a standard ciné projector, in front of which was set up a T. camera. The arrangement was not entirely satisfactory, due in part to the troubles associated with synchronising the projector frame frequency with the T. camera frame frequency. Modern film scanners have been developed especially for T. transmission in which the film moves through the 'gate' at a constant speed, and scanning is accomplished by means of a 'flying spot' scanner. The latter, in its simplest form, produces a *Raster* on the screen of a special cathode-ray tube operated to give a very bright image. Nothing except

form differs from the Brit. in sev. respects, and has the following chief characteristics. Negative modulation is used to transmit an interlaced picture of 525 lines and thirty frames. The accompanying sound is broadcast, using frequency modulation (*see* MODULATION). The Netherlands Philips Company operate an experimental system at Eindhoven similar to the Amer. but of 625 lines and twenty-five frames, while the Fr. favour 819 lines and twenty-five frames. Sev. attempts have been and are being made to reach an agreed standard for Europe, so that programmes can be exchanged internationally. To do this it is essential that the number of lines and frames be the same even if the direction of modulation is different, as the latter can be converted for relay purposes. A figure of 625 lines and twenty-five frames has been looked on with some favour, although the Fr. have since decided to proceed with a service on 405 lines, similar to that in Great Britain.

Receiving Aerials.—Unlike domestic

radio receivers, which will operate satisfactorily with a simple length of wire for an aerial, T. sets require something more elaborate for the best results. Because the wave-length for any T. station is relatively short a resonant aerial becomes possible, and this usually consists of a half-wave aerial made of light alloy or steel tube, and fed at the centre with low impedance coaxial or balanced cable. Greater gain is obtained if a reflector element be added, and quite complicated arrays are used in areas of weak signal strength (see BEAM WIRELESS). These aerials are mounted either vertically or horizontally to conform with the polarisation of the transmitting aerials. Tubing is used for the elements, since an aerial made of wire would be too sharply resonant with resulting loss of band width, and therefore poor picture definition. In the U.S.A., where a number of stations are available to the viewer, sev. aerials may be necessary, both because of the different frequencies used and because each aerial receives from a different direction.

Receivers.—Receivers (see RADIO RECEIVERS) used for broadcast reception are of two main types, namely, tuned radio frequency (T.R.F.) and 'superhet' (super-heterodyne), of which the latter is more common. T. receivers, too, exist in both varieties, and the tendency is also to favour the superhet. Their main characteristics are that they should have sufficient sensitivity; the band width accepted should be wide enough to reproduce all the picture detail; the time bases should lock easily and not respond to impulsive interference; both vision and sound channels should also discriminate against such interference; and, finally, the picture should be sharply focused and bright, with correct grading of half-tones. It must be remembered the eye is far less tolerant of poor reproduction than the ear, and therefore a high standard of receiver performance is called for compared with a broadcast set.

As its name implies, the T.R.F. receiver is one which accepts the vision and sound signals at their carrier frequencies and amplifies them directly. Separate channels are usually used for sound and vision, following a common radio frequency (R.F.) amplifier (see VALVES), and each has its separate detector. After detection the receiver operation becomes identical with that of the superhet. More stages of amplification are necessary than in a broadcast set, partly because the gain per stage is lower at the higher carrier frequency used, and partly because a much wider acceptance band is essential (as explained earlier).

In a superhet receiver the first valve is invariably an R.F. amplifier, like its T.R.F. counterpart, accepting both sound and vision channels. Next follow one, or in some cases two, mixer valves, but only one oscillator is used. This oscillator beats with the sound and vision carriers to give two intermediate frequencies (I.F.), which are then fed to separate I.F. amplifier valves. The vision I.F. con-

taining one, or both side-bands, may have two or three such valves, while the sound, by virtue of the narrower band width, is sufficiently amplified by one or two only. The sound-channel is treated in exactly the same way as in the conventional broadcast set, but the range of musical notes that it reproduces is somewhat greater than for medium-wave broadcasting. The vision (or 'video') signal is detected, amplified, and passed to the electrode of the cathode-ray tube which controls the intensity of the beam, and hence the light and shade of the picture. At the same time, the processes of 'sync separation' and 'D.C. restoration' are performed. The sync separator carries

out the very necessary function of removing the synchronising signals from the video signal existing after detection discriminating between line and frame signals, and passing them to their respective time bases. The D.C. restorer sets the 'black level' of the tube at zero potential, and by fixing it ensures that the video signals above 'black' in the picture are positive. The cathode-ray tube itself may have a face diameter of anything from 9 to 15 in., on which the picture of ratio 3:4 is reproduced. In addition to the normal voltages common to other valves in the receiver a source of 'extra high tension' is necessary, which may be between 5 and 10 Kv. in a domestic receiver. Early sets had a high voltage secondary winding added to their mains transformers to produce the extra high tension (E.H.T.) required, but the resulting transformer was heavy and the reliability in some cases was bad, besides

being dangerous to the unwary service engineer. Most present-day receivers employ one of two other systems for E.H.T. generation. The first of these, 'line fly-back,' makes use of the fact that, on the horizontal return stroke of the beam, a very rapid change of current takes place in the winding of the line transformer which, possessing appreciable inductance, opposes this change so that a very high-voltage pulse appears across it. This pulse can be rectified, voltage doubled or trebled, smoothed and used for the final anode of the cathode-ray tube. The second employs a separate R.F. oscillator having a sinusoidal wave form, which after amplification is passed through a peak rectifier, and thus the necessary E.H.T. is obtained.

Big Screen Receivers and Projection Television.—Pictures reproduced by direct-viewing receivers have always

which is $2\frac{1}{2}$ in. in diameter; it is reflected by spherical mirror D to the plane mirror E through which the tube projects. Interposed between E and the second plane mirror G is a weak lens or 'corrector' plate which counteracts the spherical aberration introduced by D. The picture JK is reproduced by back projection on the screen H; 25 Kv. at 100 micro-amperes are used for the final anode of the tube, whose screen is aluminium backed to give an intense black-and-white picture. Fig. 3 shows the optical unit from which the tube neck projects surrounded by (but not shown in the diagram) the focus and deflection coils. The picture possesses good brilliance, excellent tone gradation, and is almost independent of ambient light in front of the screen. Economically the system has much to recommend it since tube replacement costs are low, and the initial outlay

The folding of the optical path reduces cabinet dimensions. The correction lens between the two 45° mirrors corrects the spherical aberrations

Mullard Electronic Products Ltd.

tended to compare unfavourably with home cinema pictures with which they are inevitably classed. For this reason development of big screen reproduction has engaged T. engineers for many years. Before the Second World War at least two Brit. manufacturers did demonstrate such pictures successfully. The more remarkable of the two was that produced by the Scopony Company, using high-precision mechanical scanning to give a bright picture which was projected on a cinema screen. The mechanical scanner, however, was very expensive and required skilled operation.

Projection T. is the system whereby pictures are thrown by optical means from the face of a small cathode-ray tube on to a much larger screen. Early attempts used projection lenses, but they lacked sufficient brilliance. A more recent development, an example of which is the Mullard projection T. system, makes use of a Schmidt mirror lens arrangement. The light-path is 'folded,' as shown in Fig. 3, so that the whole assembly becomes compact enough for inclusion in a domestic receiver cabinet. The picture is produced at AB on the tube face C,

becomes an economic proposition for picture sizes larger than those having a 15-in. diagonal.

Colour Television.—Like the cinema, T. is always striving for improvement of the monochrome picture by the addition of colour, and a number of colour systems have been demonstrated. J. L. Baird was an early pioneer in this direction, and one of the first techniques developed employed a system whereby the normal frame frequency was increased by a factor of 3, each successive frame containing the material for one primary colour. The receiver used revolving colour disks in front of the viewing screen, synchronised with the correct frame colours at the camera. A similar system replaced the colour disks by three superimposed projected pictures corresponding to the three primary colours. These systems are expensive, both in equipment costs and also the frequency spectrum required, but in 1949 the Radio Corporation of America produced a six megacycles compatible high-definition colour T. system which, it is claimed, requires no wider frequency band than for a monochrome picture, and enables standard monochrome

receivers to accept the same signal without modification.

In view of the high cost it is likely to be a number of years before colour T. can provide a public service. Its main use is on closed wire circuits, e.g. in a teaching hospital where a camera over the operating table can transmit images in full colour to a number of receivers located at a remote point where students can follow in close-up detail the operation being performed.

Telford, Thomas (1757-1834), Scottish civil engineer, b. at Westerkirk, Dumfriesshire, son of an Eskdale shepherd, and apprenticed to a local stone-mason when fourteen years old. He went to Edinburgh in 1780, and to London and Portsmouth in 1784. T. built the Severn bridges at Montford and Buildwas, 1793-1796; the Ellesmere Canal, 1796-1801; the Caledonian Canal, 1801-23, and in the same period over 1000 m. of road and 1200 bridges throughout Scotland. His greatest achievement was the improvement of the London-Holyhead road with the building of the Menai suspension bridge. He also did much harbour work in Scotland; he built St. Katherine Dock, London; the Gotha Canal, Sweden; and designed the Warsaw frontier road for Tsar Alexander. A man of talent, wholly self-educated, T. often gave his services gratuitously. He was one of the founders of the Institute of Civil Engineers (1818), and was its first president. He is buried in Westminster Abbey. His autobiography was pub. in 1838. See A. Gibb, *The Story of Telford: the Rise of Civil Engineering*, 1935.

Tel Jezar, see GZER.

Tell, William, national hero of Switzerland. The story in the form which first appears in a chronicle written between 1467 and 1476 would appear to be largely legendary, but sev. Swiss critics suggest that T. did really live, and that he may have played some part in the rising of the Inner Cantons against the tyranny of the Hapsburgs at the beginning of the fourteenth century, though his importance has been greatly exaggerated in the legends that remain, and his real character has been obscured by a confusion with old folk-themes. The prin. source of the life and deeds of T. is the *Chronicon Helveticum* of Aegidius Tschudi (1505-72), which is even more embellished. From this Schiller took his drama *Wilhelm Tell* (1804). The story centres on the struggle for independence of the cantons Schwyz, Uri, and Unterwalden, and is as follows: T. having refused to do homage to the cap which Gessler, the Austrian governor, set up for the purpose in the market-place of Altdorf, was taken prisoner, and on being brought before the landgrave was promised his liberty if he could cleave an apple in twain, placed on his son's head, at the distance of eighty paces. He accomplished the task, but confessed on

compulsion that the other arrow in his hand was meant for Gessler's heart had he failed, whereupon he was again seized and taken on the lake en route for Kussnacht Castle. But a storm having arisen, T. was asked to steer the ship, and while doing so effected his escape. He sprang ashore, pushing the boat back from the shore by his spring, an incident which has given its name to a place, the Tellsprung. He afterwards killed the landgrave, and his actions became symbolic of the courage of the Inner Cantons in their struggle against the Hapsburgs. See F. Schiller, *Wilhelm Tell* (trans. by A. Latham, Temple Classics). See also P. Lang, *Die schwarze Tellsprünge*, 1924; F. Gropengießer, *Wilhelm Tell in der schweizer Geschichte*, 1940; K. Meyer, *Der Ursprung der Eidgenossenschaft*, 1941; R. Labhart, *Wilhelm Tell als Patriot und Revolutionär*, 1947.

Tellurium (symbol Te, atomic weight 127.6, atomic number, 52), rare element of the sulphur group. It occurs in the free state in nature, but is chiefly obtained in combination with other elements, as in tellurite (TeO₂) and tetratellurite (Bi₂Te₃). It is a bluish-white solid with a metallic lustre (melting-point 452° C.; sp. gr. 6.26). T. forms tellurides with hydrogen and the metals, corresponding to the sulphides. Two oxides, the dioxide and trioxide, are known, which give rise respectively to the two acids, tellurous acid and telluric acid.

Tellus, see GAEA.

Telpher, see under MONORAIL.

Telugu, Dravidian language spoken in the central and E. portions of S. India. It may be said that Telugana ('Teluguland') stretches roughly N. from Madras to the borders of Orissa and N.W. to Bellary, where T. meets the Kanarese. Of all the Dravidian languages, T. is spoken by the largest number of people, about 22,000,000. It is strongly admixed with Sanskrit.

Teme, riv. of Great Britain. It rises in Wales, and flows through Shropshire and Worcestershire, to join the Severn near Worcester. It is 60 m. in length.

Temesvar, or **Timisoara**, as it is now called, city of Rumania, on the Bega. It is the cap. of the Banat. It is strongly fortified, and is the see of a Rom. Catholic bishop and of a Gk. Orthodox bishop, with a fine cathedral and a castle. It is now an industrial centre. Manus. include textiles, brewing and distilling, chemicals, leather, and shoes. Its univ. was founded in 1945. Pop. 110,000.

Tempera, or **Fresco Secco**, see under FRESCO PAINTING; MURAL DECORATION.

Temperance. The recognition of the social, moral, and physical evils which may be directly or indirectly traced to the excessive consumption of alcohol is of comparatively recent origin. The attitude of civilised mankind on this subject

has undergone change within the last century. The more critical attitude adopted has been accompanied by widespread constructive endeavour towards the abatement of intemperance on the part of numerous organisations and individuals. It can now be generally assumed (1) that the occasional drinking and retotalled numbers of the pop. have steadily increased; (2) that the heaviest drinking occurs chiefly among those engaged in heavy industry or with no regular occupation, using alcohol as a means of escapism from poverty, unemployment, and illness. The *per capita* consumption has fallen from 33 gal. annually to 13.5 gal. during the period from 1875 to 1948 with respect to beer, and from 1.3 gal. to .20 gal. with respect to spirits. During the nineteenth century various computations gave intemperance as the chief cause of the major social evils, some authorities placing the proportion as high as 75 per cent. A more intelligent examination of records by skilled investigators yields a more moderate figure, especially as regards intemperance as a direct cause. After careful analysis, it has been found that intemperance was responsible only for 14 per cent of cases of destitution, and the modern point of view among publicists may be expressed, in terms of psychology, that people drank because they were poor, not that they were poor because they drank. On the other hand intemperance is still regarded as being a potent cause of 'secondary' poverty. According to the Lunacy Commissioners' tables, about 10 per cent of cases of lunacy are directly attributable to excessive drinking. That alcoholism is responsible for crime is acknowledged, but there does not appear to be sufficient evidence to support the allegation that excessive drinking is the cause of major crimes other than suicide, since forgery, theft, and crimes of violence require good physical condition in the person of the perpetrator.

The prin. existing means adopted since the origination of the T. movement in 1826 may be conveniently classified into: (1) prohibition and local option; (2) the Scandinavian company system, which places the control of the sale of liquor in the municipality, the profits to be utilised for public purposes; (3) state monopoly of municipal control; (4) the institution of counter attractions; (5) high licence; (6) taxation of liquor. Prohibition (*q.v.*) was tried in the U.S.A. and other countries, and involved the suppression of the buying and selling of liquor within the ters. concerned. Eng. T. organisations have, with but few exceptions, never favoured prohibition, except as a long-term policy, but are for the most part strongly in favour of local option (*q.v.*). Under the Scandinavian company system, called the Gothenburg system, the liquor traffic was controlled by companies to whom the municipal authorities transferred all liquor licences (*see further under LOCAL OPTION*). In Sweden in 1919 the Bratt system replaced the Gothenburg system, by a charter of the Stockholm City Council, and

control rests in the hands of a central trade organisation subject to a royal board of control. Moreover it became necessary for the individual consumer of spirits to take out an official permit or *matbok*, wherein a record is kept of his purchases. These must not exceed the prescribed quantity per month. Finland, like the U.S.A., had an absolute prohibition law adopted in 1919. An advisory national plebiscite was held in Jan. 1932, a great majority voting in favour of abolition of prohibition. The Parliament thereupon set about passing a law permitting the sale of all liquors, but under a state-controlled monopoly. The system of state monopoly was adopted in tsarist Russia. The Soviet Gov. abolished on-consumption of spirits in the state drinking premises, and made many other stringent provisions against public inducements to tipping, and it has also been effective in reducing intemperance in a country which was overrun with the evil. For a time the most promising 'solution' of the drink problem was considered to lie in the direction of the municipal control of the drink traffic, but experiments along these lines have not been wholly successful, particularly when they have been divorced from any democratic control by local option. Opponents of public ownership contend that the mere transfer of the vested interest from private to public ownership does not necessarily improve sobriety. They maintain that it simply confers a civic dignity upon the trade in intoxicants. Prominent supporters of T. include Father Mathew, Cardinal Manning, Archbishops Frederick and Wm. Temple, Lord Snowden, and Lady Astor. *See T. N. Carver, Government Control of the Liquor Business*, 1919; M. E. Tydings, *Before and after Prohibition*, 1930; G. E. G. Catlin, *Liquor Control*, 1931; G. B. Wilson, *Alcohol and the Nation*, 1940; and H. C. Heath, *The Control of a Dangerous Trade*, 1947.

Temperature: 1. In physics, the condition of a body on which its power of transferring or receiving heat (*q.v.*) from another body depends. The sensation of touch gives no accurate knowledge as to whether one body is hotter than another. To obtain this one of the other effects which heat produces on matter is employed. The effect generally made use of is, that most substances, when heated, change in size, and in gases the change is proportional to the change in T. over a very large range. The liquid mercury is, however, generally adopted, its expansion being nearly proportional to the change in T.; thus most thermometers contain this liquid, the T. being indicated by the measurement of the volume of mercury contained. Alcohol is used for the measurement of low Ts. owing to its low freezing-point, but is of little use for high Ts. owing to its low boiling-point. The most accurate thermometer is the gas thermometer. *See further under THERMOMETER AND THERMOMETRY*. For absolute T., *see GAS AND GASES; PYROMETER*.

2. **Body Temperature.**—The T. of the

body varies with the different forms of life. In man it lies between 98.4° F. and 99.5° F. in a state of health, and between these limits there are slight variations due to the amount of exercise, ingestion of food, the T. of the surrounding atmosphere, etc. In the cold-blooded animals the Ts. have a wider range and are much lower than in the human family. Thus the T. of the frog may vary from 63° F. to 48° F., according to circumstances, and that of the python, about 76° F.; may be higher when the female is coiled around her eggs. It is not always easy to draw a hard and fast line between the cold-blooded and warm-blooded animals; hibernating animals like the dormouse, hedgehog, and others resemble cold-blooded animals during their winter sleep. Some of the mammals which are born in a state of immaturity (naked and blind like rabbits and rats) bear a resemblance to cold-blooded animals. There are small fluctuations in T. in human beings during the day; it reaches its maximum during the afternoon and evening, from about 4 p.m. to 9 p.m., and a minimum in the morning hours, from about 1 a.m. to 7 a.m. The source of animal heat is due to the oxidation within the tissues of the body, and different foods have different values as heat producers. The almost uniform T. of the body is maintained by a process of adjustment, superfluous heat being eliminated by different means, the lungs and skin playing a major part in this process.

3. *Air Temperature* varies appreciably with time, but, in any one place, the mean T. over an interval of, say, ten minutes changes only slowly and can be measured approximately by a thermometer which has a short time-lag, shielded from radiation in a Stevenson screen or whirled through the air (see further under METEOROLOGY). A detailed record of this 'mean' T. throughout the day can be obtained by using a thermograph (q.v.), but a rough idea may also be obtained by using maximum and minimum thermometers in addition to reading an ordinary thermometer at fixed times. Ts. in the upper air are measured by instruments attached to aircraft, or supported by kites or kite balloons or, more frequently nowadays, by radio-sonde (q.v.). Since the air near the surface is warmed or cooled by contact with the earth's surface, the daily maximum usually occurs in the early afternoon when the outgoing earth's radiation just begins to balance the incoming solar radiation which has warmed the earth's surface in the first place. The daily minimum T. usually occurs about dawn when the sun's radiation begins to warm the earth's surface again. Near the earth's surface, the highest observed T. is 136° F. at Azizia, Tripoli, Sept. 13, 1922, and the lowest, -93.6° F. at Verkhoyansk, Siberia, Jan. 3, 1885. In the Brit. Isles the highest is 100.5° F. at Tonbridge, July 22, 1868, and the lowest, -17° F. at Braemar, Feb. 11, 1895. For more detailed figures of air T. see CLIMATE.

Tempering, heat treatment process for

relieving certain stresses that may occur in hardened steels, and for recovering to specific limits the hardness and ductility essential to hardened steels. A hardened steel that has not been tempered or stress relieved can be brittle and susceptible to cracking. The process itself consists of reheating the steel to a specific temp. and quenching in oil and water or, in the case of air hardening steel, by cooling in air. The oldest and most commonly used method of determining T. temp. is one of observing the surface oxide colour tints that occur whilst the steel is being reheated. These tints indicate with some measure of accuracy the temps. reached. When the appropriate colour change appears the steel is cooled in air, oil, or water. This method calls for extreme skill and experience on the part of the heat treater.

The methods commonly used for heating steels to T. temps. are: (1) by the use of hot cast-iron plates, upon which the parts to be tempered are placed. As soon as the required T. colour appears the parts are quenched in oil or water. (2) The parts to be tempered are placed in a box or tray of clean dry sand and heated upon a fire hearth or forge, and similarly quenched. (3) Baths containing oil, lead, or salt are heated and maintained at exact temps. The parts to be tempered are placed in a suitable basket or cradle and suspended in, or passed through the hot liquid and allowed to cool in air.

Lastly, there are various types of electrically heated and air-controlled furnaces in which the parts to be tempered are heated. The trend in modern methods of T. is to use liquid baths for reheating, and towards the use of pyrometer and thermo-electric control for accurate measuring of T. heats.

Temperley, Harold William Vazeille (1879-1939), Eng. historian, b. at Cambridge, and educated at Sherborne School and at King's College and Peterhouse, Cambridge. He became a fellow of Peterhouse in 1904. T. frequently visited the Balkans between 1905 and 1909, notably during the Young Turk revolution. In the First World War he served in the Dardanelles campaign. T. had many adventures in Yugoslavia and Hungary (1918-20), where he tried to mediate in the fighting after the armistice. In 1920-1924 he ed. the *History of the Peace Conference of Paris*. T. was recognised as one of the leading modern historians by his work on the *Foreign Policy of Canning* (1925). He collaborated in the production of the *Cambridge Modern History*. With G. P. Gooch he was given the task of editing the Brit. documents relating to the origin of the First World War, which were produced in 11 vols. (1926-38) as *British Documents on the Origins of the War*. From 1923 to 1937 he was editor of the *Cambridge Historical Journal*, and from 1930 was prof. of modern hist. in the univ. of Cambridge. He was president of the International Historical Conference from 1933 to 1938. In 1938 he succeeded Lord Birdwood as master of Peterhouse. T. was considered an authority on Brit. foreign policy since 1815.

Tempest, Dame Marie (1866-1942), Eng. actress, b. in London, her real name being Mary Susan Etherington. She was educated at the Convent des Ursulines, Thildonck, Belgium, and studied music in Paris and at the Royal Academy of Music under Manuel Garcia. In 1885 she acted in Suppé's *Boccaccio*. She attracted attention in the title role of the operetta *Dorothy*, which ran for over two years. From 1895 to 1900 she was the leading attraction at Daly's and drew great audiences to such musical comedies as *The Geisha*, *San Toy*, *A Greek Slave*, and *An Artist's Model*. She then abandoned the musical stage until 1924, when she sang in Clifford Bax's *Midsummer Madness* at the Lyric, Hammersmith. Her change to 'straight' acting proved immediately triumphant. She began with historical and romantic comedy, appearing as Nell Gwynne and Peg Woffington, following these with Becky Sharp and Polly Eccles. Her technique was artificial, yet an ideal medium for the expression of caprice and waywardness in light comedies. Her chief parts in this type were in *The Marriage of Kitty* and in Arnold Bennett's *The Honey-moon*. She had a series of successes in Somerset Maugham's epigrammatic comedies, such as *Mrs. Dot* and *Penelope*. As an actress of the mannered style she had no equal during all her later years, and her vivacity was perhaps her outstanding natural gift. She was created D.B.E. in 1937.

Templars, or Knights Templars, military order of the Middle Ages, the most famous and powerful of this type, and deriving their name from their armoury adjoining the Temple convent at Jerusalem. They are known also as the Brethren of the Temple at Jerusalem, the Soldiery of the Temple, or the Soldiers of Christ. Like the other military orders the T. owed their origin to the burst of crusading zeal which marked the eleventh and twelfth centuries. The Order of the Templars was founded in 1118 by nine Fr. knights, led by Hugh de Payns, and they received their rule in 1128 from St. Bernard, who was then in the Holy Land. Their original vow was simply to maintain free passage for the pilgrims who should visit the Holy Land. The name that they first took was the Poor Soldiers (*Pauperes Commilitones*) of the Holy City, and they professed to have no source of subsistence but the alms of the faithful. Pope Honorius II. confirmed their rule and assigned a white mantle as their badge. Pope Eugenius added a red cross on the left breast to the mantle. The standard of the T., *Beauseant* (O.F., a black and white horse), was a red cross on a field striped black and white, and *Brauseant* was the famous war-cry of the order. Their motto was *Non nobis, Domine, non nobis, sed Nomini Tuo da gloriam*; and their seal showed two knights riding one horse. The constitution of the Knights Templars was simple. At the head was the grand master, who was elected by the general body of the knights. Under him was his seneschal or lieutenant; other high officers were the marshal, the

treasurer, etc. The sev. countries in Asia and Europe in which the order had possessions were denominated provs., and each of them was presided over by a resident chief, called a grand prior, grand preceptor, or prov. master. Under the prov. masters were the priors, otherwise called bailiffs or masters, who each had charge of one of the dists. into which the prov. was divided; and finally, under the priors were the preceptors, each of whom presided over a single house or estab., hence called a preceptory. The head prov. was that of Jerusalem, and here the grand master resided till 1187. After this he retired to Acre, and then to Limisso. For more than 170 years the Soldiers of the Temple formed the most renowned portion of the Christian troops, and almost every encounter with the enemy bore witness to their prowess and daring. By 1300 the order had 15,000 members, and its property included 9000 castles and manors. The destroyer of the T. was Philip le Bel of France. He compelled the pope to summon the grand master, Jacques de Molay, to Europe. In 1307, whilst Molay was at Paris, two individuals of notoriously evil character made certain revelations accusing the T. of heresy, idolatry, unbelief, and a number of foul practices. As a result, the order was suppressed at the council of Vienne in 1312, many of its members tortured, and its property confiscated. It continued, however, in Portugal, where it took the new name of the Order of Christ. The name survives in the Temple, London, and the Temple, Paris, etc., and a number of their churches, built in the round style peculiar to the order, still exist. The London Temple Church survived the Second World War with severe damage.

Temple, Eng. earldom. Eng. title held by the Grenville family, together with the dukedom of Buckingham and Chandos. The first earl was Richard Grenville (1711-1779), eldest son of Richard Grenville (1678-1728) and Hester T., afterwards Countess T.; succeeded to his mother's peerage in 1752 and took the name of Grenville-T., M.P. (1734). *George Nugent Temple-Grenville* (1753-1813), second son of George Grenville and nephew of the first Earl T., succeeded his uncle as second Earl T. in 1779. He was created marquis of Buckingham in 1784 and was a lord-lieutenant of Ireland. His son, *Richard Temple Nugent Brydges Chandos Grenville* (1776-1839), became first duke of Buckingham and Chandos (created 1822), having married the heiress of the last duke of Chandos, and was M.P. as Earl T. from 1797 to 1813. His son, *Richard Plantagenet Temple Nugent Brydges Chandos Grenville* (1797-1861), was second duke of Buckingham and Chandos (*q.v.*). His successor, Richard, the third duke (1823-1899) was colonial secretary, 1866-68. On his death the dukedom became extinct. His titles of Earl T. and Viscount Cobham passed to relatives. The family seat was at Stowe, near Buckingham. The sixth earl T. of Stowe was born in 1909.

Temple, Frederick (1821-1902), Eng. prelate, educated at Blundell's School and

Balliol College, Oxford, where he met and formed a friendship with Jowett, Matthew Arnold, and Clough. T. was ordained deacon in 1846 and priest in 1847. In 1857 he became headmaster of Rugby, where he continued the work of Arnold, though he laid more stress than the latter on the place of orthodox religion in school life. His friendship with Gladstone, whose Liberal views he shared, led to his being appointed in 1869 to the see of Exeter, where he won for himself great popularity by his sincerity and humanity. He was appointed bishop of London in 1885, and in 1896 archbishop of Canterbury. Among the ideals which T. had much at heart was the cause of temperance. He worked hard to prevent the influence of the Oxford movement from resulting in a split within the fabric of Anglicanism. *See* lives by W. F. Aitken, 1903, and E. G. Sandford (ed.), 1906.

Temple, Henry John, *see* PALMERSTON, VISCOUNT.

Temple, Sir William, Bart. (1628-99), Eng. statesman and man of letters, *b.* in London; studied at Emmanuel College, Cambridge. Travelled in his youth, and in 1655 married Dorothy Osborne (*q.v.*).

Temple, William (1881-1944), Eng. prelate, *b.* at the Palace, Exeter; son of Frederick T., and educated at Rugby and Balliol College, Oxford. T. was fellow and lecturer in philosophy at Queen's College, Oxford, 1904-10. He was ordained priest in 1909, and was chaplain to the archbishop of Canterbury, 1910-21. T. was headmaster of Repton School, 1910-1914, and rector of St. James's, Piccadilly, 1914-18. He was bishop of Manchester, 1921-29, and was appointed archbishop of York and a privy councillor in 1929. T. became archbishop of Canterbury in 1942. As a writer, T.'s fame will rest chiefly on his essays in philosophy and on his application of that philosophy to social and economic problems. As a thinker he is considered by some to follow in the line of eccles. thinkers of the calibre of St. Anselm. The two vols. of his *Readings in the Gospel of St. John* (1939), shows his deep devotion. His Gifford Lectures, delivered at Glasgow Univ. while he was archbishop of York and collected under the title *Nature, Man, and God* (1934), are an outstanding contribution to theology. *See* life by F. A. Iremonger, 1948.

Temple, structure designed for the worship of a deity or deities. The first *temple* of the Romans was simply the space of earth and sky marked off by an augur for divination. The anc. Egyptians built enormous Ts. by degrees over a long period; anc. India is noted for cave Ts. hewn out of the solid rock; but the most celebrated Ts. of antiquity were those of the Gks. In the Far E. and in S.E. Asia the T. is known as *pagoda*, while the anc. Mexican T. was known as *teocalli*. In France Protestant churches are known as Ts., as also are some Jewish synagogues.

The Jewish Temple.—The sacred edifice of the anc. Heb., erected at Jerusalem. It was built on Mt. Moriah, which

was one of the hills of Mt. Zion. **Solomon's Temple.**—The idea of building the T. was suggested to the mind of David, but it was Solomon, his son and successor, who commenced the work in the fourth year of his reign. The building of the T. required seven years. The T., whose building was directed by Phœnician craftsmen, was of imposing character. It is described in detail in the Bible (1 Kings vi., vii.; 2 Chron. iii.-v.) and by Josephus (*Ant.* viii. iii). The rock-altar (see below) is the only remains still preserved. The site of the T. lies to-day within the sacred enclosure of the Muslims known as the Haram esh-Sherif ('The Noble Sanctuary'). The most striking natural feature of the Haram is the anc. rock-altar (a great outcropping of rock measuring 58 ft. by 51 ft. by 4-6½ ft.), known as es-Sakhra ('sacred rock'), and covered by the Kubbet es-Sakhra ('Dome of the Rock'). One can still trace on this rock the channels which conducted the blood to an opening which in turn conducted it to a sacred cave underneath. **The Second Temple** was built, on the same site, by Zerubbabel, and was completed in 516 B.C., seventy years after the first T. was destroyed. It was probably without ornaments, and was as nothing in the eyes of those who had seen the T. in its former glory. **The Herodian Temple** (described by Josephus, *Ant.* xv. xi., and *Wars* v. v., and in the Babylonian Talmud, *Qodashim, Middoth*) was begun in 20-19 B.C., and was finished in A.D. 64, six years before it was finally destroyed. According to Tacitus, it was 'a temple of immense wealth.' The 'Western' or 'Wailing Wall,' (*q.v.*) belongs to the remains of the enclosure-walls of the Herodian T.

Temple, London, *see under* INNS OF COURT.

Temple Bar, former gateway of London dividing Fleet Street from the Strand. When the sovereign visited the city, the custom was to ask the permission of the lord mayor to pass T. B. The old archway was built by Wren in 1670, but was removed in 1878 and was re-erected in Theobalds Park, Cheshunt, Hertfordshire. It is now represented by a monument called the Temple Bar Memorial.

Tempo (It. time), musical pace. The speed of any musical composition, determined, not by the note-values used by the composer, which are relative, but by the directions set above the staff at the opening of a piece or section (e.g. *allegro*, *andante*, *adagio*, etc.). These words cannot fix the exact pace required by the composer; this can only be done by means of metronome marks (e.g. ♩ = 96, i.e. 96 crotchets to the minute, etc.).

Temporal Power, *see under* PAPACY.

Temporary Rank, rank sometimes conferred upon an officer to enable him to command officers senior to him in a certain locality. It only holds good within

the 'command' or country in which it has effect, but therein it has the same advantages of precedence, command, and pay as ordinary rank.

Temuchin, *see* GENGHIS KHAN.

Temuco, city of Chile, cap. of the prov. of Cautin, 430 m. S. of Santiago and 106 m. N.E. of Valdivia. Cereals, timber, and apples are the main products. It is the headquarters of the S. Amer. Missionary Society. T. is a cathedral city with a pop. of 85,000.

Tenacity, *see under* ELASTICITY; STRENGTH OF MATERIALS.

Tenant, *see* LANDLORD AND TENANT.

Tenants in Common, *see* COMMON, TENANCY IN.

Tenasserim: 1. Tn. of Lower Burma on the T. R. 2. Div. of Lower Burma, consisting of a narrow strip of land lying to the E. of the bay of Bengal. There is a heavy rainfall, and where cultivation is possible, rice is grown. Some tin is mined. Cap. Moulmein. Area 35,886 sq. m. Pop. 2,111,000.

Ten Brink, Bernard, *see* BRINK, BERNAUD TEN.

Ten Brink, Jan, *see* BRINK, JAN TEN.

Tenby, municipal bor. and seaside resort of Pembrokeshire, Wales, 9 m. E. of Pembroke. It is situated on a narrow promontory jutting out into Carnarthen Bay. T. has a long hist., and by the late fifteenth century was a prosperous little port. Part of the castle and most of the tn walls still exist. By virtue of its unique position and favourable climate T. is a popular holiday resort. Pop. 4500.

Tench (*Tinca vulgaris*), freshwater fish with exceedingly small scales, abundant secretion of mucus, and the presence of a short barbule at each angle of the mouth. It is rich olive green in colour, shading into light grey on the belly. It spawns in early summer, the greenish ova numbering about 250,000. Like the carp, to whose family it belongs, it feeds on both animal and vegetable substances. It attains a length of about 18 in. and a weight of 4 lb.

Ten Commandments, *see* DECALOGUE.

Ten, Council of, secret committee of the Venetian Senate, estab. in 1310 and vested with such a measure of executive authority as was deemed effective to cope with extraordinary crises. Its institution marked the final overthrow of the democratic constitution, in favour of a system of close oligarchies of hereditary aristocrats. After the defeat of Tiepolo's revolution (1310) against the growing exclusion of so many Venetians from any share in the government, the aristocratic element deemed it advisable that the Great Council, then composed almost entirely of the nobility, should elect ten of its members, the Doge, his council, and the Supreme Court another ten, and that from these the Great Council should make a final selection of ten to act as a committee of public safety. Eventually the C. of T., though theoretically outside the constitution, became the most powerful organ of government. It was not finally abolished until 1797, the date of the fall of the republic.

Tender, in law, offer of money in payment of a debt. To be valid it must be: (1) Unconditional; but a T. will not be invalid merely because it is made under protest. (2) Of the whole debt; though if the creditor's claim is made up of separate items the debtor may validly make a T. of payment of any one item provided he makes it clear in respect of which item it is made. (3) In the current coin of the realm. Bank of England notes of £1 and 10s. are legal T. in Great Britain and N. Ireland to any amount; those of £5 in England and Wales only. Change cannot be demanded except from the Bank of England. Gold (dated 1838 onwards), if of or over the least current weight, is legal T. to any amount. Silver (dated 1816 onwards) is legal T. up to 40s., nickel brass 3d. up to 2s., and bronze (introduced 1860 to replace copper) up to 12d. A valid T. does not extinguish the debt but it exposes the creditor in his action against the debtor as the litigious oppressor, and a plea of T., if sustained by the debtor, will assuredly result in the plaintiff having to pay the costs of the action. But the defendant, if he pleads T., must pay the amount into court. The other effects of T. are that it stops the further accrual of interest, and extinguishes any right of lien (*q.v.*) the creditor may have. T. in commerce is a written offer of terms for executing a specific piece of work or for supplying a certain consignment of merchandise.

Tendon, *see under* MUSCLE.

Tendon of Achilles, tendon attaching the muscles of the calf of the leg to the heel-bone. It is capable of resisting a great tensional strain, and yet is sometimes ruptured by the contraction of the muscles in sudden extension of the foot. Ant. surgeons regarded wounds in this tendon as fatal, probably because of the legend of Achilles. It was so called from the hero Achilles, whose mother dipped him when an infant into the Styx, so that he became invulnerable except in the heel by which she held him.

Teneriffe, or **Tenerife**, largest of the Sp. Canary Is. The volcanic peak of T., Pico de Teide, has an elevation of 12,180 ft. The climate of T. is mild and healthy, and bananas, tomatoes, grapes, sugar, and dates are produced. Tourism is a growing industry. Cap. Santa Cruz de Tenerife, also cap. of the Sp. maritime prov. of T., of which T. is an important port. Area 730 sq. m. Pop. 261,800. (Area of prov. of T. 1329 sq. m. Pop. 427,900.)

Tengri Khan, *see* KHAN-TENGRI.

Tengri-Nor, lake of Tibet. It is 80 m. from Lhasa and has an area of 950 sq. m. Altitude 15,400 ft.

Teng-Yuah-ting, *see* MOMEN.

Teniers, David, the Elder (1582-1649), Flemish painter, b. at Antwerp. He studied painting under Rubens and Adam Elsheimer at Rome. His subjects were familiar scenes of ordinary Flemish life or mythological in subject. Three paintings, including 'Playing at Bowls,' are in the National Gallery, London.

Teniers, David, the Younger (1610-90).

Flemish painter, b. at Antwerp, the son of David T., the Elder, from whom he received his prin. instruction. He was a master in the Antwerp Guild (1632-33). He was appointed court painter to Archduke Leopold and keeper of his pictures. His work was mainly a development of his father's style, and was extremely popular. He was happiest in his portrayals of small figures in landscape. His best picture, 'Meeting of the Civic Guards,' is at Leningrad, while his 'Village Fête,' and other works are in the National Gallery, London.

Tennant, Emma Alice Margaret, see OXFORD and ASQUITH, COUNTESS OF.

Tennant, Smithson (1761-1815), see under DIAMOND.

Tenne, see FALÉMÉ.

Tennessee, central S. state of the U.S.A., having an area of 42,246 sq. m. It is known as the Volunteer State. Its boundaries on the N. are Kentucky and Virginia; on the E. N. Carolina; on the S. Georgia, Alabama, and Mississippi; and the Mississippi R. on the W. separates it from Arkansas and Missouri. Along the E. boundaries rise the Unaka and Great Smoky Mts., with peaks over 6000 ft. high, whilst between these highlands and the Cumberland Plateau, the mean elevation of which is 2000 ft., is the valley of K. T. (watered by the upper reaches of the 652-m.-long T. R., scene of the T. Valley Authority (q.v.) project, and its tribs.), part of the Great valley of the Alleghanies. The Cumberland R., affluent of the Ohio, waters a fertile valley W. of the Cumberland Mts. In the N. of the state. There are wide level tracts in the W. between the Mississippi and the lower T. The state enjoys a pleasant climate, the average ann. fall of snow being 8 in. and of rain 52 in. The mean extremes of temp. are 38° F. in the winter and 78° in the summer. Over a half is still woodland, and lumbering and timbering bring in a large revenue; national forest lands cover some 564,471 ac. Cultivated lands are dispersed over the rest, there being 17,788,997 ac. of farmland in 1945. The best crop is maize (63,500,000 bushels in 1947), though conditions favour the growth of wheat, oats, potatoes, and peanuts. Cotton, hay, sweet potatoes, pease, sorghum, tobacco, and fruits, especially strawberries, are also cultivated. Agriculture is the largest single industry, and owes its new prosperity, to a large extent, to the T. Valley Authority. Stock raising has declined since the beginning of the century, but is still important. The fields of bituminous coal cover an area of over 4400 sq. m. Other mineral products are iron, copper, lead, zinc, manganese ore, clay, gold, silver, marble, and cement. There are flour and grist mills, saw-mills and foundries, blast furnaces, textile factories, and tobacco, cotton seed, oil and cake, and leather are prepared. Nashville is the cap. (pop. 167,400), but the largest city is Memphis (293,000), whilst Chattanooga (128,000) and Knoxville (111,600) are also important. Norris Dam is 27 m. N. of Knoxville. During the Second World War production of the

atomic bomb was carried out at Oak Ridge, a 'new' tn. 9 m. from Norris Dam, built specially for the purpose of housing the workers. It was opened to the public in March 1949. T. has good rail and air services, and in the Mississippi and the T. Rs. has excellent natural waterways. Education is compulsory and there are forty-nine univs., colleges, and professional schools, including eight for Negroes. The state univ. is at Knoxville. Negroes numbered slightly less than one-fifth of the total pop. in 1940. The leading religious denominations are S. Baptists, S. Methodists, and Negro Baptists. T. was explored by De Soto in 1541, and first settled in 1757, as part of N. Carolina. It had its first settlement at Watauga, led by James Robertson in 1769; admitted to the Union, 1796; seceded, 1861; readmitted, 1866. Its General Assembly consists of a Senate and a House of Representatives; it is represented in Congress by two senators and ten representatives. Pop. (estimated 1948) 3,149,000. See T. Oldland, *Tennessee*, 1946.

Tennessee Valley Authority (T.V.A.), created by the Tennessee Valley Act in 1933. The authority initiated regional planning on a scale never previously attempted. Among the reasons why the Tennessee Valley was selected as the site of this great experiment was the existence of a large gov.-built nitrate plant, the Mussel Shoals nitrate works at the Wilson Dam, built during the First World War. Proper control of the Tennessee R. was also crucial for the prevention of disastrous floods on the lower Mississippi. There was further the consideration that flood control could be readily related to improved navigation and to the profitable generation of electric power; and the needs of this backward region could largely be met by cheap electric power, which was supplying 750,000 customers in 1948. The Tennessee valley used to be known as one of the most depressed areas of the U.S.A., affecting parts of the states of Alabama, Kentucky, Missouri, Virginia, Georgia, and N. Carolina. Its disastrous state was due to reckless exploitation by early settlers: the soil was barren and the woods had been cut down; the rvs. frequently flooded. Under the T.V.A. water control was begun. Great dams were built and lakes created over forty times the area of the Eng. Lake Dist. Co-ordinated research plans were undertaken throughout the entire area, which is approximately 42,000 sq. m. Soil regeneration, afforestation, malaria control, and similar measures were scientifically applied. National parks were laid out, tourist facilities organised, and cultural and educational activities promoted. The whole project affords a valuable lesson in the possibilities of judiciously applied regional planning, though it was opposed by numbers of influential interests. It should be pointed out that the financial structure of the project has been severely criticised by orthodox economists. Over \$800,000,000 had been spent by T.V.A. by the end of the 1949

financial year, and had increased the income of over 3,000,000 people who had previously been below the 'poverty line.' Expenditure by T.V.A. in the financial year 1949 was \$29,274,300, a decrease of about \$3,000,000 compared with 1948.

Tenniel, Sir John (1820-1914), Eng. cartoonist and illustrator, *b.* in London. T. studied at the Royal Academy Schools. His first serious picture appeared at the exhibition of the Society of Brit. Artists in 1836. His design for a mural decoration of the new palace of Westminster in 1845 resulted in his being commissioned to paint a fresco in the House of Lords. Meantime his reputation as a humorous artist had grown, and in 1850 Mark Lemon invited him to succeed Richard Doyle as joint cartoonist with John Leech in *Punch*, his illustrations to *Æsop's Fables* having attracted much attention. His first cartoon was 'Lord Jack the Giant-Killer,' representing Lord John Russell attacking Cardinal Wiseman. Some 2300 cartoons and many smaller drawings were executed by T. before he severed his connection with *Punch* in Jan. 1901. In them can be traced a political hist. of the period (see illustration in article GREAT BRITAIN). His drawing and the originality of his conceptions coupled with his sense of humour make him unrivalled as a cartoonist. His illustrations for Lewis Carroll's *Alice in Wonderland* and *Through the Looking-Glass* have delighted children of all ages, and are his greatest claim to fame. He was knighted in 1893.

Tennis, one of the oldest ball games in existence, is often called real T., royal T., or court T. to distinguish it from lawn T., a game which was evolved from T. about 1870. Even in 1100 the game is known to have resembled very closely the T. of to-day.

The royal T. court at Hampton Court is the oldest place in the world where a ball game is still played. It was built in 1529 by Henry VIII., and has served as a model for all later courts erected in England. Henry VII. and Charles II. were good players. Edward VII. played at Princes' when Prince of Wales. Among other courts in active use to-day are those at Lord's and Queens' in London, and at Manchester, Leamington, Oxford, Cambridge, Moreton, Murrel, and elsewhere. The game has been ousted in general popularity by lawn T. and squash owing to the expense of building and maintaining a court.

Regulation courts measure 96 ft. by 31 ft. 8 in. Round the two ends and along one of the side walls runs the penthouse, a sloping roof over the dedans, galleries, and grille. (It is 7 ft. wide and is 7 ft. 1½ in. high at the side of the court and 10 ft. 7 in. at the further edge.) Across the middle of the court is stretched a net, 5 ft. high at the sides and 3 ft. in the centre. In the back wall on the service side is a large rectangular opening—the dedans. On the back wall of the hazard side is a small square opening—the grille. A ball struck so that it enters the dedans, the grille, or the gallery on the

hazard side furthest from the net, known as the winning gallery, wins the point outright. On the main wall, near the grille, is a projection known as the tam-bour. The winner of the toss has choice of ends and usually takes the service side. A service to be good must strike the penthouse at least once on the hazard side of the court and drop into a prescribed area on the floor. The striker-out may volley the service or return it at first bounce. Basically the scoring is as in lawn T. except for a great number of variations; e.g. if the server fails to touch the ball with his racquet when it is returned, the marker watches where the ball falls on its second bounce, and calls the chase, the floor being marked with chase lines for this purpose. That point is held in abeyance, and when two chases have been made the players cross over, and the one who is now striker-out must make a better, i.e. shorter, chase in order to win the point. If he makes the same chase, the score remains unaltered, and the marker calls 'chase off.' If other player is at game point, they cross over if one chase is made.

A short chase is made by playing the T. 'stroke,' i.e. a heavily cut stroke that comes down sharply off the wall below the dedans. There are also chases on the hazard side. A set is the best of eleven games. The balls are solid and should not be less than 2½ in. and not more than 2¾ in. in diameter. They should weigh not less than 2½ oz. and not more than 2¾ oz. There are no restrictions as to size or shape of racquets. The game is played by two or four players.

The first recognised world champion was Clergo (France, 1750). The present world champion (since 1928) is Pierre Etchebaster (France). Recent amateur champions are E. Baerlein (1914-27, 1929-30), L. Lees (1928, 1931, 1933-37, 1946), Lord Aberdare (1932, 1938), W. D. Macpherson (1939), Lord Cullen (1947), P. Kershaw (1948), Ogden Phipps (1949), Alastair Martin (1950). See C. G. Heathcote, *Tennis, Lawn Tennis, Rackets, Fives, 1903, and Rackets, Squash Rackets, Tennis, Fives and Badminton* (Lonsdale Library vol. xvi.).

Tennis, Lawn, see LAWN TENNIS.

Tennyson, Alfred, first Baron (1809-92). Eng. poet, *b.* at Somersby, Lincolnshire, son of the rector of Somersby, and younger brother of Charles Tennyson-Turner and Frederick T., both of whom were poets. He was educated at Louth Grammar School and at Trinity College, Cambridge. It is only in recent years that research has shown how unhappy T.'s childhood and youth must have been. His father was eccentric and morose, and later became mentally unbalanced, and the whole family displayed extreme neurotic tendencies. Biographers suggest that this background accounted for much of T.'s remarkable sensitivity and reserve in later years. In 1827 he pub., with his brother Charles, a vol. called *Poems by Two Brothers*, to which Frederick had also contributed. At Cambridge T. won the chancellor's medal for Eng. verse in 1829,

and next year brought out a vol. of *Poems, chiefly Lyrical*. This contained some verse of great promise, and was favourably reviewed by Leigh Hunt, though Blackwood made some scathing criticisms. T. was deeply hurt by these, and sought an escape in a tour of France, Germany, and Italy with Arthur Henry Hallam (q.v.). From the pictorial impressions he gained on this tour he took the inspiration of many of his later poems. In 1833 he pub. a vol. which included

extremely happy marriage. In April 1850 Wordsworth died, and the poet-laureateship was offered to Samuel Rogers (q.v.), who declined it on account of his advanced age. T. was then offered the honour, and immediately accepted.

The *Ode on the Death of the Duke of Wellington* appeared in 1852, and three years later the popular *The Charge of the Light Brigade* and *Maud*. Of all poets laureate, T. was perhaps the best able to produce patriotic stanzas which possessed inspiration and real poetic quality; but work of this type was not his true *métier*, and it is by his lyrics that T. should be judged, though *Maud* has scenes of great power and contains some of T.'s finest poetry. In 1859 *Idylls of the King*, variations in lyric form on the Arthurian romances, were pub. These contain some of T.'s loveliest descriptive passages, and have a music and a pathos which links them with the much earlier *Lady of Shalott*. T.'s Arthurian legends have not the vigour and fire of Malory's interpretation; but they possess a stately, rich grandeur equally effective in describing an ornately vivid tournament scene, the pathos of Elaine, and the final tragedy of the defeated Arthur. His other works include *Locksley Hall* (1886) and a number of poetic dramas which, though they enjoyed contemporary popularity, are inferior to his other poetry, and generally lacking in the essential dramatic qualities.

His own age saw T. as midway between Virgil and Shakespeare; but a more just appreciation would attempt no comparisons, and would rather point to his richly decorative phrases, his happy expression of aspirations in which his age devotedly believed, and to the flashes of rippling lyricism which mark the height of his real genius. There are biographies and studies by his son Hallam (1897), H. Nicolson (1923), H. I'Anson Pausset (1929), and Sir C. Tennyson. See also W. H. Auden, *Tennyson: an Introduction and a Selection*, 1946.

Tenor, see under JOINTERY.

Tenor: 1. Highest adult male voice, the compass being from tenor C to treble A, i.e. an octave below soprano. It is so called because in the old plainsong the T. part was of sustained notes around which the harmonics were set. 2. Instrument, especially the viola, playing part between bass and alto. 3. Tenor bell, the largest of a peal or set.

Tenrec, or Tailless Hedgehog, see CENTETES.

Tension. Newton's third law states that action and reaction are always equal and opposite. Where the action and reaction of two bodies tend to keep them apart, these constitute a thrust, but where they tend to keep two bodies together they constitute a T. A good illustration is a tug of war, the T. in the rope being the same everywhere. T. is measured in the same way as other forces—in pounds, or dynes in the c.g.s. (centimetre-gramme-second) system.

Tent, movable dwelling or shelter made of cloth, skins, or tree bark supported by

N.F.G.

ALFRED, LORD TENNYSON

Painting by G. F. Watts.

The Lady of Shalott, the *Lotus Eaters*, and *A Dream of Fair Women*. These were unfavourably reviewed by the *Quarterly*, but were liked by the general public, and T.'s work began to be known and admired by a small circle. He pub. no more poetry for nine years; this delay was partly due to his sensitive dislike of the bitter criticism which had been directed at his earlier work, but also because in these early years T. wrote far more slowly, and often with more discernment, than he did when he became famous. *The Princess* (1847), a fancy, written mainly in epic style, but embodying some of his finest lyrical fragments, was T.'s first great popular success, and this ran through five eds. in six years. But he achieved immediate and nation-wide fame with *In Memoriam*, which he had begun in 1833, as an elegy to Hallam. The theme expanded under the poet's hands and so the work, while not ceasing to be personal, became a great religious poem as well. It expresses the spiritual conflict which followed upon his friend's death, and sets forth his faith in God, immortality, and the 'one far-off divine event to which the whole creation moves.' *In Memoriam* was pub. anonymously in 1850. It was praised lavishly on all sides, and T.'s improved financial position enabled him to marry Emily Sellwood, to whom he had been engaged for sev. years. This was an

poles and secured by ropes and pegs. Ts. have been used by nomadic peoples since the dawn of hist. Those used by the Bedouin Arabs are made of strips of woven goat's hair and have changed little in construction since O.T. days. The *tepi* of the N. Amer. Indian is a conical-shaped T. made generally of skins or tree bark stretched over a tripod of poles. Also in the N. Amer. continent is found the flimsy summer skin T. of the Eskimo. Probably the most luxurious T. used by nomadic tribes is the Mongol *yurt*, a felt-covered dwelling with walls of latticed hurdles; richly embroidered felt curtains line the interior and form partitions. Ts. have long been recognised as a means of housing troops in active service areas. In the W. world Ts. are now generally used by people visiting open spaces, enabling them to remain independent of permanent dwellings. Modern Ts. vary in size from the smallest one-man sleeping shelter to the marquee of many hundred feet in length, but have in common the fact that they are generally made of canvas suspended on a minimum framework of poles—sometimes only a single pole—and are held secure by adjustable guy-lines of cord or rope attached to pegs in the ground.

Tenterden, Charles Abbott, first Baron of Hendon (1762-1832). *b.* at Canterbury. His father was a barber, and sent him to King's School at Canterbury. From there he gained a scholarship to Corpus Christi College, Oxford. He studied the law and was admitted to the Bar, and became a special pleader. He was made recorder of Oxford in 1801, and the following year pub. his treatise *Law relative to Merchant Ships and Seamen*. His treatise is still an authority in mercantile law.

Tenterden, municipal bor. (since 1449) of Kent, England, 18 m. S.S.E. of Maidstone. At one time it was a member of the Cinque Ports Confederation as a limb of Rye. Its thirteenth-century church (St. Mildred's) once formed part of an Augustinian monastery, and is crowned by a lofty Perpendicular tower. T. is an agric. centre. Pop. 8500.

Ten Thousand, Expedition of the. In anct. Gk. hist. the 'Ten Thousand' was an army originally composed partly of large levies of native troops in the Persian satrapies of Asia Minor, but mainly of Gk. mercenaries, collected by Cyrus, younger son of King Darius II. of Persia, hoping to win the crown from his elder brother Artaxerxes II. At the battle of Cunaxa (401 B.C.) the Gks. routed their opponents but Cyrus was killed. The native levies at once dispersed and the Gk. mercenaries found themselves marooned in Mesopotamia. Their officers were killed by a trick of the enemy. The Gks. chose new officers, among them Xenophon (*q.v.*), the historian of the expedition, and fought their way N. into the Armenian mts. Ultimately they reached the Euxine at Trapezus (Trebizond). A graphic account of the remarkable wanderings of the Ten Thousand is contained in the *Anabasis* of Xenophon.

Tenths: 1. The tenth part of the ann.

profit of an eccles. living which formerly went to the pope, but at the Reformation was transferred to the Crown. Afterwards various benefices were exempted from payment of T. altogether (*see under* QUEEN ANNE'S BOUNTY; TITHES). 2. In music, the octave of the third; an interval comprehending nine conjoint degrees, or ten sounds, diatonically divided.

Tentyra, or Tentyris, *see* DENDERA.

Tenure, Feudal. Tenure is defined by Williams as the relation between feudal lord and tenant of land (*Real Property*). This is sufficiently accurate because the feudal system is the foundation of modern Eng. real property law, although the fabric of that system was effectually shattered in the early part of the seventeenth century. The theory that all land was held mediately or immediately of the sovereign in return for either free or base services was essentially a Norman innovation into England adapted by the Conqueror from continental feudal institutions. In return for his loan of land the feudal tenant was bound to perform either free or base services. From these services were developed respectively freehold tenure and copyhold through tenure in villeinage. Of freehold tenures the most honourable was that of knight service. Most of the anct. feudal incidents were abolished by the Statute of Tenures, 1660 (12 Car. II. c. 24), which assimilated knight service to 'free and common socage.' Generally speaking, all the anct. forms of tenure were abolished by the Law of Property Act, 1925. *See also under* DE DONIS, KENTAIL, ESCHEAT, ESTATE, FORFEITURE, LAND, LAND LAWS, and LANDLORD AND TENANT; and also under the various forms of tenure.

Teocalli, *see under* MEXICO, *Archaeological Research*.

Tephigram ($T\psi$ -gram) is used in meteorology to complete (in a vertical direction) the weather analysis achieved horizontally in a weather map. It was introduced by Sir Napier Shaw, its name being derived from the main co-ordinates, temp. (T) and entropy (ψ). If air expands (as it must in ascent, for pressure decreases with height) without absorbing heat from any source its temp. falls because of the work done in expansion. This is an 'adiabatic' expansion, and the consequent rate of loss of temp. with height or 'lapse rate' is constant at $5.4^\circ \text{ F./1000 ft.}$ When the air has cooled to its dew point it becomes saturated, and any further lifting above this level, called the condensation level, causes condensation into cloud droplets which are carried up with the rising air, and eventually rain or snow may be formed (*see further under* RAIN). The liberated latent heat of condensation warms the air somewhat, and the new 'saturated adiabatic' lapse rate is therefore less than the 'dry adiabatic' above, the difference being greatest at high temps., where most water vapour is available for condensation. The T. has five sets of lines on it: (1) slightly curved diagonal lines representing equal pressure; (2) vertical lines representing equal temp.; (3) dry adiabatics or lines of equal entropy,

represented by horizontal lines; (4) saturated adiabatics, represented by curved lines which become almost parallel to the dry adiabatics at low temps. where there is little moisture in the air; and (5) steeply sloping lines representing humidity mixing ratio of saturated air (see further under *HYGROMETER*). A point on the T. can be defined by temp. and pressure, and it can therefore represent the state of a small parcel of air; and a line (the 'environment curve') can equally represent the state of the air at all levels. Vertical motion (i.e. between two pressure levels) is represented by a movement of the point along the appropriate adiabatic (saturated or dry); the dew point (which may be defined as the temp. to which the air must be cooled to achieve saturation) moves along a saturated mixing-ratio line, and where it meets the corresponding dry adiabatic is the condensation level. It is therefore easy to detect and measure on a T. the movement of air over colder and warmer surfaces, up and down hills and over or under other masses of air, and the ascent or descent caused by regional inflowing or outflowing.

Atmospheric Stability.—If the environment curve shows a greater lapse rate than the corresponding adiabatic (dry or saturated according to whether the air is dry or saturated) air slightly disturbed will be warmer (and lighter) than its surroundings in ascent and cooler (and heavier) in descent. Convection will therefore arise automatically and the air is unstable. The greater the instability the more violent the convection, the most violent being in thunderstorms, tornadoes, and waterspouts (q.v.). If the lapse rate is less than the corresponding adiabatic the air is stable and no convection occurs. Limited depths of instability (e.g. near the earth on a sunny day) may be extended to great heights by convection reaching above the condensation level, with consequent decrease in adiabatic lapse rate for ascending air; instability may also develop by bodily lifting until much of the air becomes saturated. All these effects can be traced easily on a T.

Air Mass Analysis.—Coming from different geographical regions, air masses (see *METEOROLOGY*) have distinctive environment curves on the T. The distinction is especially clear if 'Normand' curves formed by joining condensation-level points corresponding to each point of the environment curve are used. The Normand curves have the property of not changing their position relative to the curved saturated adiabatics throughout any lifting or descent, or even if any rain falls from or is evaporated into the air. One air mass lying over the top of another as in a front generally appears as a distinct discontinuity in the Normand curve, even if it appears to be quite smooth in the environment curve. The shape of the Normand curve can only be altered by radiation, which changes the pattern in lower levels or, very slowly, near cloud tops, by mixing, which tends to uniformity, or by horizontal inflow and outflow, which extends or squashes the

pattern in height. Ts. can thus help to identify air masses even if their previous hist. is unknown.

See *Admiralty*; *Hydrographic Dept.*, *Admiralty Weather Manual* (H.M.S.O.), 1938, 1941; D. Brunt, *Physical and Dynamic Meteorology*, 1939, 1941; S. Petterssen, *Convection in Theory and Practice* (Geofysiske Publikasjoner, Oslo vol. xvi., No. 10), 1946.

Teral, see *TARAI*.

Teramo (anc. *Interamnium*), tn. in Italy, cap. of prov. of same name on the It. Tordino. It is the seat of a bishopric, and has a fine cathedral with a spectacular fourteenth-century Gothic portal, and sev. churches. There are many Rom. remains. Chief manufs. are wool, silk, and pottery. Pop. (prov.) 274,900, (tn.) 38,700.

Teraphim, biblical term of uncertain etymology, indicating probably small portable images (Gen. xxxi. 19, 35), such as have been dug up often in the course of excavation. They were household deities, and may have constituted a sort of legal title of ownership for the house. They have often been compared to the Rom. *lares* and *penates*, which were supposed to protect the home and bring it good luck. The T. were closely associated with the practice of divination (1 Sam. xv. 23; Zech. x. 2); would drive away evil spirits and plague demons (1 Sam. xix. 13 ff.).

Teratology, science dealing with abnormal developments of formations of parts of the body, and with monstrosities. See *ALBINISM*; *BOTANY*; *CLUBFOOT*; *DEFORMITY*; *DWARF*; *GALLS*; *GIANTS*; *HERMAPHRODITE*; *HERNIA*; *HYBRID*; *PATHOLOGY*; etc.

Terbium, metallic chemical element, symbol Tb, atomic number 65, atomic weight 159.2. It is a member of the group of rare earths.

Ter Borch, Terborch, or Terburg, Gerard (1617–81), Dutch painter, b. in Zwolle. He studied under his father, Geert Ter Borch, and later in Haarlem under Mollijn, and in Italy and France, and visited England, Germany, and Spain. One of his masterpieces, 'Peace Congress of Munster,' is in the National Gallery, London. His technique was fine and, painting mainly interiors, he chose his figures, usually not more than three, from the wealthier classes. He delighted in rich costumes, and bathed his pictures in a clear, silvery tone. See lives by F. Bellens, 1911, and W. Rothes, 1921.

Terecira, see under *AZORES*.

Terebene, colourless liquid consisting of terpene and other hydrocarbons. It is prepared by treating turpentine with successive quantities of sulphuric acid and distilling the product. The smell of T. resembles thyme or pinewood, and it is used as an antiseptic and deodoriser.

Terabinth, or Turpentine Tree (*Pistacia terebinthus*), small tree belonging to the family Anacardiaceae, from which Cyprus turpentine is obtained by making incisions in the trunk. *P. lentiscus* yields mastic (q.v.), and the fruits of *P. vera* are called pistachio nuts (see *PISTACIA*).

Teredo, Ship Worm, Woodworm, or

Pileworm, genus of lamellibranch molluscs with a long worm-like body clothed in a thin shelly tub or sheath. The true bivalve shell is small and occurs at the thicker end where it protects the various organs. At the more slender end are two tubes, one of which conveys water to the gills and the other expels it with excavated matter. With its sucker-like foot it bores into timber, and is very destructive to ships, piers, and submarine cables. From 1914 to 1920 it caused damage in San Francisco Bay estimated at \$10,000,000. Francis Drake's *Golden Hind* was destroyed by the T.

Terence (Publius Terentius Afer) (195-159 B.C.), Rom. comic poet, b. at Carthage. He was the slave of a Rom. senator, P. Terentius Lucanus, who brought him to Rome. He received a good education from his master and was manumitted. His first play was the *Andria*, said to have been much praised by Cæcilius, the foremost comic poet of the time, and by the pub. of this he found himself introduced into the most intellectual circles of Rome. He became acquainted with the younger Scipio, Lælius, and Furius Philus, and through Scipio probably had an introduction to Polybius. He spent some time in Rome, but eventually went to Greece, where he occupied himself with translating the works of Menander, whom he took as his model. Of his works only six are extant: *Andria*, first represented in 166; *Heccyra* (165); *Heauton Timoroumenos* (163); *Eunuchus* (162); *Phormio* (162); and *Adelphi*, which was first acted at the funeral games of L. Æmilius Paulus, 160. These are probably all that T. produced. They are founded on Gk. originals, but T. retouched and improved his models. Though a foreigner and a freedman, T. wrote some of the finest Lat. that exists. There are eds. by A. Wagner (1869, 1892); A. Fleckeisen (1857, 1898); R. Y. Tyrrell (1903); and R. Kauer and W. M. Lindsay (1926).

Teresa, or Theresa, St. (1515-82) Sp. saint, nun, and monastic reformer, b. Teresa Cepeda de Almadra at Avila. She entered a Carmelite convent in her native tn. in 1533, but seeing the relaxation of discipline within the religious orders determined on reform, and set about founding a house in which all the original rules of the Carmelite order would be observed. She met with great opposition from clerical and lay authorities, but having obtained permission from the pope, she estab. (1562) the auct. Carmelite rule at a small house in Avila which she dedicated to St. Joseph. Here the sisters (at first only four in number) lived subject to the strictest discipline. After a time the number was increased to thirteen, and T. herself took up her abode with them. Between 1562 and her death she founded fifteen new houses directly, and seventeen indirectly, through the intervention of others. With the help of St. John of the Cross she estab. her reform among the Carmelite friars. St. T. was canonised in 1622. Her feast-day is on Oct. 15. Her works include *The Way of Perfection*, *The Castle of the Soul*, and *The Book of the*

Foundations, all of which have been trans. into Eng. by E. A. Peers (1946). See lives by G. Cunningham-Graham, 1894; H. Waack, 1947. See also Victoria Sackville-West, *The Eagle and the Dove*, 1943.

Ter-Gouw, see GOUDA.

Tergoviste, see TARGOVISTE.

Terminable Annuities, see under PUBLIC DEBT.

Terminal Velocity. If a body moves under the influence of a continuous force in a resisting medium, the resistance being some function of the velocity of the body, there is a limit to the velocity that it can attain. This limit is known as the T. V. and is the velocity to which that of a body falling through the atmosphere continually tends. The T. V. is small for snowflakes, greater for drops of rain, and greater still for hailstones, and it depends partly on the size and density of the falling body.

Terminator. The line which divides the dark from the illuminated portion of the disk of the moon or of a planet.

Termites (Termitidae), family of insects (family Isoptera), characterised by the possession of biting jaws and by the absence of a metamorphosis. T. are the only insects other than those belonging to the Hymenoptera which are known to exist in organised communities. In their habits they resemble ants in many respects, and are often called 'white ants,' though structurally they differ from ants very considerably, while their communities are differently composed. The communities consist of 'kings' and 'queens,' which are fertile males and females that have cast their wings by a rupture at a transverse suture close to the root, and of infertile males and females whose wings never develop, and who become 'soldiers' or 'workers' according to the nature of their food. The head is large, and though many forms are blind others have compound and simple eyes. The 'soldiers' are provided with especially large heads and powerful mandibles. The queen's abdomen becomes enormously swollen, her ovaries producing eggs at the rate of about one per sec. She and the king are usually confined in the central cell in the nest, and in case of disaster to them, nymphs are always in readiness to take their places, after stimulation of their reproductive organs by special feeding. T. are confined to the tropical and warmer temperate regions, some species occurring in S. Europe. They feed on wood and waste substances, and construct earthen tunnels and galleries, cementing the walls of their runs with their excrement, which hardens like brick. Some of the tropical species raise vast earthen nests as much as 20 ft. high. They are very destructive, especially of woodwork and of wood foundations of buildings. Wood treated with creosote is immune, and wood that has been attacked may be cleared by fumigation.

Termonde, see DENDERMONDE.

Terms: 1. In law the limitation of an estate or the whole time or duration of an estate, as a lease for the T. of twenty-one years, for the T. of three lives, etc. (see also LIMITATION OF ESTATES; SHELLEY'S

CASE, RULE IN; VENDORS AND PURCHASERS). 2. The law T. or portions of the year during which the high court sits. They are four in number, viz. Hilary, which usually begins about Jan. 11 and ends about the end of March; Easter, which begins in the early part of April and ends in the middle of May; Trinity, which begins towards the end of May and ends towards the end of July; and Michaelmas, which begins in the second week in Oct. and ends just before Christmas. The 'Inns of Court' T., called by the same names as the above, are the 'dining terms' for students, who in the process of qualifying for call to the Bar fulfil the notion of residence that obtains in colleges or other places conferring degrees, by eating dinners during term time. 3. In univs. and colleges the time during which instruction is regularly given to students. Schools have adopted the same system. 4. In formal logic, the expression in language of the notion obtained in an act of apprehension. T. are divided into simple, singular, universal, common, univocal, equivocal, abstract, concrete, etc. (see also SYLLOGISM). 5. In algebra, a member of a compound quantity, as a , in $a + b$; or ab , in $ab + cd$.

Tern, or **Sea Swallow** (*Sterna*), genus of birds resembling the gulls, to which they are allied, but smaller and slenderly built and with a forked tail. They are extensively distributed, especially in temperate climates. Though poor walkers and swimmers, they are very active on the wing, skimming the surface of the sea from sunrise to sunset in search of small fish and other marine animals. A number of species occur in Britain, the commonest of which is *S. fuscicollis*, with grey plumage. The others are the sooty T. (*S. fuscigaster*), the Arctic T. (*S. macrura*), the Sandwich T. (*S. caesia*). The Arctic T. is remarkable for the range of its migration, from Greenland, N. America, and N. Europe as far S. as the Antarctic. The black T. and other similar species known as marsh Ts. are now placed in the genus *Hydrochelidon*. They are distinguished by their shorter bills, short and slightly forked tails, and less fully webbed feet.

Ternate, tn. and is. in the Malay Archipelago, one of the Molucca Is. The tn. was formerly the headquarters of the Dutch residency of the is. It now forms part of E. Indonesia. It has a gov. quay and private pier, but there is no considerable trade or shipping, its harbour being unsuited to large ships. Some quantity of rice, sago, and pepper is produced and exported. Area 115,900. Pop. (18.) 494,000, (tn.) 87,300. See further under MOLUCCAS.

Terneuzen, seaport of Zeeland, Netherlands, situated on an arm of the Scheldt, 28 m. W.N.W. of Antwerp. It is at the end of the 20½ m.-long Ghent-T. canal. Pop. 12,900.

Terni, tn. in Perugia, Italy, cap. of the prov. of T., among the Apennines, with steel works and iron foundries. There are also manufs. of jute, electrical machinery, and textiles. There are sev. Rom. ro-

mains, and it is the bp. of the Emperor Claudius. In the Second World War the cathedral was heavily damaged and sev. medieval and baroque buildings also suffered. Pop. (tn.) 79,400, (prov.) 216,900.

Terpenes, name given to hydrocarbons which occur in essential oils and have a molecular formula $C_{10}H_{16}$. They are all volatile, and are unsaturated compounds. The most important members are limonene, camphene, and pinene (*q.v.*). Many Ts. are derivatives of cymene (para-methylisopropylbenzene), and sev. of them have now been synthesised.

Tarpsichore (Gk. 'delighting in the dance'), muse of choral song and dance. See further under MUSES.

Terra, or **Tellus**, see GÆA.

Terra Australis Incognita, vast unknown continent which was commonly believed to lie beyond the ocean of the S. hemisphere as a counterpart to the land masses of Europe, Asia, and Africa. The belief was held by the geographers of antiquity and the Middle Ages and was only finally exploded by Capt. James Cook in the late eighteenth century. T. A. I. was believed to stretch in a solid mass as far N. as Tierra del Fuego as late as the sixteenth century. Discoveries by Magellan, Drake, Torres, Tasman, and other explorers gradually brought about a realisation that this supposed land mass did not exist; finally, Cook ascertained the limits of Australia and of the Antarctic continent and proved the original theory entirely false.

Williamson, *Cook and the Opening of the Pacific*, 1946.

Terraces, in geology, are horizontal shelves or benches on hillsides or on sloping ground. River T. occur wherever the valley has been sufficiently widened and graded to allow formation of flood-plain. On reduction of the level of the flood-plain, the portions resting on the valley slopes are left as ledges, and indicate the various steps in the processes of erosion and oscillations in sea level. Smaller T. are formed in higher courses of rvs. by the washing up of material forming the banks; they are not level, but have a slight gradient towards the riv. See also BRACHES, RAISED.

Terracina (Anxur), city and seaport of Italy on the S. coast of the prov. of Latina, 60 m. S.E. of Rome. There is trade in wool and cereals. In the old tn. is the celebrated temple of Venus, thought to be the palace of Theodorice. There are sev. other Rom. remains, and the Gothic cathedral is founded on the ruins of a Rom. temple. The Rom. aqueduct is still used. T. was an important tn. on the Appian Way but is now chiefly a tourist centre. Pop. 26,100. *See also under* ANXUR.

Terra Cotta (It., baked earth, Lat. *terra cotta*), hard, unglazed pottery fabric, used for bricks, tiles, and architectural ornaments, as well as for tombs and coffins, vases and statues. It may be left with its natural brownish red surface unglazed and uncoloured, or it may be painted as was customary among the Gks., or it may be covered with enamel.

Terra del Fuego, *see* TIERRA DEL FUEGO.

Terra di Lavoro, *see* CASERTA.

Terra Japonica, *see under* CATECHU.

Terramare (from It. *terra*, earth, and *marina*, marl), natural fertiliser found in the valley of the R. Po, Italy, in flat-topped mounds which were vils. of peoples of a Bronze Age culture. The settlements, which were built on pile foundations but which were nevertheless on land, have taken generally the name of the fertiliser. *See* T. E. Peet, *The Stone and Bronze Ages in Italy*, 1909, and C. F. C. Hawkes, *The Prehistoric Foundations of Europe*, 1940.

Terranova, or **Gela**, seaport S. of Sicily in the prov. of Caltanissetta. It was founded at the end of the thirteenth century on the site of the anct. Gela (*g.r.*). There are manufs. of coarse cotton and woollen goods, and fisheries of tunny and sardines. Wine, grain, sulphur, and soda are exported. Pop. 41,300.

Terrapin, name given to various tortoises of the family Testudinidae, some of which, especially *Malaclemmys terrapin*, found in the salt marshes on the E. shore of N. America, are highly valued as food. Among the most important are the yellow-bellied, the red-bellied, the chicken, and the salt-water Ts. They are all active swimmers, their clawed digits being united by a web. They are almost omnivorous, but feed chiefly on aquatic animals. In America and Australia they are commonly kept and fattened in captivity. *See also under* TORTOISE.

Terra Sigillata, *see* SAMIAN POTTERY.

Terre Adèle, *see* ADELIE LAND.

Terre Haute, city of Indiana, U.S.A., co. seat of Vigo co., on Wabash R., 68 m. W.S.W. of Indianapolis. The centre of an agric. and a coal-mining region, it is now a predominantly industrial city, has foundries, and manufs. iron goods, cars, clothing, glass, etc. There is a state teachers' college and polytechnic engineering institute. Pop. 62,700.

Terre-Neuve, *see* NEWFOUNDLAND.

Terrestrial Magnetism, *see* MAGNETISM, *Terrestrial Magnetism*.

Terrier, term originally applied to dogs which pursue rabbits and other game into their burrows. The Kennel Club lists the

following as true Ts.: Airedale, Australian, Bedlington, Border, Bull, Cairn, Dandie Dimmont, Fox, Irish, Kerry Blue, Lakeland, Manchester, Norwich, Scottish, Sealyham, Skye, Staffordshire Bull, Welsh, and West Highland White. But the word is also now applied to a number of breeds, many of which are too large and some too pampered to justify the name; these include Boston Ts. The true T. is a particularly intelligent dog. *See separate articles.*

Terrier, Old, or White, English, *see* OLD or WHITE ENGLISH TERRIER.

Terriess, **William** (1847-97), Eng. actor, b. in London, his real name being Wm. Charles James Lewin. He was educated privately. He tried sev. careers, serving for a time in the merchant navy, but went on the provincial stage in 1867, and soon came to London. His best parts were Squire Thornhill in *Olivia* and William in *Black-eyed Susan*. He was assassinated at the stage door of the Adelphi Theatre by a mad and unsuccessful actor.

Territorial Army. *History*.—When the Brit. infantry was territorialised under Lord Cardwell's scheme of 1881, volunteer rifle corps were linked with regular and militia units to form the regimental dist. For this reason most T. A. infantry units now bear the title of a line regiment (*e.g.* (Green Howards) with a battalion number above 4. There are exceptions to this, of the following order: 'expatriate' units with titles like Tyneside Scottish; battalions from cos. which do not support a regular regiment, such as Cambridgeshire, Hertfordshire, and Herefordshire; numerous London Light Infantry units with roots in the 1859 Volunteer Movement such as the Artists' Rifles, Queen's Westminster, etc.; and the unique Honourable Artillery Company which was formed before the regular regiments existed; nevertheless every T. A. unit is affiliated to some regular unit whether it shares its name or not. Under the Cardwell scheme this affiliation means little in practice but after the passing of the Territorial and Reserve Forces Act of 1907 and Lord Haldon's administration of it, liaison between regular and T. A. units became a reality. Under this Act co. associations were formed which raised and administered (but did not command) the new territorial force. These associations still function under the 1947 reorganisation.

The territorial force was intended at first for home service only, but provision was made for individuals to volunteer for overseas service. In 1914 so many of the 11,900 officers and 302,000 other ranks did so volunteer that war units were mobilised in their entirety and brigaded in the fifteen territorial (and yeomanry) divs., which took part in the First World War (*see table below*). The fourteen mounted brigades which completed the force up to 1914 were not employed as such but the fifty-three regiments of which they were composed went to reinforce other armies or to form the 74th Div., where units came from all parts of the United Kingdom. The other fourteen divs. were at first

known only by their regiment designation, and the now well-known members were not allotted until May 1915; the regimental titles are shown in the first column of the table at the end of this section.

Up to 1914 the defence forces by land consisted of: first line, regular army; second line, special reserve; third line, territorial force. In 1920 a reorganisation promoted the territorial from third to second line and renamed them the T. A.; the special reserve reverted to its old name of militia (*q.v.*), but in practice no militia was raised until 1938. The 1920 estab. provided for the same fourteen infantry divs. (but only two brigades of cavalry), some army troops, and a coast defence and an anti-aircraft (A.A.) component. Now the obligation to serve overseas was placed on all members. A small proportion of the cavalry was mechanised. About 150,000 men were recruited and numbers remained at about this figure until 1938. In 1935 a new estab. was drawn up and partly put into effect: 46 and 47 Divs. were disbanded and went to fill the ranks of five A.A. divs.; the field force was now to consist of nine infantry, three motorised, and one armoured div. Now for the first time old promises were implemented: some brigades and a few divs. were commanded by T. A. officers, and the deputy director general was also a T. A. officer. In 1938 numbers rose to 204,000 and between them and the outbreak of war almost doubled. But of these 405,000 some 107,000 belonged to air defence units, so that approximately the same numbers were available for the field force as in 1918. During the war the T. A. ceased to exist as a separate force and recruiting for it ceased. But the fusion of regular T. A. and conscript elements in the air defence force, which then retained only men of certain medical categories, had the effect of releasing enough fit men to form a further seven divs., largely composed of territorials, for the field force (these divs. are shown second in the second column of the table).

London (No. 1 area)	56	56
All England	74 cavalry	--

As in 1920, so on Jan. 1, 1947, the T. A. was re-estab. The A.A. divs. remain but are now called groups. There are besides the field force some independent brigades

and a much higher proportion than heretofore of corps, army, and G.H.Q. troops, to be drawn principally from regions where the field force div. has been disbanded. Since June 1950 national servicemen on completion of their eighteen months' full-time service with the regular army, now undertake a further four years' part-time service in the T. A.; they are required by law to complete a total of sixty days' training with the T. A. during these four years.

Pay and Conditions of Service.—The permanent staff of T. A. units (adjutants, quartermasters, instructors, some unit commanders) is composed of regular officers and N.C.Os. Officers of the T. A. must be Brit. subjects and sons of Brit. subjects of pure European descent. Promotion conditions follow much the same lines as for regular officers. 'Boys' (*i.e.* recruits under eighteen) are no longer listed. When in camp, territorials receive pay and allowance on the same rate as regulars. Travelling expenses from home to place of training are paid. All ranks receive a bounty if present on embodiment, and all except officers receive an ann. bounty (originally £3, now £12) on completing ann. training. The requirements of the latter vary from term to term but amount generally to about ten full days and some fifty drills of two hours each.

Territorial Waters. Most modern states recognise the sovereignty of every other state over its own marginal waters. The limit is generally fixed at one marine league from the shore measured from low-water mark. This distance of permissible appropriation is the subject of much criticism by writers on international law, because it was in its origin suggested by the supposed range of a gun; the tremendous range of modern artillery has made the distance meaningless (*see* on this W. E. Hall, *International Law*, 8th ed., 1924). Three m. at low-water mark, however, remains the minimum claim to sovereign control of the high seas. A more extensive jurisdiction to the waters surrounding their coasts is claimed by some states, though this extended claim may be restricted to certain specific purposes. The acquittal for want of jurisdiction of a Ger. prisoner charged at the Central Criminal Court with manslaughter through the running down of the *Strathclyde* by the *Franconia* (in the famous trial of *Reg. v. Keyn*, 1876) 2 m. off Dover led to the passing of the Territorial Waters Jurisdiction Act, 1878. By that Act the Eng. courts have jurisdiction to arrest and try persons, whether Brit. subjects or not, for offences committed on the high seas within the T. W. of the Crown, *i.e.* within one marine league from the coast. (*See* L. Oppenheim, *International Law* (vol. I., *Peace*, 6th ed.), 1947.

Terror, Reign of, *see* under FRANCE. *History*.

Terry Family, Eng. actors and actresses. Benjamin Terry (1818-92) and his wife were well-known provincial actors, although in their later years they also had engagements in London with Macready

and Charles Kean. Their children were: (1) *Kate Terry* (1844-1924), the eldest of the family, made her first appearance on the stage in 1850, and the next year came to London and was engaged by Charles Kean. She appeared as Cordelia, Ophelia, Ariel, Juliet, Viola, all of which she played with remarkable success, but especially made a great hit in 1862 by her part of Mrs. Union in *Friends or Foes*. (2) *Dame Ellen Alicia Terry* (q.v.) (1848-1928). (3) *Marion Terry* (1856-1930) won a great reputation as an actress, notably in *Lady Windermere's Fan*, in which she reappeared in 1911 at St. James's Theatre. (4) *Florence Terry* (d. 1896) played in *The Iron Chest* with Irving, and was the original Little Nell of Halliday's play. (5) *Fred Terry* (1865-1933) first appeared on the stage in 1880 under the Bancrofts. Together with his wife, Julia Neilson (q.v.), he played in *Sweet Nell of Old Drury*, *Hyppatia*, *As You Like It*, *The Scarlet Pimpernel*, *Henry of Navarre*, etc. His daughter *Phyllis Neilson-Terry* (b. 1892) became well known as a Shakespearian actress.

Topical Press

DAME ELLEN TERRY

Terry, Dame Ellen Alicia (1848-1928), Eng. actress, b. at Coventry, daughter of Benjamin T., an actor. She made her first appearance on the stage as the boy Manilius in *The Winter's Tale* in 1856 at the Princess's Theatre under the management of Charles Kean. In the same company she played Puck in *Midsummer Night's Dream* and Arthur in *King John*. In 1863 she played in various companies in London, including the role of Beatrice in *Much Ado*. She married the painter George Frederick Watts, nearly thirty years her senior, in 1864, but they separated a year later. Ellen T. returned to the stage in 1866, at Queen's Theatre, Long Acre, where she first acted with Henry Irving; they played Katharine and Petruchio in Garrick's version of the *Taming of the Shrew*. In 1875 she scored

a great success as Portia in *The Merchant of Venice*, revived at the Prince of Wales's Theatre under the management of the Bancrofts. While in John Haro's company at the Court Theatre, she married E. A. Wardell (Charles Kelly, d. 1885), and won great praise for her Olivia in Wills's *Fear of Wakefield* in 1878. The same year she was engaged by Irving as leading lady at the Lyceum, where she acted constantly for thirteen years, appearing as Ophelia, Portia, Desdemona, Juliet, Beatrice, Viola, Lady Macbeth, Katharine (*Henry VIII.*), Cordelia, Imogen, and Volunna (*Coriolanus*). At the Lyceum she also played the title-part in *Nance Oldfield* in 1891, Rosamund in *Becket* in 1893, and Clarisse in *Robespierre* in 1899. She appeared with Mrs. Kendal in Tree's revival, at His Majesty's, of *The Merry Wives of Windsor*, in 1902. Her stage jubilee was celebrated in 1906. In 1907 she married James Carew, an Amer. actor. She pub. her autobiography in 1908. Among her later parts were Cecely Waynflete in Shaw's *Captain Brassbound* and Alice in Barrie's *Alice Sit-by-the-Fire*. Ellen T. was one of England's greatest actresses. Her interpretation of Portia was famous throughout the Eng.-speaking world, and most critics agree that it has never been excelled. Her exquisite voice and skilful use of gesture were perhaps best seen in her Shakespearian performances. Of these her tragic roles are best remembered, but her versatility was remarkable, and contemporaries realised the worth of her performances in Shakespearian comedy and in modern dramas. With Irving Ellen T. helped to raise the international reputation of Eng. acting; her interpretations played a considerable part in the success of the Shakespearian revival. Her influence, particularly in tragedy, has not decreased since her death. In addition, she strongly supported the Women's Suffrage movement. She received sev. honorary degrees, and in May 1922 the Grand Cross of the Order of the Brit. Empire. See E. Gordon Craig, *Ellen Terry and her Secret Self*, 1930; E. Craig and C. St. John (eds.), *Ellen Terry's Memoirs*, 1932; and C. St. John (ed.), *Ellen Terry and Bernard Shaw: a Correspondence*, 1931.

Terschelling, one of the W. Frisian Is., in the prov. of N. Holland, Netherlands. It is 16 m. long and 3 m. broad. Hoorn and Westerschelling are the chief vils. Fishing is the prin. industry. Pop. 3600.

Tertian Fever, see under MALARIA.

Tertiaries, see under FRANCISCAN.

Tertiary, or **Cainozoic**, in geology, system which includes all the sedimentary accumulations formed between the close of Cretaceous time and the beginning of the Glacial Period. T. strata are divided into four systems, viz. Eocene, Oligocene, Miocene, and Pliocene, according to the percentages of recent molluscs contained. The strata are of great lithological variety, and are found in the structure of all the continents and their great mt. chains. The Alps, Himalayas, Atlas, Carpathians, and Cordillera were formed in T. times. The T. crust movement was accompanied

by volcanic action ranging from Auvergne to the Carpathians and through the Mediterranean. The volcanoes of the Andes, Iceland, and Japan first became active about this time. During the deposition of the T. strata, older forms of life became extinct and their place was taken by the present-day species of animals and plants. The climate of the period was at first warm and moist, but gradually became colder, and culminated in the glacial periods of the Pleistocene. During the first inter-glacial period of the Pleistocene, traces of humanly made artifacts are first found in Europe, but near-human tool-users are thought to have existed in the Pliocene. *See also* EOCENE; OLIGOCENE SYSTEM; MIOCENE; PLIOCENE.

Tertullianus, Quintus Septimius Florens (c. 160-230), early Christian theologian, b. probably at Carthage. He became an advocate or rhetorician, in which profession he appears to have attained to some eminence. In all probability it was at Carthage that he was converted to Christianity, and upon his conversion he was ordained a presbyter, though where we are not told. He himself speaks of having been at Rome, and it is known that he could write Gk. His conversion probably took place about 190. About the end of the second century he became a Montanist. Jerome ascribes this change to his suffering from the envy and insults of the clergy of the Rom. Church, but a more adequate and more probable reason for it is to be found in the character of T. himself. T. holds one of the first places among the Lat. fathers for learning and intellectual power. His writings are apologetic, practical, and doctrinal. The *Apology* was written at Carthage, probably in the reign of Severus, and contributed largely to the better understanding of the character of Christianity and the mitigation of persecution. The best ed. is that in the *Vienna Corpus Scriptorum Ecclesiasticorum Latinorum*, vol. xx. (1890). *See* R. E. Roberts, *The Theology of Tertullian*, 1924; J. Morgan, *The Importance of Tertullian in the Development of Christian Dogma*, 1928; and T. Brand, *Tertullianus Ethik*, 1929.

Teruel: 1. Prov. of N.E. Spain, with an area of 5720 sq. m. It is extremely mountainous, the highest point being Mt. Javalambre, in the S (6568 ft.). It has sev. large rvs., the prin. being the Tagus, Guadalquivir, and Guadaloupe. Chief products are corn, oil, wine, fruits, timber, etc.; and industries are mainly agriculture, mining, and weaving. Pop. (1947) 237,200. 2. Cap. of above, situated on the l. b. of the Guadalquivir. It is connected by rail with Valencia. It is a small Aragonese city, retaining much of its medieval plan, enclosed by a wall. The cathedral dates from the sixteenth century. When the civil war of 1936 broke out T. sided with the Nationalists, but the Republicans captured it after fierce fighting in Dec. 1937. It was recaptured by Franco in Feb. of the following year. Pop. 14,400.

• **Terza Rima**, It. rhyme scheme in which the second line of each tercet rhymes with

the first and third of the next tercet, imitated from Dante's *Commedia*. Wyatt was the first in England to use T. R. The form *aba, beb, cdc* shows that it is continuous in movement; thus in Shelley's *Triumph of Life* the closing line of the stanza rarely coincides with the end of a sentence; and further instances may be found in Byron's *Prophecy of Dante*, though in his *Francesca of Rimini* he avoids the interlocking of stanzas, as does Browning in *The Statue and the Bust*. *See* E. Smith, *The Principles of English Metre*, 1923.

Teschen (Polish, Cieszyn; Czech, Tesin), formerly one tn. in the Austro-Hungarian Empire, 50 m. S.E. of Troppau, on the R. Olza. Peace was made here between Austria and Prussia in 1779. The area around it, known also as T., was in medieval times an independent principality. In 1625 both duchy and tn. fell to Bohemia, passing to Austria in 1723. Remains of the old tn. include the ruins of a twelfth-century castle. In 1920 the dist. was divided between Poland and Czechoslovakia, the line running through the tn., thus creating, for political purposes, two tns. Czechoslovakia ceded her section to Poland in 1938, but regained it after the Second World War. The div. had always been bitterly resented by the Poles, who contended that they should have had the whole dist., and the Czech Gov. granted Poles in Czech T. certain rights in 1947 which were extended under the Communist Gov. Czech T. had a pop. of 10,600 in 1937, textiles being the main industry. Manufs. in Polish T. include paper, furniture, timber, clocks, metal-work, and machinery. There are coal-mines in the dist. Pop. 15,000. The dist. of T. has an area of 350 sq. m.

Tesho, or **Teshu Lama**, *see under* LAMAISM.

Tessenderloo, tn. in the prov. of Limbourg, Belgium, 15 m. N.W. of Hasselt. It is the seat of an important chemical industry. In April 1942 a heavy explosion destroyed the tn., and as far as Antwerp, about 33 m. away, shop windows were smashed by the blast. Pop. 8000.

Tessin, *see* TICINO.

Test, riv. of Hampshire, England, rising near Ashe. Stockbridge and Romsey are the largest places on its banks. It enters Southampton Water. Length 30 m.

Test Acts: 1. By the Test Act, 1673, all office-holders of the Crown, civil and military, were obliged within six months after appointment to make a declaration against transubstantiation, take the sacrament in accordance with the ceremony of the Church of England, and take the oath of supremacy. This Act was usually conjoined with the Corporation Act, 1661, which compelled all holders of municipal offices to take the sacrament, a provision aimed at both Presbyterians and Rom. Catholics. Lord John Russell in 1828 carried a motion for their repeal. 2. The Parliamentary Test Act of 1678, which was passed after the perjured evidence of Titus Oates, and repealed in 1829. It

prohibited Rom. Catholics from sitting in Parliament.

Testament, see under BIBLE.

Testament, see WILLS AND TESTAMENTS.

Testamentum Domini, book of church order belonging to the same class of writings as the Apostolic Constitutions. Its date is somewhere between c. A.D. 350 and the fifth century, and its place of origin probably Asia Minor.

Testes, Testicles, or (in the U.S.A.) **Spermaries**, reproductive organs (gonads) of the male animal, in which are manufactured the reproductive cells (spermatozoa or sperms) whereby the eggs are fertilised. There is usually a single pair of T. in each individual.

Testimony, see under DECLARATIONS OF DECEASED PERSONS.

Testing Clause, in Scots law, technical name for the clause in written deed or other formal legal instrument which authenticates the document according to the forms of law. It contains the name and designation of the writer of the instrument, a record of the number of folios of which it consists, and the names and designations of the witnesses to the writer's signature.

Testing, Electric, see under ELECTRICITY.

Testing of Metal, see under METALLURGY.

Test Matches, see under CRICKET.

Test-papers, paper slips impregnated with some chemical reagent. Litmus papers are used for testing for acids and alkalis, acids turning the blue variety to a red colour and alkalis turning the red papers to a blue. Paper containing lead acetate is used as a test for hydrogen sulphide, which turns it brown. Oxidising agents, such as chlorine, ozone, etc., are tested for with papers containing potassium iodide and starch, which are turned blue by their presence. Turmeric paper, yellow in colour, is used as a test for alkalis and boric acid, which cause it to become brown.

Testudinaria, see ELEPHANT'S FOOT.

Testudo, technical name applied to a Rom. military formation which was used when attacking fortified positions. The soldiers who were attacking raised their shields well above their heads and interlocked them.

Testudo, see TORTOISE.

Tetanus, or Lockjaw (from Gk. *τετανος*, to stretch), infectious disease characterised by violent muscular contractions. The cause of the disease is the introduction into a wound of the *Bacillus Tetani*. The existence of this micro-organism was demonstrated by Nicolaier in 1885, but a pure culture of it was first obtained by the Jap. scientist, Kitasato, in 1889. The germs are not themselves carried away in the blood-stream, but they set free toxins of poisons of unparalleled virulence, production of a drop of a cultivated example having been known to kill a mouse. The toxin acts upon the cells of the central nervous system, and the voluntary muscles are very quickly out of the control of the sufferer. The bacillus of T. is found in soil, animal excrement, etc., and it obtains an entrance to the body through a wound which has become contaminated

with dirt. There is no truth in the supposition that wounds in the thumb are particularly liable to set up T. The duty of cleaning a wound which has come into contact with soil should never be neglected, as the development of the injurious toxin proceeds with fatal rapidity. The first sign of the disease is a feeling of stiffness at the back of the neck and difficulty in swallowing; the muscles of the jaw are then affected, with the result that the mouth is opened with difficulty, and afterwards becomes closely shut. The stiffening of the muscles proceeds to the body and limbs, until parts of the body become absolutely rigid to the touch. Besides the constant rigidity, there occur convulsions at intervals which may be as short as 10 min. The muscles are then contracted with such violence that they may become ruptured or lead to the fracture of a bone. The absence of complete relaxation serves to distinguish lockjaw from the spasms associated with strychnine poisoning. The treatment of T. should commence with an effort to make the wound surgically clean. Morphine or chloroform should be used to lessen the pain caused by the spasms. T. antitoxin has been found useful as a prophylactic, but when a patient has been demonstrably attacked the development of the toxin has usually proceeded too far for any injection treatment to be of avail. Curare ('arrow poison') is useful, since it relaxes the muscles.

A considerable measure of success attended the results of inoculation with anti-T. serum of troops during the First World War. T. is much more likely to be fatal if it occurs soon after a wound than if its onset is delayed. Thus an onset within a week of wounding gave a death rate of 60 per cent, whereas when the onset was delayed to thirty-six days, the rate was only 15 per cent. In the Second World War T. was a relatively rare disease. See paper by Sir D. Bruce, chairman of the War Office Committee on T., pub. by the Research Defence Society, 1920.

Tetanus (in horses), see under HORSE (DISEASES).

Tetany. The syndrome to which this name is given is characterised by localised neuro-muscular irritability, manifesting itself, in typical cases, as a carpopedal spasm, i.e. a tonic spasm of the hands and feet, in which the hands assume the so-called accoucheur position (fingers and thumb approximated), the arms are held close to the body, the knees are flexed, and the feet are in the equinovarus position. In severe cases all the muscles of the body may be affected. It is frequently associated with *tetanystridulus*. It may result from (a) disease or damage to the parathyroids (the latter may occur in very radical operations on the thyroid); (b) disturbances of calcium metabolism; (c) alkalosis (e.g. following over-administration of alkalis in cases of peptic ulcer); (d) hyperventilation, either voluntary, hysterical, or after exercise. In children it usually occurs in association with rickets, when the deficient absorption of calcium is due to lack of vitamin D.

It may occur in cases of pyloric stenosis with vomiting, chronic diarrhoea, chronic interstitial nephritis, high intestinal obstruction, and in certain cases of poisoning, e.g. by arsenic, lead, chloroform, and morphine. Treatment, which should include that of the associated condition, consists of administration of parathormone and calcium, either by the mouth or intramuscular or intravenous injection.

Tetbury, mkt. tn. and par. of Gloucestershire, England, 10 m. S.W. of Cirencester, and 8 m. from Stroud, on the W. region of the Brit. Railways. It is a centre of the agric. trade. Pop. (rural dist.) 6700.

Teternikov, Fedor Kuzmich, see SOLOGUB.

Tethmosis, see THOTHMES.

Tethys (Τηθύς), in Gk. mythology, was the daughter of Uranus and Gaia, and the wife of Oceanus, by whom she was the mother of the Oceanides and the riv.-gods. She was also the instructress of Hera.

Tethys, one of the satellites of Saturn. Mean distance from the centre of Saturn is 183,200 m. Its periodic time is 1 day, 21 hrs., 18 min. Stellar magnitude at mean opposition distance, 11.7.

Tetrabelodon, see MERTHERIUM.

Tetrachord, see under HARMONY.

Tetragrammaton, see under JEHOVAH.

Tetrahedron, see under POLYHEDRON.

Tetrao, see BLACKCOCK; CAPERCAILLIE; GROUSE.

Tetraroh, ruler over the fourth part of a country. The term was borrowed by the Romans from the Gks., with whom, however, it had quite a different meaning. On the death of Herod the Great, his dominions were divided among Archelaus, Herod Antipas, and Herod Philip. Part remained under the direct rule of a Rom. procurator.

Tetrazzini, Luisa (1871-1940), It. soprano, b. in Florence. She studied with her sister Eva, and with Ceccherini at the Florence Liceo Musicale. She made her first appearance at Florence in 1895. Later she toured Europe, Mexico, and S. America. In 1904 she appeared in San Francisco. She appeared in London at Covent Garden in 1907, as Violetta in *La Traviata*. She later went on sev. other concert tours in Europe and America. Her expressive coloratura fitted her to highly dramatic parts, and she achieved particular successes in the title-part in *Lucia di Lammermoor*, and as Anna in *La Sonnambula*. In 1921 she pub. her reminiscences, *My Life of Song*.

Tetridopyrrol, see IODOLK.

Tetryl, powerful explosive, formula $C_7H_5O_8N_4$; melting point 129.1° C. Obtained by nitrating pure dimethylaniline with nitric and sulphuric acids below 55° C. and washing and crystallising from benzene. It burns smoothly, but detonates violently on striking. Also used as a detonant, usually admixed with chlorates or perchlorates.

Tetschen, Ger. name for Děčín Podrušký, tn. of Bohemia, Czechoslovakia, 83 m. N.N.E. of Prague, on the r. b. of the Elbe opposite Podmokly. It is an industrial tn. and a large riv. port. Pop. 30,700.

Tettenhall, urb. dist. in Staffordshire,

England, 2 m. from Wolverhampton. The original Wrottesley Hall which was a fine example of early eighteenth-century architecture was destroyed by fire in the early part of the present century, but was subsequently rebuilt. The Wrottesley family has owned a residence here since the twelfth century. The dist. possesses two open spaces known as the Upper Green and the Lower Green, the maintenance of which are vested in the council. The old collegiate church of St. Michael and All Angels was also destroyed by fire on Feb. 3, 1950. This church was a 'Royal Free Chapel' of Saxon foundation and must have been in existence from about the year 975. T. College is a Free Church public school, incorporated in 1915.

Tetuan, Duke of, see O'DONNELL, LEOPOLD.

Tetuan, tn. of Morocco, on the Mediterranean, 40 m. S.E. by E. of Tangier, and a few m. S. of the strait of Gibraltar. The tn. is surrounded by walls and includes a citadel. The chief industries are tile works and inlaying. Here resides the Sp. high commissioner who administers the Sp. zone of Morocco. Pop. 49,500.

Tetzel, Johann (c. 1465-1519), Ger. Dominican friar, b. at Pirna. By the scandalous manner in which he carried on the traffic in indulgences T. roused Luther to precipitate the Ger. Reformation in 1517. T. was later discredited and retired to a monastery. See life by F. Koerner, 1880; also G. Buchwald, *Unbekannte Predigten von Tetzel*, 1930.

Teucer, see under TROY.

Teutoburger Wald, range of hills in N.W. Germany extending along the borders of Hanover and Westphalia and through Lippe. The greater part of the chain is densely wooded. Volmerstedt, in Lippe, is the highest peak (1542 ft.). It is reputed to be the scene of the battle (A.D. 9) in which Arminius and the Ger. tribes defeated the Rom. legions under Quintilius Varus. There are sev. spas. Coal, iron, and zinc deposits are found.

Teutonic Knights, one of the great semi-religious orders of knights founded during the period of the crusades. The order originated in a brotherhood formed by certain Ger. merchants of Bremen and Lübeck to alleviate the sufferings of the attacking troops during the siege of Acre in 1190. A hospital was started, and as a result the T. K. of the Hospital of St. Mary of Jerusalem were founded. The new order, distinguished by a white mantle with a black cross, was formed on the model of the Knights Hospitallers, and its members were also pledged to tend the sick, to protect the Church, and to wage war against the heathen. In 1198 the hospital was turned into an order of knighthood. The T. K. conquered Lithuania and the Baltic regions of Prussia during the thirteenth and fourteenth centuries. For a century their headquarters were at Acre (1191-1291), but the seat of the order was transferred to Marienburg in 1308. Their defeat at the hands of the Poles and Lithuanians at Tannenberg (1410) struck a great blow at

their prestige and the order declined rapidly. It had already departed from its original moral standards. In 1525 the 'high master,' Albert of Brandenburg, was converted to Protestantism, and the order was secularised. It was suppressed by Napoleon in 1809.

Teutonic Languages, equivalent term for Germanic languages. *See* under INDO-EUROPEAN LANGUAGES.

Teutons (*Teutones*), Germanic tribes who came into prominence in the last centuries B.C. The name T. was afterwards applied to the Ger. peoples generally, including the A.-S. The earliest accounts we have of the T. come from Rom. times. Julius Cæsar praised their bravery in battle, and Tacitus described their tribal customs. During the last two or three centuries B.C., the T. appear to have been pressing the Celtic peoples across the Rhine. This movement was stopped by the Romans, who invaded their ter., and estab. a military frontier along the Rhine and the Danube, but the tribes living beyond these rvs. were never subjected to Rom. rule. In subsequent centuries various teutonic or Germanic tribes overran most of Europe. *See* also MYTHOLOGY, *Teutonic Mythology*. *See* G. Schulte, *Our Forefathers*, 1929, and C. S. Elston, *Earliest Relations between Celts and Germans*, 1934.

Toverone, *see* ANIO.

Teviot, riv. in Roxburghshire, Scotland, rising in the S.W. and following a N.E. course of about 40 m., joining the Tweed at Kelso. It has good salmon and trout fishing. The valley it drains is called Teviotdale.

Tew, Great, vil. in Oxfordshire, England, picturesquely situated in a valley of the wolds near Deddington and 5 m. E. of Chipping Norton. The groups of dwellings in yellow local stone were nearly all built in the mid or late seventeenth century. When the Royalist peer Lucius Cary, second Viscount Falkland, inherited the property in 1625 he found the medieval vil. in a state of poverty and disrepair, and set on foot the reconstruction of the entire vil., so that G. T. became one of the earliest existing examples of a planned vil. During the first years of the eighteenth century the vil. again fell into disrepair. The subsequent planning of the estate generally on landscape and ecological principles suggests that it was carried out by John Loudon (*q.v.*).

Tewkesbury, municipal bor. and mkt. tn. in Gloucestershire, England. It is situated on the Avon, close to the point where that riv. joins the Severn, 10 m. N.E. of Gloucester. The 'Bloody Meadow' on the S. side of the tn. was the site of the battle of T., May 4, 1471, one of the bitterest battles of the Wars of the Roses, in which the Lancastrians were routed. T. was settled in Rom. times and in 1087 was a bor. and market. Its most magnificent building is its abbey church, all that is left of a great Benedictine abbey, erected in the twelfth century on a Saxon foundation. Monuments include Beauchamp Chantry (1425) and the tomb of Hugh Despenser (*d.* 1349). Prince

Edward, son of Henry VI., is reputed to be buried under the tower. T. has a sixteenth-century grammar school and sev. old timbered houses. In Tudor times it was famous for mustard making; now it is an agric. centre. Mrs. Craik's *John Halliday, Gentleman* is set in T. Pop. 5100.

Tewpatoria, *see* EUPATORIA.

Texarkana, name given to two cities which are adjacent, one being the co. seat of Miller co., Arkansas, U.S.A., and the other of Bowie co., Texas. The chief articles of trade are lumber, cotton, cotton-seed, and oil, while machinery, furniture, and railway engines are the chief manufs. Pop., T. in Texas, 17,000; T. in Arkansas, 11,800.

Texas, 'the Lone Star State,' the southernmost of the central states of the U.S.A. and the largest (263,641 sq. m.) in the Union, with a coast-line along the gulf of Mexico, stretching for 370 m. from Mexico N.E. to Louisiana. It is more than three times as large as Great Britain. Its extreme length is 760 m. and extreme breadth 620 m. It is separated from Mexico, on the S.W., by the shifting Rio Grande; New Mexico and Mexico border it on the W., Oklahoma and New Mexico on the N., and Arkansas, Oklahoma, and Louisiana on the E. The general slope is N.W. to S.E. The 'Llano Estacado' is a barren plateau in the W., with a mean elevation of from 3000-5000 ft. The descent to 1000 ft. is swift, and then come the fertile tracts of rolling prairie, with plentiful forests of yellow pine in the E., and with flat pastures alternating with rich corn lands—tracts which extend terracewise to the fertile lowlands and barren swamps of the coastal belt. Behind Padre Is., which hugs the shore for over 100 m. northward from the mouth of the Rio Grande to that of the Nueces, is a region of white sands, known as 'the desert.' With the exception of the Iro and Canadian, which carry their waters eastward to the Mississippi, all the rvs., including the Brazos, Colorado, and Trinity, drain S.E. to the gulf of Mexico. T. is too large to enjoy a uniform climate, and it has extremes ranging from temperate to sub-tropical. The air in the W. is remarkable for its dryness. T. is one of the great granaries of the world, and one of the chief agric. states of the Union. Its agric. potentialities are indeed enormous, vast areas of available arable land not yet being under cultivation. Since 1930 the problem of soil erosion, from both wind and water, has been increasingly studied. In 1939 a Soil Erosion Act was passed. Since then about 150 soil-conservation dists. covering approximately 136,000,000 ac. have been estab. In 1939 nearly half the irrigable land in T. was irrigated. Results of such care include the 'Magic Valley' of the Lower Rio Grande, formerly almost desert, where citrus fruits and vegetables are now grown. T. leads all the states in value of agric. crops per annum. Maize, oats, wheat, and rice are important crops. Cotton is of great importance, T. producing about a seventh of the world's supply. Other agric. products are fruit

(especially peaches, oranges, and grapefruit), potatoes, sweet potatoes, and other vegetables, peanuts, and sorghum. Much of T.'s farming is done by large-scale, highly mechanised, commercial farms, which now form a majority, though a large number of small farms still remain. Stock-raising is of vital importance, T. being one of the great cattle states. It raises over 20,000,000 head of live-stock, including cattle, swine, sheep, horses, and mules. Petroleum is the most valuable mineral product, representing nearly half the U.S. total output. The outputs of clay, coal, and Portland cement are also considerable. Lignite, sulphur, natural gas, quicksilver, and silver are also present, and in the W. are great potash fields, as yet unexploited. It produces over 70 per cent of all the sulphur in the U.S.A. T. is the only source of helium in the country. Slaughter-houses and meat-packing stores, and after them flour and grist mills, are profitable industries. But lumbering and timbering, cotton mills, and the manuf. of cotton-seed oil and cake are very thriving, whilst iron founding and the making of machinery and cars as well as rice cleaning are making T. an increasingly industrial state, a process accelerated by the building of war plant and 'new ties' to house their workers during the Second World War. Much of the labour is done by Mexicans, some of the frontier tns. having a pop. half Mexican.

Education is compulsory between seven and sixteen years of age. In 1948 increased educational provision was made for Negroes. There are seventy-eight listed institutions for higher education, including ten for Negroes. Chief religious bodies are the Rom. Catholic, S. Baptists, S. Methodists, and Negro Baptists. Segregation of white and coloured races is statutorily enforced. The state has good harbour facilities and has over 1000 m. of navigable waterways. There are over 17,000 m. of railways and over 27,000 m. of state highways. In 1950 T. had more than 600 airfields. The Houston Ship Canal, 30 m. long, connects Houston with the gulf of Mexico, making that city the largest inland cotton market in the world. Galveston is connected with the mainland by a causeway 2 m. long. The cap. is Austin, pop. 88,000, where T. State Univ. is situated. Other large cities are Houston, 495,000 (1940 census, 384,000); Dallas, 478,000 (294,700); San Antonio, 400,000 (253,900); Fort Worth, 271,000 (177,600); El Paso, 135,000 (96,800); Corpus Christi, 125,000 (57,300). Galveston has a pop. of 60,800. Increased industrialisation during the Second World War accounts for much of the large increase in T.'s city pops.

The Sp. explorers De Vaca and Coronado (q.v.) were the first to explore the region now known as T. (the name was that of an Indian tribe), but the first permanent settlement was made by La Salle in 1685 at Fort Saint Louis. T. was surrendered by the Fr. to the Sp. in 1713, who founded many religious missions. These contributed greatly to the conversion of T. not only to Christianity, but

from a waste land into a civilised country. When Mexico revolted and became independent in 1821, Coahuila and T. formed one state. T. was colonised to a large extent by Amers. and Eng., and when trouble broke out with the Mexican Gov., T. was constituted an independent republic in 1836. In 1845 it sought and gained admission as a state of the U.S.A. After the Mexican war, which was precipitated by this admission, T. prospered. In 1861 it seceded with the S. states. The legislature consists of a Senate of thirty-one members and a House of Representatives of 150. Two senators and twenty-one representatives attend Congress. Pop. 6,414,824 (census 1940); estimated (1948), 7,230,000. See C. R. Wharton, *History of Texas*, 1935; R. N. Richardson, *Texas*, 1943; J. Frank Dobie, *A Vaquero of the Brush Country*, 1949.

Texas City, port of Texas, U.S.A., on the bay of Galveston, 5 m. N.W. of Galveston city. In fifty years it has grown from a hamlet into one of the U.S.A.'s largest ports, dealing with rather more trade than San Francisco. A severe explosion on a ship in T. C. harbour in 1947 killed over 600 people and destroyed much of the city. Pop. 28,000 (5700 according to 1940 census).

Texcoco, see **TEZCUCO**.

Texel, one of the Dutch W. Frisian is., covering 71 sq. m., separated from the mainland by the 2-m.-broad Marsdiep and opposite the tn. of Den Helder. At one time it was joined to the is. of Vlieland and the foreshore beyond. The N. part of the is. is called Eilerland or Eger Land from the bird observatory erected in this part of the is., where thousands of birds belonging to more than a hundred species breed every year. Of late years the is. has been much frequented by tourists, and by holiday-makers as a camping centre. In 1945 it was liberated by the Russian prisoners-of-war who had been quartered there. The whole is. forms one municipality; the inhab. live by sheep-breeding, agriculture, and fishing. There are considerable exports of lambs to England. T. ewe-cheese is famous as a Dutch export. The farmhouses on T. have a peculiarly square shape, with tall pyramidal roofs (*stolpen*). It was off T. in 1653 that an Eng. fleet under Monck beat a Dutch fleet under Tromp, who was killed during the battle. Pop. 9400.

Textiles, see **FABRICS**, **TEXTILE**. See also under **CLOTH MANUFACTURE** and **FINISHING**; **COTTON SPINNING** and **MANUFACTURE**; **WOOL**.

Tezucuo, or **Texcoco**, tn. in Mexico, situated near Lake T. It is an old city and was originally the centre of the Aztec culture, some of its old buildings still remaining. Pop. about 25,000.

Tezeu, or **Tezewo** (Ger. *Dirschau*), tn. of Poland on the l. b. of the Vistula, about 20 m. from Gdansk (Danzig). It has sugar factories and railway works. Pop. 16,000.

Tezuitlan, tn. in the state of Puebla, Mexico. Pop. 12,000.

Thackeray, **William Makepeace** (1811-1863), Eng. novelist and essayist, b. in

Calcutta. His father, Richmond T., was in the service of the East India Company. He died in 1815, leaving his son an inheritance of nearly £20 000. T. was sent to England to school in 1817, and was educated at the Charterhouse, London, and at Trinity College, Cambridge, where he was a friend of Fitzgerald and Tennyson. He left the univ. after a year and travelled in Germany, staying chiefly at Weimar. In 1831 he entered the Middle Temple, but did not long pursue his legal studies. He spent much of the following year in Paris, and in 1833 became part owner of a weekly paper, the *National Standard*. The paper came to an end in the following year, when its losses were borne by T. The remainder of his patrimony disappeared with the failure of an Indian bank in 1833. He was at this time in Paris studying art. He now hoped to earn his living as an illustrator, and in April 1836 pub. *Flore et Zephyr—Ballet Mythologique*, a set of eight plates. In Aug. he married Isabella Shawe. Shortly after he became Paris correspondent of the daily newspaper, the *Constitutionnel*. This also failed, and in March 1837 he returned to London, where his daughter Anne Isabella, later Lady Ritchie, the eldest of his three children, was born. To this period belong his contributions to *Fraser's Magazine*, including the *Yellowplush Correspondence* (1837-38) and *Catherine* (1839-40). Shortly afterwards his life was permanently clouded by his wife's insanity. The *Paris Sketch Book* followed *Catherine* in 1840 but was unsuccessful. This was followed in 1841 by *Comic Tales and Sketches*, collected periodical writings, which revealed the two pseudonyms 'Yellowplush' and 'Michael Angelo Titmarsh' as the same person. In 1842 he visited Dublin and *The Irish Sketch Book* appeared in 1843. His friendship with Mrs. Brookfield, begun in 1842, marked by a correspondence extending over many years, was one of the major influences of his life.

At this time recognition as a writer was slow in coming. *The Great Hoggarty Diamond* was refused by *Blackwood's Magazine* and appeared serially in *Fraser's* (1841), as also did *Barry Lyndon* in 1844. This was one of his greatest works, excelling in irony and brilliant wit. Since 1842 he had contributed regularly to *Punch* and increased his reputation with *The Book of Snobs* which appeared in *Punch* (1846-1847). *Mrs. Perkins' Ball* (1846), a 'Christmas Book,' brought him further popularity, but he did not become really famous until the pub. of *Vanity Fair*, which was brought out in monthly parts from Jan. 1847 to July 1848. The first ed. in one vol. was pub. in 1848. Its success was slow at first. As soon as it was finished he began work on *Pendennis*, and the first of twenty-four monthly parts appeared in Nov. 1848. These two works placed him in the front rank of living novelists. In 1851 he resigned from the *Punch* staff in order to devote himself to the writing of *Esmond*, which was pub. in Oct. 1852. The same month he sailed to America, where he gained a great success

with his lectures on *The English Humorists of the Eighteenth Century* which had been delivered in London and the provs. the previous year. *The Newcomes* was pub. in monthly parts from Oct. 1853 to Aug. 1855. While it was coming out *The Rose and the Ring*, a delightful extravaganza, appeared (1854). In 1855 T. repeated his Amer. success, travelling widely and lecturing on *The Four Georges*. These lectures were also given in England and Scotland on his return from America in 1856. The following year he unsuccessfully contested Oxford in the Liberal interest. *The Virginians* came out in 1857-59, and in 1860 T. became first editor of the *Cornhill Magazine*, to which he contributed *Lovel the Widower* (1860), *The Adventures of Philip* (1861-62), and the delightful *Roundabout Papers* (1860-1863). He resigned the editorship in 1862. At the time of his death he was engaged upon *Denis Duval*, the fragment of which has been pub. (1864).

T. has been hailed by many critics as the lineal literary descendant of Henry Fielding (*q.v.*), and as only second to him as an Eng. novelist. In temper and style he had inherited much of the eighteenth-century literary tradition; but his work shows a blending of many influences, and he really stands apart from any of the other great novelists of his own or the previous century, though possessing characteristics of sev. His writing is finely seasoned with a highly developed wit and irony, as polished and sustained, on occasion, as that of Swift or Pope, but without their bitterness.

Collections of T.'s works include those by Lady Anne Ritchie (13 vols., 1898-99). The ed. by Lewis Melville (20 vols., 1901-7) is complete and has all the original illustrations. T. was one of the greatest of Eng. letter writers, and his correspondence has been pub. in various forms. The earliest collection appeared in 1887 and contained letters written to Mrs. Brookfield, 1847-55. Other collections include *Letters and Private Papers of W. M. Thackeray*, ed. by G. N. Ray, in 4 vols. (1945). There is an important biography by Lewis Melville (1899); repub. in an enlarged ed. with bibliography in 1909 and 1927). See also A. Trollope, *Thackeray* ('English Men of Letters' series), 1879; G. Saintsbury, *A Consideration of Thackeray*, 1931; M. Elvin, *Thackeray, a Personality*, 1932; and L. Stevenson, *The Showman of Vanity Fair*, 1947.

Thaddæus, see JUDAS.

Thailand, see SIAM.

Thaler, abbreviation for Joachimsthaler, silver coins coined at Joachimsthal, Bohemia, in 1519. From 1857 to 1873 the T. was the unit of the Ger. monetary union, being equivalent to 3 marks, but after this it fell into disuse. The word dollar is derived from T.

Thales (fl. 600 B.C.), Gk. philosopher, chief of the seven wise men, b. at Miletus. He taught that water or moisture was the one element from which all things evolved. He appears to have owed much to the astronomy of the Egyptians and to the civilisation of Mesopotamia. He is

regarded as the founder of abstract geometry, of the strict deductive form as shown in Euclid's collections; he is said to have shown how to calculate the distance of a ship at sea, and the heights of objects. In astronomy he was credited by the ancients with the prediction of the total solar eclipse identified by Airy, Zech, and Hind with the date May 28, 585 B.C.; he is said to have noted the 'Lesser Bear' and to have shown its superiority for the purposes of navigation.

Thalia, one of the nine Muses (q.v.).

Thallium, metallic chemical element, symbol Tl, atomic number 81, atomic weight 204.2. It was discovered by Crookes (1861) in the seleniferous deposits from the sulphuric acid manufactory. It occurs in small quantities in iron pyrites, and also occurs associated with copper, silver, and selenium in the mineral 'crookesite.' The metal is prepared by displacement from its solutions by means of zinc. T. compounds give a bright green line in the spectrum (hence the name, from Gk. *thallos*, a green twig); some of them find a use in the manuf. of optical glass.

Thame, nrkt. tn. and urb. dist. of Oxfordshire, England. It is situated on the R. T., 13 m. from Oxford and 45 m. from London. Its chief building is the church of St. Mary the Virgin, which is an exceptionally large church in mainly Early Eng. and Perpendicular style, containing some interesting brasses. It has a sixteenth-century grammar school and a famous inn known as the 'Spread Eagle.' The R. T. has its source in the Chiltern Hills and flows past T. to the Thames, which it joins near Dorchester. It is 35 m. long. Pop. 3600.

Thames, riv. of Canada, which flows across the Lakes Peninsula in Ontario, between Lakes Erie and Huron, and into Lake St. Clair, after a course of 150 m. The chief city on it is London (q.v.).

Thames, New Zealand, see GRAHAMSTOWN.

Thames and Severn Canal leaves the Thames at Lechlade, and reaches Stroud, 30 m. N.E. The N. Wilts Canal communicates with it at Cricklade, and the Stroudwater Canal from the Severn at Stroud. It runs through the cos. of Wiltshire and Gloucester.

Thames Conservancy. The conservation of the Thames was granted to the lord mayor of London in 1487 and delegated to twelve conservators in 1857, the powers being reconstituted in 1894. The duties relative to the lower part of the riv. devolved upon the Corporation of London until 1857, those relative to the upper part upon the Upper Thames Commissioners until 1866, when under the Thames Navigation Act the riv. from Staines to Cucklade, in Wiltshire, was added to the conservators' jurisdiction. The Port of London Authority (q.v.) by an Act of 1908, took over all rights and duties of the conservators in respect of the riv. below Teddington. Since that date the conservators' powers and duties have been further amended by the Thames Conservancy Acts of 1910, 1911, 1921, and 1924,

and finally consolidated in the Thames Conservancy Act, 1932. By the Land Drainage Act, 1930, the conservators were constituted the Drainage Board of the Thames Catchment Area, and exercise jurisdiction over 2382 m. of 'main riv.,' comprising the Thames itself above Teddington and part or the whole of certain tribs. In consequence of the additional duties imposed by this Act, the number of conservators was increased in 1932 to thirty-four, each appointed by an interested authority. The whole of the riv. above Teddington Lock towards its source is exclusively governed by the by-laws of the T. C. Board. The prin. duties of the board have to do with the preservation of the riv. from pollution, both in the main stream and in tribs., docks, and canals, the protection of fisheries, the control of navigation, and drainage, etc.

Thames Ditton, residential dist. of Surrey, England, forming part of the urb. dist. of Esher. The Swan and Angel Hotels are sixteenth-century foundations, and there are almshouses of the early eighteenth century. Pop. 9000.

Thames, The, riv. of England, rises near Cirencester in the Cotswold Hills and follows a course of 210 m. to the Nore, where it debouches into the North Sea. It is England's largest and most important riv. At Gravesend, the head of the estuary, it has a width of half a mile, gradually increasing thence to 10 m. to the Nore. By the addition of its tribs., the Colne, Leach, and Churn, it becomes navigable for barge traffic at Lechlade, where the canal to the Severn leaves. At Oxford the navigability improves, and the Wilts and Bucks Canal joins a few miles down at Abingdon, the Wye Canal leaving via the Kennet at Reading. From here barge and tug traffic, with important depots at Reading and Kingston, is considerable, while riv. steamers ply between the latter place and Oxford. Tidal waters are reached at Teddington, 60 m. from the mouth, where is the first lock from the sea except for the tidal lock at Richmond. There are in all forty-seven locks. St. John's Lock, Lechlade, being nearest the source. The normal rise and fall of the tide is from 15 to 23 ft. at London Bridge and from 13 to 19 ft. at Tilbury. Until the Tower Bridge was built, London Bridge was the lowest in the course, the reach between the two being known as the Pool. Gravesend, 20 m. lower, grew up at the spot where vessels awaited the turn of the tide. A little further the Medway, by virtue of its estuary the chief trib., enters; just inside this is Chatham, the important naval depot. Opposite to Gravesend and on the N. bank is Tilbury, the terminus of many large liners. From London Bridge downwards the riv. is lined with docks and wharves. At Woolwich, on the S. bank, 8 m. below London Bridge, is the arsenal, and a little further up the riv. Greenwich with its Royal Naval Hospital. The embankments of the T. in London were the work of Sir Joseph Bazalgette (1819-91) (q.v.), chief engineer of the Metropolitan Board

of Works. The Albert Embankment on the S. side was completed in 1869, the Victoria Embankment from Westminster to Blackfriars in 1870, and the Chelsea Embankment from the Royal Hospital to Battersea Bridge in 1874. In Jan. 1949 work was started on a new embankment, designed by J. Rawlinson, chief engineer of the L.C.C., on the S. side from County Hall to Waterloo Bridge. The riv is spanned by over fifty bridges, including Tower Bridge, a bascule bridge, and suspension bridges at Hammersmith and Marlow. The chief tunnels under the T. are the T. Tunnel, completed by Brunel in 1841, now used for railway only, the Blackwall Tunnel (1897) from E. India Dock Road to E. Greenwich, and Rotherhithe Tunnel (1918) from Shadwell to Rotherhithe. In 1948 a scheme was put on foot for the maintenance of the towpaths from Teddington to Cricklade as a public open space. The Port of London Authority (*q.v.*) is responsible for the control and conservation of the riv. below Teddington; above Teddington the T. Conservancy (*q.v.*) is the responsible authority.

Until the nineteenth century the London T. was an important means of transport for passengers; the names of 'stairs' are traces of the great passenger barge traffic. Since the Second World War passenger traffic on the T. has been revived by 'water buses.' The T. has been frozen over at various times, the earliest recorded occasion being A.D. 1150. See H. Belloc, *The Historic Thames*, 1914; J. H. Salter, *Guide to the Thames* (31st ed.), 1929; C. F. Smith, *The Thames*, 1931; A. Bell, *Said Noble River*, 1937; A. G. Thompson, *The Royal Thames*, 1937; R. Gibbings, *Sweet Thames Run Softly*, 1940; M. S. Briggs, *Down the Thames*, 1949.

Thana, see Tanna.

Thane, or **Thegn**, A.-S. rank, which originally seems to have been applied to the personal followers of the king and had a distinct military significance. Early *l.*s give the *werzild* (*q.v.*) of a T. as between that of a *eorl* and an *earl*. The complex society of later Saxon England suggest that the T. was no longer confined to a class of fighting nobles, bound to the king by personal loyalty, but could include successful merchants and *eorls*. It appears to have become essentially a mark of social standing. Historians no longer suggest that the Norman knight derived from the Eng. T. The Ts. did not hold their land by military tenure, but were bound to fight for their king by bonds of loyalty. They received their lands of him as a reward for past services. See Sir F. Stenton, *Anglo-Saxon England*, 1943.

Thanet, Isle of, extreme E. part of Kent which was formerly separated from the mainland by the R. Wantsum which remained in part navigable up to the end of the fifteenth century. Ebbsfleet is generally accepted as the landing place of the Saxons in A.D. 449, and in the same area St. Augustine and the Christian missionaries made landfall in 597. The is. was in the full stream of Brit. hist. for many centuries and its famous churches

bear evidence of its great importance from early times. It has exceptionally bracing air, and is now well known for its watering-places of Margate, Broadstairs, and Ramsgate, the latter being also a seaport with a busy harbour. See J. Lewis, *The History and Antiquities . . . of the Isle of Thanet* (2nd ed.), 1736.

Thanet Sands, lowest div. of the Eocene system (*q.v.*) exposed along the margin of the chalk in the E. part of the Thames Basin and particularly in E. Kent, especially in the Thanet dist. Some seventy species of marine fossils are known. Thanet sand is used for moulding; its occurrence in W. Kent determined the site of Woolwich Arsenal.

Thanksgiving Day, ann. festival of thanksgiving in the U.S.A., celebrated as a national holiday according to the choice of President Lincoln in 1864, on the last Thursday in Nov. President Roosevelt further defined the date of celebration as the fourth Thursday in Nov., in 1941. It is in essence a national harvest celebration, and was first observed by the Pilgrim Fathers at Plymouth in 1621, after they had gathered in their first harvest.

Thapsus, in anct. geography, tn. in Tunis, 30 m. S.E. of Susa. In 46 B.C. Julius Caesar here routed the Pompeians under Cato, Scipio, and Juba, so ending the war in Africa.

Thar and Parkar, dist. in the E. of Sindh, Pakistan. It divides the fertile plain of Nara and a dry region. Pop. 457,000.

Tharawadi, tn. and dist. of Lower Burma. Rice is produced. The cap. is T., 68 m. N.W. of Rangoon. Area 2851 sq. m. Pop. (dist.) 594,000; (tn.) 9000.

Thatching, art of roofing houses or protecting stacks of hay or grain with a covering of reeds, rushes, straw, etc. Thatch should be at least 12 in. in thickness and laid to a pitch of 45 degrees. Best or true Norfolk reed is used in T. Norfolk reed with an admixture of lesser reed mace lasts longer, besides being less expensive than best reed. Wheat or rye straw is considerably cheaper than reed but may require renewal after twenty years, whereas reed thatch should last about seventy-five years. Heather also provides a durable thatch but in exposed places is liable to strip.

Thaulow, Frits (1847-1906), Norwegian painter. During his early days he was a pupil of the Norwegian romantic painter Gude; later when in Paris in the 1870s he came under the influence of Corot and Daubigny. After his return to Norway he was known for his landscape paintings which, after another period of travels abroad, matured in colouristic refinement and won him world repute. He is represented in the Nasjonalgalleriet, Oslo, and in collections in Europe and America.

Thaw, the melting of snow and ice. A partial and temporary T. may be caused by the sun's heat if it is not too low in the sky; but a permanent T., particularly in the Brit. Isles, is mostly due to a complete change of air mass, as for instance from northerly or easterly winds to comparatively warm westerly winds from the Atlantic. In northerly or cold

continental regions the 'spring T.' is a pronounced ann. event, the ice-bound seas, lakes, and rivs. breaking up and the winter snows melting.

Thaxted, tn. of Essex, England, 7 m. N. of Great Dunmow. It was important in medieval times, and was formerly a bor., incorporated by charter of Philip and Mary. It is famous for its massive Perpendicular church, which has a fine crotched spire (181 ft.), and is one of the finest in Essex. The guildhall in Town Street is a picturesque three-storeyed timber-framed building of mid fifteenth-century date, and is of great interest as it is one of the few remaining medieval guildhalls in England. Horham Hall is in the par. Pop. 1700.

Theatines, Rom. Catholic religious order of priests, marked by its extreme observance of poverty. They were founded in 1524 by Gaetano del Conti (1480-1517), canonised in 1671, and Giovanni Caraffa, afterwards Pope Paul IV., with the object of restoring the standard of clerical life and recalling the laity to the practice of virtue. They exist to-day mainly in Italy. There are also Theatine nuns, founded by Ursula Benincasa in 1583.

Theatre, place designed for enabling an audience to see the performance of plays, consisting of a stage and an auditorium, with ancillary accommodation for actors and audience.

Greece.—The religious origins of the drama (*q.v.*) made it from the beginning essentially a popular art so that the T. in which it was presented had to provide ample standing and, later, seating accommodation for the participating spectators. In the earliest Ts. these simple requirements were met by a suitable hillside with a level circular space (*ὀρχήστρα*, orchestra) at the bottom, in the centre of which an altar was erected. The primitive Gk. T. thus assumed its shape, having seats in a slightly extended semicircle (the *theatron* or auditorium) around the orchestra. At Athens, about 465 B.C., the orchestra was moved 50 ft. forward, and on the further side a small wooden hut (*σκήνη*, *skene*) was built as a dressing-room for the actors. It had a long front wall with projecting wings towards either end, between which a stage was probably raised a foot above the level of the orchestra. This stage was possibly backed by a row of columns (*προσκήνιον*, *proskēnion*, *proscenium*), originally also of wood, behind which was the wall pierced by doors for the actors' entrances and exits. At each end of the extended semicircle of the auditorium was a passageway (*παράδος*, *parados*), between stage and auditorium.

By the third and second centuries B.C., the chorus had practically disappeared from tragedy, and though choral odes were still retained in comedy, they had become separate interludes. The *skene* was generally two-storeyed, with a row of columns some 10 ft. in front, the spaces between filled in with painted boards, and on top a platform on which the actors performed. Immediately behind and above this was the *proscenium*, which

usually had three doors. By Græco-Rom. times the stage front and the background had been altered. The *proscenium* was more elaborate, and dominated the T. with its columns, doors (seven at Ephesus), and architectural embellishments. Spectacular scenic effects were eagerly sought. Projecting wings (*παράσκηνα*, *paraskēnia*) now formed part of the structure of the T. Low platforms carrying scenic effects could be pushed on to the stage through the doors; semicircular and triangular turntables painted with tragic, comic, and satiric designs; a hook and pulley device for lowering and raising divinities from and to the heavens; trapdoors in

A GREEK THEATRE

This diagram shows the lowest part of the auditorium and the *skene* of the Theatre of Lykurgos at Athens
1, orchestra; 2, 2, *parados*; 3, *proskēnion*; 4, *skene*
5, 5, *paraskēnia*.

the orchestra through which ghosts and spirits could appear; means of producing thunder and lightning, fires, etc., are all either recorded or to be inferred from a study of the plays. Stage costume was highly stylised. Certain conventions fully estab. by Æschylus's day remained unchanged from then till Rom. times. Although the earlier tragedies and comedies had always been set in the legendary Homeric era, the tragic actor's dress was always that of the fifth century (see under **COSTUME DESIGN, THEATRICAL**).

The Rom. T. differed from the Gk. T. first in having nothing to do with religion, and secondly in being built on level instead of sloping ground, possibly for the sake of a more imposing architectural exterior. The auditorium was an exact semicircle around the orchestra space, the further half occupied by the stage, the front half being used sometimes for additional seating accommodation and sometimes for gladiatorial or other spectacular displays, when it could be rolled off to protect the audience. The stage doors in the front wall (*hyposcēnium*) and steps down from the stage to the orchestra were usual. This wall was no longer plain but decorated in keeping with the embellishment of the *frons scēnæ* at the back of the stage, from which a roof reached

out over it. Awnings over the auditorium were also provided. The earlier elaborate portals over the *paradoi* were transformed into covered passages.

Gk. tragedy and comedy introduced to Rome degenerated into dance and satirical mime, and the status of the Rom. actor never approached the dignity of that of his Gk. predecessor. In the original Gk. drama the poet himself would play the leading part and train the chorus. Actors were originally amateurs, but later companies of actors were formed with their own guild and were held in high esteem. In Rome, the custom of maintaining permanent troupes of actors, mostly slaves, and the introduction of women to the stage, made the profession generally despised.

The Middle Ages.—Though the Ts. were destroyed by Lombard invasion in the sixth century, the players survived. The rich had always hired them for private entertainments, and continued to do so. The barbarians, moreover, were accustomed to keep court poets to ensnare their triumphs in epic narrative. By A.D. 800 these two employments merged in the household minstrel (*menestrier*). Less fortunate actors took to the road and became tumblers, acrobats, puppet-masters, dancers, singers, masks, etc., known generally as *jongleurs*, and these with the later *goliards*, the wandering scholars (mostly defrocked clerks and students travelling between the univs.), noted for their ribald satires, formed the vast body of nomad players, the *histriones*, of the eleventh to thirteenth centuries.

The T. was reborn once more of religion, this time of the Christian liturgy and in the Church, when in the tenth century, for the benefit of the faithful who had no Lat., the clergy began to act the parts they sung, i.e. to give simple mimes of the gospel story incorporated in the mass. Short episodes of this kind at Easter and Christmas, the two most important Church feasts, grew into cycles covering the 'ill stories' of the Resurrection and the Nativity. The plays became so popular that early in the twelfth century the crowds were more than the churches could hold. Performances were given in refectories and in the open—the churchyard or the market-place. The plays were arranged as they had been inside the church, the settings for each scene, wooden platforms and stages, known in England as 'houses,' erected in front and on either side of a cross in the same relative position to it as before they had been to the main altar.

On the Continent such stationary settings were the general rule, but in England, with a few exceptions, it became the practice to mount the 'houses' on wheels and tour the tn. in procession, each 'house' stopping to perform its scene at pre-arranged stages. By the thirteenth century the whole of hist. from the Creation to the Judgment was incorporated in the various cycles, and the clergy, even helped out by the wandering scholars, were unable to provide enough actors for the major festivals. The laity were thus called in to take part, and between 1350

and 1450 they gradually took over the financing, production, and entire control of all public performances.

Similar conditions prevailed on the Continent, except that there the plays were also produced by companies of actors which had no counterpart in England. In France the most famous of these was the *Confrérie de la Passion*, estab. by royal patent in 1402, and the first permanent theatrical troupe to have its own T. in Europe.

Renaissance: Italy.—In Italy during the Renaissance companies of young men specially associating for the purpose, more after the Fr. than the Eng. manner, had taken over the miracle plays (*sacre rappresentazioni*) from the Church, while the travelling players, starting from fair-ground and street corner, had by the sixteenth century evolved the unsurpassed *Commedia dell'Arte* (q.v.). At the turn of the fifteenth century the contemporary study of perspective was applied to theatrical *décor* and a type of classicised medieval multiple-setting evolved. In 1551 Sebastiano Serlio in his *Architettura* advocated a synthesis of classical and medieval practice in a stage on which stock settings with corresponding perspective back cloths could be erected according to the play performed. These settings were constructed, like the medieval 'houses,' in canvas and lath, which would give them an appearance of solidity. The action of the play took place as in classical and medieval practice in the open (on the *platea*). The Teatro Olimpico at Vicenza, built (1580-84) to the design of Palladio, combined Rom. solidity with medieval multiplicity. A long narrow front stage was backed by an ornamental architectural proscenium, with a perspective view shown through a large central arch (the former *porta regia*), flanked on either side by small doors. The Teatro Farnese at Parma (1618-19) introduced the proscenium arch, and was also the first T. to have seats in the orchestra up to the stage. Accounts of classical 'machines' were studied and ingenious scenic effects contrived; movable scenery is first heard of at Venice in 1639. A curtain was installed, but was mostly used only at the beginning of a performance to surprise the audience by the sudden revelation of a particularly striking opening set.

Renaissance: France.—As Renaissance ideas reached France, medieval and classical methods were similarly though more directly combined. Fr. drama did not yet observe the unities as strictly as It., and to present the sev. settings required for each play *décor simultané* was used, as many *à l'esquisse* type 'houses' and perspectives being set up together on the stage as a play required. Scaliger's comment, in 1561, that actors in France when silent were presumed not to be on the stage, is in keeping with this system of production.

The Elizabethan Stage.—In England the traditional drama, the new classical influence, and humanist teaching were alike dominated by the Reformation. The

first public T., known as the Theatre, was built in 1576 by an actor, James Burbage, who, to escape interference by the city authorities, chose a site at Shore-ditch outside the city walls. Within a year a second T. called the Curtain was built not far away. We know nothing about these except that they were regarded as 'sumptuous.' The Swan was built by Francis Langley about 1595.

THE ELIZABETHAN THEATRE
The Swan, on Bankside: a reproduction, reduced,
of a drawing by Arend van Buchell.

A drawing of this building, made by a Dutchman, Arend van Buchell, based on a description given him by his friend Johannes de Witt of Utrecht, who visited the T. in 1596, is the earliest information we have about these first London Ts. It shows a building of three galleries, which are roofed, and in the galleries are seats; the centre is open to the sky, and there is a large platform stage; there is standing space for spectators on three sides. The drawing shows three people acting on the stage. Over the stage is a canopy, known as the heavens, which in the drawing covers only a small part of the stage, but was probably over the whole of it. At the rear of the stage there are two doors, and over them a balcony, with people in it. At the top there is a thatched room with a flag and a trumpeter. The Swan was said to accommodate in its seats 3000 persons, which was probably an exaggeration, for a large number of spectators had to stand in the pit. In

1599 there was built the most famous of all Ts., the Globe, also on Bankside. It was a handsome building, constructed of timber, plastered, with thatched roof, surpassing all the other Ts., but practically nothing is known about it except by conjecture, based upon references to the building in plays, etc., and upon the contract for building the Fortune T. shortly after, which refers to the Globe.

It is conjectured that it was 84 ft. wide between the outer walls and that the width of the pit was 58 ft. There were three roofed galleries, with three rows of seats in each. The stage was, possibly, 43 ft. long and 23 ft. wide, and extended to the middle of the pit: there was a heavens or canopy over it; at the back there were doors at each side and in the centre a curtained inner stage. Over the inner stage there was a balcony, also curtained, which may have projected. There were traps in the floor of the stage for ghosts, etc. Actors and properties could be let down from the heavens. There was one entrance to the T. for spectators and another at the rear of the stage for the actors; the 'tiring' rooms for the actors were at the rear of the stage, probably on sev. floors. The admission was one penny, increased for special performances, which entitled to standing room in the pit. Those who wanted to go into the galleries paid another penny for entrance to the gallery staircase, which allowed for a seat in the third gallery; if a seat in the first and second gallery was required a third penny would be paid. The galleries on each side of the stage contained gentlemen's boxes for a seat in which a shilling would be charged. Spectators were allowed on the stage, for which perhaps a shilling was charged. Performances were given in the afternoon, by daylight; on such a stage Shakespeare's plays were performed. There can be little doubt that the open platform stage enabled Shakespeare to do all he

wished. It was richly decorated, elaborate properties would be used, and the dressing of the actors was magnificent. Heraldry and music were important features. The Fortune T. was built by Philip Henslowe and Edward Alleyn, the actor, in the par. of St. Giles, Cripplegate Without, in 1600. It was square, 80 ft. each way, constructed of wood or a brick and tile foundation and covered with plaster. It was three storeys high. It was burnt down in 1621 and rebuilt at once, but dismantled in 1649. London was well supplied with Ts. until the Civil war put an end to all theatrical activity.

The masque was a private entertainment of an expensive and elaborate kind given in palaces or lords' houses. It consisted of scenic display, dancing, and music, in which the guests took part, and was not considered to have any relation to the T. Inigo Jones designed a building for these entertainments at Whitehall known as the Cockpit in which plays were given at the Restoration (see MASQUE).

The Restoration Theatre.—When Charles II. came back from exile with ideas of the Fr. and It. Ts., which were entirely different from the old Eng. T., he gave patents to Sir W. Davenant and to Thomas Killigrew to set up two companies of players, Davenant's to be his brother James's and Killigrew's to be his own, and to build Ts. They got to work at once and performed in converted tennis courts and other buildings, until Killigrew took a site in Bridges Street and in 1663 opened the first T. Royal, Drury Lane, to become one of the most famous Ts. in the world. It was a covered T. with a glass roof, benches in the pit, two galleries, a royal box at the back in the centre, and a stage rather like that of the old Ts. except that scenery in perspective could be used on it. Performances were still given in the afternoon by daylight. Then Davenant instructed Sir Christopher Wren to design a new T. for his company. This was opened as the Duke's House in 1671, and was a wonderful building, seating 1000, with an enormous gilt proscenium arch, on the top of which was situated the orchestra; the scenes were placed behind the arch, while the acting took place on the stage in front of it.

On Jan. 25, 1672, the T. Royal was burnt down and a second T., designed by Sir Christopher Wren, was opened in 1674. This T. lasted until 1791. It was rectangular, with three galleries, each with four rows of seats, the first gallery being divided into boxes; the entire floor was devoted to the benches for the pit. The stage projected 17 ft. beyond the proscenium arch; on each side there were two proscenium doors with windows over them. Neither T. was popular and in 1682 the two companies were amalgamated and played at the T. Royal, abandoning the Duke's House. There are sev. points to be noted in the Restoration T., which entirely transformed the drama and acting from what they had been in England. The first is that women appeared on the stage, for it was Charles's order that they should do so. Women had never appeared on the Eng. stage (except when a Fr. company visited London), for acting had been done by men and boys. It was part of the Puritan objection to the T. that boys dressed up as women. The appearance of actresses transformed the drama and they soon took a predominating part, often appearing in men's parts, and plays were written to exploit their charms, and movable scenery was also used. Spectacle for its own sake became one of the leading features of the T. The audience was placed further and further from the stage so as to get the full advantage of the scenes in perspective, and the apron stage became more and more reduced; then the actors were forced to play in the scenes, though for a long period, indeed until the first quarter of the nineteenth century, they insisted on using the apron too. Thus arose the 'picture-frame' stage and the convention of the 'fourth wall.' Finally the two patents granted by Charles had created a monopoly, the most effective

stranglehold upon the Ts. that could have been conceived.

Eighteenth and Nineteenth Centuries: England.—The heaviest blow the T. sustained was Horace Walpole's Licensing Act of 1737, which prohibited Ts. anywhere except by the authority of letters patent from the king or a licence from the lord chamberlain. Not until 1788 was this severe restriction upon building relaxed, when an Act enabled Ts. to be built under justices' licence, though it did not apply to London or 20 m. around.

In London, however, the T. monopoly continued, and there was continual rivalry between the two patent Ts. of Drury Lane and Covent Garden. They both opposed the unlicensed playhouses which had no legal right to produce legitimate drama. There was great objection to the monopoly, and in 1843 the Theatre Act was passed, which, with minor amendments, governs the T. throughout the country to-day (see under THEATRES, LAWS RELATING TO). There were in 1950 forty-two Ts. in or adjoining the W. End of London, with a number of 'private' Ts. and a number of Ts. in the suburbs. The designs of all the Ts. are largely based on Wyatt's Drury Lane, being smaller versions of what is practically a Fr. form of T. building. There are no really modern buildings in London. This applies to other cities in England; also to Stratford-on-Avon, where the original Shakespeare Memorial T., opened in 1879, was burnt down in 1926; it was rebuilt in 1932, but repeated the general plan of the Fr. T.

The Eighteenth Century: Italy.—In Italy throughout the eighteenth century there was considerable theatrical activity, and, abandoning the original Renaissance rectangular buildings, many new Ts. were built in semicircular and horseshoe form. The main experimentation was in the position of the proscenium arch. At first action was placed before it, the scenes being set behind, but early in the century all action was placed behind the arch, the platform stage being completely abolished. This form of stage was copied in France, whence a century later it was transported to England. There was practically no development in T. building anywhere throughout the nineteenth century, and the picture-frame stage was firmly estab. for spectacle and realism.

The Twentieth Century.—The most important influence in the twentieth-century T. was Gordon Craig's, whose ideas of staging were so inappropriate to the picture-frame T., however, that his ideas of production could not be reconciled with the requirements of the commercial T. Craig's ideas were the basis of the work of Max Reinhardt in Germany and Austria where in great spectacular shows such as *The Miracle*, and in performances at the Grosses Schauspielhaus in Berlin, he applied Craig's simplicity, immensity, and theatrical effectiveness. In France Jacques Copeau at the Théâtre du Vieux Colombar transformed the stage into a semi-permanent setting for plays.

In the U.S.A. the estab. of the T. was

slow, owing to Puritan opposition, but made headway in the nineteenth century, when much T. building was carried out; but the centre of the commercial T. remains in New York city, where it is a leading element in the city's entertainment industry. The Ts. were built on European designs and no developments took place. In the little Ts. that sprang up all over the country under amateur

Brit. T. has continued to be a private enterprise in London and throughout the country. Generally speaking the ownership and management of Ts. has been in other hands than those responsible for the production of plays, though there have been exceptions. The production of plays is mainly in the hands of commercial groups, who with their own money or the money of 'backers' provide the con-

Architectural Review

A view of the auditorium and stage, from the lower circle, of the Theatre Royal, Bristol (*q v*)

control a good deal of experimentation was done in modernising the stage and in the creating of intimate Ts., and a T. is now a normal part of Amer. univ. equipment. The Folger Shakespeare Library in Washington, the greatest Shakespearian collection in the world, is housed in a building constructed on the design of an Elizabethan playhouse, the detailed contract for the Fortune T. of 1600 being closely followed. Thus America has an example of a Shakespearian playhouse, but it is not used for performances. Stage design in America owes much to the work of Robert Edmund Jones and Norman Bel Geddes, and to-day the expressionist or constructivist setting is often seen in use.

Production and Management.—The original acting companies in the Elizabethan T. were self-governing, and Shakespeare's company, known as the King's, had its own Ts., the Globe and the Blackfriars. Other Elizabethan Ts. were built by business men such as Philip Henslowe, who for a period had Edward Alleyn the actor as partner, and by building speculators. At the Restoration the two London Ts. were built by the patentees who had official support from investors. The

considerable finance required. Some of these commercial groups, which operate in London and in most large cities, are on a permanent basis. There are exceptions to these commercial interests such as the Old Vic, some of the repertory companies, the Stratford-on-Avon Shakespeare Festival Company, and other companies formed with the object of sustaining theatrical art. The Arts Council is a gov.-appointed body with Treasury support (formed in 1940 as C.E.M.A.), one of whose objects is to support the T. as an art.

In France, Germany, and many other countries the T. has been under state or royal patronage, the T. being provided and the performances given as national or civic enterprises, but most Ts. are private enterprises. In Soviet Russia and other Communist controlled countries the T. is state controlled and used for propaganda and public education. In England public money is now being made available for the T.

The Brit. Gov. is to provide the sum of £1,000,000 for a National T. on a site provided by the London Co. Council, but economic conditions have not yet allowed the scheme to be carried out. Under the Local Government Act, 1948, local

authorities are empowered to build and manage 'Ts. At present the stage is organised to provide pictures in perspective or interior sets of a realistic kind. Stage management is a highly specialised occupation observing, largely, traditional methods. Some stages (e.g. Drury Lane) have mechanical devices enabling the floors to be raised or lowered in sections, and all stages provide for scenery, sometimes complete sets, to be 'flown.' The use of the space over the stage for raising or lowering properties or actors has existed since the Elizabethan T. with its 'heavens.' Movable floors (e.g. Stratford-on-Avon Memorial T.) enable settings to be transposed into the 'wings,' and revolving stages are often employed. Stagelighting is now sometimes operated by remote control from the auditorium.

Acting.—The essential art of the T. is acting, to which all other theatrical arts are subordinate. At all times acting has been conditioned by theatrical buildings as well as by the requirements of the drama, so that there have been considerable differences in acting from period to period and from country to country. The original Gk. actors were the dramatists who took the part of the protagonist, and the poet Thespis (535 B.C.) gave his name to the art of acting. When plays in the fifth century were first performed by professional actors they were always men. The most famous Rom. actor was Roscius (Gallus (d. c. 62 B.C.), excellent in tragedy and comedy, who wrote a work on acting. Women did not perform on the Rom. stage until the second century A.D., when spectacle and pantomime were the main dramatic fare. The Christian Church condemned actors, and in the fourth century excluded them from the sacraments, a prohibition that lasted for more than a thousand years. By the sixth century there was an end of acting in Europe. Its revival came through the teaching of the clergy both in Church and schools, and in the Middle Ages there were performances everywhere, by amateurs, of mystery, allegorical, and comic plays. Companies of actors existed in England from the fifteenth century onwards, attached to the households of great lords. In Italy in the sixteenth century arose the *Commedia dell'Arte*, one of the greatest schools of comedy acting. In the sixteenth century the Burbages estab. the actor's art as a permanent feature of London life. Thereafter there were many famous actors, the first being Richard Burbage and Edward Alleyn, and there is a tradition that Shakespeare was an actor. Continental acting was early adapted to the picture-frame stage, but Eng. acting did not fully accommodate itself to this form of staging until the nineteenth century. No school of acting exists in England comparable with the *Comédie Française*, which since the late seventeenth century has maintained a standard of classical acting in France. The feature of Eng. acting has always been its naturalism. At all times the activities of amateur actors have been considerable in England, and amateur

drama is now one of the most important cultural activities in the country, the number of amateur societies being reckoned to be 25,000. Some of these societies individually or through local federations have Ts. of their own.

Théâtre Français, see *COMÉDIE FRANÇAISE*.

Theatre Royal. In London Drury Lane Theatre (q.v.) and the Haymarket Theatre (q.v.) are permitted to use this title.

Theatre Royal, Bristol, oldest playhouse in England, opened in 1766. The plan owes much to the Drury Lane Theatre of 1674, but the auditorium is believed to be the first in England constructed in a horse-shoe shape. After its opening licensing difficulties were experienced until, in 1778 by a special Act of Parliament, letters patent were granted. Almost every actor of note since 1766, except David Garrick, has appeared on its boards. The theatre is now under the control of the Arts Council, and is the home of the Bristol Old Vic Company.

Theatres, Laws Relating to. By the Theatres Act, 1843, all theatres for the 'performance of stage-plays' must be licensed. Stage-play by section 23 includes 'every tragedy, comedy, farce, opera, burletta, interlude, melodrama, pantomime, or other entertainment of the stage.' The lord chamberlain is the licensing authority as to all theatres (except patent theatres, the only existing example of which is Covent Garden) within the parli. boundaries of London and Westminster, and in the bors. of Finsbury, Marylebone,

Tower Hamlets, Lambeth, Southwark, New Windsor, and Brighton. In co. bors. the licences are granted by the tn. councils, in non-co. bors. by the co. council, while the L.C.C. is the authority for those parts of London which are not within the jurisdiction of the lord chamberlain. A licence will be granted to the manager of the theatre only. (As to licensing of plays, see CENSORSHIP OF THE DRAMA.) Keeping a 'theatre' without a licence entails a penalty of £20 for every day; representing for hire a stage play in an unlicensed place, a daily penalty of £10; performing in public a new play without the leave of the censor, £50, and avoidance of the theatre licence. In regard to structural requirements for the prevention of fire, the L.C.C. has power under the London County Council (General Powers) Act, 1915, to revoke music and dancing licences if the terms or conditions on which they were granted are contravened, and under a similarly entitled Act of 1923, the council may vary the conditions attached to licences for stage plays granted by it under the provisions of the Disorderly Houses Act, 1751, the Cinematograph Act, 1909, or any amending Act. The enforcement of fire regulations is also provided for under the London County Council (General Powers) Act, 1923, and, in the metropolis, the council can close theatres for breach of the regulations. Provision is now made for compulsory registration of theatrical employers under the Theatrical Employers Registration Act, 1925, the object of which Act is to prevent persons of no substance from engaging companies and then abandoning them or failing to pay their salaries. All theatrical employers must hold a certificate of registration issued by the appropriate authority, which is the co. or bor. council or, for the metropolis, the common council. The Act does not apply to an employer or his agent having a licence under the Theatres Act, 1843, or a music and dancing licence; or to persons who employ for charitable performances, and not for gain or by way of business. By an amending Act of 1925 the registration authority can institute and prosecute proceedings against and oppose applications by persons whose certificates have been cancelled; and they can also refuse, cancel, or suspend the registration of a person who has been convicted of an offence involving dishonesty. Places licensed for music and dancing are exempt from the provisions of these two Acts. Restrictions are imposed by the Children and Young Persons Act, 1933 (re-enacting analogous provisions of the Education Act, 1921, and the Children (Employment Abroad) Act, 1913, respectively), on children taking part in entertainments, and on the taking of children or young persons out of the United Kingdom with a view to their singing, playing, performing, or being exhibited for profit. The proper course where it is proposed to put a child on the stage is to obtain the leave of a magistrate. In Scotland, where the fitness of a child for training is proved, the petty

sessional court will grant a licence allowing it to be trained for the stage, provided the court is satisfied that provision has been made to secure kind treatment. Dramatic and musical performances are protected by the Musical Performers' Protection Act, which prohibits unauthorised persons from making records (i.e. any mechanical contrivance for reproducing by sound) of any such performances; but it is a good defence to prove that the record was not made for purposes of trade. See also CENSORSHIP OF THE DRAMA; MUSIC AND DANCING LICENCES.

Thēbaine ($C_{10}H_{11}NO_2$), one of the alkaloids contained in opium in combination with meconic acid. It is very poisonous, causing severe convulsions. It gives a blood-red coloration with concentrated sulphuric acid.

Theban Legion, The, legion of the Emperor Maximian Herculeus, which consisted of Christians recruited in Upper Egypt. Traditionally the entire legion was massacred in 287 when its members refused to take part in the pagan sacrifices prepared by Maximian at Agaunum, Switzerland, before engaging in battle. The names of some of the legionaries are known. A basilica was built at Agaunum (St-Maurice-en-Valais) in the fourth century to enshrine the martyrs' relics. Some authorities question whether the whole legion was massacred. The feast of the T. L. is celebrated on Sept. 22.

Thebes: (Gk. *Θῆβαι*, Heb. *No-Ammon*). 1. Name of an anc. city of Upper Egypt, which was then known as Thebais. It survives to-day in the splendid array of ruins at Karnak and Luxor. T. was founded probably under the 1st Dynasty, and sprang into prominence in the 12th Dynasty. The city consisted of two main portions, separated by the Nile, each part extending from the bank of the riv. to the base of the hills which envelop the valley of the Nile. Its site is now marked by the tn. of Luxor and the vil. of Karnak on the E. side and by Gournou and Medinet-Habou on the W. Its most flourishing period appears to have been between 1600 and 1100 B.C., when it was the cap. of all Egypt, and a prin. seat of the worship of Ammon. The Gks. learned of its fame as early as the time of Homer, who describes T. with enthusiasm. Its circumference was estimated by Diodorus Siculus to be about 17 m. It was the residence for sev. centuries of Egyptian kings, whose tombs have since been discovered. During the reigns of the Ptolemies T. was neglected and Memphis became the cap. In 525 B.C. T. was partly burned by the Persians under Cambyses, and in 86 B.C. it was captured and plundered by the Gks. The buildings and sculptures still extant are among the most anc. and the best specimens of Egyptian art and architecture. Discoveries by archaeologists suggest that T. was a much more important city than had previously been thought. See W. M. Flinders Petrie, *St. Temples at Thebes*, 1896; J. Capart and M. de Werbrouck, *Thebes: la gloire d'un grand passé*, 1925; M. L.

Pillet, *Karnak and Louxor*, 1928; and H. E. Winlock, *Tomb of Queen Meryet-Amun at Thebes*, 1932. 2. Chief city of Boeotia in auct. Greece. Its position was well defended, since it was situated in the middle of a plain surrounded by mts. No city is more famous in the mythical ages of Greece than T. It was here that the

use of letters was introduced from Phoenicia; it was the traditional bp. of Dionysus and Hercules; it was the native city of Tiresias the soothsayer and of Amphion the musician. It was the scene of the tragic fate of Oedipus, and of the war of the 'Seven against Thebes.' Soon afterwards, the Argive or descendants of the seven, marched against T. to avenge their fathers' death, captured the city, and destroyed it. The first historical trace of the city is found in the conquest by the Boeotians about the year 1100 B.C. T. then became the chief city of a confederation. Later the city fought Athens, and later supported Persia against her invaders. She became the closest ally of the Spartans, and during the Peloponnesian war was Athens' bitterest foe. At

the close of the war, however, she allied with Athens against Sparta, but the city was conquered and garrisoned by the Spartans. After the battle of Leuctra (371 B.C.) for a short time she became, under Epaminondas, the most powerful state in Greece; but with the death of Epaminondas at the battle of Mantinea, 362, T. lost her newly won supremacy. She was defeated and captured by the Macedonians, and utterly destroyed by Alexander the Great (335 or 336 B.C.). The tn. was restored about 315 B.C. Pop. 6800.

Thecla, Saint, Gk. saint of the Christian Church, who lived in the first century. The *Acts of Paul and Thecla*, which was written in the second century and is often untrustworthy, describes her as a member of a noble family in Iconium, in Lycaonia, who was converted by the preaching of St. Paul. She is said to have followed him, dressed in boy's clothes, and to have suffered many cruel tortures for her faith. The prayer for the dying in the Rom. ritual stresses 'three most cruel torments.' St. T. is said to have died in Seleucia. Though the story seems to have a factual basis, it appears to have become much embellished. Her feast-day is on Sept. 23.

Theft. In most communities, auct. and modern, the institution of private property has occasioned the formulation of copious laws for the redress of violations by T. of the exclusive rights of ownership. But in an age of ungoverned violence, when legislators or law-givers had not as yet attained to the conception of the preservation of public order for its own sake, the legal code of an auct. state reflected a very different view of the moral aspect of stealing from the modern view, or even from that of the earliest Christianised communities. Maine asserts with a great show of probability that the auct. Rom. and Gk. codes had no real law of crimes at all, and that such penal laws as they do reveal are no more than the law of wrongs or torts (see TORT). The first civil wrong recognised by the Twelve Tables was that of *furtum* (T.), and even assaults and violent robbery were no more than *delicta* (torts). All such wrongs gave rise to an obligation or *vinculum juris*, the fulfilment of which was considered complete with the payment of money. T. is defined in the *Institutes of Justinian* as 'the fraudulent dealing (*contractatio rei fraudulosa*) with a thing itself, or with its use, or its possession; an act which is prohibited by natural law.' This definition affords some striking points of resemblance to most modern definitions of stealing (cf. that of larceny in Eng. law, under LARCENY). Though, whether by reason of the influence of Christian ideas or the attainment of a more subtle analysis of motive, the text of the *Institutes* continues: 'A person, however, who borrows a thing and applies it to a purpose other than that for which it was lent, only commits theft if he knows he is acting against the wishes of the owner . . . for there is no theft without the intention to commit theft.' In England the doctrine of the King's Peace was the foundation of T. as a public wrong; on the Continent it is to be traced to the

source of *Naturrecht* or Natural Law (see JURISPRUDENCE and *JUS GENTIUM*). The A.-S. laws of Ina, Athelstan, and others respecting the punishment of T. reveal a curious compromise between the Draconian severity of a pagan state and the mildness inculcated by the Christian missions from Rome; death was nominally the punishment in cases of T. where the value of the article taken exceeded 12d.; but in practice the thief could always compound his offence by a fine. Up to comparatively recent times, however, felonious T. remained a cap. offence (see CAPITAL PUNISHMENT). At the present time T. connotes a variety of cognate but distinct offences, varying from larceny (*q.v.*) to fraudulent breach of trust. See also BURGLARY; EMBEZZLEMENT; FRAUD; LARCENY.

Thegn, see THANE.

Theine, see CAFFEINE.

Theism, see DEISM.

Theiss (Hungarian Tisza), central European riv., which flows through the Ukraine, Hungary, and Yugoslavia. It rises in two head-streams on the slopes of the Carpathians, where it is known as the White T. and the Black T. It takes a winding course, generally in a W. or S.W. direction, to empty its waters into the Danube near Titel, after receiving the Szamos, Maros, Körös, Sajó, and Latorcza. Length 820 m.

Thellusson, Peter (1737-97), Brit. merchant, b. in Paris, son of the envoy of Geneva; he settled in London and became naturalised. He amassed a great fortune and his son, Peter Isaac, was created Baron Rendlesham (1806). His name is remembered for his eccentric will, the harsh provisions of which led to the passing of what is known as the Thellusson Act (1800). By his will T. directed the income of his property to be accumulated during the lives of all his children, grand- and great-grandchildren, who were living at the time of his death, for the benefit of some future descendants to be living at the decease of the survivor, thus keeping within the letter of the rule of perpetuities which allowed any number of existing lives to be taken as the period for an executory interest (see EXECUTOR). For the provisions of the Thellusson Act, see under ACCUMULATION. See also PERPETUITY.

Theme, in music, prin. melodic feature in a composition, differing from a subject by greater length and more self-contained completeness, a subject being usually susceptible to development, *e.g.* in a fugue or sonata-form work, whereas a T. may be said more often to undergo restatement or decorative elaboration, especially in varied form. Sets of variations are always based on a T.

Themis, in Gk. mythology, daughter of Uranus and Gea, and by Zeus the mother of Eunomia, Dike, and Eirene. She was the personification of law and order and presided over the oracle at Delphi before Apollo.

Themistius (c. A.D. 320-90), oriental philosopher and rhetorician, was a native of Paphlagonia. He settled in Constanti-

nople about 347, where he became a senator (355) and prefect (384). He wrote paraphrases of various works of Aristotle. The *editio princeps* is that of Aldus (Venice, 1534). See eds. of G. Diudorfio, 1832, L. Spengel, 1866, and E. Baret's *De Themistio Sophista*, 1853.

Themistocles (c. 524-459 B.C.), Athenian soldier and statesman. He was always ambitious, and began his career by setting himself in opposition to those who had most power, and especially to Aristides, to whose ostracism (483) he contributed. From this time he was the political leader in Athens. T. advocated naval expenditure to protect Athens from Persian invasion, and through his influence 100 new triremes were constructed and the port moved from Phaleron to Piræus. During 493-492, the years of his archonship, T. was supreme, and for the next ten years exercised almost unlimited power. It was T. who forced the naval engagement at Artemisium to take place. Seeing that the commander Eurýbiades was wavering and unwilling to fight, T. sent a message to Xerxes that unless he attacked at once the Gks. would make good their escape. The Persians, accordingly, blocked the W. exit of the bay with 200 ships, so that a battle was inevitable, and the glory of the battle of Salamis in which the greater part of the fleet of Xerxes was destroyed (483) fell to T. On the retirement of the Persians, he rebuilt the walls of Athens and strengthened the fortress and harbour of Piræus. He also removed the *μετοικισμός*, an alien's tax, and thus encouraged many foreign traders to settle in Athens. He appears to have gradually lost his influence with the Athenians soon after the Persian defeat, probably on account of his arrogant manners, and about 471 was accused of peculation (possibly justly), ostracised, and banished from Athens. He retired to Argos, and when accused of treason fled to Coreyra, and finally was welcomed by Artaxerxes. He settled in Magnesia, where he lived till his death. See lives by Plutarch and Cornelius Nepos, monograph by A. Bauer, 1881, and G. Grote, *History of Greece*, 1846.

Theobald (d. 1161 or 1162), Eng. prelate, studied law under Lanfranc at the abbey of Bec, Normandy. In 1138 he was nominated archbishop of Canterbury by Stephen. It was probably at his instigation that the pope refused to give his permission to T. to crown Stephen's son Eustace as king of England (1152). He was one of a select body of experienced Eng. advisers who were appointed by Henry II. soon after his coronation as justiciars.

Theobald, Visconti, see GREGORY (popes), Gregory X.

Theobalds Park, dist. in Hertfordshire, England, near Waltham Cross, 12 m. from London. Here Lord Burghley built a house which subsequently became the property of James I. who died there. It was pulled down about 1765 and another house was built. In 1888 the old Temple Bar of Fleet Street was re-erected here at one of the park entrances. In 1931 the house, which had been the property of the Meux family, was opened as a country club.

Theocracy (Gk. *θεοκρατία*, government by God), a term applied to the constitution of the Israelitish government as established by Moses, on account of its being under the direct control of Jehovah. This constitution underwent modification with the election of Saul as king, and with the subsequent choice of David, the king 'after God's own heart.' Israel became a theocratic monarchy: the king was considered as mediator between God and his people (II Sam. xxiv. 17). In the books of the Maccabees the concept of God's personal gov. is less apparent (see, however, I. Macc. iv. 20).

Theocritus, bucolic poet, was a native of Syracuse, and the son of Praxagoras and Philinna. He visited Alexandria during the latter end of the reign of Ptolemy Soter, where he received the instruction of Philotas and Asclepiades. His first poems, in 285 B.C., obtained for him the patronage of Ptolemy Philadelphus, in whose praise he wrote the 14th, 15th, and 17th Idylls. T. was the creator of bucolic poetry as a branch of Gk., and, through imitators such as Virgil, of Rom. literature. The bucolic idylls of T., 30 of which are extant, are of a dramatic and mimetic character, and are pictures of the ordinary life of the common people of Sicily. He also wrote epic poems. See J. A. Symonds, *The Greek Poets*, 1873; W. S. Landor, *Criticisms on Theocritus*, 1876, and P. E. Legrand, *Étude sur Theocritus*, 1898.

Theodicy (*θεος δίκη*), etymologically the justice of God. The present use of the term is due to Leibnitz who pub. in 1710 his *Essai de Theodicee sur la Conté de Dieu, la liberté de l'homme et l'origine du mal*, a defence of the justice of God and investigation of the problem of evil. T. is really a sub-division of Natural Theology (q.v.) as it follows logically from the treatise on the existence and nature of God.

Theodolite, most important of the instruments used in surveying, by which the measurement of angles, vertical, but especially horizontal, is performed. It consists of a telescope mounted so as to move on two graduated circles, one of which is horizontal, and the other vertical. The axes of the telescope pass through the centres of these two circles. The instrument is carefully adjusted on a pedestal which when in use stands upon a tripod stand. An elaborate arrangement of screws and plates enables the T. to be adjusted with great precision. Though the T. can measure both vertical and horizontal angles, the latter only can be measured with perfect accuracy. For the measurement of vertical angles a levelling instrument is more accurate. There are three main types of T.—the Everest, the Y-pattern, and the transit—but the differences between them do not essentially affect the construction. It is important to notice a change that has been made in graduating Ts. Until recently, Brit. Ts. were divided into degrees, of which 360 made the complete circle, but they are now frequently made with the Fr. centesimal graduation in which the circle is divided into 400 divs.

THEODOLITE.

The illustration shows one form of Theodolite resting on its levelling screws on a tripod.

A, object-glass and cap, B, upper plate or limb, C, supporting limbs of telescope, etc., G, body of telescope, and diaphragm; H, eyepiece; K, spiral level on telescope; M, microscope for vernier, N, levellers, V, levelling-screws, V¹ and W slow-motion clamping-screw.

Theodora (c. A.D. 508–548), wife of the Byzantine emperor Justinian, notorious before her marriage as an actress and dancer of ill-repute, was proclaimed empress in 527. She showed high courage in the Nika insurrection (532), and was an able counsellor in all matters of State. She succoured the poor, especially those of her own sex, and died at an early age, exhausted by the cares of State. Her character suffered no taint after her marriage, and indeed posterity might have known nothing derogatory to her but for the *Secret History* of Procopius, whose other writings extolled Justinian and his Empress. There is no hint of her profligacy in other writers. See A. Debidur, *L'impératrice Theodora: Étude critique*, 1885, which is a refutation of Procopius. T. is the subject of a play by Sardou, produced in Paris, 1884. See W. G. Holmes, *The Age of Justinian and Theodora*, 1912.

Theodore von Neuhoff, see NEUHOF, THEODOR VON.

Theodore of Abyssinia, see ABYSSINIA.

Theodore of Tarsus (St. Theodore) (c. 602–690), saint and archbishop, b. at Tarsus, Cilicia. He spent some time at Athens and became a monk at Rome. At the age of sixty-six he was appointed by Pope St. Vitalian to the see of Canterbury at

the suggestion of the African St. Adrian, who accompanied him to Eng., and acted as his adviser. T. has been rightly called the second founder of the see of Canterbury and the first primate of the Eng. church. He travelled extensively over the country, promoted learning, opened schools, consolidated or re-established dioceses, and held the first national council in 673 at Hertford. His activities involved him in disputes with St. Chad and St. Wilfrid on questions of jurisdiction, but these controversies were amicably settled. St. T. has a strong claim to be considered as a prominent figure in Eng. hist. See lives by O. Fritzsche (1847), H. B. Swete (1880-82), A. Mai (1832, 1854), and E. Sachau (1869). See also L. Patterson, *Theodore of Mopsuestia and Modern Thought*, 1926.

Theodoretus or Theodoret (c. 393-457), Syrian bishop and theologian. Trained by Theodore of Mopsuestia and St. John Chrysostom, he became a deacon in the church at Antioch and in 423 bishop of Cyrus. His efforts against the Marcionites were so successful that he claimed to have baptised 10,000 of these heretics. Having protested against the condemnation of Nestorius (see NESTORIANS) by the council of Ephesus (431) T. was deposed and compelled to retire to a monastery (449). But at the council of Chalcedon (451) he made his submission and was reinstated in his bishopric. T. was the author of a *History of the Church from 329 to 429*, *Φαλόσιος Ιστορία*; *Exanistes*, a dialogue against Eutychianism, *Ten Orations against the Heathen*, an *Apology for Christianity*; *A Concise History of Heresies*; besides 146 letters and commentaries on the O.T. and on the epistles of St. Paul.

Theodoric (or Theoderic) I., king of the Visigoths (A.D. 418-51), and son of Alaric. He succeeded Wallia, and warred against the Romans from 425-40, defeating them at Toulouse (439), soon afterwards concluding peace with them. Then, uniting with Aëtius, the Rom. general, against Attila the Hun (450), he fell in battle at Châlons-sur-Marne. **Theoderic II.**, his second son, became king of the Visigoths (452-66), after murdering the elder, Thorismund, and ruled over most of Spain and Gaul. He was assassinated by his brother Euric.

Theodoric the Great (A.D. 455-526), founder of the Ostrogothic monarchy in Italy, b. in Pannonia. As a child he was a hostage at Constantinople, and soon after his return to his father, Theudemir, attacked the king of the Sarmatians and captured Singidunum (Belgrade). Theudemir and his son now successfully invaded Mœsia and Macedonia, and on Theudemir's death (c. 474), T., after some raids against the emperor Zeno and a rival Gothic chieftain, set out to win Italy from Odoacer, whom he defeated at Verona. The conquest was delayed by treachery, and Ravenna, whither Odoacer had fled, was besieged. After its capitulation, T. violated the terms by slaying Odoacer (493). T.'s thirty-three years' reign was a period of peace and prosperity for Italy such as it had

not known for centuries. He maintained his traditional Arian creed, but was impartial in religious matters. His closing years were sullied with the judicial murders of Symmachus and Boethius. He figures in the Nibelungenlied, being known to the Gers. as Dietrich von Bern (Verona). See T. Hodgkin, *Theoderic the Goth*, 1891, 1923; E. Caspar, *Theoderich und das Papsttum*, 1931; M. Brión, *Theoderic, Roi des Ostrogoths*, 1936; G. Vetter, *Die Ostgoten und Theoderich*, 1938.

Theodosia, see EPHESIA.

Theodosius, Rom. general of the reign of Valentinian I. He fought against the barbarians of Britain and Germany (367), and crushed a Moorish insurrection in Africa (373). The reason of his execution at Carthage (376) is unknown. His son was the emperor Theodosius the Great.

Theodosius I., Flavius, the Great (c. 346-395), E. Rom. emperor, b. in Spain, son of Theodosius, the general of Valentinian I. He became emperor in 378 at the invitation of Gratian. T. warred successfully against the Goths, and by skilful diplomacy enlisted 40,000 of them as his allies (382). In 388 he defeated the usurper Maximus at Aquileia, and secured the W. throne for Valentinian II, brother of Gratian. After Valentinian's death (392) T. marched against another usurper, Eugenius, whom he defeated near the Frigidus (394), and became sole emperor. After a few months, however, he d. at Milan, and the empire was divided between his two sons, Honorius and Arcadius, the former ruling the W., the latter the E. T. was responsible in 390 for the famous massacre of the governor by the circus-mob. He did his utmost to countermand the order, but his messengers were too late; and St. Ambrose compelled him to do public penance before admitting him to the cathedral at Milan. See V. E. Ffichier, *Histoire de Théodose le Grand*, 1679; T. Hodgkin, *Dynasty of Theodosius*, 1889; E. Stein, *Geschichte des spätromischen Reiches* (vol. I.), 1928.

Theodosius II. (401-50), grandson of T. the Great, and son of Arcadius, succeeding him as emperor of the E. (408). His sister, Pulcheria and his empress, Eudocia, and the praetorian prefect, Anthemius, ruled during his minority. Wars with the Persians (421-41) and the Huns under Attila (441-48) were among the chief events of his reign. *The Codes* (Constitutions in 16 books, was pub. in 438. See F. D. Gerlach, *De Theodosio Juniore*, 1751; A. Gildemeier, *Geschichte des oströmischen Reiches unter Arkadius und Theodosius II.*, 1885; T. Mommsen and P. M. Meyer, *Theodosian Libri XVI.*, 1904-05; E. Stein, *Geschichte des spätromischen Reiches*, vol. 2, 1928.

Theognis of Megara (b. c. 540 B.C.), Gk. elegiac and gnomic poet, was by birth a noble. He was deprived of all his property and shared the exile of the oligarchical party. The greater part of his poems were composed during his period of exile. He is the best preserved of the G. elegists, and owes his fame chiefly to his 'maxims.' There is an ed. of his works by H. Williams, 1910.

Theogony (Gk. *θεός*, god; *γονός*, seed), genealogy of the gods. Many early Gk. poets wrote verse theogonies, of which only one, that of Hesiod, is extant.

Theology (Gk. *θεός*, god, *λογία*, science), science of religion, dealing therefore with God, and man in his relations to God. The term may be still further restricted to mean systematic T., in which dep. it deals with the specific doctrines, principles, and characteristics of Christianity alone. T. is treated under two main heads, Natural and Revealed T., and until the last century it was usual to keep the two subjects strictly apart. Various causes, chief of which is the application of the theory of evolution to religion and T., have led to the rise of a Broad or Modernist school of thought. This seeks to do away with hard and fast divisions, and in T., as elsewhere, strives to minimise the importance or deny the existence of critical points in the world's hist., and to trace instead an orderly development. It is evident that without an entire break with historic Christianity, no such change can take place with regard to dogmatic T., and modernist T. has not shrunk from a somewhat drastic restatement.

There is a very close affinity between T. and philosophy. While philosophy seeks the ultimate reality underlying phenomena, T. seeks the knowledge of God in Himself, and in the light of that knowledge the creature's relation to Him. It may at first appear so much a question of faith that investigation of it along the lines of reason must be beset with difficulty. But while philosophers claim that religion is in no way opposed to reason and that the study of faith as a human experience lies within the limits of legitimate knowledge, theologians apply themselves to the doctrinal content of such faith. According to Hegel, a leader of the rational school, religious knowledge is composed of doctrines based first upon the dictates of reason through actual experience, and then by deduction after examination of such experience.

In contrast to all this, Catholic T. of all ages takes its stand upon a divine revelation from without the human mind. Rationalists are also attacked by the philosophers who form the empirical school, not in protest against their attempt to compass understanding of God with human understanding, but rather because they allow the possibility of other systems of deistic beings. Both Locke and Butler are of this school. They base their T. upon human experience as the source of revelation of God's will, and they deny the possibility of there being any soul other than God's, of which the human soul is a part. The dogmatists, who form what may be termed the parent body of the theologians, accept without question the fact of God's existence. Every act of man which leads him towards God is regarded not as upon man's initiative, but upon God's. And God by such acts of man is expressing this Divine Will in a progressive process of revelation to him. Dogmatists are therefore metaphysical,

and this is particularly noticeable in their presentation of the theory of Christ and His Incarnation. Many hold that Christ's divinity is certain: the Alexandrian School did so from a Platonic standpoint. The Antiochene School, however, while professing Christ's divinity, sought to discard the allegorical interpretation of the scriptures, and approached the subject from an empirical direction. Of the two schools, that of Alexandria has proved the more popular throughout hist. The question of Christ's divinity and His identification in the Trinity is the subject of discussion even to-day outside the Rom. Catholic and Orthodox Churches. Unitarians disregard His divinity, indeed, deny it, seeking thus to dispose of the difficulty, but among early Trinitarians were differences of opinion as to whether Christ is God in another manifestation, or a part of Him as a divine emissary.

The study of T. begins with exegesis, the submission of the Scriptures to the Lower and Higher Criticism, and from this follows *historical T.*, the study of Christian doctrine as it has manifested itself in the hist. of the Church from the formative or Patristic period to the present day. The study of the nature of God (as distinct from doctrine) is known as *systematic T.*, and the philosophy of religion, with which Natural T. (*q.v.*) is now identified, concerns itself with this branch of study. It includes the study of the idea of God, the freedom of God, and the operation of Grace, and finally the nature of immortality, which is the subject, as a separate study, of eschatology (*q.v.*). The philosophy of religion, which embraces comparative religion and the psychology of religion came into being in its modern scientific forms only since the Renaissance. It divided into two main streams—the traditional, founded on revelation as it exists in the Scriptures, and the empirical, which, while also recognising the scriptures as the source of doctrine, argues the existence of God from the nature of man. In the nineteenth century mainly through the influence of Hegel and in the work of Schleiermacher (*q.v.*) and Otto, this more subjective view of T. held sway. In more recent times there has been a marked swing away from the importance attached to the religious experience of man and a return to the importance of revelation in the Word of God. This movement is associated particularly with the work of Karl Barth and Emil Brunner, and was clearly seen in the Oecumenical Council of Churches at Amsterdam in 1948. See also BIBLE; FAITH; RELIGION. See H. R. Mackintosh, *Types of Modern Theology*, 1937; K. E. Kirk (ed.), *The Study of Theology*, 1939; C. Van Til, *New Modernism*, 1946; E. Brunner, *Christianity and Civilization*, 1947; W. R. Matthews, *God in Christian Thought and Experience* (7th ed.) 1947; A. Vidler, *The Theology of F. D. Maurice*, 1949; and C. Dawson, *Religion and Culture*, 1949.

Theophrastus (c. 372-287 B.C.), Gk. philosopher and naturalist, b. at Eresos in Lesbos. He was the pupil of Plato and

Aristotle in Athens, and on the death of the latter became head of the Peripatetic school, which drew large numbers of pupils from all parts. He was a close follower of the Aristotelian philosophy, giving his attention especially to natural history (e.g., fire, winds, and weather signs), and to botany. His chief works include treatises on politics, legislators, laws, metaphysics, the senses and imagination, oratory, poetry, and plants. His *Ethical Characters* are depictions of moral types, and were the model for later character writers. He is the reputed author of over 220 works, and, as the successor of Aristotle, was for long a supreme authority; but his writings are in great part lost. Eng. trans. by R. C. Jebb was pub. in 1870. The Oxford Classical Text of the *Characters*, ed. by H. Diels, was pub. in 1910. The text and trans. (by Sir A. F. Hort) of *The Enquiry into Plants* is in the Loeb Library. See J. M. Bochénski, *La logique de Théophrastus*, 1947.

Theorbo, obsolete instrument of the lute type, actually a kind of bass lute of large size with a double neck on which only the upper strings are stretched over a finger-board, the bass strings being at the side of it and not capable of producing different notes, except by retuning.

Theorem (Gk. θεωρημα, something to be looked at or seen), in mathematics, any proposition which states its conclusion, or makes some affirmation or negation requiring proof, whereas a problem states something which is to be done.

Theory, properly speaking, the mode of making seen and known the dependence of truths upon one another, or a supposition explaining something, especially one based on principles independent of phenomena to be explained. T. is popularly opposed on the one hand to fact and on the other to practice—the opposition is not essentially valid, and arises from the imperfection of Ts which cannot be reconciled with the data of experience certain or assumed. The distinction between theoretical and practical labourers in the field of science or art is not strictly a just one, for there is no theorist whose knowledge is based wholly on T., and there is no practical man whose skill is all derived from experience.

Theosophy (Gk. θεός god, σοφία wisdom) dates from a very high antiquity, coming down to us from the Neoplatonists, Plotinus, Iamblichus, and Proclus. It may be defined as a syncretistic attempt at a higher knowledge or more immediate approach to God than is offered to the ordinary believer by revealed religion, or by reason.

It is based on intuition. Numbered among theosophists also are Paracelsus, Boehme, and the Rosicrucians. In the E. also T. is of very ant. origin, the Sanskrit equivalent being *Brahma-Vidyā*, or divine knowledge. It is closely allied to mysticism, and involves a belief in one absolute, incomprehensible, and supreme deity who is the root of all nature, and

of all that is visible and invisible, a belief in man's eternal nature, which, being a radiation of the universal soul, is of an identical essence with it, and a belief that by returning to the purity of nature one can gain certain occult powers. Helena Petrovna Blavatsky (q.v.) (1831–91), a Russian princess, who it is claimed was initiated in Tibet, is the recognised founder of the two great branches of to-day. T. is supposed to be preserved by initiates scattered over the world who have attained spiritual perfection, but elect to watch over religion which they hope to unify under one system of ethics. A group of these Arhats, Mahātmās, or Masters, it is said, led Helena Blavatsky to found the Theosophical Society in 1875. Its teachings in general may be said to be founded on the two great principles of 'Karm'—which in Christian terminology would mean 'Whatsoever a man sows that shall he also reap'—and Reincarnation (q.v.), or the belief that man must undergo a series of lives until he has assimilated all the soul experiences and can attain to Nirvāna (q.v.). The terminology and the thoughts seem to the Westerner to be Buddhistic, but it is claimed that T. is not Buddhism (q.v.). After Helena Blavatsky died, W. G. Judge, of America, became the leader, and upon his death the society split into two sections, one following Mrs. Katherine Tingley, and the other Mrs. Annie Besant. See Helena Blavatsky, *Isis Unveiled*, 1877, *The Secret Doctrine*, 1888, and *The Key to Theosophy*, 1889; Annie Besant, *Theosophy and the New Psychology*, 1904. See also KRISHNAMURTI.

The secret powers claimed by Mme. Blavatsky were rejected by the London Society for Psychical Research. See E. Garrett, *Isis very much unveiled*, 1884, and F. Podmore, *Studies in Psychical Research*, 1895.

Theotocopuli, Domenico, called **El Greco** (c. 1545–1614), Greco-Spanish painter, b. at Phodele, near Candia, Crete. He studied in Venice under Titian. He was in Rome 1570–c. 1576, when he migrated to Toledo. In that city, where he lived the rest of his life, he painted for the cathedral the picture 'El Espolio' (the Stripping of Christ) (1579). His masterpiece, 'The Burial of Count Orgaz,' was painted, probably in 1587, for the church of S. Tomé, Toledo. T. was also an architect and sculptor. His stormy and mystical paintings, especially his religious works, with their foreshortened or strangely elongated figures, vehemently express his spiritual intentions. He reduced his palette to five colours, yet believed that colour was more important than design and used those few pigments to intense dramatic effect. Many of his portrait works are in the Prado, Madrid. He is represented in the National Gallery, London, by two early works and a much-restored replica of his 'Christ on the Mount of Olives.' There are better examples of his art in America. See Manuel B. Cossio's various works on T., especially *El Greco*, 1908, and studies by A. F. Calvert and C. G. Hartley, 1909;

A. Meyer, 1911; M. Barrès, 1911 and 1912; H. Kehrer, 1914; Elizabeth du Gue Trapier, 1925; F. Rutter, 1930; M. Legendre and A. Hartmann, 1937; L. Goldschneider, 1938. See also SPANISH ART.

Thera, Thira, or Santorin, Gk. is in the Aegean Sea, the most southerly of the Sporades group, and lying about 60 m. N. of Crete. Its steep shores vary in height from 500 to 1200 ft. The entire N. half is composed of volcanic material, and from the earliest times the is. has been a centre of volcanic agency. The coastline is some 30 m. long, and opposite the inner or W. curve lies the smaller is. of Therasia. Both T. and Therasia have yielded interesting archaeological discoveries in the form of prehistoric dwellings, with antique vases and carefully-worked stone instruments. According to Herodotus, Cadmus estab. a Phœnician colony in T. The tns. of the is. are built along the edge of the cliffs, which are striking for their black lava tufa and other volcanic strata, much of which is deep red in colour. The largest tn. is Thera (pronounced Phera), the houses of which have their foundations in the tufa. The is. produces some cereals such as barley, as well as figs, dried grapes, etc.

Therapeutics, Therapeusis, or Therapy, that branch of the science of medicine which deals with the cure of disease, the relief of certain symptoms, or the prevention of their occurrence, by various agencies. Remedial agencies are divided into classes, according to general similarity of treatment, e.g. aerotherapeutics (q.v.), balneotherapeutics (q.v.), occupational electro-therapeutics, occupational therapy (q.v.), psychic therapeutics or hypnosis, physiotherapy (q.v.), serum therapeutics (q.v.), vaccine therapeutics (q.v.), hydrotherapeutics or hydropathy (q.v.), thermotherapeutics (by the use of drugs), etc.

Therapnæ, tn. in Laconia, on the Eurotas, near Sparta, celebrated in Gk. mythology as the bp. of Castor and Pollux. Menelaus and Helen were said to be buried here.

Theresa, St., see TERESA.

Therezina, see TERESINA.

Therm, statutory unit of heat, on the basis of which coal-gas is bought and sold. It is equal to 100,000 Brit. Thermal Units (B.Th.U.), and the latter unit is defined as the amount of heat required to raise 1 lb. of water through 1° F. (from 60° to 61° F.), and equals 251.9 calories (q.v.).

Thermæ, huge buildings which were erected by the Rom. emperors, which comprised not only baths of various kinds, but often also libraries, gymnasia, theatres, etc. The apartment provided for undressing was the *apodyterium*; the *alipterium* or *unctuarium* was a room for anointing, etc.; in the *frigidarium* was a cold bath, and in the *calidarium* warm baths. The *tepidarium* was a warm room, with no bath, in which the bather usually spent some time before undressing. T. were built by Agrippa (21 B.C.) and by the emperors Nero (A.D. 65), Titus (81), Domitian (95), etc.

Thermal Unit, see CALORIE; ELECTRICITY; HEAT.

Thermidor (from Gk. θερμη heat, and δωρον gift), month in the Fr. Republican calendar, introduced at the time of the Revolution. It extended from July 19 to Aug. 18, and became the eleventh month in the new calendar.

Thermionics and Thermionic Valve. T. is the branch of science that deals with the emission of electrons from matter under the influence of heat. Following the discovery of the electron by J. J. Thomson in the closing years of the nineteenth century, O. W. Richardson discovered the law connecting the emission of electrons from a body with its temp. This emission is really an evaporation of electrons from the body, and the rate of the evaporation is a function of the temp. of the body; the higher the temp. the greater the rate of evaporation. The evaporation depends on the nature of the surrounding gas, but Richardson found that in a highly evacuated atmosphere the formula $n = A\sqrt{T}e^{-b/T}$ is a fairly accurate representation of the phenomenon: n is the number of electrons emitted per sq. cm. of the surface of the body per sec., T its absolute temp., b a constant, and A a constant, typical of the body. Further investigation by Langmuir led to the discovery that the evaporated electrons form a 'cloud' surrounding the heated body, and that ultimately equilibrium is estab. between the rate of evaporation and the rate of condensation, i.e. the return of the electrons under the electrical repulsion of the electron cloud or 'space-charge.'

The application of the results of Richardson's and Langmuir's researches led to the discovery and subsequent development of modern wireless technique, which depends for its success on the thermionic valve. (See further under VALVES.)

Thermit, or Thermit, mixture of finely powdered aluminium and oxide of iron ('hammer scale,' Fe_2O_3), the heat of combustion of which produces a temp. of about 2600° C. It was invented by Vauten of London and utilised for welding by H. Goldschmidt of Essen. (See under WELDING). T. is used in incendiary bombs.

Thermochemistry, science founded on the law of the conservation of energy, which deals with the thermal effects accompanying chemical actions. Reactions in which heat is evolved are called 'exothermic,' and where heat is absorbed they are termed 'endothermic.' Measurements of the heat of formation of substances, the heat of solution, of combustion, and of the neutralisation of acids and bases, have been determined; also the heat of hydration, the heat of combustion, the heat of ionisation, the heat of dilution, etc. The heat of formation of a compound is measured by the number of units of heat expended during the formation of one gram molecular weight of it from its element. Heat of decomposition is the same as heat of formation, but with the sign reversed.

The amount of heat liberated in chemical reaction is determined by allowing it to warm a known quantity of liquid (generally water) whose specific heat is known, and measuring the rise of temp. by means of an accurate thermometer. The water calorimeter generally employed for this purpose consists of an inner platinum vessel surrounded by water contained in an outer vessel of silver, which is protected by poorly conducting material so as to diminish the loss of heat by radiation. The reacting substances, either in the pure state or in solution, are brought to the same temperature and introduced into the inner vessel. The temp. of the water is taken before and after the reaction, and from the rise of temp., the quantity of water present, and its specific heat (and knowing the water equivalent of the calorimeter) the amount of heat liberated is determined. In order that a reaction may be studied thermochemically it must take place at ordinary temps. and must proceed rapidly to the end. Many reactions which do not fulfil these conditions, such as many processes of combustion, can be made to fulfil them. This is done by causing the substance to be burnt, in the presence of oxygen under increased pressure, in a steel bomb lined with platinum or enamel. Only in a comparatively few cases has it been possible to make direct determinations of the heat value of chemical changes. Thermal values which cannot be determined directly can be calculated indirectly by methods depending on the fundamental principle of thermochemistry which was propounded by Hess (1840). This principle, known as the 'constancy of the heat sum,' may be stated thus: 'The heat evolved in a chemical process is the same whether it takes place in one or in several stages.' The heat change, therefore, is dependent only on the initial and final stages of the reaction or system of reaction. Thus the heat of formation of methane cannot be determined directly, but a value may be arrived at by subtracting the heat evolved when methane is burnt from that evolved when the corresponding weights of free carbon and hydrogen are burnt. The unit of heat used in thermochemical measurements is the caloric, or the quantity of heat which is required to raise the temp. of 1 gram of water from 0° to 1° C. The results of measurements are expressed by symbols, which mean gram-atomic, or, in the case of compounds, gram-molecular weights of the substances which react. Thus $\text{H}_2 + \text{O} = \text{H}_2\text{O} + 68360$ calories means that 68,360 calories of heat are liberated when 2 grams of hydrogen and 16 grams of oxygen unite at ordinary temp. to form 18 grams of water. If the reacting substances are in solution, the presence of a large quantity of water is denoted by the symbol 'aq'—thus: $\text{KOH}_{\text{aq}} + \text{HCl}_{\text{aq}} = \text{KCl}_{\text{aq}} + 13,700$ calories. Other units of heat used are 100 gram-calories (K) and 1000 gram-calories (Cal.). As well as being of theoretical importance, T. has been found of great value in determining the heating power of fuels for com-

mercial purposes and calorific values of foodstuffs.

Thermodynamics. At the beginning of the nineteenth century the caloric theory of heat was accepted by scientists generally. According to this theory, heat is a fluid called the caloric that occupies the interstices between the particles of a body. The sum total of the caloric in the universe is constant, and it can neither be created nor destroyed. When a body is heated in a flame, caloric passes from the flame into the body, and the exchange increases the temperature of the body and decreases that of the flame. As the weight of a body does not increase when it is heated without chemical changes taking place, it was evident that the caloric was a weightless fluid. In order to explain the fact that different substances have different specific heats (*q.v.*), it was supposed that they possessed different affinities for the heat fluid. A change of state such as from ice to water without an accompanying rise of temp. was accounted for on the supposition that there was more room between the particles of water for the caloric, and that a given weight of water therefore contained more caloric than an equal weight of ice. The theory had its uses, and it is interesting to note that the theory of the caloric is implicitly used to-day in the earliest stages of instruction in physics. Two semi-quantitative experiments troubled the supporters of the caloric theory at the end of the eighteenth century. The first was performed by Rumford (*q.v.*) in 1798. A quantity of water was placed in a crude calorimeter of gun-metal, and a blunt steel borer pressing on its base was caused to rotate rapidly by means of horse power: eventually the water boiled, and Rumford demanded to know where the caloric had come from. The calorists gave the unsatisfactory explanation that a small quantity of the gun-metal had been broken up by the borer into fine powder and the caloric had escaped into the water. In the following year Davy (*q.v.*) caused two pieces of ice to be placed in the exhausted receiver of an air-pump arranged so that one piece of ice was fixed while the other was driven to and fro over its surface by means of a clockwork arrangement. Liquefaction was found to take place, and Davy confronted the calorists with the same serious problem of explaining the source of the caloric required to change the ice into water. Rumford and, to a lesser degree, Davy were convinced that the caloric theory had broken down and that 'heat is motion.' Nevertheless the caloric theory held its ground until the researches of Mayer and Joule definitely estab. its falsity in 1849.

The First Law of Thermodynamics.—Joule's experiment was essentially as follows. A special calorimeter was fitted with fixed lateral vanes between which other vanes attached to a vertical spindle could rotate. Round a pulley mounted on this spindle a double cord was wound, to pass from there over two pulleys to lead weights hanging freely. The weights descended, and the water inside the calori-

meter was churned, and was thereby heated. By a series of careful measurements Joule discovered that the amount of heat produced was always directly proportional to the mechanical work done in rotating the spindle. Furthermore, the constant of proportionality was always the same. The quantitative result of his experiments was that 772 foot-pounds of work expended produce 1 Brit. Thermal Unit of heat (i.e. the quantity required to raise the temperature of 1 lb. of water 1° F.). Joule's quantitative researches confirmed Mayer's qualitative speculations that heat is a form of Energy. In 1847 Helmholtz read a paper to the Physical Society of Berlin, *Ueber die Erhaltung der Kraft* (On the Conservation of Force) and he is regarded as one of the founders of the law of the Conservation of Energy which was propounded the same year by Joule in a lecture in Manchester, in which he gave 'the first full and clear exposition of the universal conservation of that principle now called energy.' His ideas met with a hostile reception, not only in Manchester, but also from the Brit. Association itself at its meeting in Oxford that year.

Fortunately the attempt made to stifle the discussion of the paper by the illustrious chairman was frustrated by the enthusiasm of a young man in the audience. Wm. Thomson, afterwards Lord Kelvin (*q.v.*), and from that date the real importance of the principle began to be realised. Expressed in simple terms, the First Law of T. states that work and heat are equivalent. It is an excellent example of a physical law, viz. a law that is based on physical measurements and claims to be a law only in so far as it is justified by those measurements. Refined experiments, notably by Callendar and Barnes, and by Reynolds and Moody, have confirmed Joule's conclusions, and the accepted quantitative relation between heat and work is 1 calorie = 4.186×10^7 ergs or 4.186 joules. Expressed mathematically the law is written $W = H$, where both are expressed in the same units. A conservative preference for retaining the original units leads to the usual expression $W = 4.186 \times 10^7 H$, where W is measured in ergs and H in calories. The First Law of T. is a *sine qua non* of the Kinetic Theory of Matter that regards heat as the kinetic and potential energy of the molecules of a substance. Further, its importance in leading to the recognition that Heat, Light, Electricity, and Sound are all forms of energy cannot be too strongly emphasised.

T., however, had its origin in an attempt by Carnot 'to determine mathematically how much work can be gotten out of a steam-engine.' Carnot's researches were published in 1824, when he still held to the caloric theory. His theories were subsequently modified by Wm. Thomson to accord with the dynamical theory of heat as expressed in the First Law of T. Carnot began by considering an ideal heat engine, performing in a manner that enabled him to deduce the relation between the work done by the engine and

the heat taken in from the furnace. A modern statement of his principles is as follows: Carnot's engine, Fig. 1, is a cylinder C fitted with a frictionless and air-tight piston D . The piston and the

FIG. 1

sides of the cylinder are supposed to be perfect non-conductors of heat, while the base is a perfect conductor of heat. The cylinder C can be placed either on a non-conducting slab E or in contact with the source of heat A at temp. t_1° or with the 'refrigerator,' or, as we should say, condenser, B at temp. t_2° . The cylinder may contain air or any other working substance under pressure. Fig. 2 is the Watt's indicator diagram of the Carnot cycle of operations performed by the engine. The cycle consists of parts of two isothermals AB, CD , corresponding to the temps. t_1°, t_2° , and parts of two adiabatics AD, BC . The four stages corresponding to the parts AB, BC, CD, DA of a complete cycle are as follows: (i) The cylinder is placed in contact with the hot source t_1° and the piston is allowed to rise slowly so that while the working substance expands it takes up heat from the source, so that its temp. remains constant at t_1° . This isothermal expansion is represented by AB on the indicator diagram. (ii) The cylinder is now placed on the non-conducting slab E and the piston is allowed to rise still further. The expansion is adiabatic, i.e. no heat is communicated to or abstracted from the working substance during this expansion, in which the temp. falls from t_1° to t_2° ; the expansion is represented by BC on the indicator diagram. (iii) The cylinder is now placed in contact with the condenser t_2° and the piston is slowly driven inwards, so that while the working substance is compressed it gives up heat to the condenser and its temp. remains constant at t_2° . The isothermal compression is represented by CD in the indicator diagram. (iv) The final stage is an adiabatic compression. The cylinder is placed on the non-conducting slab, and compressed so that its temp. rises from t_2° to t_1° . The adiabatic compression is represented by DA in the indicator diagram.

The cycle of operations is now complete. We can deduce the efficiency of this engine in the following way. Let Q_1 be the heat absorbed by the working substance while

in contact with the hot source during the isothermal expansion; let Q_1 be the heat rejected by the working substance to the condenser during the isothermal compression. The mechanical work done by the engine during one complete cycle is then represented by the area $ABNLA + BCPNB - DCPMD - ADMLA =$

FIG. 2

area $ABCD$. By the First Law of T. this work W = net heat converted into work. Hence $W = Q_1 - Q_2$, since no heat is transferred to or from the substance during the adiabatic changes. The efficiency of an engine being defined as the ratio of the mechanical work done to the heat taken in at the source, the efficiency of the Carnot engine is $\frac{W}{Q_1}$ or $\frac{Q_1 - Q_2}{Q_1}$.

Reversible Engines.—Carnot's engine is an ideal one, but it gives us a start in the development of the subject of T. A reversible engine is not merely one that will work in the reverse direction, reverse in the sense that the cycle is performed backwards and work is converted into heat, but one that works backwards so that at each stage of the process the heat taken up (or rejected) is exactly equal to the heat rejected (or taken up) in the forward process. Furthermore, the work done by the engine in the reversed process must be exactly equal to the work done by the engine at the corresponding stage of the forward process. The conditions for reversibility in this sense include (i) complete absence of frictional forces causing a dissipation of mechanical work; (ii) that no conduction of heat shall take place; (iii) that pressure differences between the working substance and the external atmosphere shall always be so small that 'free' expansion does not take place at any stage. It is clear that no real engine is reversible. Nevertheless, in accordance with the usual practice of discussing the mathematical physics of ideal processes in order to develop the underlying theory of engineering processes, the study of reversible engines leads to valuable results. Carnot's engine is a reversible engine, and from a study of its performance we are led to the conclusion known as Carnot's

Principle, viz. no heat engine working between two given temps. as source and condenser respectively can be more efficient than a reversible one. The formal proof of this principle depends on *The Second Law of T.* Two equivalent statements of this law are as follows: *It is impossible for a self-acting machine, unaided by any external agency, to convey heat from one body to another at a higher temperature (Clausius).* In other words, heat cannot of itself pass from one body to a hotter body. Kelvin's statement of this law reads: *It is impossible by means of unaided material agency to derive mechanical effect by cooling a body below the temperature of the coldest of the surrounding bodies.* In other words, work cannot be obtained by using up the heat of the coldest body of a system.

The Second Law applies only to complete cyclical processes; there is no direct proof of this law. Our confidence in it depends on the fact that it accords with our practical experience, and no objection to it has yet been upheld. The meaning of the law may be realised from the approximate statement that an engine must work by drawing heat from a furnace and rejecting heat to a condenser. If the condenser is at the same temp. as the furnace, the engine will not work; further, the engine will not work by using up the heat of the condenser and rejecting heat to the furnace.

Proof of Carnot's Principle.—Let A be a reversible engine, and let B be an engine working between the same source and condenser as A . Then it follows that the efficiency of B cannot be greater than that of A . For suppose it is; let the two engines be coupled together so that B working forwards drives A working backwards, and let B take up a quantity of heat Q from the source, while the amount of working substance in engine A is adjusted so that it delivers Q to the source when working backwards. If B rejects a quantity of heat Q_B to the condenser while A takes up a quantity of heat Q_A from it, then the efficiency of B is $\frac{Q - Q_B}{Q}$, while that of A is $\frac{Q - Q_A}{Q}$.

Since the former is supposed to be greater than the latter

$$\frac{Q - Q_B}{Q} > \frac{Q - Q_A}{Q}$$

The work done by B is $Q - Q_B$; that done by A is $Q - Q_A$. Hence the compound engine can do an amount $Q_A - Q_B$ of work in an external system. Now the net loss of heat from the source is zero, while the net loss of heat from the condenser is $Q_A - Q_B$. Hence this compound engine does work by using up the heat of the condenser. This violates the Second Law of T. Hence $\frac{Q - Q_B}{Q}$ cannot be greater

than $\frac{Q - Q_A}{Q}$, i.e. no engine can be more efficient than the reversible one working between the same source and condenser. Similarly it may be proved of all reversible engines working between the same source and condenser. It is interesting to note

that the most efficient heat engines, the steam turbines, actually used to-day have an efficiency of about 33 per cent, and the efficiency of Diesel engines may be as high as 38 per cent.

The whole science of T. is based on the two laws already stated. From this point, however, the science develops along two main lines: (i) its applications to heat engines, (ii) to pure T., a powerful method of analysis in deriving a variety of important physical and chemical results. The theory of heat engines derives much from the theory of pure T.

Kelvin's Absolute Scale of Temperature.—The definition of a scale of temp. is given under THERMOMETER. Kelvin's absolute scale of temp. is independent of the properties of any thermometric substance and it is absolute in this sense. It is derived as follows: Let Q_1 be the heat taken in at temperature t_1 by a reversible engine, and let Q_2 be the heat it rejects to the condenser at temperature t_2 . Then its efficiency is $\frac{Q_1 - Q_2}{Q_1}$ and by Carnot's

Principle this is the efficiency of all reversible engines working between the source and condenser. Hence $\frac{Q_1 - Q_2}{Q_1}$ or

$(1 - \frac{Q_2}{Q_1})$ depends only on t_1 and t_2 , or mathematically, $\frac{Q_1}{Q_2} = f(t_1, t_2)$ where f is

some unknown function. Suppose we have two reversible engines, one working between t_1 and t_2 and the other between t_2 and t_3 , adjusted so that the first absorbs Q_1 from the source and rejects Q_2 to the condenser, while the second absorbs Q_2 from its source and rejects Q_3 to its condenser.

Then $\frac{Q_1}{Q_2} = f(t_1, t_2)$ and $\frac{Q_2}{Q_3} = f(t_2, t_3)$. If these engines are coupled together they will act as a compound reversible engine absorbing Q_1 at the source t_1 and rejecting Q_3 to the condenser at t_3 .

Hence $\frac{Q_1}{Q_3} = f(t_1, t_3)$. But $\frac{Q_1}{Q_3} = \frac{Q_1}{Q_2} \cdot \frac{Q_2}{Q_3}$. Hence $f(t_1, t_3) = f(t_1, t_2) \cdot f(t_2, t_3)$.

$\therefore f(t_1, t_2) = \frac{f(t_1, t_3)}{f(t_2, t_3)}$. Suppose, now, t_3 is some standard temp. while t_1 and t_2 are variable. Then $f(t_1, t_3)$ may be written as $\phi(t_1)$, where ϕ is some different function, and $f(t_2, t_3) = \phi(t_2)$.

Hence $f(t_1, t_2) = \frac{\phi(t_1)}{\phi(t_2)}$ and therefore $\frac{Q_1}{Q_2} = \frac{\phi(t_1)}{\phi(t_2)}$.

Kelvin therefore adopted a scale of temp. on which $\phi(t_3) = T_3$; $\phi(t_2) = T_2$. Hence $\frac{Q_1}{Q_2} = \frac{T_1}{T_2}$. In other words, on the

Kelvin scale of temp. the ratio of two temps. is defined as the ratio of the heat absorbed at the source to the heat rejected to the condenser by a reversible engine working between those two temps. In view of Carnot's Principle the ratio $\frac{T_1}{T_2}$ is the same whatever be the working sub-

stance in the engine, i.e. this scale is independent of the peculiar properties of any thermometric substance, and it is therefore absolute.

A T. thermometer consists of a series of reversible engines each doing the same amount of work W in a cycle. The first takes in Q_1 at temp. T_1 and rejects Q_2 at temp. T_2 ; the second takes in Q_2 at temp. T_2 and rejects Q_3 at temp. T_3 ; etc.

But $W = Q_1 - Q_2 = Q_2 - Q_3 = \dots$ etc., and from above, $\frac{Q_1}{T_1} = \frac{Q_2}{T_2} = \frac{Q_3}{T_3} = \dots$ etc.

$\therefore T_1 - T_2 = T_2 - T_3 = \dots$ etc. Thus equal intervals of temp. are indicated on the absolute scale of temp. When we reach the temp. 0° on this scale the above equations show that the heat rejected to the condenser is zero, i.e. the condenser at that temp. cannot give up any heat to an engine using it as source. This is therefore the lowest possible temp., and the zero of the absolute scale of temp. is the absolute zero of temp. The Kelvin scale is, of course, an ideal scale, but the scale of a perfect gas thermometer can be shown to coincide with its indications. Now although there is no gas that is perfect, it is possible to reduce the readings of a gas thermometer such as the hydrogen thermometer, to those of the ideal perfect gas thermometer. Hence all thermometer readings can be referred to the absolute scale of temp., thus avoiding the idiosyncrasies of the different thermometric substances.

Entropy.—If a substance undergoing a reversible change takes in a quantity of heat dQ at temp. T , $\frac{dQ}{T}$ is called the increase of entropy of the substance. All natural processes are irreversible, and it can be shown that there is always an increase of entropy in such processes. Increase of entropy is accompanied by a loss of available energy in a system. Hence it follows that the processes of radiation, convection, conduction, etc., that involve an increase of entropy of the material universe also involve a loss of available energy in the universe. The entropy of the universe tends to a maximum that will be reached when all temp. differences have disappeared. The available energy in the universe will then be exhausted (Second Law of T.) and the universe will suffer, what Jeans terms a 'Heat-death.' See T. H. Preston, *Theory of Heat*, 1929; J. H. Duncan, *Steam and other Engines*, 1929; J. R. Partington, *A Textbook of Thermodynamics*, 1949.

Thermo-electricity, see under ELECTRICITY AND MAGNETISM (CURRENT ELECTRICITY).

Thermograph, instrument used for automatically recording temp., frequently the temp. of the air. The 'Richard T.' is a Bourdon tube, a curved metal tube containing a suitable liquid. Rise or fall of temp. respectively straightens or increases the curvature of the tube by the alteration in the vol. of the liquid. The movement is transmitted by levers to a pen, which makes a trace on a revolving drum. Other patterns use a

bimetallic spiral (Met. office pattern), an electrical resistance element, a steel bulb filled with mercury connected by capillary tubing to a Bourdon tube (distance T.), or consist of a revolving drum of prepared paper on which is photographed the position of a bubble of air introduced into the mercury column and which moves up and down with the temp.

Thermometer and Thermometry (Gk. *θερμ.* heat, *μετρον*, a measure). The thermometer is any instrument that measures the variations of sensible heat or temp. (*q.v.*). The effects of temp. on different substances vary considerably, but ignoring the promotion or retardation of chemical action and modification of the properties of matter, we can deal with the relevant change for the present purpose—expansion or contraction. In general, a rise of temp. causes bodies to expand and a fall of temp. causes them to contract, and although there are exceptions to this rule, they do not affect the metals and liquids used in thermometers. Mercury as a thermometric liquid has many advantages over other liquids, amongst which may be noticed its wide range (-40°C. to 356°C.) in the liquid state; its regular expansion which is very nearly, though not quite, proportional to changes of temp.; its utility in the capillary tubes which it does not 'wet'; and the expeditious way of obtaining it in a very pure form. On the other hand, alcohol has a lower range (to -80°C.) while pentane can be used to -200°C.

Temp. can be ascertained by noticing the change in the volume of a body or a liquid, and any apparatus constructed on this principle can be called a thermometer. Two temps. are taken as points of reference; that of melting ice and that of steam given off by water boiling under normal atmospheric pressure, which is 760 mm. of mercury. This is essential as boiling point is affected by atmospheric pressure. Many other precautions and refinements are necessary in the manufacture of thermometers and for these details readers are referred to any standard work on Heat. Three thermometers are in general use, the Centigrade (or Celsius) (the centesimal scale was adopted by Celsius in 1742), the Fahrenheit and the Réaumur. On the Centigrade scale the freezing point is taken as zero and the boiling point as 100° ; the space between being divided into 100 equal intervals, each known as a degree. Graduations on the same scale are extended on either side of these standard points, those below freezing point being negative. This scale is usually employed for scientific purposes. On the Fahrenheit scale the freezing point is marked 32° and the boiling point 212° , so that 180° correspond to the range between freezing point and boiling point, and hence 100°C. are equal to 180°F. or, expressed more simply, $5^{\circ}\text{C.} = 9^{\circ}\text{F.}$ On the Réaumur scale the freezing point is also taken as zero, like the Centigrade scale, but the boiling point is taken as 80°C. This thermometer is used in some European countries for medical and domestic pur-

poses just as the Fahrenheit thermometer is in Great Britain. Clinical thermometers in the latter country are always Fahrenheit.

Maximum and minimum thermometers for recording highest and lowest temps. vary in construction. Rutherford's maximum self-registering thermometer consists of an ordinary mercury thermometer placed in a horizontal position, and having a small piece of steel inside the tube beyond the mercury. As the mercury expands with increase of temp. it pushes the steel before it, and as it contracts it leaves the steel in the furthest position to which it has been driven. The end of the steel nearest the surface of the mercury marks the highest temp. since it was last set. The instrument can be reset for another observation by means of a magnet. The minimum thermometer contains alcohol instead of mercury and inside the alcohol contained in the tube there is a small index of glass, with the furthest end touching the surface of the alcohol. This tube is also placed horizontally. As the alcohol contracts it carries the index of glass with it, but when it expands the index is left behind. Thus the end of the index nearest the surface of the spirit shows the lowest temp. The index can be again got into position by inclining the tube.

In addition to the usual thermometers in which mercury, alcohol, etc., measure the changes in temp., there are other types, such as the metallic thermometer, the platinum resistance thermometer, the thermo-couple thermometer, and the gas thermometer. The metallic thermometer—the best known instrument of this class is Breguet's thermometer—depends on the principle that if two strips of different metals with unequal coefficients of expansibility be soldered together and wound into a spiral with the most expansible metal inside, a rise of temp. causes the spiral to unwind. This is due to the greater expansion of the inner strip, and similarly, a fall of temp. causes the spiral to wind up. A needle deflected in the process of winding or unwinding indicates the variation in temp. In the platinum

resistance thermometer use is made of the well-known fact that the resistance of platinum to an electric current varies with change of temp. The Wheatstone's Bridge enables us to detect very small changes in resistance and hence the small changes in temp. can be determined. The thermocouple thermometer is based on the principle of the thermo-couple—that electric currents can be produced by applying heat or cold to one of the junctions in a circuit composed of two different metals. If a very delicate galvanometer is used to measure the current the temp. can be deduced, and temps. up to 1500°C . can be measured with great accuracy in this way. A gas thermometer is much more sensitive than the ordinary types of thermometers, owing to the relatively large coefficient of expansion of gas. It suffers from the defect that it is cumbersome and also requires a large amount of the liquid the temp. of which is to be found.

The figure shows essential parts of a

CONSTANT VOLUME AIR THERMOMETER

simple gas thermometer known as the Constant Volume Air Thermometer. The large bulb *A* and the connecting wide capillary tube contain air or hydrogen, etc., while the tubes *BDC* form a simple manometer. The instrument is calibrated by placing the bulb in clean, melting ice and allowing the air to take up the temp. of the ice. The vertical tube *C* is now raised or lowered until the mercury in the vertical tube *B* is brought opposite some convenient graduation on a scale mounted between *B* and *C*, and the pressure of the air in the bulb is then read off from the manometer. In the present instance this pressure would be $P + H$, where P is the height of the mercury barometer and H is the vertical height of *C* above *B*. Suppose this pressure is called

p_0 . The bulb is now placed in boiling water and the tube *C* is again adjusted to bring the mercury in *B* back to the same graduation as before. Hence the name constant vol. air thermometer. Let p_{100} be the pressure of the air in the bulb at the boiling point of water taken as 100°C , 760 mm.; see previous remarks on atmospheric pressure and boiling point. Then a rise of 1°C . on this thermometer is defined as the rise of temp. that produces an increase of pressure of the constant vol. of air of amount $\frac{p_{100} - p_0}{100}$. The temp. corresponding to any pressure p of the constant vol. of air will be $\frac{p - p_0}{p_{100} - p_0} \cdot 100^{\circ}\text{C}$.

See J. Smith, *Pressure Gauges, Indicators, Thermometers, Pyrometers*, 1924; L. B. Hart, *Introduction to Advanced Heat*, 1928; T. H. Preston, *Theory of Heat*, 1929; R. G. Mitton, *Heat*, 1939; and W. E. K. Middleton, *Meteorological Instruments*, 1913.

Thermoplastics, see under PLASTICS.

Thermopylae, often called simply *Pylae*, celebrated pass leading from Thessaly into Locris. The pass of T. is especially celebrated on account of its heroic defence by Leonidas against Xerxes, 480 B.C.

Thermosetting in Plastics, see under PLASTICS.

Thermos Flask, see VACUUM FLASK.

Thermostat, instrument for maintaining an appliance set at a predetermined temp. All Ts. comprise essentially an element extremely sensitive to temp. changes and a switch or lever. For the temp. element use is made of one or other of the following properties: the expansion of metals; the increase in vol. of a liquid; the increase in pressure of a fluid.

Ts. which depend upon the expansion of metals are known as the bi-metal type and consist of a composite strip of two metals with widely different coefficients of expansion. This strip may be used flat or formed into a coil, one end being free and the other fixed. When the temp. alters, the unequal expansion of the two metals causes distortion, and an appreciable movement is produced at the free end which in turn moves the switch or lever. A magnet is sometimes used in the bi-metal type so that the completion of the closing operation is positive and quick; this is useful in the control of an electrical device to prevent any sparking which might be caused by a poor contact. The two metals usually used are brass, which has a large expansion, and a steel alloy with a negligible expansion. For liquid heating control the composite strip is in a brass tube which is inserted in the medium. Bi-metal Ts. are used for many types of temp. control among which may be mentioned the regulation of boilers, immersion heaters, cookers, and space heating.

The second type of T. consists of a cylindrical bulb, a capillary tube, and a metallic bellows. The system is completely filled with a liquid and sealed, so that the only way in which the liquid can expand when the temp. rises is by pressure

on the bellows. Attached to the latter is a rod with spring adjustment which moves the device attached to it. The bellows type is often used where it is necessary or desirable for the sensitive element to be at a distance from the switch or lever. It is used in most refrigerators and in some air-conditioning plants. In space-heating the sensitive bulb is mounted directly on the bellows.

The third or vapour pressure type T. is similar to the second except that the system is only partially filled with a volatile fluid of a low boiling point leaving a vapour space. As the pressure of the vapour will vary according to the temp., movement will again be produced by the bellows. See also FIRE BRIGADES AND FIREFIGHTING, *Fire Alarms*. See R. Griffiths, *Thermostats and Temperature Regulating Instruments*, 1950.

Thesaurus, see under DICTIONARY.

Theseus, great legendary hero of Attica, son of Ægeus, king of Athens, and of Æthra, the daughter of Pittheus, king of Troezen. He was brought up at Troezen, and when he reached maturity he took his father's sword and sandals, and went to Athens. Having been acknowledged by Ægeus as his heir, and after slaying the Marathonian bull, T. went of his own accord as one of the seven youths whom the Athenians were obliged to send every year, with seven maidens, to Crete, in order to be devoured by the Minotaur. When they arrived at Crete, Ariadne, the daughter of Minos, became enamoured of T., and provided him with a sword with which he slew the Minotaur, and a clue of thread by which he found his way out of the labyrinth. Having effected his object, T. sailed away, carrying off Ariadne. He was generally believed to have had by her two sons, Erichon and Staphylus. As the vessel in which T. sailed approached Attica, he neglected to hoist the white sail, which was to have been the signal of the success of the expedition; whereupon Ægeus threw himself into the sea. T. thus became king of Athens. One of the most celebrated of the adventures of T. was his war with the Amazons whose queen, Antiope, bore him a son, Hippolytus. T. figures in almost all the great heroic expeditions. He was one of the Argonauts; took part in hunting the Calydonian boar, and helped Adrastus to recover the bodies of the slain at Thebes; joined Pirithous and the Lapithæ against the Centaurs; with Pirithous abducted Helen from Sparta and tried to abduct Proserpina from Hades. In this last-named adventure Pirithous perished and T. was held in durance until his liberation by Hercules. Meanwhile Menestheus incited the peoples against T., who, being unable to re-establish his authority, retired to Scyros where he was treacherously thrown headlong from a cliff by the king, Lycomedes and killed. An important addition is made to our knowledge of the legend of T. by the discovery of the *Odes* of Bacchylides (Sir R. C. Jebb's ed., 1905).

Thesiger, Frederick; Frederick Augus-

tus; and Frederick John Napier; see CHELMSFORD, BARONS.

Thesmophoria, festival in honour of Demeter as the founder of agriculture and patroness of marriage, celebrated widely in Greece and especially at Athens. It was held for five days in the month Pyanepsion (early Nov.), only married women of Attic birth and stainless character taking part. On the first day of the feast (*Στήνεια*) there was a procession to the deme or township of Halimus. Others, however, say that the T. was in honour of Ceres, surnamed Thesmophoros, the law-giver, that goddess being supposed the first who taught mankind the use of laws. The institution of the festival is variously described, some attributing it to Triptolemus, some to Orpheus, and others to the Danaides. See also MYSTERIES.

Thespia, anct. Gk. city near the base of Mt. Helicon, in Boeotia. Its hist. seems guided by an inveterate hatred for the neighbouring and stronger city of Thebes, which dismantled its walls in 423 B.C., captured it in 372 B.C., and finally razed it to the ground. In 480 B.C. T. did not disgrace itself by siding with the enemy.

Thespis, father of Gk. tragedy, lived during the latter part of the sixth century B.C. He introduced into the old tragedy connected with the Dionysian festivals an actor, for the sake of giving rest to the chorus. This actor took various parts in the same piece under various disguises, which took the form of linen masks. See A. E. Haight, *Tragic Drama of the Greeks*, 1896; A. Croiset, *History of Greek Literature*, 1904; and J. T. Sheppard, *Greek Tragedy*, 1920, 1934.

Thesprotia, prefecture of Greece in the Epirus. Pop. 65,000.

Thessalonians, The Epistles to the, were probably written by St. Paul from Corinth when he was working there with Silvanus and Timothy (Acts xviii. 5) between A.D. 51 and 53. They are, therefore, among the earliest of St. Paul's epistles, and their genuineness is universally acknowledged. Acts xvii. describes St. Paul's visit to Thessalonica, and of the bad reception he received from the Jews. The Gks. and devout women, however, showed much eagerness to learn his message, and to them he turned. The Epistles, then, which followed each other closely, were addressed to a Gentile audience. The immediate occasion of the First Epistle is the favourable intelligence brought to the Apostle by Timothy of the steadiness with which the Thessalonians adhered to the faith in spite of the persecutions with which they were assailed by their own countrymen. From it we learn what had been St. Paul's message and appeal when he was himself in Thessalonica. He had appealed to the primary feelings of the human heart and then passed on to speak of Jesus 'which delivereth us from the wrath to come' (i. 10). This particular insistence on the Judgment and the Second Advent had led to much questioning, and in the latter part of the letter St. Paul deals with this. His letter, however, did not settle all difficulties, though the news which he

later received from Thessalonica was in many aspects encouraging. The expectation of the immediate coming of the Lord still caused great excitement and the neglect of the duties of daily life. The Second Epistle is intended to allay this excitement. See article in *Hasting's Dictionary of the Bible*: C. Lattey's trans. of the Epistles to the Thessalonians, 1913; H. N. Bate, *Guide to the Epistles of St. Paul*, 1926, and a commentary on the E. to the T. by E. J. Ricknoll, 1939.

Thessalonica, or **Thessaloniki**, see SALONICA.

Thessaly, largest div. of anc. Greece. T. proper is a large plain, drained by the R. Peneus, and its affluents about 70 m. across shut in on every side by mt. barriers, broken only at the N.E. corner by the valley and defile of Tempe, which separates Ossa from Olympus. There were two other dists. included under the general name of T.; one, called Magnesia, being a long narrow strip of country extending along the coast of the Aegean Sea from Tempe to the Pagasæan Gulf, and the other a long narrow vale at the extreme S. of the country, lying between Mts. Othrys and Oeta. Thessaly proper was divided in very early times into four dists. or tetrarchies, a div. which we still find subsisting in the Peloponnesian War. These dists. were: (1) Hestiaeotis, in the N.W.; (2) Pelasgiotis, in the E.; (3) Thessaliotis, in the S.W.; and (4) Phthiotis, in the S.E. It is in this dist. that Homer places Phthia and Hellas proper, and the dominions of Achilles. Besides these there were four other dists., viz.: (5) Magnesia; (6) Dolopia, a small dist. bounded on the E. by Phthiotis, on the N. by Thessaliotis, on the W. by Athamania, and on the S. by Oëta; (7) Oëtaea, a dist. in the upper valley of the Spercheus; and (8) Malis. The Thessalians were a Thesprotian tribe, and invaded the W. part of the country, afterwards called Thessaliotis, whence they subsequently spread over the other parts of the country. The gov. in the separate cities became oligarchical, the power being chiefly in the hands of a few great families descended from the anc. kings. Of these, two of the most powerful were the Aleuadae and the Scopadae. The Thessalians never became of much importance in Gk. hist. In 344 B.C. Philip completely subjected T. to Macedonia. The victory of T. Flamininus at Cynoscephalæ, in 197, again gave the Thessalians a semblance of independence under the Romans. The area of modern T. is given as 5,200 sq. m. and its pop. 569,300. In recent years excavations have been made by the Brit. School of Archaeology in Athens. Mineral deposits exploited include iron-pyrites, copper, zinc, bitumen, and marble.

Thetford, mun. bor. and mrkt. tn. of Norfolk, Eng., situated on the borders of the great state forest of Thetford Chase and the Breckland. The Rs. Thet and Little Ouse unite just above the tn. bridge. It was once the cap. of the kingdom of E. Anglia. The earthworks of Castle Hill are one of the largest and most interesting examples of early military

fortifications in England. The site of the Saxon tn. is being excavated by the Ministry of Works. The ruins of the Clunian priory (founded c. 1103) stands on the banks of the Little Ouse. There are remains of the Benedictine Nunnery of St. George and of the monastery of the Canons of the Holy Sepulchre. Pop. (estimated) 9700.

Thetis, Gk. mythology, a sea-goddess, daughter of Nereus (q.v.) and Doris, and mother of Achilles. Poseidon and Zeus are said to have sued for her hand; but when Themis (q.v.) declared that the son of T. would be more illustrious than his father, both gods desisted from the suit. Others state that T. rejected Zeus because she had been brought up by Ilia and that the god, to revenge himself, decreed that she should wed a mortal: and, at length, she was given against her will in marriage to Peleus (q.v.).

'Thetis', Brit. submarine of the Trident class (1090-1575 tons), which on her trial run sank in Liverpool Bay on June 1 (1939) with the loss of 99 lives, only four men being saved. The submarine was beached on Oct. 3 on the Anglesey coast, recommissioned for war service as the *Thunderbolt*, and then finally lost through enemy action off the coast of Sicily on March 13, 1943, with the loss of all hands.

Thian-Shan, see TIENSHAN.

Thibaudet, Albert (1874-1936). Fr. literary historian b. at Tournus, Saône-et-Loire. From 1925 he was prof. of literary hist. at Geneva. He was chiefly interested in the literature of the late nineteenth century. Among his works are *La poésie de Mallarmé* (1912), *Flaubert* (1922), *Trente ans de vie française* (1920-25), *Intérieurs* (1924), *La république des professeurs* (1927), *Mistral* (1930), *Physiologie de la critique* (1930), *Stendhal* (1931), *Histoire de la littérature française de 1789 à nos jours* (1936). See life by G. Truc, 1935.

Thibault, Jacques Anatole, see FRANCE, ANATOLE.

Thibaw, or **Hsipaw**, Shan state of Upper Burma, with an area of 5080 sq. m., traversed by the Namtu. Rice, cotton, and tea are the chief articles of produce. Pop. 130,000.

Thibet, see TIBET.

Thielt, see TIELT.

Thiers, Louis Adolphe (1797-1877). Fr. statesman and historian, b. at Marseilles of humble parentage. In 1821 he entered the offices of the *Constitutionnel*, his articles in which quickly placed him in a position of independence. Journalism not satisfying his ambition, he collaborated with Félix Bodin in the production of *Histoire de la révolution française* (1825-27), the greater part of which was the work of T. In 1830, his antipathy to the Bourbons prompted him to seek a more vigorous polemical field than that of the *Constitutionnel*, and he founded the *National*, which helped to provoke the revolution of that year. After the nomination of Louis Philippe as king of Fr. T. was rewarded for his publicist services by being nominated a councillor of state and given a post in the Treasury.

Later he became under-secretary of state to the treasury (1831), supporting the peace policy of Casimir Périer. T. was minister of the interior in Soult's cabinet of 1832 during the Paris insurrection. Four years later he was placed at the head of the cabinet, and carried out, among other liberal reforms, the suppression of lotteries and gaming-houses, and the reduction of tariff duties on inland trade. In 1840 he became president of the council and foreign secretary. He supported Mehemet Ali against Turkey with the object of assuring to the latter the retention of Egypt. Later, after the conclusion of peace between England, Russia, Turkey, Prussia, and Austria, he made all preparations for war as a demonstration against the exclusion of France from the European concert, but his policy resulted only in the prompt recalling of the Fr. fleet from Turkish waters and his own retirement. He then devoted himself to writing historical works, and pub. his huge work, the *Histoire du Consulat et de l'Empire* (1845-69). After the proclamation of the republic on the fall of Louis Philippe's gov., T. made strenuous efforts to overthrow the republic while appearing to support it, but he was banished from Fr. ter. on the subsequent restoration of the empire, whither he did not return till 1852. In 1863 he was nominated deputy for one of the divs. of Paris. On the fall of the empire following upon the débâcle at Sedan, he was elected president of the assembly, and shortly after became president of the republic. In 1873, wishing to avoid being made the instrument of monarchist intrigue, he voluntarily resigned.

See R. Dreyfus, *Thiers contre l'Empire, la guerre, et la Commune 1869-71*, 1928; and life by M. Rochus, 1932.

Thiers, tn. in the dept. of Puy-de-Dôme, France, on R. Durolle. There are important manufs. of cutlery, whale-bone, and bank-note paper. Pop. 15,400.

Thigh, the part of the lower limb between the pelvis and the knee. The T.-bone, or *femur*, is the longest bone in the human body, constituting about 0.275 of the height from sole to crown. It articulates with the *os innominatum* above, and with the *tibia* below.

Thionville, tn. in the dept. of Moselle, France, situated on the Moselle, 20 m. N. of Metz by rail. The former Ger. name was Diedenhofen. The tn. is of anc. origin and strongly fortified. Imperial diets were held here in the eighth century; in 1870 it surrendered to the Prussians. It has manufs. of wine, hosiery, and iron goods. During the Second World War, the part W. of the Moselle was captured by Amer. forces on Sept. 14, 1944, but the Gers. held the E. part until on Nov. 15 they were cut off by Amer. crossings of the riv. to the S.W. and N.E. Pop. 12,000.

Thiophene, C₄H₄S, a colourless liquid (b.p. 84° C.) discovered in 1883 by Victor Meyer as an impurity in benzene obtained from coal tar. It gives a blue coloration with iastin dissolved in concentrated sulphuric acid, and in its general pro-

perties closely resembles benzene (*q.v.*). T. may be separated from benzene by prolonged shaking with cold concentrated sulphuric acid, which removes the T.

Thiosulphate of Soda, see HYPO.

Third. The interval between the two notes of which lie three degrees of a diatonic scale. Ts. can be major, minor, or diminished, in the last case being equal to major seconds on the pianoforte, but written to look like Ts., e.g. C♯-E♭. A diminished T. is the inversion of an augmented sixth. The T. of a diatonic scale is the most characteristic interval determining the difference between major and minor.

Third Estate, that Fr. social class which was represented in the states-general, as well as the clergy and nobility.

Third International or Komintern, see COMINTERN.

Third Party Insurance, insurance against liability to pay damages for personal injuries sustained by third persons or for injuries to the property of third persons. This form of insurance has gained in popularity in view of the fact that the insurer is thereby relieved of the trouble of dealing with the claim, whether genuine or not, and of all legal costs and expenses. In their inception, T.P. policies were taken out in respect of horse-drawn vehicles; other risks were gradually accepted by the insurance companies, until to-day all manner of risks are covered. The largest development has been in regard to motor business, especially since the Road Traffic Act of 1930, under which T.P.I. was made compulsory, and the chief feature of the motor policy now lies in the 'liability to the public' section. (See MOTOR VEHICLE INSURANCE.) Most insurance companies, however, now deal with this class of business as a separate activity. Experts aver that legislation has given no great impetus to T.P.I., though some business accrues as a consequence of the Housing Acts, a class of business known as 'Property Owners' Indemnity' and 'Landlords' Indemnity.' Generally speaking, insurance companies find their third-party depts. profitable; there is considerable competition for the business on its own merits, although freedom in rating has led to some risks being accepted at very low premiums in order to protect tariff-rated insurance against competition. In this connection, however, driving accident insurance and cinema risks are classes of public liability business which have been somewhat fettered by tariffs.

Third Reich, term applied to the Ger. National Socialist régime, formally begun on Feb. 1, 1934. The empire of 1871 to 1918, and the succeeding Weimar republic, were the two anterior constitutions.

Third Republic, in France, lasted from the fall of the Second Empire (*q.v.*) in 1870 to the surrender of the Fr. Gov. on June 17, 1940.

Third Silesian War, see SEVEN YEARS' WAR.

Thirlage, in old Scots law, that servitude by which possessors of lands in some parts of the country were bound to grind

their grain at a particular mill—to which mills the lands were said to be 'astricted' or 'thirled.'

Thirlmere, lake of the Lake District, Cumberland, England, $3\frac{1}{4}$ m. S.S.E. of Keswick. It is 3 m. in length and about $\frac{1}{2}$ m. in width, with a depth of nearly 100 ft. It is surrounded by lofty heights; on its E. shore rise Helvellyn and White-side, whose slopes are well wooded, while on its W. side are Arncliffe Fells and Raven Crag, whose slopes are cut by mountain torrents. T. affords part of the water supply of Manchester.

Thirsk, mikt. tn. and rural dist. of the N. Riding of Yorkshire, England. 22 m. from York. It has a beautiful par. church. Its fairs and mikt. are noted, and a trade is carried on in livestock, corn, wool, timber, etc. With the par. of Sowerby (pop. 2500), it forms one continuous built-up area. Pop. 2500.

Thirst, desire for drink, made known by sensations projected to the pharynx. The amount of water contained in the body is subject to great changes. It is always being lost by various organs, the amount lost varying greatly with the conditions of life. This loss directly affects the blood, but this is not lasting, as the blood draws upon the vast resources of the other body tissues for its supply of water; consequently the tissues require a new supply to restore them to their normal state. The sense of T. then comes into play; we become thirsty and take into our bodies water in varying quantities according to our needs. Little is known concerning the nervous mechanism controlling this sensation, but it is assumed that as the water content falls below a certain amount the nerves in the pharyngeal region are stimulated and so give rise to T.

Thirty-Nine Articles, The, of the Church of England are described in their heading as 'Articles agreed upon by the archbishops and bishops of both provs. and the whole clergy, in the Convocation held at London in the year 1562, for the avoiding of diversities of opinions, and for the establishing of consent touching true religion.' Their hist., however, begins before this date. On the death of Henry VIII., the gov. of the country was left in the hands of a group of nobles, of whom many were in favour of the reformed doctrines, and the changes in the teaching and practice of the Church increased with great rapidity. The ancient landmarks were being removed, and it was desirable that fresh ones should be set up. In 1549, Parliament empowered the king to appoint a commission for the drawing up of eccles. laws, and in accordance with this Act a commission was appointed in 1551 consisting of eight bishops, eight divines, eight lawyers, and eight other representatives of the laity. This commission, which included Cranmer, Ridley, Coverdale, and Peter Martyr, began by drawing up a code of forty-two articles which were pub. by royal authority in 1553. To these articles was prefixed Cranmer's *Catechism*. In the same year Edward VI. died, and the Con-

vocation of the first year of Mary denied that the articles had received its consent, and entirely repudiated them. The tide of reformation was thus stemmed for a while, but on the accession of Elizabeth it was resumed. This period is marked by greater moderation. Parker occupied the see of Canterbury, and he submitted to Convocation a revised form of the original forty-two articles. These underwent considerable further alterations, in course of which they were reduced in number to thirty-nine and were finally promulgated in 1571. The first half of the twentieth article was omitted in some copies, and there continued to be some discussion as to which was the authorised form, until in 1604 they were finally settled in the form in which they are now used. The T. A. were adopted by the Convocation of the Irish Church in 1635, and by the Scottish Episcopal Church in 1804. There has been, especially during the last century, much controversy as to the nature and meaning of the articles. Some have tried to interpret them as an orderly body of divinity, but they were probably devised for a special need, and bear the marks of compromise in every line. They are, indeed, chiefly negative, condemning the errors of the medieval Church and those of certain of the Protestant sects. They are, on the whole, Calvinistic in tone, but their extreme elasticity has been well shown by Newman and Jowett. The former of these, in the famous *Tract XC.*, attempted to prove that they were in no way contrary to the Decrees of Trent. Commentaries are those of W. Beveridge (1716), and Harold Browne (1850). See W. H. G. Thomas, *The Principles of Theology, an Introduction to the Thirty-Nine Articles*, 1930; *Introduction to the Thirty-Nine Articles*, 1946.

Thirty Years' War, The. Practically it may be said that the T. Y. W. was the result of the Ger. Reformation and the Counter-Reformation. The war began in 1618 by the offer of the crown of Bohemia to the Lutheran prince, the elector of the Palatinate, son-in-law of James I. of England and father of the Princes Rupert and Maurice. The troops of the Emperor immediately entered Bohemian ter. and drove out Frederick, depriving him also of his electorate of the Lower Palatinate, a task rendered more easy by the inactivity of James I. of England. The ter. so annexed by the Emperor Ferdinand were handed over to Maximilian of Bavaria and so became Catholic; an illustration of the sixteenth-century principle that the religion of the prince is also the religion of his subjects. The Hapsburgs now developed their policy on large lines; Germany was to become a Hapsburg possession and the ter. lost to Catholicism by the Reformation was to be regained. The imperial generals, Tilly and Wallenstein, swept all before them; N. Germany and the Baltic ports seemed to lie at their mercy. Christian IV. of Denmark came forward as the champion of Ger. Protestantism, but was defeated and forced to make peace in 1629 (Lübeck). Wallenstein had estab.

the Hapsburg supremacy in the N., but had failed to take Stralsund. In the following year Gustavus Adolphus, aided by Fr. subsidies, came forward as the champion of Protestantism, and with his appearance began the turn of the tide. Wallenstein had been dismissed at the Diet of Ratisbon; the Ger. princes feared the man whom they regarded as a mere mercenary upstart. Gustavus Adolphus marched from victory to victory. Tilly was defeated at Breitenfeld, and Gustavus marched to the S. In 1631 he again defeated and killed Tilly on the banks of the Lech, and then Wallenstein was recalled. Gustavus won the battle of Lutzen (1632), but was killed, and much of his work was undone. From this point the religious motives of the war entirely disappear. France, anxious to break the power of the Hapsburgs, gave support to the Swedes and Ger. Protestant princes. Richelieu played his hand well; enemies to the Hapsburgs were raised up in Germany, Italy, and Spain; the Dutch were given support in their struggle against Sp. power; and the power of the Hapsburgs, both Austrian and Sp., began to decline. The policy of Richelieu was continued after his death by Mazarin, and the Fr. generals Condé and Turenne won brilliant victories over the imperialists. Finally the end came in 1648, when the Emperor, suffering from defeats in Germany at the hands of the Swedes and the Fr., agreed to terms of peace. The Peace of Westphalia was signed in Oct. 1648. The territorial gains of France and Sweden, and the independence of the Ger. princes, were recognised. The attempted revival of the power of Catholicism by the sword had failed, and the imperial power became nominal elsewhere than in Austria. The independence of Portugal and the United Provinces (Holland) was also recognised by this treaty. See S. R. Gardiner, *The Thirty Years' War* (11th ed.), 1898; H. G. R. Reade, *Sidelights on the Thirty Years' War*, 1925; and C. V. Wedgwood, *The Thirty Years' War*, 1944.

Thisbe, see PYRAMUS and THISBE.

Thistle, name given to various composite plants of which the best known are those that belong to the genera *Carduus* and *Cnicus*. Others are the Scotch T. (*Onopordion acanthium*); the Carlue T. (*Carlina vulgaris*); the Globe T., which belongs to the genus *Echinops*; and the Hedgehog T. (*Echinocactus*). The Holy T. is *Silybum marianum*. Its roots and young leaves are edible.

Thistle-finch, Black-headed, see SISKIN.

Thistle, Order of the, see ORDERS OF KNIGHTHOOD.

Thistleton-Dyer, Sir William Turner, see DYER.

Thistlewood Conspiracy, see CATO STREET CONSPIRACY.

Thomas, tn. of Portugal. Here are ruins of a Templar's castle, the famous convent of the Order of Christ, and the palace of Henry the Navigator. There are gold mines in the vicinity. Pop. 37,176.

Thomas, St., one of the twelve disciples, called also Didymus (John xi. 6), a Gk.

trans. of the Heb. form of 'Thomas.' All the information about him in Scripture is given in the Fourth Gospel. Later tradition says that he evangelised India and Parthia, dying at Edessa. His festival falls on Dec. 21.

Thomas à Kempis, Saint, see KEMPIS.

Thomas, Albert (1878-1932). See under INTERNATIONAL LABOUR ORGANISATION.

Thomas of Celano, see CELANO.

Thomas Aquinas, or Thomas of Aquino, see AQUINAS, THOMAS.

Thomas, Arthur Goring (1850-92), Eng. musical composer, b. at Ratton Park, Sussex. Educ. at Haileybury College, and studied music in Paris and at the Royal Academy, London, under Prout and Sullivan. The success of his *The Light of the Harem* led to the Carl Rosa Company's invitation to write the opera *Esmeralda*, which was successfully produced at Drury Lane (1890). His best opera is *Nadeshu* (1885) (libretto by J. Sturgis). He also composed *The Sun Worshipers* (cantata); *The Swan* and *The Skylark*, and a number of songs.

Thomas Becket, see BECKET, THOMAS A.

Thomas, Bertram Sydney, Brit. explorer, and orientalist (b. 1892). His crossing of the Rub' al Khali, the great desert of S. Arabia, one of the largest unknown regions in the world, in the winter of 1930-31, is one of the greatest feats of exploration of the present century. T. went with a camel caravan. He was awarded the Founders' Medal of the Royal Geographical Society and the Burton Memorial Medal of the Royal Asiatic Society. Previously, in 1927-28, he had made a 600-m. journey through the southern borderlands from the toe of Arabia nearest India to Dhufar, and in 1929-30 he explored the steppe for 200 m. to the northward of Dhufar, right to the edge of the sands. Pub. *Alarms and Excursions in Arabia* (1931); *Arabia Infelix* (1932).

Thomas, Dylan (b. 1914), Welsh poet. Against the intellectual school of W. H. Auden there has been in Eng. poetry a reaction towards the mystic and the romantic, of which T. is a foremost figure. A master of language, rich in imagery, he treats of the elemental processes of human life, his best work being in those poems, such as *In Memory of Ann Jones*, which are unified by a single theme. His new stanza forms will probably have a lasting effect. His pubs. include *Eighteen Poems* (1934); *Twenty-five Poems* (1937); *The Map of Love* (verse and prose, 1939); *Portrait of the Artist as a Young Dog* (prose, 1940); and *Deaths and Entrances* (1946). See study by H. Treece, 1949.

Thomas, Edward, see THOMAS, PHILIP EDWARD.

Thomas van Erpen, see ERPENIUS.

Thomas, Freeman Freeman, see WILLINGDON, VISCOUNT.

Thomas, James Henry (1874-1949), Brit. Labour politician, b. at Newport, Monmouthshire, son of a labourer. As an engine-driver he was elected to the Swindon tn. council, and in 1904 became president of the Amalgamated Society of

Railway Servants. T. was M.P. for Derby 1910-36. In the First World War he was a member of Lord Balfour's mission to the U.S.A., and in 1918 became general secretary to the National Union of Railwaymen; president of the Parl. Committee of Trades Union Congress (1920-21), and president of the International Federation of Trades Unions (1920-21). Vice-chairman of the Parl. Labour Party, 1921, T. was appointed secretary of state for the colonies in the first Labour Gov., 1924, and lord privy seal and minister of employment in the second Labour Gov. (1929-30). In June 1930 he became secretary of state for dominion affairs, being transferred to the Colonial Office in 1935. In 1936 he resigned both from office and from Parliament as a result of the report of a Tribunal set up to consider unauthorised disclosures relating to the Budget. T. was author of *When Labour Rules* (1920); *The Red Light on Railways* (1921); and *My Story* (1937).

Thomas, Philip Edward (1878-1917). Eng. author of Welsh extraction, b. in London, eldest son of Philip Henry T., staff-clerk at the board of trade. Educated at St. Paul's School and Lincoln College, Oxford, he enlisted in 1915, became a second-lieutenant, R.G.A., and was killed at Arras, April 9. Much of his prose is in newspaper files, but in his best work the qualities revealed are truth and a love of the countryside of England and Wales. Imagination, having the quality of mysticism, was a characteristic of his prose. His poetry, the late flower of his literary work and written for his own delight, is perhaps his greatest gift to literature. The verse is clear in content. Two of his best poems are *Lights Out and Out in the Dark*. Works include: *The Woodland Life*, a vol. of nature studies, (1897); *Horae Solitariae*, (1902); *Oxford*, (1903); *Beautiful Wales*, (1905); *Richard Jefferies*, (1909); *The South Country*, (1909); *Rest and Unrest*, (1910); *Feminine Influence on the Poets*, (1910); *Light and Twilight*, (1911); *George Borrow*, (1912); *Swinburne*, (1912); *Walter Pater*, (1913); *The Happy-go-Lucky Morgans* (novel), (1913); *In Pursuit of Spring*, (1914); *Collected Poems*, (1920); and *The Last Sheaf*, (1928). See Helen Thomas, *Is it Was* (1926) and *World Without End* (1931).

Thomas, Richard, & Baldwins Ltd., iron, steel, tinplate, etc., manufacturers, producing 10 per cent of Britain's output of steel and employing 8 per cent of the steel industry's labour force; the organisation has interests ranging from the raw materials of the industry to its finished products. Richard Thomas & Co. was registered in 1884, taking over a family business. After 1899 there was continued expansion until by 1914 the company controlled a steelworks and 83 tinplate mills. Further amalgamation in 1917 gave control of coal and iron ore supplies and led to development at the Redbourn Works and the operation of blast furnaces and additional steel furnaces, tinplate mills, etc. A further phase of expansion began in 1933. In 1935 Richard Thomas & Co. acquired the Ebbw Vale site and

erected an integrated plant inclusive of the first wide hot strip mill built in this country, which began to operate in the autumn of 1938. The name of the company was changed to R. T. & B. Ltd. in Jan. 1945 upon fusion with Baldwins Ltd. which had been incorporated in 1902 and represented the amalgamation of sev. oldest estab. undertakings, makers of quality steel products. The company (R. T. & B.) now has a steel ingot capacity of some 1,500,000 tons annually, approximately 250,000 tons of tinplate and 400,000 tons of sheets representing one-third of Britain's output of each of these products. The company's production also includes coke, iron ore, and limestone, as well as pig iron and a variety of steels including stainless, silicon and castings, bricks, slag, etc.

Thomas, Christians of St., oldest Christian church of India, is Nestorian in doctrine, and probably owes its origin to the Nestorians of Persia. Tradition, however, ascribes it to St. Thomas. From 1599 to 1653 they were brought under Rom. jurisdiction, but they now claim entire independence. They number a few hundred thousand and are found in the states of Malabar and Cochin. The liturgical language is Syriac. See G. M. Rae, *Syrum Church in India*, 1892.

Thomas of Woodstock, see GLOUCESTER, DUKES and EARLS OF.

Thomas the Rhymer, see ERILDOUNE THOMAS OF.

Thompson, Alice, see MEYNELL, ALICE.
Thompson, Sir Benjamin, Count Rumford (1753-1814), Anglo-Amer. scientist and administrator, b. at Woburn, Mass., his family having settled in New England. Early made chemical and mechanical experiments and, by turns, studied medicine and took up school teaching. At 19 he married the well-to-do widow of a Col. Rolfe, and daughter of a minister who had settled at Rumford, now called Concord. This marriage was the foundation of his success, though within a few years he left his wife to settle in Europe. During the war of Amer. Independence his sympathies were opposed to the Amer. cause, and in 1776 he was therefore chosen by Gov. Wentworth of New Hampshire to bear despatches to London and later became an under secretary of state. His official duties, however, did not preclude scientific pursuits, and in 1779 he was elected a fellow of the Royal Society. Among the subjects of which he made special study were ballistic experiments, a differential thermometer, and light-house improvements. A few years later he was introduced to Prince Maximilian, afterwards Elector of Bavaria, and entered the service of that state as minister of war, grand chamberlain, and principal adviser to the elector. In 1791 he was created a count of the Holy Roman Empire, choosing his title of Rumford from his Amer. associations. In 1795 he again visited England and devoted himself to the problems of smoke abatement. In 1799 he co-operated with Sir Joseph Banks in projecting the estab. of the Royal Society. T. himself selected Sir Humphry

Davy as the first scientific lecturer there. He was the founder and first recipient of the Rumford Medal of the Society. His complete works were pub. by the Amer. Academy of Arts and Sciences at Boston in 1872.

Thompson, Elizabeth see BUTLER, ELIZABETH SOUTHERDEN, LADY.

Thompson, Sir Edward Maunde (1840–1929), Eng. librarian and palaeographer, b. in Jamaica and educated at Rugby and Univ. College, Oxford. He was a co-founder of the Palaeographical Soc., in 1873, of which he became president in 1903. T. was keeper of MSS. in the Brit. Museum (1878), librarian (1888), and one time director there. His chief works are: *Handbook of Greek and Latin Palaeography* (1893), on the course of development of the handwritings of former ages; and *An Introduction to Greek and Latin Palaeography* (1912). He ed. and pub. a number of MSS. from the Brit. Museum.

Burns Oates & Washbourn.

FRANCIS THOMPSON

Thompson, Francis (1860–1907), Eng. poet and writer, b. at Preston, Lancs. He was educated atshaw College, near Durham, and afterwards studied medicine at Owens College, Manchester, but failing to take a degree he sought his fortune in London. Here he spent some years in various occupations, until in 1893 he sent a poem to the magazine *Merrie England*. This was at once recognised by Willrid Meynell as a work of merit, who rescued T. from destitution and helped him to publish his first vol. of *Poems*, which were praised by Coventry Patmore in the *Fortnightly Review*. This vol. was followed by *Sister Songs* (1895) and *New Poems* (1897), both of which gave him a recognised place among poets. The most famous of his poems is *The Hound of Heaven*. He also gained a reputation as

a prose writer, and pub. *Health and Holiness* (1905), a treatise dealing with the ascetic life, and an *Essay on Shelley* (1909). *The Works of Francis Thompson* in three vols. were pub. in 1913; *Collected Poetry* in 1924. See J. Thompson, *Francis Thompson, Poet and Mystic*, 1923; E. Meynell, *The Life of Francis Thompson*, 1926; R. L. Megroz, *Francis Thompson, Poet of Earth in Heaven*, 1927; also lives and studies by F. Olivero, 1935 (Eng. trans. 1938), and T. L. Conolly, 1944.

Thompson Submachine Gun, see under SUBMACHINE GUN.

Thoms, William John (1803–85), Eng. antiquary and miscellaneous writer, b. at Westminster, was for some years a clerk in the secretary's office of Chelsea Hospital, and was appointed Clerk in 1845, and subsequently deputy librarian to the House of Lords. He was founder in 1849 of *Notes and Queries*, which for some years he also edited. He also ed. Stow's *London*, (1842), and was secretary of the Camden Society. He introduced the word 'folklore' into the language.

Thomsen, Hans Peter Jörgen Julius (1826–1909), Dan. chemist, passed his life in Copenhagen, teaching chemistry at the Polytechnic (1847–56) and Military High School (1856–66), before he was appointed to the chair of his science in the University (1866–91). He was awarded the Davy Medal in 1883 and became a member of the Royal Society in 1902. His name is famous for his work on thermochemistry. *Thermochemistry* (1908), an abstract of his *Thermochemische Untersuchungen* (1882–86). He also made accurate determinations of the atomic weights of oxygen and aluminium.

Thomson, Sir Charles Wyville (1830–82), zoologist, b. at Bonnyside, W. Lothian; educated at Edinburgh Univ., he became prof. of zoology at Cork, at Belfast and, from 1870, at Edinburgh. He is chiefly remembered as director of the scientific staff in the *Challenger Expedition* (1872–76). Knighted in 1876. He wrote *The Depths of the Sea* (1872) and *The Voyage of the Challenger* (1877).

Thomson, Elihu (1853–1937), Anglo-Amer. electrician and inventor, b. in Manchester, and moved to the U.S.A. with his parents while a child. He was educated at the Central High School in Philadelphia. From 1875 to 1880 he was prof. of mechanics and chemistry at this institution. From 1880 he was chief electrician for the Thomson-Houston Co. and the General Electric Company, which under his inventions operate more than 600 patents. Besides numerous inventions in electric lighting and dynamo making, he was the discoverer of the method of electrical welding. He was the first to utilize a magnetic field to move an electric arc, made the first high frequency dynamo, invented the electric watt-hour meter, and was the first to make stereoscopic X-ray pictures. He was presented with medals by most of the great societies of the world, among them the Rumford medal in 1902, the Hughes medal of the Royal Society in 1916, the Kelvin medal in 1924, the

Franklin medal in 1925, and the Faraday medal, 1927. He was an hon. member of the Royal Institution.

Thomson, Sir George Paget (b. 1892), British physicist; b. at Cambridge, the son of Sir J. J. Thomson, the discoverer of the electron. Elected a fellow of Corpus Christi College, Cambridge, in 1914, he served in France 1914-15, and worked on aerodynamical problems from then until 1919, when he returned to Cambridge. From 1922 to 1930 he held the chair of Natural Philosophy at Aberdeen, and since 1930 has been prof. of physics at the Imperial College of Science and Technology, London.

De Broglie's view that electrons possess not merely the properties of discrete particles but also have many of the attributes of wave motion was strongly supported by experiments performed by T., who in 1937 and 1939 respectively was awarded the Nobel Prize for physics, and the Hughes Medal of the Royal Society. He was a member of the Aeronautical Research Committee 1937-41, and in 1943-44 acted as scientific adviser to the Air Ministry. From 1946-47 T. was scientific adviser to the Brit. delegation to the Atomic Energy Commission of the United Nations. His pubs. include *Applied Aerodynamics* (1919); *Wave Mechanics of the Free Electron* (1930); *The Atom* (1937); and *The Theory and Practice of Electron Diffraction* (1939).

Thomson, James (1700-48). Scottish poet, b. at Edinm in Roxburghshire, was educated at Edinburgh Univ., where he occupied his leisure in writing great quantities of verse, of which three poems appeared in the *Edinburgh Miscellany* of 1720. He had originally some intention of entering the ministry, but he abandoned all thought of this, and in 1725 went to London to pursue a literary career. He became a tutor to Thomas Hamilton (afterwards seventh earl of Haddington), and made the acquaintance of many of the leading men of letters. He pub. u 1726 *Winter*, which was highly applauded, and thus he followed in the next year with *Summer*. *Spring* appeared in 1728, and two years later he repub. these three poems, adding to them *Autumn*, under the title of *The Seasons*. He subsequently carefully revised this work, but it was not brought out in its amended form until 1744. T. in 1730 had his play *Sophonisba* produced at Drury Lane, but in spite of its many merits it was not successful. In 1731 he accompanied the 'son of Lord Chancellor Talbot on the 'grand tour.' This inspired the poem *Liberty* (1734). *Agamemnon* (1738) was his next work, and in 1740, in collaboration with David Mallet, he wrote *The Masque of Alfred*, which is famous because therein first appeared the undying ode 'Rule Britannia.' It is virtually certain that T. was the author of 'Rule Britannia,' though Mallet's claims to it have been discussed. Since 1738 T. had been in receipt of a pension from Frederick, Prince of Wales, and in 1744 was given by Lyttelton the sinecure office of surveyor-general of the Leeward Is. His later works include the

plays *Edward and Eleonora* (1739), *Tan-*

buried in Richmond Church. When T. began to write, Eng. poetry was dominated by artificiality, and Pope was the prin. living poet; but T. introduced the true, simple, romantic treatment of nature, and his influence on his contemporaries, as on his successors was unbounded. T.'s *Works* were first collected in 1763. The Oxford Ed. of the poetical works is by J. L. Robertson (1908). See lives by R. Shiel, 1753, S. Johnson, 1781. G. C. Macaulay, 1908.

Thomson, James (1822-92), British physicist, was also an engineer, inventor, and geologist. He was prof. of civil engineering at Belfast (1857-73) and Glasgow (1873-89), and was the first to demonstrate the possibility of lowering the freezing-point of water, etc., by pressure.

Thomson, Sir John Arthur (1861-1933), Brit. naturalist, b. in E. Lothian. Educated at the Univs. of Edinburgh, Jena, and Berlin. Sometime lecturer in zoology and biology in the School of Medicine, Edinburgh, he was also Regius prof. of natural hist., Aberdeen, 1899-1920. Author of: *Study of Animal Life* (1892) (rev. 1917); *Herbert Spencer* (1906), *Darwinism and Human Life* (1910) (rev. 1916), *Biology of Birds* (1923), *Science and Religion* (1925); *Outline of Biology* (1930); *Biology for Everyman* (1934). He was knighted in 1930.

Thomson Effect, see ELECTRICITY, *Thermo-Electricity*

Thomson, Sir Joseph John (1856-1940), Brit. physicist; b. near Manchester, eldest son of J. J. Thomson. Educated at Owens College and Trinity College, Cambridge, where he was Second Wrangler and second Smith's prizeman, 1880. Lecturer at Trinity College, 1883, and Master of Trinity College and Prof. of Physics, his association with Cambridge lasted throughout his life. In 1884 he succeeded Lord Rayleigh as Cavendish Prof. of Experimental Physics (1884-1918). To T. belongs, by general consent, the credit for the discovery of the electron, following researches in which he estab. that electricity has mass. His book, *Application of Dynamics to Physics and Chemistry* (1886) was to a great extent the foundation-stone on which the study of physical chemistry was built. This was followed by numerous papers on electrical theory and experiments on gases. After Röntgen had demonstrated the existence of X-rays produced by substances struck by cathode rays, T. assisted by Rutherford then a young -urch student from New Zealand) adapted the discovery to his own use and used the X-rays for producing more controllable electrified gas. Through his researches in this field he proved that all matter is made of electricity and that electricity is atomic in nature. His subsequent researches into the nature of electricity resulted in the development of the study of atomic physics, in which T. as a pioneer, gained international recog-

nition from the scientific world. He was awarded the O.M. in 1912, and was president of the Royal Society from 1916 to 1920. His pubs. include: *On the Motion of Vortex Rings* (1883); *Application of Dynamics to Physics and Chemistry* (1888); *Elements of the Mathematical Theory of Electricity and Magnetism* 1895; *The Discharge of Electricity through Gases* (1898); *The Conduction of Electricity through Gases* (1903); *Corpuscular Theory of Matter* (1907); *Thermochemistry* (1915); and *The Electron in Chemistry* (1923). See life by Lord Rayleigh, 1942.

Thomson, William, see KELVIN, BARON.

Thor, god of thunder, see MYTHOLOGY.

Thoracic Duct, duct which conveys the greater part of the lymph and chyle into the blood. It is the common lymph trunk of the body except for the right upper extremity, right side of the head, neck, and thorax, right lung, right side of the heart, and convex side of the liver. It does not, as its name would seem to imply, lie wholly within the thoracic cavity, but begins in the abdomen, on the front of the body of the second lumbar vertebra, by a dilatation known as the *receptaculum chyli*. It reaches the thorax by passing through the aortic openings in the diaphragm, passes upwards to the root of the neck, and then takes a curved course outwards and downwards, emptying itself into the left subclavian vein at its junction with the left internal jugular vein. The duct measures, in the adult, between 15 and 20 in. in length.

Thorax, see CHEST.

Thordsson, Sturla (1214-1284), nephew of Snorri Sturlason (q.v.), whose *Heimskringla* he is credited with having taken to Norway in 1263. He is famed for the supplement, *Skaldatal* ('list of skalds'), which he ordered to go with *Heimskringla*. T. was himself a very distinguished skald.

Thoreau, Henry David (1817-62), Amer. naturalist and author, b. at Concord, Mass., of mixed Scottish and Fr. descent. T. passed through school and Harvard Univ. without gaining any distinction. The two famous years of his life were those he spent as a recluse in his self-made shanty in the woods near Walden Pond (1845-47), and it is his *Walden* (1854) which reveals his curious and arresting originality. Here he lived happily on a bare pittance, indulging to the full his sympathies with bird and beast, and giving free rein to his fresh and noble but rather egotistic thoughts. Other writings are *A Week on the Concord* (1849); *Excursions* (pub. posthumously, 1863); *The Maine Woods* (1864); *Cape Cod* (1865). The standard ed. is the Riverside 10 vols. 1891, 1895; there is also a collection (*Journal omitted*), *The Works of Thoreau*, ed. by H. S. Canby (1947). See H. A. Page, *Thoreau, his Life and Aims*, 1878; also lives by F. B. Sanborn (1882); H. S. Salt (1890); F. H. Allen (1908); J. B. Atkinson (1928); W. White; (1939); and J. W. Krutch (1948).

Thorez, Maurice (b. 1900), Fr. politician, b. at Noyelles Godault, l'as de Calais, son of a coal-miner. He joined the Communist party in 1920 and was its leader

from 1936 to 1939. A military tribunal condemned him in absence for avoiding military service at the outbreak of the Second World War. He spent some time in Moscow, returning in 1944 to become a member of the consultative assembly and a minister of state under de Gaulle. He held various cabinet offices until 1947 when President Auriol removed Communist ministers after they had opposed the gov. of which they were a part.

Thorium, metallic element, symbol Th, atomic weight 232.2, atomic number 90. T. was discovered by Berzelius in 1828, and is obtained commercially from the monazite sand of Brazil, Malay, Travancore, etc. Thorium oxide, ThO₂, is extracted from the sand, and is used in the preparation of incandescent gas-manifests. Metallic T. is difficult to isolate, owing to its chemical activity, but it has been prepared pure by strongly heating thorium chloride with sodium in a vacuum. It is a greyish metal, melting at over 1800° C. When heated in air or oxygen it burns brilliantly. T. is radioactive, thorium atoms gradually disintegrating to mesothorium, thorium-x, thorium emanation, and so on, a final product which is one of the isotopes of lead. Helium is also given off.

Thorn, see TORUS.

Thornaby-on-Tees, par. and mun. bor. in the N. Riding of Yorkshire, with the co. bor. of Middlesbrough to the E. The riv. is the boundary with the mun. bor. of Stockton-on-Tees, Co. Durham. Charter of Incorporation granted 1892. Prin. industries: engineering and bridge-building, iron foundries, flour milling, sugar refining, and wire rope manuf. T.-on-T. is in the Parl. constituency of Middlesbrough W. Pop. 24,000.

Thorn Apple, see DATURA.

Thorncliffe, Dame Sybil (Mrs. Lewis Thomas Casson), (b. 1882), Eng. actress, b. at Gainsborough, Lincs; daughter of Arthur John Webster T., hon. canon of Rochester. Educated at Rochester High School. With her brother, she joined Ben Greet's Academy, her first professional appearance being in 1904 at Cambridge. After touring with that company in America for four years, she was with Mrs. Horniman's Manchester Co., 1908-09. Married in 1908, she joined the Chas. Frohmann repertory, 1910, and made an Amer. tour with John Drew, 1910-11. From 1914 to 1918 she played leading rôles at the Old Vic, and at the Little Theatre from 1920 to 1922. Her creation of the title rôle in Shaw's *St. Joan* in 1924 gained her wide recognition. Her range and quality have been shown in the classical parts of Lady Macbeth, Medea, and Lady Teazle, in Peer Gynt as Aase (1944), and in *The Linden Tree* (1947). She was created D.B.E. in 1931.

Thorne, mkt. tn. and rural dist. on the Don, with barge-building, mining, engineering, and textile industries, in the W. Riding of Yorkshire, Eng. Pop. of rural district 33,000; area, 38,419 ac. Pop. of tn. about 15,000.

Thornhill: (1) suburb with woollen and shoddy mills, S. of Dewsbury, in the W.

Riding of Yorkshire, England. (2) picturesque vil. with ruins in the neighbourhood of Dumfries, Scotland. Near it are Drumlanrig Castle, seat of the duke of Buccleuch and Queensberry; and Maxwelltown House, b.p. of Annie Laurie Pop. 1200.

Thornton, (1) vil. 4 m. S. of Fleetwood, on the Wyre, in Lancashire, England. It is now joined with the seaside resort of Cleveleys to form the urban dist. of Thornton Cleveleys. Pop. (1931) 10,144. (2) Former vil. 4 m. W. of Bradford, Yorkshire, and b.p. of the Brontës. In 1899 it was incorporated in the City of Bradford. Agriculture is carried on, and there are wooden and worsted industries.

Thornycroft, Sir William Hamo (1850-1925), Eng. sculptor; b. in London; son of the sculptor, Thomas Thornycroft (1817-55). Educated at Macclesfield Grammar School and Univ. College School, London. He helped his father with the Park Lane Fountain (removed in 1948) 1872, contributing Comedy, Shakespeare, and Fame. He won R.A. gold medal, 1875. Other works 'Lot's Wife,' 1878, 'The Mower,' 1884, in Walker Art Gallery, Liverpool; statue of Cromwell in front of the Houses of Parliament, and Gordon's statue in Trafalgar Sq. He was knighted in 1917.

Thorough-Bass (actually the old spelling of Through-B.), system of shorthand notation used by composers during the early part of the seventeenth century and persisted until about the middle of the eighteenth.

Thoroughbred, see under HORSE.

Thorow-wax, see RUPELURUM.

Thorshavn, cap. of the Faroe Is., is situated on the S.E. coast of Strøma. To the E. of Eystaravag are the remains of an auct. fortress, parts of which serve as prison and lighthouse. The prin. buildings are the church, the Parliament building, the governor-general's house, the library (and museum) and the theatre. In 1940 the Faroe Is. came under L.t. protection and during the war Thorshavn was a R.A.F. flying-boat base. Pop. 4000.

Thorwaldsen, Bertel (1770-1844), a Dan. sculptor, b. at Copenhagen, son of a poor woodcarver. He studied for a while in the school of art in his bp., and subsequently went to Italy, where he was influenced by Canova and where he remained for twenty-three years. Soon after his death a permanent exhibition of his work was formed at Copenhagen, while his statue of Byron is now at Trinity College, Cambridge. The Lion of Lucerne (see LUCERNE) is also his work. Thorwaldsen estab. an international reputation during his life-time, and examples of his monumental sculpture may be seen on buildings and in churches all over Europe. His art was dominated by classical Gk. and Rom. sculpture, and his artistic achievement is one of successful imitation and of skill rather than creative vision. See lives and studies by J. M. Thiele, 1852-56; A. Rosenberg (2nd ed.), 1901; and E. E. Douglas, 1933.

Thospia, see under VAN.

Thoth, Egyptian deity, resembling the Gk. god Hermes, and later identified with Hermes Trismegistus. He was the god of magic, science, and invention, and taught man how to write and calculate. He is represented with the head of an ibis, this bird being sacred to him.

Thothmes, Tethmosis, or Tehutmes, name of four kings of auct. Egypt, who belong to the eighteenth dynasty; *Thothmes I.* (c. 1540 B.C.) finally subdued and enlarged Cush or Nubia, fixed the boundary of his kingdom at the fourth cataract, and made successful campaigns as far as the Euphrates. He enlarged the Theban temple of Ammon or Amen at Karnak (*q.v.*), which gradually became the largest temple in the world. He was the first king to be interred in the valley of the tombs of the kings at Thebes. *Thothmes II.*, his son, reigned less than three years. *Thothmes III.*, the son of Thothmes II., did little till the death of his stepmother and aunt, the despotic Queen Hatshepsut. He fought successful campaigns in Libya, Ethiopia, and the revolted Syria, secured the Phœnician ports, and received ann. tribute from Crete, Cyprus, and the Ægean Isles. He built an enormous number of temples, his greatest work being the colonnade at Karnak, and set up sev. magnificent obelisks. His conquests enriched the country, and he proved an efficient administrator. He d. at a very advanced age. *Thothmes IV.* was a grandson of Thothmes III., and ruled till about 1400.

Thouars, tn. in the dept. of Deux-Sèvres, France, on the R. Thouet. Parts of the medieval walls are standing, and there are old churches and a castle. There is an active trade in grain, wine, oil, etc. Pop. 10,400.

Thought Reading, see PSYCHICAL RESEARCH; TELEPATHY.

Thourout, tn. of Belgium, in the prov. of W. Flanders. It holds large horse fairs and produces leather, cloth, chicory, etc. Pop. 10,578.

Thousand and One Nights, see ARABIAN NIGHTS.

Thracia, or **Thrace**, was in earlier times the name of the vast space of country bounded on the N. by the Danube, on the S. by the Propontis and the Ægean, on the E. by the Pontus Euxinus, and on the W. by the R. Strymon and the easternmost of the Illyrian tribes. It was divided into two parts by Mt. Hæmus (the *Balkan*), running from W. to E., and separating the plain of the lower Danube from the rivs. which fall into the Ægean. At a later time the name *Thrace* was applied to a more limited extent of country. *Thrace*, in its widest extent, was peopled in the times of Herodotus and Thucydides by a vast number of different tribes. The earliest Gk. poets, Orpheus, Linus, Musæus, and others, are all represented as coming from *Thrace*. The Thracian Chersonesus was probably colonised by the Gks. at an early period, but it did not contain any important Gk. settlement till the migration of the first Miltiades to the country, during the reign of Pisistratus. The first really historical

fact respecting the Thracians is their subjugation by Megabazus, the general of Darius. After the Persians had been driven out of Europe by the Gks., the Thracians recovered their independence; and at the beginning of the Peloponnesian war almost all the Thracian tribes were united under the dominion of Sitaces, king of the Odrysæ, whose kingdom extended from Abdera to the Euxine and the mouth of the Danube. Sitaces fell in battle against the Triballi in 424, and was succeeded by his nephew Seuthes, who raised his kingdom to a height of power and prosperity which it had never previously attained. Philip, the father of Alexander the Great, reduced the greater part of Thrace; and after the death of Alexander the country fell to the share of Lysimachus. It subsequently formed a part of the Macedonian dominions. T. was the centre of disturbances in more modern times. It was one of the theatres of war in the Balkan war of 1912, when the Bulgarians entered it and defeated the Turks. With the help of the Serbs Bulgaria took Adrianople, and nearly all T. was given to Bulgaria by the treaty of London signed in 1913. However, quarrels with her allies about the div. of the conquered terrs. led to the second Balkan War in 1913, when the Turks recaptured Adrianople and re-occupied Thrace. The treaty of Sept. 1913 gave Bulgaria her outlet to the Aegean Sea through Thrace. In 1919, after the First World War, the boundary was again changed, and the sea coast given to Greece, which obtained most of Thrace by 1920. In 1923, the treaty of Lausanne provided for the giving up to Turkey of E. Thrace as far as the Maritza, and W. Thrace, except Karagach, was given to Greece. Thrace in Greece has an area of 3,315 sq. m., and is divided into two prefectures—*Ileevros* (pop. 153,000), and *Rhodope* (pop. 201,800), total pop. (1940) 351,800. *Alexandroupolis* (17,800) and *Komotini* (32,900) are the respective caps. of the two prefectures. E. Thrace, or Turkey-in-Europe has an area of 9,256 sq. m. and a pop. (1945) of 1,497,000. It includes the cities of Istanbul and Edirne. Gk. Thrace was occupied by Gers. and Bulgarians in 1941 and annexed to Bulgaria until the 1944 armistice. During this period attempts were made to give the area a Bulgar character, these activities contributing to much unrest during the Gk. civil war which began in 1946. See W. Tomaschek, *Die Allen Thraker*, 1893; 94; A. J. Toynbee and others, *The Balkans*, 1915; F. Schevil, *The Balkan Peninsula*, 1922; *Treaty of Peace with Turkey*, signed at Lausanne, July 24th, 1923, 1923; *Cambridge Ancient History*, vol. 8, 1930.

Thrace-Illyrian Languages, see under INDO-EUROPEAN LANGUAGES.

Thrale, Henry (1728–81), Eng. brewer, famous as the host of Dr. Johnson. He inherited his father's brewery in 1758 and, in 1763, married Hester Lynch Salusbury, 'of good Welch extraction, a lady of lively talents, improved by education' (Boswell). T. and his wife were lifelong

hosts of Dr. Johnson at their home at Streatham Park. Three years after T.'s death, Mrs. T. married Gabriel Piozzi, a musician (see also PIOZZI, HESTER LYNCH).

Thrale, Hester Lynch, see PIOZZI.

Thrasea, P. Pæstus (d. A.D. 66), Rom. senator and Stoic philosopher in the reign of Nero, a native of Patavium. He made the younger Cato his model, of whose life he wrote an account. After incurring the hatred of Nero, he took his life by command of the emperor.

Thrashing, or Threshing, separation of the grain from the straw, or the seed from the haulm. Formerly the operation was performed by the flail, and this laborious but effective implement is still occasionally used by seed growers and on small holdings. The first workable threshing machine was invented by Andrew Meikle about 1786; the modern machine, besides effectively sorting out the products of the sheaf, delivers the straw unbroken and ready for trussing. The machine was at first worked by hand, then by portable steam engines which were drawn from farm to farm by horses until they were superseded by self-propelled steam engines. These, in turn, were followed by tractors, those with Diesel engines appearing to be the most suitable. Water power and even horse gears are occasionally employed, more especially with fixed machines. The corn is passed by hand or self-feeder into the drum mouth and is threshed out by beaters. The straw is passed out, after the grain has been shaken away, by means of riddles, an air blast from a fan, and rotary screens which grade the corn. The most common of the threshing machine's auxiliaries are the chaff cutter, for cutting oats or barley straw into short lengths for cattle feed; the straw tier, which produces bundles or trusses of straw for thatching etc.; the straw baler, which compresses the straw into wire-bound bales; and the huller, which is used for threshing very small seeds. The combine harvester cuts and threshes in one operation and has threshing mechanism similar to that of a stationary threshing machine. However, it is not always possible to produce clean grain because of the quantities of green weeds cut close to the ground which tend to clog the sieves in the machinery, and thus small pieces become included in the threshed grain; for this reason it may be necessary to pass the grain through a separate dressing machine. Since the grain is cut and threshed at the same time, and has no opportunity to dry naturally in the traves and stack (see REAPING), the moisture content may remain high. Unless the grain is then dried artificially in plant installed in the farm buildings for that purpose, it may heat or ferment when stored. The straw left by the combine tends to be much broken, but if wanted for litter or fodder, it can be collected by a pick-up baler or swept up to a stationary baler or stack. Otherwise it is left to be ploughed in or burnt.

Thrasimene, see TRASIMINE LAKE.

Thread, fine cord made by twisting the fibres of such substances as cotton, wool,

silk, and flax. The slightly twisted yarns used for weaving are strictly called Ts., but the term is more commonly applied to the stronger and more highly finished cords used for sewing, etc. The cotton or other material is first twisted into yarn, which is doubled upon itself and twisted in the opposite direction to the original twist. The product is then two-ply thread. To make a stronger thread, e.g., six-cord T., a number of two-ply yarns are twisted by the winding machine again in the opposite direction to the previous twist.

Thread (of sores), *see under* SCREWS, BOLTS, AND NUTS.

Thread Cells, Stinging Cells, or Cnidoblasts, occur in Coelenterates as cells with bulb-shaped structures (nematocysts) containing fluid and having the narrower end prolonged into a fine tube folded inwards in the cavity of the bulb as a spiral coil. Externally the cell bears a conical projection (cnidocil), and when a small animal comes in contact with this the fine tube turns inside out and is shot into the animal's body, becoming fixed by barbs at the base of the tube while poison passes through it. They are the stings of the jelly fish and are also well developed in the 'Portuguese Man-of-War' (Physalia).

Threadneedle Street, busy thoroughfare running W. from Bishopsgate to the Bank of England in the City of London. It received its name from the Merchant Taylors' Company. The Bank of England is sometimes called familiarly 'The Old Lady of Threadneedle Street.'

Thread-worms, *see* NEMATODES.

Threats. It is a felony either (a) *verbally* to accuse or threaten to accuse another of any infamous crime (e.g. murder, rape) with a view to extorting from the person so accused or threatened or from any other person any property, money, or valuable security, or (b) to send a letter containing T. to accuse another person of crime with intent to extort something of value; and so grave does the law regard this offence that a conviction may involve a sentence of imprisonment for life. The guilt or innocence of the recipient is material only in considering whether the intention of the prisoner was to extort money by his T., or merely to compound a felony (*see under* COMPOUNDING). Similarly it is a felony punishable with imprisonment for any term up to life to send a letter demanding with T. and *without reasonable cause* any money or other property. Sending a letter containing T. to murder a person, or to burn or destroy his house, or to maim his cattle, are all felonies punishable with ten years' imprisonment.

Three Choirs Festival, Eng. music festival estab. in 1724. It is held annually, in Sept., successively in the cathedrals of Hereford, Gloucester, and Worcester. New works from eminent contemporary composers have always been a feature of the T. C. F., the works of Parry and Elgar having especially been promoted there.

Three-Colour Process, *see under* PROCESS WORK.

Three Kings, Feast of, *see* TWELFTH DAY.

Three Mile Limit, *see* TERRITORIAL WATERS.

Three Rivers. (1) tn. of Michigan, U.S.A. with mineral springs and light car factories, on the St. Joseph R. Pop. 6700. (2) in Quebec, *see* TROIS RIVIÈRES.

Threnody (Gk. *threnos*, *thrénos*, wailing and *ōdē*, ode), song of lamentation, especially on a person's death. Gaelic literature supplies examples in the typical 'keens,' as e.g. the 'Keen on Art O'Leary,' originally pub. in Mrs. Morgan J. O'Connell's *The Last Colonel of the Irish Brigade* (1892). The true example of the spontaneous keen is in short broken lines, containing in quick, natural succession, appeals, reminiscences, laments, and moves backwards and forwards as the irregular promptings of grief and affection dictate without form or premeditation. *See also* DIRGE; GAELIC LANGUAGE AND LITERATURE.

Threshing, *see* THRASHING.

Thresher, *see* FOX-SHARK.

Thrift, or Sea Pink (*Armeria vulgaris*), summer-flowering perennial plant of the family *Plumbaginaceae*. It has slender stiff grass-like leaves growing in bundles from the woody branches of the root-stock. The soft funnel-shaped rosy flower heads rise on hairy slender stems from the tufts of leaves. T. grows wild on cliffs and rocks in seaside places, and also in int. dists.

Throat, the front of the neck; or the upper part of the respiratory passages in the neck. *See* PHARYNX, LARYNX, QUINSY, SORE THROAT, etc.

Thrombin; enzyme (organic catalyst), which brings about the clotting of blood by catalysing (speeding up) the conversion of *fibrinogen*, present in the blood plasma, into *fibrin*. The latter substance, as its name implies, is deposited as a fibrous network in which the corpuscles of the blood become entangled, the whole mass constituting the clot, whereby further loss of blood is prevented. Since blood does not normally clot whilst still circulating in the vessels, it is thought that T. is not present as such but in the form of its precursor, *prothrombin*. The damaged tissues of blood platelets at the site of a wound liberate *thromboplastin* which, under the influence of calcium salts, combines with *prothrombin* to form T.

Damaged tissues and platelets

The blood-sucking leeches are able to produce *hirudin*, which combines with *prothrombin* and hence prevents clotting. The clotting mechanism is disturbed in the conditions of (1) *thrombosis*, when it takes place in the vessels, and (2) *hæmo-*

philia, an inherited disease in which the blood continues to escape for a long period even from a small wound.

Thrombosis and Embolism, formation of a plug by the coagulation of blood or by depositions from it, and results from injury to the endothelial cells lining the walls of the vascular system. The clots are deposited on the injured wall, and serve as nuclei for further deposits. They obstruct the circulation, and may even completely close the lumen of the blood-vessel. Since blood flows more slowly through the veins, venous thrombosis is more common than arterial thrombosis. The extent of the injury caused by thrombosis depends on the size, situation, and condition of the thrombus. In a main vessel, the blockage may be fatal; in smaller vessels it usually results in the necrosis of the surrounding tissues. Septic thrombi cause local abscesses, and may give rise to empyema. Frequently by the movement of the blood or by disturbing body movements the thrombus, or pieces of it become detached, forming emboli, and the carriage of these in the blood-stream is termed embolism. Embolism may also be due to the occlusion of air, usually resulting from the exposure of a wound. Emboli of fat may be formed by the escape of fat from bone marrow when bone is badly fractured. Emboli may block the circulation at a point far removed from the situation of the thrombus, and, when septic, cause abscesses and empyema. An embolus blocking the pulmonary artery will cause sudden death, but in arteries with numerous branches comparatively little interference with circulation is caused by the obstruction of one branch. Obstruction of vessels at some distance from the heart may result in gangrene (*q.v.*).

Thronhjelm, see TRONDHEIM.

Thrush, species of inflammation of the mouth due to a particular fungus known as *Oidium albicans* or *Saccharomyces albicans*, and characterised by diffuse white patches. It generally occurs in feeble children, but adults, prostrated by wasting diseases, may also be affected by it. It is also a disease which affects the frog of a horse's foot.

Thrush (*Turdidae*), family of passerine birds of very extensive distribution and of omnivorous diet. The typical genus *Turdus* includes sev. Brit. species, such as the blackbird, the ring ouzel, redwing, and fieldfare, to which the name T. is not commonly applied. The song T. (*q.v.*), thrush, or mavis, is one of the best-known Brit. song-birds. The nussel T. or holm T. (*T. viscivorus*) is a larger bird with a slightly forked tail. It sings before and during storms.

Thucydides (c. 464 c. 404 B.C.), Gk. historian, the son of Olorus, or Orolus, and Hegesippyle, was a native of Attica. He is said to have been instructed in oratory by Antiphon, and in philosophy by Anaxagoras. He possessed gold mines in that part of Thrace which is opposite to the is. of Thasos, and here he was a person of the greatest influence. He commanded an Athenian squadron of seven ships at

Thasos (424), but failing in his attempt to save Amphipolis, he became an exile, probably to avoid a worse punishment. He spent twenty years in exile (v. 26), returning in 404 B.C., when a general amnesty was granted on the restoration of the democracy by Thrasybulus. According to some accounts, he was assassinated at Athens soon after his return; according to others, he d. at Thasos, and his bones were carried to Athens. At all events, his death cannot be placed later than 401.

The Peloponnesian war forms the subject of the hist. of T. Though he was engaged in collecting materials during the whole of the war, he does not appear to have reduced them into the form of a hist. until after his return from exile, since he alludes in many parts of it to the conclusion of the war (i. 13; v. 26). He did not, however, live to complete it: the eighth book ends abruptly in the middle of the year 411 B.C., seven years before the termination of the war. The object of the hist. was to give such a faithful representation of the past as would serve as a guide for the future (i. 22). His observation of human character was profound, and his painstaking accuracy and careful attention to chronology are remarkable. His strict impartiality is another feature of his work. His style is marked by great strength and energy, but he is often obscure, particularly in the speeches. J. M. Stahl's ed. of T. was pub. 1866-82, 1873-74. The Oxford text ed. by H. Stuart Jones was pub. 1898-1900. Jowett's trans. of *The Peloponnesian War* with analysis and notes appeared in 1881. A trans. by C. F. Smith is in the Loeb Library, and R. Crawley's trans. (1876) is reprinted in Everyman's Library. See G. B. Grundy, *Thucydides and the History of his Age*, 1911 (revised ed., with vol. ii, 1948), C. N. Cochrane, *Thucydides and the Science of History*, 1929; and A. W. Gomme, *A Historical Commentary on Thucydides*, 1945; also J. B. Bury's *Ancient Greek Historians*, 1909, and Sir R. C. Jebb's essay on the speeches of T. in *Hellenica*, 1880.

Thucydides, Athenian statesman who led the aristocratic party in opposition to Pericles. He was ostracised in 444 B.C.

Thugs, roving bands of fanatical murderers and robbers who used to infest parts of Central and N. India. Thuggery, as their system was called, had a religious basis, the murdered persons and a certain part of their belongings being regarded by the T. as sacrifices to the goddess Kali. The systematic suppression of the T. was begun about 1830 by Capt. W. H. Sleeman, Bengal Army (afterwards Major-Gen. Sir William Sleeman), and continued for many years afterwards; indeed the department for the suppression of Thagi and Dakaiti only came to an end in the present century.

Thujam see ARBOR VITAE.

Thule, (1) name generally given by the ancients to the most northerly part of Europe known to them. According to Pliny, it was an is. in the N. ocean, dis-

covered by the navigator Pytheas of Massilia, who reached it after six days' sail from the Orcaades. Müllenhoff plausibly identifies it with the Shetlands. Procopius and others use it to denote Scandinavia. The name T. appears to be merely a classic form of the Gothic *Tiel* or *Thiule*, 'remotest land.' The phrase 'ultima Thule' is commonly used to describe any far-away unknown region. (2) In Greenland, a Dan. possession, the most northerly settlement in the world. It has a hospital. Pop. 300. See also RASMUSSEN. See K. Rasmussen, *Greenland by the Polar Sea* (trans.), 1921, and A. Gilberg, *Eskimo Doctor* (trans.), 1948.

Thulium, metallic chemical element, symbol Tm, atomic weight 169.4, atomic number 69, belonging to the rare-earth group (*q.v.*). It was discovered in 1879 by Cleve, but was first prepared pure by James in 1911. Its salts are pale green in colour. T. is extracted from the minerals gadolinite, euxenite, etc.

Thulla, see ADULE.

Thumbscrew, iron instrument of torture for compressing or breaking the thumbs. It was used by the Sp. Inquisition and in the persecutions of the Covenanters in Scotland, where its last recorded use was towards the end of the seventeenth century.

Thun: (1) Lake of canton Bern, Switzerland, traversed by R. Aar, and also receiving the Simme. Length 10½ m.; average width, 2 m.; greatest depth, 700 ft.; altitude 1840 ft. (2) Tn. of canton Bern, on R. Aar, 1 m. below its exit from above lake. A trade centre, and has slate and brick works. Pop. 20,000.

Thunder, see LIGHTNING and THUNDERSTORMS.

Thunderer, The, see 'TIMES, THE.'

Thunderbolt, or **Thunderstone**, common name for objects once erroneously thought to have been formed by thunder and lightning, the belief being that thunder somehow sent forth a destructive bolt or dart (*cf.* Jupiter's levin bolts in *Æk.* mythology). A so-called thunderbolt is really a discharge of lightning from one part of the sky to another, and especially one to earth which does damage. Lightning in certain cases does leave behind it a vitrified tube, called a fulgurite (*see* FULGURITES), which, however, is not flung or darted, but is created by vitrification or fusing on the spot where it is found. The term thunderstone is used especially for objects having more or less a dart or arrow shape, for bleminites, for meteorites (*q.v.*), and the pyritous nodules to be found in cretaceous rocks. The thunderbolt myth recurs in many lands; but the Sioux 'among their varied fancies about thunder-birds (an imaginary bird in the mythology of races of low culture, and personifying thunder) and the like, give unusually well a key to the myth. They consider the lightning entering the ground to scatter there in all directions *thunder-bolt stones*, which are flints, etc., their reason for this notion being the very natural one, that these siliceous stones actually produce a flash when struck.' (Tylor, *Primitive Culture*.) In the traditions of

the Finns concerning purification by fire, it became expedient to find a substitute and hence the healing virtues of the thunderbolt were embodied in the *Keraunio* or thunderstones. The 'holy stones' of the A.-S., or 'holed stones,' arrow heads, flint knives and the like worked by prehistoric men, were popularly believed to be stones which, falling down from heaven possessed heavenly virtues, and were of use in all sorts of diseases.

Thunderstorm, rain, snow or hailstorm with thunder and lightning. Lightning is an electrical discharge which causes rapid expansion and contraction of the air producing the sound of thunder. Lightning travels at 186,000 m. per sec., the speed of light, but thunder only at 1100 ft. per sec. so that, although both occur simultaneously, thunder is heard some time later, 5 sec. for every mile away. Since different parts of the lightning flash are at different distances and heights, and the speed of sound decreases with height, the thunder is not normally heard as a single crack but as a succession of rolling sounds. As a rule thunder can only be heard at distances up to 10 m. but this varies with the conditions and thunder has on occasion been heard up to 300 sec. after the lightning flash—from 60 m. away.

Observations in America by a close network of ground stations and specially equipped lighter aircraft have shown that a T. consists of several convective cells each up to 5 m. in diameter starting with an up current extending up to more than 20,000 ft. often attaining more than 60 m.p.h. As this air rises its temp. soon falls to the dew point and below, and water droplets are condensed out forming cloud and eventually raindrops in great quantities. The maximum raindrop size is 5.5 mm. diameter with a maximum falling velocity through the air of 18 m.p.h.; after any further growth the raindrops are deformed and broken (*see* RAIN AND RAINFALL); so that they are carried up into the top parts of the cloud. From there, and even lower levels if the up current is slanting, the rain can fall into surrounding, initially drier, air into which it begins to evaporate. This air then becomes colder and heavier than its surroundings and generates a down current which appears at the surface as a cold gust or squall. Although much of the rain is evaporated in maintaining saturation of the down current most reaches the surface and the heaviest rainfall is observed in this region of cold air. When the down current reaches the surface it must spread out and can extend as much as 12 m. in advance of the T. It acts as a cold wedge and may give the initial up thrust to start new convection cells of the T. Eventually the up current in the older convection cell fades from the base upwards and the whole cell then consists of a down current before dying away completely.

Sir George Simpson's theory of the lightning that accompanies the storm attributes the origin of the formation of enormous charges of electricity to the breaking up of the raindrops. When a

raindrop breaks up the air in its vicinity becomes negatively charged, while the raindrop receives an equal positive charge. The negatively charged air rises more quickly than the drops, thus separating the charges which continues until at last the potential difference between the negatively charged layers and the positively charged drops, or between the drops and the ground attains the order of a million volts, when the insulation of the air breaks down and the discharge takes place.

Thurber, James Groves (b. 1894), Amer. cartoonist and humorous writer, b. in Ohio. In 1926, joined the staff of the *New Yorker*. His writings are illustrated by his own characteristic drawings and include: *Is Sex Necessary?* (with E. B. White), a satire on pseudo-scientific sex literature and *The Owl in the Attic and Other Perplexities* (1931); *The Seal in the Bedroom and Other Predicaments* (1932); *My Life and Hard Times* (1933); *The Middle Aged Man on the Flying Trapeze* (1935), satirising Falkner; *Let Your Mind Alone* (1936), satirising popularly-written works on psychoanalysis; *The Last Flower* (1939), an ironic allegory of modern war; and *The Male Animal* (with Elliott Nugent, 1940), a comedy.

Thurgau (Fr. *Thurgovie*), canton of N.E. Switzerland, having Lake Constance and the Rhine to the N. and N.E. Area 386 sq. m. It is watered by the Thur, Sitter, and Murg. Embroidery, spinning, and weaving are the chief industries. Cap. Frauenfeld. Pop. 138,000.

Thurifer (Lat. *thus*, incense, *fero*, I bear), that attendant or acolyte who bears the incense at services.

Thurii, more rarely **Thurium** (*Terra Nuova*), Gk. city in Lucania, founded in 443 B.C. near the site of the an. t. Sybaris. It was built by the remains of the pop. of Sybaris, assisted by colonists from all parts of Greece. Among these colonists were the historian Herodotus and the orator Lysias. The new city rapidly became one of the most important Gk. tns. in the S. of Italy.

Thuringia, name applied to a region of Central Germany, including the former minor states of Saxe-Weimar, Saxe-Coburg-Gotha, Saxe-Meiningen, Saxe-Altenburg, Schwarzburg-Rudolstadt, Schwarzburg-Sonderhausen, and two Reuss principalities. In April 1919 the two Reuss principalities merged into the one People's State of Reuss, and the Coburg state elected to merge with Bavaria. In the same year the seven Thuringian states combined into one, but in 1922 they divided into ten tn. and fifteen country dists. and one sub-dist. The tn. dists. were: Gera, Jena, Weimar, Gotha, Eisenach, Altenburg, Greiz, Apolda, Arnstadt, and Zella-Mehlis; the country dists., Stadtroda, Weimar, Eisenach, Meiningen, Hildburghausen, Sonneberg, Schleiz, Greiz, Altenburg, Gera, Saalfeld, Rudolstadt, Arnstadt, Gotha, Sonderhausen, and the sub-dist. of Camburg. T. became a land of the Russian occupation zone after 1945. The total area is 6099 sq. m. and the pop. 2,927,400. The Thuringian

Forest is a mt. range extending N.W. from the Frankenwald for 50 m. to the Werra, culminating in the Beerberg (3225 ft.), and the Schneekopf (3205 ft.).

Thurles, par. and mrkt. tn. of Tipperary, Eire, on the Suir. It is on the main Dublin-Cork road and rail routes. There are turf-bogs and coal-mines near by, and there is a sugar-beet factory. Pop. 6000.

Thurloe, John (1616-68), Eng. politician, was appointed secretary to the Council of State in 1652, in which capacity he revealed remarkable adroitness in unmasking the intrigues of the enemies of the administration. He sat in Parliament (1654-56), and in Cromwell's second council (1657), and was appointed governor of the Charterhouse (1657), and chancellor of Glasgow Univ. (1658). He opposed the Restoration, but was acquitted on a charge of high treason (1660), and subsequently wrote sev. papers on foreign affairs for the information of Clarendon.

Thurlow, Edward, first Baron (1732-1806), Eng. lawyer, b. at Bracon-Ash, Norfolk, son of a clergyman. Educated at Canterbury Grammar School and at Culus College, Cambridge, he was sent down for insubordination in 1751 without a degree. Called to the Bar, 1754, he distinguished himself at an early age in his legal career, taking silk in 1762. In 1768 he was returned to Parliament for Tavistock in the Tory interest, and his speech in the same year in the Douglas Peerage case greatly enhanced his reputation. As a zealous supporter of Lord North he became solicitor-general in 1770 and attorney-general the following year, supporting the gov.'s stand against the rights of juries in cases of libel and the liberty of the press. He won over George III by upholding his Amer. policy and sharing the king's hostility towards the N. Amer. colonies. In 1778 he became Lord Chancellor and Baron Thurlow, and while retaining office under the Rockingham Gov. he opposed all its measures in a spirit of violent factiousness and always in opposition for the king who was virtually his own Prime Minister and foreign minister. Under Fox and North, however, he was forced to resign, but returned to the Woolsack under Pitt when he once more began to undermine the influence of his colleagues. Eventually, when he openly attacked Pitt's National Debt Redemption Scheme, Pitt intimated to the king that either he or T. must go, and the king at length agreed to T.'s removal (1792). T. was a master of mordant wit, profane, vulgar, overbearing, and immoral, but 'no man,' said Fox, 'was so wise as Thurlow looked,' a gibe excited by T.'s physical appearance—harsh dignified features, piercing eyes under shaggy eyebrows. He was the patron of Dr. Johnson and of George Crabbe, and it is said that he was the first to discern the legal talent of Eldon. See J. C. Campbell, *Lives of the Chancellors*, 1845-69, and E. Foss, *Judges of England*, 1848-64.

Thurn and Taxis, Princes of, succession of princes who ruled over an immense

stretch of land in Central Europe. The most famous of them, Count Matthias, commanded the Bohemian forces at the time of the dispute over the Bohemian succession, and later served Denmark and Sweden, being finally imprisoned and released by Wallenstein. The Princes of Thurn and Taxis claimed an hereditary right over the administration of postal affairs in Central Europe, they having estab. posts as early as 1460. The last vestige of those rights disappeared in 1868 with their purchase by the N. Ger. Federation. See J. B. Mehler, *Das fürstliche Haus Thurn und Taxis*, 1899.

Thurrock, urb. dist. of Essex, created in 1936, by the amalgamation of the former urb. dists. of Grays, Thurrock, Tilbury, and Purfleet, and the rural dist. of Orsett, is one of the largest urb. dists. in England. Industries carried on in the area include oil refining and storage, manuf. of boots and shoes, cement, paper, margarine, and soap. At Tilbury are extensive docks and ship repairing workshops, and close by is Tilbury Fort, estab. by King Henry VIII. In Hamman's Wood, Little Thurrock, are a celebrated group of dene holes. A passenger and car ferry connects Tilbury with Gravesend on the S. bank of the Thames. Pop. (estimated, 70,000).

Thursday, fifth day of the week. It is named after Thor, the Scandinavian God of Thunder. In the Rom. calendar the fifth day was Jupiter's Day, *dies Jovis*.

Thursley (from Thors-lee, the name of a pagan god of pre-Christian times), vil. of Surrey, England, near Hindhead. It has a picturesque common and an old par. church which is partly Saxon. Iron was formerly worked in the vicinity. Pop. about 500.

Thurso, seaport and markt. tn. of Caithness, Scotland, on Thurso Bay. It was formerly a trading centre with Scandinavia, and now exports Caithness flagstones. Harold's tower, over the grave of Earl Harold, once owner of Caithness and the Orkneys and Shetlands, is near T. Castle, home of a branch of the Sinclairs. T. was once the centre of Norse power on the mainland when at its zenith in the early eleventh century and afterwards until the battle of Largs. The main industry is fishing, and it is also a holiday resort. Pop. 3,200.

Thyatira, see AKHISAR.

Thylacine, or **Tasmanian wolf** (*Thylacinus cynocephalus*), pouched mammal of Tasmania, somewhat resembling a wolf. The fur, however, is close and short, and the tail long and tapering; its fur is grey-brown and striped with black.

Thyme, or **Thymus**, genus of small prostrate aromatic plants (family Labiata), with rose-coloured, white, or heliotrope flowers. The two Brit. species are *T. chamaedrys* and the mt. T. (*T. serpyllum*), of which the lemon-scented T. of gardens is a variety. The T. used for seasoning and flavouring is *T. vulgaris*, a native of S. Europe.

Thymus Gland, temporary organ lodged partly in the anterior superior mediastinum, partly in the neck. It attains its

full development at about the end of the second year of life, after which it gradually atrophies, and at puberty has almost entirely disappeared. Its function is uncertain. A persistent T. G. in the adult has been considered (probably incorrectly) to be responsible for the condition of *status lymphaticus*, when death may follow any sudden exertion or shock. Recently the T. G. has been removed in the treatment of *myasthenia gravis*. See further under DUCTLESS GLANDS.

Thyroid Gland (*thyros*, shield, *ēidos*, form), one of the so-called ductless glands consisting of two lateral lobes, conical in shape, connected at about their lower thirds by an isthmus which passes transversely across the trachea. A third lobe called the pyramid sometimes arises from the upper part of the isthmus or from one of the lobes, generally on the left side, and ascends to the level of the hyoid bone. Occasionally this lobe is found to be detached. Structurally, it consists of follicles lined with epithelium, producing a peculiar yellowish, glue-like substance known as colloid. Its function is the production of the hormone thyroxine, which controls metabolism and mental activity. In amphibibia thyroxine causes metamorphosis, e.g. of the tadpole into the frog. Enlargement of the gland, which may be due to hypertrophy of any of its constituent parts, is called goitre, and is occasionally associated with a disease known as exophthalmic goitre, in which the eyeballs protrude. Cretinism or myxedema results when the secretion of the gland is deficient, and can be treated by preparations of T. G. of animals. See DUCTLESS GLANDS; THYROIDIA.

Thyrsus (Gk. *θύρσος*), wand carried by Dionysus and the Bacchantes when taking part in his orgiastic rites.

Thysanura, or **Bristle Tails**, order of wingless insects, with long, many-jointed feelers and small paired limbs on several of the abdominal segments. They occur under stones or in damp earth, and often in human dwellings, one especially favouring bakers' ovens. One of the best known is the 'silver fish' (*Lepisma saccharina*) often found among papers in drawers and cupboards.

Thyssen, Fritz (b. 1873), Ger. industrialist, b. at Mülheim, Ruhr, son of August T. (1812-1926), one of the founders of the Ger. steel industry. His father left him a 26 per cent interest in the vast Vereinigte Stahlwerke, or Ger. steel cartel, and he became its chairman of directors after 1926, with control of great iron and steel manufacturing plants. He had always been a nationalist and during the Fr. occupation of the Ruhr in 1923 he was court-martialled and imprisoned. He was among the first Ger. industrialists to aid Hitler's rise to power, and after Hitler became chancellor, T. was rewarded by the reorganization of his virtually bankrupt company at the expense of the Reich, becoming, in effect, economic dictator of the Ruhr industrial region, and also a member of the Prussian Council of State. He was also a member of the central com-

mittee of the Reichsbank and of the Reichstag. From 1936, however, he began to disagree with Hitler's policies and at the outbreak of war in Sept. 1939 he fled to Zurich. The Reich Gov. confiscated all his property in the following Dec. He wrote *I Paid Hitler* (1941).

Tian Shan, see TIENSHAN.

Tiara, papal triple crown, symbol of sovereign power, not sacred like the mitre. It is a high cap of gold cloth, encircled by three coronets and surmounted by a gold cross.

Tiber (Lat. *Tiberis*, It. *Tevere*), chief riv. in Central Italy, on which stands the city of Rome. It rises in two streams issuing from the Apennines near Tifernum, on the E. frontier of Tuscany, and flows S.W., dividing Etruria from Umbria. After flowing 110 m., it receives the Nera, and from its union with this riv. is navigable. Three m. above Rome it receives the Teverone, and within the walls of the city it is about 300 ft. wide and from 12 ft. to 18 ft. deep. The T. empties into the sea by two arms, enclosing a dismal morass, once known as the Sacred Isle or Isle of Venus. Length 245 m.

Tiberias. Tn. in Palestine. The auct. city lay on the W. shore of the Sea of Galilee. Herod Antipas founded a new city c. A.D. 26, and called it T. in honour of the Emperor Tiberius, his benefactor. It later became the cap. of Galilee, a position held previously by Seppholis. It continued to be the seat of gov. under Agrippa I. and under the Rom. procurators. After the destruction of Jerusalem (A.D. 70) it became a resort of the Jews. T. was the seat of a bishop under Constantine. It was taken by the Arabs in 637. Later, it was taken by the Tancred, who erected a church in the city, but lost by the Crusaders in 1187. The modern tn., Tabariyyeh, stands at the N.E. corner of the plain, some of the front walls actually rising out of the water. T., like tns. in Syria and Trans-Jordan, is built of black basalt, which gives it a sombre aspect. It is partly surrounded by walls and bastions, restored by Omar al-Daher. A new residential quarter has grown up outside the walls on the slopes to the N.W. of the old tn. To the S. of the tn. are the hot baths, famous for their curative properties in the Rom. occupation. The present baths were built by Ibrahim Pasha in 1833, during the Egyptian occupation, and additions were made in 1890 by the Turks. The therapeutic properties of the baths for rheumatism and skin diseases have long been recognised. The saline constituents of the water are chiefly sodium and calcium chloride and magnesium bromide, and the water is slightly radioactive. Below the baths is the tomb of the famous Talmudist Rabbi Meir, and to the N. of the tn. those of Maimonides and Rabbi Ben Akiba. At the N. end of Lake T. is Capernaum (Tel Hum), the synagogue of which has been excavated and re-erected.

Tiberine Republic, see UNDER ITALY, History.

Tiberiopolis, see VARNA.

Tiberius Claudius Nero (42 B.C.-A.D. 37),

Rom. Emperor, the stepson of Augustus. He was the son of T. Claudius Nero and Livia, afterwards the wife of Augustus. He was carefully educated and became well acquainted with Gk. and Lat. literature. At the age of twenty-two he was sent by Augustus to restore Tigranes to the throne of Armenia. In 13 B.C. he was consul with P. Quintilius Varus. Three years before this he had been given charge of the N. wars together with Drusus, and during the years from 12 to 9 B.C. he had conquered Pannonia. He remained in Germany until 6 B.C. in which year he obtained the *tribunitia potestas* for five years, and retired with the emperor's permission to Ithodes. He returned to Rome at the end of seven years, and in A.D. 4 he was adopted by Augustus. In the same year he took command of the Rom. armies in N. Germany, and here he remained during the next seven years. On the death of Augustus, Tiberius hurried home, and the skilful management of Livia secured the throne to him without opposition. Tiberius was suspicious in character, and he began his reign by putting to death Postumus Agrippa, the surviving grandson of Augustus. Then he proceeded to make himself absolute. Tacitus admits that from A.D. 14 to 23 Tiberius governed with justice and moderation (*Annals*, Bks. I.-III.), but ascribes the departure of Tiberius from Rome to a desire to give full vent to his sensual inclinations in private. Tiberius had long hated Rome, and in A.D. 26 he left it, never to return. He first went to Campania on the pretext of dedicating temples there, but in the next year he moved to Capri, an is. off the Campanian coast. Meanwhile his minister Sejanus, in whose hands the real gov. of the state had long rested, was plotting to obtain for himself the imperial power. In A.D. 31 he was put to an ignominious death, to which many of his friends followed him. On March 16 Tiberius d. at the villa of Lucullus at Misenum, having been smothered by the order of Macro, the prefect of the Praetorians. The character of Tiberius has been one of the most disputed points in hist. Tacitus and Suetonius unite in painting it in the blackest colours. He is defended by Dean Merivale in *History of the Romans under the Empire* (1850-62), and by E. S. Beesly in *Catiline, Clodius, and Tiberius* (1878). See S. J. Baring-Gould, *The Tragedy of the Caesars*, 1892; J. C. Tarver, *Tiberius the Tyrant*, 1902; G. P. Baker, *Tiberius Caesar*, 1929; F. B. Marsh, *The Reign of Tiberius*, 1931; and L. C. Douglas, *The Iobes* (novel), 1942.

Tibesti, mountainous dist. of the Sahara, in the region inhabited by the Tibbus. The camels are valued in E. Sahara, and the dist. also produces donkeys, goats, and sheep.

Tibet or Thibet, Tübet or Bod-pa, country in Central Asia, nominally a dependency of China. It is bounded by the Kwenlun Mts. on the N., separating it from E. Turkestan; by China on the E.; by the Himalayas on the S., separating it from India, Bhutan, Nepal, etc.; and by

Kashmir on the W. The boundaries are, in some cases, ill defined, as, e.g. in Bhutan, where the bamboo forests appear to be accepted as the limit between the Tibetan rule as, too, was Darjeeling.

T. may be divided into four major physical regions: (a) the N. Plains (Chang Tang), a tangled mass of plains and valleys, averaging over 16,000 ft. and rising sev. thousand ft. higher in its mt. peaks and ridges, the most important of which are the Nien-chen-tang-la and the Hlungpo-Gangri ranges. This region is bounded on the N. by Kunlun and the steppes of Tsaidam and extends S. to the valley of the Tsangpo; (b) S. T. consists of the valleys of the Upper Indus and Sutlej in the W. and the great valley of the Tsangpo in the S. and E. The three great rivs. all have their source in the same region, near the sacred lake of Manasarowar; (c) E. T. comprises the mts. and valleys lying between the Chang Tang and the Chinese frontier. On the E. slopes of the Chang Tang rise the great rivs. of S.-E. Asia, the Salween, Mekong, and Yangtze; somewhat to the N. the Hoang Ho; and (d) the great Tsaidam basin with the Tsaidam swamp and the Koko Nor basin to the N.E. The N. Plains are treeless owing to the great elevation; vegetation is scanty grass, but sufficient to graze large numbers of yaks, asses, goats, sheep, and other animals. Few potatoes can be grown, so that food for herdsmen has to be brought from other parts of the country. Hence most of this great region is uninhabited and forms one of the main barriers of Central Asia. S. T. is T. proper, known to the Tibetans as Po (in contrast to the Chang Tang of the N.) and here are found the chief tns., Lhasa, Shigatse and Gyantse; it also includes the seat of the Dalai Lama and his gov. E. T. is a land of considerable natural resources, grazing is abundant, agriculture is possible on a large scale, and mineral wealth is known to be considerable.

Gold is found in T., and according to some explorers there are rich deposits in N. and E. T. which have been scarcely touched. Mining is carried on in only a few places, and though some gold is exported to China it amounts to little. Iron pyrites are found and lapis-lazuli and mercury in small quantities, also salt and borax among the lakes of the N. The climate varies considerably, though for the most part cold and dry. It is influenced by the S.W. monsoon, and high winds are frequent. In certain dists. the rainfall is very high and in parts extremes of cold and heat are felt. Sheep and cattle are reared, also goats, pigs, and poultry; and horses, mules, and donkeys are used. There are innumerable species of wild animals, including the yak, leopard, deer, antelope, bear, wolf, etc., and rare kinds of pheasants and partridges are also found.

Trade is carried on principally with China, Turkestan, Mongolia, India, and Indo-China. The Tibetans are keen traders, and the country is well supplied with trade routes. There is the Srinagar-Leh-Shigatse route, which is joined at

E. N. A.

TIBET. THE SHIGATSE-DZONG, OR LAMASERY OF SHINING CRYSTAL

Leh by the 'Hindustan-Tibet' road via Simla. But the most important route from India is from Kalimpong (Darjeeling dist.) across the Dzelep La via the Chumbi valley to Phari and thence by two routes to Lhasa. From Lhasa a great route strikes N. past Nagchuka and the Chang Tang, eventually reaching Urga. From Lhasa also a well-used route goes to Chamdo whence yet other routes branch off to Litang and Dango for Tatsienlu. Tatsienlu is an important entrepôt of trade and lies on the ethnographic frontier between T. and China. Here the wool of Tibetan sheep is exchanged for Chinese tea, which the Tibetans prefer to Indian. Twice a year caravans assemble for mutual protection near Koko Nor, and merchants and pilgrims together make the adventurous crossing to Lhasa.

The chief imports are silk, carpets, gold lace, tea, porcelain, leather, cotton goods, horses, and sheep, and the chief exports are wool and woollen goods, salt, rugs, furs, drugs, borax, and some gold and silver.

The people of T. are of Mongoloid origin, as far as is known, and they speak Tibetan, which is allied to Burmese, and comprises a number of dialects. The religion of the country is Lamaism (q.v.). Polyandry is a custom of the people, all the brothers in a family having the same wife, but this custom is not widespread. The country is divided into five prov., Amdo, Kham, Wu (which includes Lhasa), Tsang, and Nari. Once dependent on China, the real rulers of T. are the Lamas, whose authority is vested in the Dalai Lama at Lhasa. At Lhasa there

is a national assembly, or *Tsongdu*, which settles all the important affairs of state, and is responsible for the foreign policy of the country.

The mysterious land of T. from very early days was the objective of explorers. Its inaccessibility and the exclusiveness of its inhabs. merely operated as a spur to explorers, who knew that the rivs. which have their source within its mt. fastnesses have become the sacred rivs. of Hinduism and that the country was also the site of many of the most sacred shrines of Buddhism. Up to the time of the Brit. expedition of 1904 no European had succeeded in penetrating to Lhasa. In 1894 foreigners were allowed to advance as far as Yatung to the N. of the Himalayan state of Sikkim for trade, but the trade with what, before 1947, was Brit. India always remained small, T. continuing to derive the bulk of the tea it consumed in the form of brick tea by difficult routes from W. Szechwan. T. and India were linked by telephone in 1922. A line also exists between Lhasa and Gyangtze. The whole area of T. is between 700,000 and 800,000 sq. in., with a pop. estimated at between 4,000,000 and 5,000,000, the majority of whom live in the dists. between Lhasa and the Chinese border.

History.—Of the early hist. of T. little is known. In 639 Srongtsangampo founded Lha-ldan, which later became Lhasa, and also introduced Buddhism into the country. From the fifth to the tenth century A.D. T. was a monarchy, which eventually disintegrated owing to opposition among the nobles to the increase of temporal power among the priesthood. This period of disunion lasted from the tenth to the thirteenth century. The greatest figure of this time was Atisha, the Indian Buddhist, who came to T. in 1026. In 1253 all the E. part of the country was conquered by Kublai Khan, and it was he who first placed the gov. in the hands of the lamas. The first priest-king was the abbot of the Sakya lamasery, but in the seventeenth century the Sakya line was overthrown by Nga-Wang Lob-sang, abbot of the Drepung lamasery, and he inaugurated the present line of rulers, the Dalai Lamas. It was not until 1720 that the country was finally brought under Chinese rule. In 1774 Warren Hastings made amicable contacts with the Tesho Lama, then regent of T. But these came to nothing of a permanent nature owing to Tibetan suspicion that the Eng. had fomented a Nepalese invasion of T. in 1792, and throughout the nineteenth century it proved impossible to come to any sort of agreement at all. India had always been anxious to open up trade with T., and between 1872 and 1886 three different missions were organised, but were abandoned. In 1888 the Chinese invaded Sikkim and a military expedition was sent to drive them out, which resulted in a treaty (1890-93). The lamas not having been consulted in the matter, they took offence, and revenged themselves by trying to bring about a treaty with Russia. Further inroads were made into Sikkim, and Lord Curzon, then viceroy of India,

came to the conclusion that strong measures were necessary. Col. (afterwards Sir) F. E. Younghusband was sent with an escort to see if he could come to terms, but he was unable to do anything. It was then decided to send an armed expedition, and in Dec. 1903 Col. Younghusband, with Gen. Ronald Macdonald in command of the troops, set out, and after some severe fighting they reached Lhasa on Aug. 3, 1904, and the Dalai Lama fled. Peace was concluded in Sept. by a treaty which provided against further incursions into Sikkim and estab. Brit. trade marts, and also prevented any foreign power receiving concessions in the country; the Tibetans also had to pay an indemnity. China concurred in this in April 1906. A treaty with Russia was concluded in the following year, in which it was agreed that no concessions should be sought by either power, and no expeditions dispatched without the consent of both countries, for a term of three years and Chinese suzerainty over T. was recognised. In 1908 the Dalai Lama was reinstated in Lhasa by Chinese authority; but in 1910 he was deposed and fled to Brit. protection in India. After the Chinese revolution of 1911 the Chinese agreed (1912) to leave the country and the Dalai Lama returned. In July 1912 the Chinese Gov. sent out another expedition with the object of reconquering T., but in consequence of a memorandum sent to China by the Brit. Gov., drawing attention to the Anglo-Chinese treaty of 1906, it was withdrawn. A conference was held at Simla, 1913-14, between England, China, and T., but the convention which was then drawn up assuring autonomy to T. was not ratified by China. Further trouble arose between T. and China in 1917, and in 1920 Sir Charles Bell (Brit. representative at Lhasa) was invited to negotiate a peace at Lhasa. No final settlement was reached.

In 1933 the thirteenth Dalai Lama d., and a regent assumed control. In 1939 a new and very youthful Dalai Lama was discovered and installed with all the customary ceremony. The Tibetan Gov. admitted to Lhasa a Chinese mission of condolence on the death of the thirteenth Dalai Lama, and since 1939 the Republic of China has had a representative at Lhasa. The regent, who acts on behalf of the minor Dalai Lama, the temporal and spiritual head of the country, is assisted by a council (*Kashag*) of four ministers (*Shaps*). There is also a national assembly (*Tsongtu*) an advisory body containing most of the monastic and lay officials. In 1950, the rise of an apparently strong and centralised Communist regime in China appeared to offer a grave threat to Tibetan independence. Should Communist China absorb T., India would have a Communist country directly on her frontiers. As late as Nov. 1949, however, official Indian opinion remained outwardly conciliatory, admitting China's special ties with T. in the past, but firmly upholding present Tibetan autonomy, and stressing T.'s direct relations with India.

Archæology.—An examination of the

wooden pillars in the halls of the two famous temples of Lhasa, the Tsuglakhang and the Ramoche strengthens the supposition that both buildings are the work of Nepalese craftsmen of about the thirteenth century. Only a few of the old frescoes are traceable, having been repainted in recent times. In Yerpa, on the road to Ganden, in a valley which opens a few m. E. of the capital on the R. Kichu are some very fine statues dating from the twelfth century and believed to be either Indian or influenced by Indian art. The place is famous from the fact that a great Indian teacher, who played a prominent part in introducing Buddhism into T. in the thirteenth century, passed much of his lifetime in that wilderness. In Ganden is the tomb of the reformer, Tsoukhapa, founder of the Yellow Church. The Kichu, where it enters the Tsampo (Tibetan name for the Brahmaputra) passes a number of places of much historical interest, such as Ramagan, with ninth century inscription; Usan, where the famous ninth century Sanskrit-Tibetan dictionary was written; Samye, built in the eighth century, noted for its temple inscriptions and statues of Indian workmanship. In the valley of On are two notable lameries: that of Ngari Takteang of the T'ang period, and that of Choding famous as the habitat of Tsoukhapa. Some distance to the N.E. is the lamery of Zuehi, sacred to Tibetans for the image of Maitreya—the Buddha to come who now dwells in a heaven, awaiting his descent upon earth. Southward along the R. Chongchic, lies Changchic, where in the stronghold of the local sixteenth century princes the fifth Dalai Lama was born, one of the leading personalities of T. According to tradition the tn. is famous for the tombs of the Tibetan monarchs: they are natural hillocks eroded by the waters and then adapted by man. One of them is the tomb of Strongtsangampo, the real founder of the Tibetan power in the seventh century (see 'Hidden Treasures of Tibet,' by Prof. Giuseppe Tucci, in *The Times*, July 19, 1949).

Literature.—Tibetan literature began with the introduction of Buddhism and the trans. of the Indian classics. A second period began in the fifteenth century, mainly under Chinese influence, but Tibetan literature has never lost its religious character. Two of the most sacred books are the *Kangjur*, or the Canon of the Buddhist law, trans. from the Sanskrit, and the *Tengjur*, a commentary upon the Canon in 225 vols. It is not known when printing or xylography was introduced into T. The text is printed from wood blocks on large sheets of paper, which are not bound, but placed between boards and wrapped in silk. A Tibetan book may weigh some thirty pounds. Apart from the sacred writings, T. is rich in folk-lore, short stories, and fables, handed down orally from generation to generation. The love of theatrical performances among the Tibetans has produced a stock of religious, historical, and fairy plays.

Art.—Tibetan painting is a sombre reflection of Lamaism, the earliest portrait being that of the goddess Tara, dating probably from the tenth century. The demonic subjects of Tibetan paintings are generally luridly depicted, while later Lamaistic paintings of a lighter character lose even this distinction, and have been pronounced as merely 'provincial Chinese art.' Tibetan architecture from an early time assumed an imposing style. Whence it originated is not known. It is distinguished for its solidity and massive design. Of old buildings still standing, the Jo Khang, the Lhasa Cathedral, and the huge lamasery of Samye may be mentioned. In the applied arts great skill and beauty were attained in the production of metal-ware, jewellery, and decorated swords. Most household utensils are of metal, chiefly copper, or wood, and the best worked metal-ware comes from the Derge dist. of Kham.

See Sven Hodin, *Central Asia and Tibet*, 1903; *Trans-Himalaya*, 1909-13; F. Grenard, *Tibet: The Country and its Inhabitants* (Eng. trans., 1904), (contains a long general account of the country); Sir F. E. Younghusband, *India and Tibet*, 1910; E. Teichman, *Travels in Eastern Tibet*, 1922, and 'Journeys through Kani' (Eastern Tibet), *Geographical Journal*, vol. lx., 1922; F. Kingdon Ward, *The Mystery Rivers of Tibet*, 1923; J. W. and C. J. Tibetan Hound, anct. breed of dog, used in Tibet as a watch-dog; it is a very powerful animal with a long coat. Mentioned in old Chinese literature and by Marco Polo, the T. H. is regarded as the ancestor of many present breeds.

Tibeto-Chinese Languages, see under LINGUISTIC FAMILIES.

Tibullus, Albius (c. 54-c. 18 B.C.), Rom. poet, was descended from an equestrian family, whose estate was at Pedum, between Tibur and Praeneste. In the year 28 B.C. he followed his patron, Messala, into Aquitania and thence into the E., but was taken ill at Corcyra and had to return. His poetry, addressed to two mistresses under the names of Delia and Nemesis, has little ardour, but is marked by its air of gentle tenderness and self-abnegation; on the other hand his bucolic elegies are some of the sweetest and best in the Lat. language. Horace was warmly attached to him. His tender

elegiac love poems, by their limpid clearness and remarkable finish, so probably justify Quintilian in putting T. at the head of all elegiac poets. The text of the poems was ed. by J. P. Postgate in Oxford Classical Texts, 1905, and with a trans. by him in the Loeb Library. The best eds. are by E. Bährns (1878) and E. Hüller (1885).

Tibur, see TIVOLI.

Tic Douleureux, see NEURALGIA.

Tichborne Case, one of the most celebrated trials in the annals of the Eng. criminal law. The prisoner, Thomas Castro, otherwise 'Bullocky Orton,' the big butcher of Wapping, was tried and convicted for perjury in putting forward in the civil courts a bogus claim to the Tichborne title and estates (1872). Not only did Orton, in posing as Sir Roger Tichborne, son of Sir J. F. Doughty Tichborne (d. 1862), answer with astonishing skill every question put to him in the civil actions, but even the real Tichborne's mother at first 'identified' him as her missing son. The whole proceedings cost the Tichborne family some £70,000 in legal expenses. In 1874 Castro was sentenced on two counts to two *cumulative* terms of seven years' penal servitude each. See J. Brown, *The Tichborne Case compared with previous impostures*, 1874; and Lord Maugham, *The Tichborne Case*, 1936.

Ticinium, see PAVIA.

Ticino, or **Tessin**: (1) Canton of Switzerland, lying on the Italian slopes of the Alps. Area 1088 sq. m. In the S. it merges into the Lombard plain. It is watered by the Ticino and its tribs. Cereals, tobacco, fruit, chestnuts, vines, and silk are cultivated. It was taken by the Swiss from Italy in 1512 and joined the League in 1803. Pop. 162,000. (2) Riv. of Switzerland and Italy, which rises in the above canton near Nufenen Pass, flows through Lake Maggiore and between Piedmont and Lombardy, and joins the Po 3½ m. S.E. of Pavia. Length 150 m.

Tickhill, tn. and par. of the W. Riding of Yorkshire, England, 6 m. S. of Doncaster. There are ruins of a Norman castle, an Augustinian priory, a thirteenth-century hospital of St. Leonard, and a fourteenth-century church. Pop. 2400.

Tidemand, Adolf (1814-76), Norwegian genre painter, b. at Mandal. From 1832 to 1837 he was a pupil at the Copenhagen Academy and later at Düsseldorf under Hildebrandt and Schadow. After visiting Munich, Rome, and Norway, T. settled at Düsseldorf in 1846, where he contributed much to the fame of the Düsseldorf School, and was a friend of his compatriot Hans Gude. Together with him T. painted *Night Fishing* (1851), *Funeral on Sogne Fjord* (1852), and *The Marquess of Landsdowne*.

Tickell, Thomas (1685-1740), Eng. poet, b. at Bridekirk, Carlisle, was appointed prof. of poetry at Oxford Univ. in 1711. His complimentary verse *Rosamund* brought him into touch with Addison, who, on becoming secretary of state in 1717 made T. his under-secretary. He

wrote much minor verse. His longest work being *Kensington Garden* (1722). His most popular *Lucy and Colin* (1725), his finest, the elegy prefixed to this ed. of Addison's works (1721). See R. E. Tickell, *Thomas Tickell and the eighteenth-century poets*, 1685-1740 (1931).

Ticks, or **Ixodidae**, family of Acarina (Mites), with flat bodies protected by horny shields. During part of their existence they are blood-sucking parasites on animals and birds, for which they have developed a rostrum or beak composed of two barbed harpoons above and a dart below. Eggs are laid on rough herbage and hatch into white six-legged larvae, which climb up the legs of passing animals and in some species complete their life hist. on the coat, but in others return to the grass for a period. T. cause irritation and anaemia, but their chief danger to their hosts is in the introduction of parasitic protozoa, causing such diseases as Texas fever and redwater.

Ticonderoga, vil. of New York, U.S.A., in Essex co., situated N.W. of Lake George, with manufactures of paper and wood-pulp. Graphite is found near by. During the Fr. War T. was unsuccessfully attacked by General Abercrombie, and General Howe was killed here in 1758. It was taken, however, by Amherst in 1759. In the War of Independence it was taken by Americans under Ethan Allen (q.v.), in 1775, retaken by General Burgoyne, on whose surrender it was abandoned, and reoccupied by the Brit. in 1780. Pop. 3100.

Ticunas, Indians found in Brazil and Peru around the confluence of the Javary and Marañon.

Tides, regular disturbances of the fluids on the earth, produced by the action of the gravitational forces of the moon and sun. The earth, having a diameter of about 8000 m., is subject to a stress due to the different degrees of gravitational pull. Some evidence of tidal action in the atmosphere is barometrically shown, but even in the tropics where it is greatest the difference in pressure never reaches 0.1 milibars. The oceanic waters are markedly disturbed, and the predominating influence of the moon is shown by the usual interval of 24 hr. 51 min. between similar phases being identical with the average interval between two successive passages of that body across the meridian. The following elementary investigation shows some of the quantitative results of tidal forces.

Tide Raising-Force.—Let E and M be the centres of the earth and the moon, respectively, and let a plane through E and M intersect the surfaces of the earth and moon in the circles $NIZIP$ and QK , this plane lying in the plane of the paper (Fig. 1). Let r be the radius of the earth which will be assumed to be a sphere, and let ME , the distance between the centres of the moon and the earth, be R . Let M_e and M_m be the masses of the earth and moon, respectively, expressed in the same units (the unit is immaterial since only M_m/M_e is required). The attractive force of the earth on a unit mass anywhere

FIG. 1. TIDE-RAISING FORCE AND TRACTIVE FORCE

on its surface, say at Z , is g , where g is the force of gravity on the earth's surface. Since the attractive force varies directly as the mass and inversely as the square of the distance of the unit mass from the centre of the attracting body, $g = M_e/r^2$, provided a suitable choice of units is made. For the same reason the attractive force f of the moon on the same unit mass at a distance d from the moon's centre is M_m/d^2 . Hence $fg = M_m r^2 / M_e d^2$. If $d = R$, that is, if the mass is at the earth's centre, the moon's attractive force on it at the earth's centre is $M_m r^2 / M_e R^2$. It will simplify the problem if the mean distance of the moon from the earth is taken throughout the computations, that is about 240,000 m., which is practically sixty times the earth's radius. Also, the mass of the moon is nearly $\frac{1}{81}$ that of the earth, and substituting these constants in the above results, the attractive force of the moon on a unit mass at the distance of the earth's centre from the moon's centre is $g/81 \times 60^2 = 0.0000034294g$.

Now consider the attractive force of the moon on unit mass at Z ; the distance MZ is $59r$ and hence the attractive force is $g/81 \times 59^2 = 0.0000035466g$. Hence the difference between the attraction of the moon on unit mass at Z and unit mass at E is $0.0000035466g - 0.0000034294g = 0.0000001172g$, and this is the tide-raising force tending to move the unit mass away from the surface of the earth at Z . If the unit mass were on the other side of the earth at N , the moon's attraction on it is $g/81 \times 61^2 = 0.0000033178g$, which is less than that on the unit mass at the earth's centre, the difference being $0.0000001116g$. From this it is obvious that the tide-raising force at Z acts in the direction ZM and that at N acts in the direction MN , because the pull on the earth's centre in the latter case is greater than that at N . It will be seen that the differential attraction of the moon or its tide-raising force is about 114 in 1000 million which is nearly the same as 1 lb. in 4000 tons. Hence when the moon is in the zenith Z or the nadir N its lifting effect is about 1 lb. in 4000 tons, and a man weighing 12 stones would weigh about one-seventh grain less when the moon was in his zenith or nadir than he would when it was on his horizon at H or H' .

The Tractive Force.—The vertical

component of the differential force in the cases just considered is of no real importance in the production of T . We must turn to the tractive power of the horizontal components for this, and the following elementary investigation will show how this can be determined for any point on the surface of the earth. Take any point P on the circle $ZHNH'$ and join P to E and M (Fig. 1). Draw a line PL parallel to EM and let the angle PEM be ϕ . Then, if PD be drawn perpendicular to EM , $ED = R \cos \phi$ and $MD = ME - ED = R - R \cos \phi$. The attractive force of the moon on unit mass at P is $gr^2/81MP^2$, as previously shown, and this force must be resolved into two other forces at right angles to each other, the force along PL which is parallel to EM , and the force along PD . The first of these is $gr^2 \cos$

$\angle LPM/81MP^2$ and the second is $gr^2 \sin \angle LPM/81MP^2$. But $\cos \angle LPM = \cos \angle PMD = MD/MP = (R - R \cos \phi)/MP$; and $\sin \angle LPM = PD/PM$. Hence if $PM = x$, we obtain the following two expressions for the components of the moon's attraction parallel; to EM and at right angles to EM :

$$\frac{g}{81} \frac{r^2}{x^2} \left(\frac{R - R \cos \phi}{x} \right) \text{ parallel to } EM,$$

$$\frac{g}{81} \frac{r^2 \sin \phi}{x^2} \text{ at right angles to } EM.$$

It has been shown that the force at the centre of the earth is $gr^2/81R^2$ along EM , and the differences between this and the forces in the two directions already considered are, therefore, as follows:

$$\frac{g}{81} \frac{r^2}{x^2} \left(\frac{R - R \cos \phi}{x} \right) - \frac{g}{81} \frac{r^2}{R^2} \text{ parallel to } EM,$$

$$\frac{g}{81} \frac{r^2 \sin \phi}{x^2} \text{ at right angles to } EM.$$

The second force remains the same because the force along EM has no component perpendicular to EM . We shall deal with the first of these differential forces. Owing to the relatively great length of PM in comparison with PD the lines MP and MD can be considered as practically equal. Now $MD = R - R \cos \phi$ and $MP = x$, hence $x = R - R \cos \phi$, from which $R^2 - 2R \cos \phi + R^2 \cos^2 \phi = x^2$, or $R^2 - x^2 = 2R \cos \phi - R^2 \cos^2 \phi$. The force parallel to EM can be expressed in the form

$$\frac{gr^2}{81} \left(\frac{R - r \cos \phi}{x^3} - \frac{1}{R^3} \right) = \frac{gr^2}{81} \left(\frac{1}{x^3} - \frac{1}{R^3} \right) \\ = \frac{gr^2}{81} \left(\frac{x^2 - R^2}{R^3 x^2} \right)$$

It has been shown that $R^2 - x^2 = 2Rr \cos \phi - r^2 \cos^2 \phi$, and hence we have

$$\frac{gr^2}{81} \left(\frac{2Rr \cos \phi - r^2 \cos^2 \phi}{R^3 x^2} \right)$$

Since r is very small compared with R , $r^2 \cos^2 \phi$ in the numerator and denominator and also $r \cos \phi$ in the denominator can be ignored, being very small in comparison with the other terms, and the component force parallel to EM is $\frac{gr^2 2Rr \cos \phi}{81 R^4} = \frac{2gr^3 \cos \phi}{81 R^3}$. The component

at right angles to EM is $gr^3 \sin \phi / 81 R^3$, since x in the expression for this component can be replaced by R .

Fig. 1 shows these components acting at the point P in the directions $P'L$ and $P'D$. If PT is a tangent to the earth

at the point P then \widehat{EPT} is a right angle and is equal to \widehat{LPD} , and hence $\widehat{LPT} =$

$\widehat{EPD} = 90^\circ - \phi$, and $\widehat{TPD} = \phi$. The component $\frac{2gr^3 \cos \phi}{81 R^3}$ resolved along PT is $\frac{2gr^3 \cos \phi \sin \phi}{81 R^3}$ and the component $\frac{gr^3 \sin \phi}{81 R^3}$ resolved along PT is $\frac{gr^3 \sin \phi \cos \phi}{81 R^3}$. The sum of these two is $\frac{3gr^3 \sin \phi \cos \phi}{81 R^3} = 1.5 \frac{gr^3 \sin 2\phi}{81 R^3}$, which is the expression for the tractive force along the earth's surface.

If these components are resolved vertically upwards along the line PN , EPN being the vertical line through the earth's

centre, then since $\widehat{NPL} = \phi$ and $\widehat{TPL} = 90^\circ - \phi$, and the force along PD when resolved along PN acts in a direction opposite to the force along PL when resolved along PN , the resultant is $\frac{2gr^3 \cos^2 \phi}{81 R^3} - \frac{gr^3 \sin^2 \phi}{81 R^3} = \frac{gr^3}{81 R^3} (2 \cos^2 \phi - \sin^2 \phi)$. If $\phi = 0^\circ$ or 180° this last expression gives $\frac{2gr^3}{81 R^3}$ and if $\phi = 90^\circ$ or 270° it gives $-\frac{gr^3}{81 R^3}$. In the case of the horizontal component of the differential or tractive force when $\phi = 0^\circ, 90^\circ, 180^\circ$, or 270° it is zero. It reaches a maximum when $2\phi = 90^\circ, 270^\circ, 450^\circ$, and 630° , since in these cases $\sin 2\phi = +1$ and hence in these circumstances $\phi = 45^\circ, 135^\circ, 225^\circ$, and 315° . These are marked 1, 2, 3, 4 in Fig. 1.

Instead of $gr^3/81 R^3$, if we assume that R is always 60r this factor becomes 0.00000005716 and the maximum tractive force is $1.5 \times 0.00000005716g = 0.00000008574g$, which implies a force of about 1 lb. in 6000 tons. This is an indication of the relatively small force exerted by the moon in producing the tides. It is smaller still in the case of the sun as the following investigation shows. Instead of taking $gr^3/81 R^3$ for the moon, let R now denote the earth's mean distance from the sun, r as before being the earth's radius. The figures 81 must now be replaced by the ratio of the mass of the sun to that of the earth, or 333, 434, and since r/R is 0.000043, the cube of which is 79507×10^{-14} , the result is 0.0000000265g as compared with

0.0000000572 for the moon. This shows that the ratio of the tidal forces exerted by the sun and the moon is 265 to 572 or 1 to 2.16. We can say that the sun's tidal effect is about $\frac{1}{2}$ that of the moon.

The problem of the T. is one of the most difficult in the whole range of dynamical astronomy and an adequate account of the subject is quite beyond the scope of this article. Something may be said, however, about Bernoulli's *equilibrium-theory*, which, it must be pointed out, is not only inadequate but is based on erroneous principles which give high water under the moon, irrespective of the depth of the water. Bernoulli supposed the earth to have a spherical solid nucleus surrounded by a shell of water of uniform depth, and his theory is briefly as follows:

Fig. 2 shows clearly the combined effects for the statical problem with a uniformly ocean-covered earth and no friction. At new and full moon both bodies are attracting in nearly the same line and give spring tides (left hand); at first and last quarter the attractions are at right angles, and high tide appears under the moon; low, under the sun. These are the neap T. Spring T. which occur at new and full moon, give a higher tide than the average and also a lower one than the average; neap T. at the quarters are lower at high, higher at low tide, than the average. The principle here being that due to the moon, the sun raises the low at the expense of the high $\frac{1}{2}$. When the moon is in perigee spring T. are higher, and if this occurs about Jan. 1, when the earth is nearest the sun, the highest T. are produced; in each case low tide is correspondingly reduced. The relative heights of spring and neap T. are about 7 : 4.

Rise and Fall.—Since the earth with its waters is rotating, every place as it comes under the influence of external attraction has its waters gradually lifted to a maximum, then gradually dropped to a minimum. The *flowing* or *flood tide* is the former, the *ebb-tide* the latter movement. Alternating high and low T. should occur, according to Fig. 3, twice each in twenty-four hours; actually the average period is 24 hr. 51 min., since during the rotation the moon travels forward in its orbit, so that a place carried by the earth's rotation from high tide position completes a full rotation, but has to travel in addition another 12° or $\frac{1}{2}$ hr. before coming again under the moon.

Priming and Lagging.—The T. *prime*, or arrive early, at the time of spring tide, the average interval being about 24 hr. 38 min.; at neap tides the interval averages 25 hr. 6 min., and the T. *lag*. These differences are due to the constriction of solar and lunar T. At new and full moon, when these T. coincide, the crest would be under the moon; at quadrature the solar wave crest and trough combining symmetrically with the lunar trough and crest respectively, produce merely a difference in height, not a displacement. In other positions displacement will occur owing to the combination

of the lunar and solar crests. This gives high tide, if the sun's influence is exerted to the W. of that of the moon, about half an hour ahead for the angle 45° , three days after full or new moon. The half-hour is gained from diminished intervals for the three preceding days. When the solar crest occurs to the E. of the lunar within a quadrant, the combined crest is found further E. and is reached later by a similar interval, giving lag.

port; at New York it is 8 hr. 13 min., with a variation of 22 min. either way during the month; at London Bridge it is 1 hr. 58 min.; at Bristol, 7 hr.; at Yarmouth 9 hr.

Height of Tides.—In the open ocean no accurate determinations have been made, but 2 to 3 ft. is the average height. Shallow seas, by diminishing the velocity, increase the height, which may be exaggerated again by entry into converging

FIG. 2. OCEAN TIDES

Diurnal Inequality.—Twice a month the moon being at its farthest point N. (28°) of the celestial equator, the tidal wave crest is found in the N. hemisphere, its antipodal crest in the S. A sublunar place is carried round by the earth's rotation in a plane inclined at an angle to the diameter forming the crests, so that its record high tide is not at the antipodal crest but to one side of it, the second high tide being thus less than the first; this is known as the diurnal inequality.

The *theory of tides* has been worked out very completely by Sir George Darwin, with very many interesting and important results. For example, Lord Kelvin concluded, from an analytical study of thirty-three years' observation, that the earth as a whole must be more rigid than steel, but perhaps not quite so rigid as glass. The friction due to T. involves a loss of energy obtained from the earth's energy of rotation, and tends to retard it, thus lengthening the day by about 1 sec. in 120,000 years according to Dr. H. Jeffreys' theoretical investigations, confirmed by Dr. J. K. Fotheringham's work on the times of anct. eclipses. This retardation of the earth axial rotation implies less angular momentum in the earth-moon system, and to maintain the constancy of this angular momentum the moon must recede from the earth, thus lengthening the month. This forms the basis of Sir George Darwin's *tidal evolution theory*, which thus accounts for planets having receded from the parent body after separation.

Actual Tides.—The configuration of land and water, and the varying depth of the latter, are the chief elements in completely upsetting calculations from theory. High T. occur at all intervals before and after the meridian noon in different places. For any port the mean interval is known as the establishment of the

channels or estuaries. A hundred feet, it is said, has been recorded in the Bay of Fundy; at Bristol 50 ft. is attained, yet the E. coast of Ireland shows a range of only 2 ft. The effect of shallow water and projecting land, giving rise to reflection and interference, is to set up tidal currents, although the true tides give no displacement of water. Such currents entering riv. mouths give rise to the bore, eiger, or mascaret. It has been sometimes stated in text books that these currents may give rise to double T. as at Southampton, the falling T. of the channel driving through Spithead, the rising tide of the Solent, each giving high water. This erroneous explanation has been frequently exposed but is still repeated. The correct explanation, which is too long to be dealt with in this article, is given in Chapter

FIG. 3. SUCCESSIVE HIGH AND LOW TIDES

M 1, first position of moon; M 2, second position; X1, X2, tides

xxvi of the third book mentioned at the end.

Uses.—Physiographically T. aid in the destruction of coast-line and help to carry debris to the sea; they prevent the formation of deltas, yet aid rivs. in building their lower flood plains. Biologically they have immense influence, the sea-shore 'between tides' having its peculiar life. Commercially they are useful in carrying vessels inland, and for the generation of electrical energy.

Absence of Tides.—Though theoretically tides are produced in all bodies of water, they are often inappreciable; thus Lake Michigan has probably a tide of 2 in. Enclosed seas such as the Mediterranean and Baltic have a tide of anything up to 1 or 2 ft.

Tides in relation to practical navigation.—In navigating coasts where the tidal range is considerable, caution is always necessary; for there are indraughts to all bays and bights, although the general run of the stream may be parallel to the shore. The turn of the tidal stream off-shore is seldom coincident with the time of high and low water on the shore. In open channels, the tidal stream ordinarily overruns the turn of the vertical movement of the tide by about 3 hours, forming what is known as tide and half-tide, the effect of which is that at high and low water by the shore the stream is running at its greatest velocity.

The tidal predictions given in Part I. of the Admiralty's Tide Tables can generally be relied upon to give the times of high and low water within a few minutes and the heights within a few tenths of a foot; times and heights at 'secondary' ports, found by means of the tidal differences given in Part II., are considerably less exact than those predicted in the tables for 'Standard' ports; times and heights found from the tidal constants may be considerably in error and caution is advised, particularly in waters where diurnal inequality is great.

The datums used on the charts of different nations vary considerably. That adopted for the Admiralty charts founded on surveys carried out by the surveying vessels of the R.N. is, in waters where the diurnal inequality is small, the level of mean low water springs, and in waters where the diurnal T. is considerable, the level of Indian spring low water. As, however, a very long series of tidal observations is required before either of these levels can be definitely determined and as the chart datum depends, in most cases, on a few weeks' observation only, the datum adopted must always be considered as approximate and differs considerably in some cases from the theoretical datum. Where Admiralty charts are founded on the charts of other nations, the datum is that used by the original authority.

It has to be remembered by navigators that the tide may fall below datum, except in cases where the lowest possible low water has been used as datum. In waters where diurnal inequality is small the lowest tides usually occur when the

moon is near perigee and near the equator at springs, or at about the equinoxes; where diurnal inequality is great the lowest tides usually occur when both the moon and sun are in high declination at springs or at about the solstices. Wind or a high barometer may also reduce the height of the tide and cause it to fall below datum. (*Admiralty Pilot*.)

See G. H. Darwin, *The Tides and Kindred Phenomena in the Solar System*, 1898; H. Lamb, *Hydrodynamics*, 1932; and A. T. Doodson and H. D. Warburg, *Admiralty Manual of Tides* (H.M.S.O.), 1914. For tidal friction in shallow seas, see H. Jeffreys, *The Earth*, chapter XIV (2nd ed.), 1929.

Tideswell, tn. of Derbyshire, Eng., 6 m. E. of Buxton, in the Peak dist. It has a fourteenth-century church and an old grammar school. There are lead mines in the area. Pop. 2000.

Tidore, is. belong to the Moluccas, Malay Archipelago, situated off the W. coast of Halmahera. The cap., Tidore, on the E. coast. In the S. the is. is a symmetrical volcanic cone from which vapour occasionally rises. It is fertile, producing cotton, maize, fruits of various kinds, and tobacco and spices. In the early sixteenth century the Portuguese captured the is., but in the next century it became a Dutch colony. For centuries there has been a sultan of T., but his sovereignty to-day is purely nominal. Pop. 32,000.

Tidworth, vil. of Wiltshire, Eng., 9 m. W. of Andover and 76 m. from London by the S. Region railway. It is in the Salisbury area and is a military centre. Pop. of par. (North T.) 3000.

Tiel, tn. of the Netherlands, in the prov. of Gelderland, on the Waal, with a considerable trade in grain and wool. Pop. 12,400.

Tielt, old city in the prov. of W. Flanders, Belgium, 16 m. S.S.E. of Bruges. Its belfry dates from 1275. Chief manufs. are linen, woollen, and cotton goods. Pop. 12,900.

Tienen (Fr. *Tirlemont*), old city of Brabant, Belgium, 26 m. E. of Brussels. Situated on the R. Gete at the crossing place of the main road from Cologne to the N. Sea. T. is most probably of Rom. origin. It was a busy market in the early Middle Ages. At present it is the seat of the most important sugar-refinery of the country, producing yearly about 600,000,000 lbs. of sugar. There are also tanneries, breweries, and engineering-workshops. Pop. 22,300.

Tienshan (*Thian-Shan*, celestial mountains), mt. system of Central Asia, forming part of the boundary between Russian and Chinese Turkestan and extending N.E. from the Pamir to the W. fringe of the Gobi desert. The main range, including the ranges of Peter the Great, Trans-Alai, Kokshal-tau, and Sary-yassy, forms the border ridge of the High Plateau of E. Asia, to which they slope on the S.E. In this chain, with a general elevation of 15,000 to 20,000 ft., are the chief peaks, Kaufmann Peak (22,500 ft.) and Khan-Tengri (24,000 ft.), and the largest glaciers, and it is crossed by passes at an elevation

of 10,000 to 14,000 ft. On the N.W. slope are a series of shorter fringing chains, running parallel to the main ridge. The general elevation of these minor chains is 10,000 to 19,000 ft. Forest rises to about 9500 ft.

Tien-Shan, Region of the Kirghiz S.S.R., on the S. border, including part of the Tienshan mts. (q.v.).

Tientsin, treaty port and city of China, in the prov. of Hopei, at the junction of the Peiho with the Grand Canal. 76 m. S.E. of Peking. It is the emporium for N. China, with an extensive trade. The exports consist chiefly of coal, skins, cotton, wools, ground-nuts, beans, peas, and dates. In the Chinese-Jap. conflict in 1937 T. was bombed (July 28) and occupied by the Japs (July 22).

Tiepolo, Giovanni Battisti (Giam-battista), lt. painter, b. in Vienna. His earliest master was Lazzarini, a noted painter in his day, but it was rather the work of Paul Veronese and of Titian that chiefly influenced him. His earliest known pieces are those in the chapel of Sta. Teresa in the Church of Scalzi at Venice. These pieces, in conception after the style of Piazzetta, have been criticised for affectation and wanton fantasy, but they have force and brilliance. His more individual taste lay in the direction of transparent atmospheric effects, in which he has never been surpassed.

Tierra del Fuego (Land of Fire), group of is. separated from the S. extremity of S. America by the strait of Magellan. It consists of sev. large is., the prin. one being called Tierra del Fuego or King Charles South Land (area 18,500 sq. m.), Navarin, Hoste, Clarence, Santa Inez, besides a number of much smaller size, the most important of which contains Cape Horn at the extreme S. The highest peak is Mt. Sarmiento (6900 ft.). It is inhabited by savages of low type, who now number less than 1000. T. was discovered by Magellan in 1520. Half of Tierra del Fuego Is., and the isles W. of it, belong to Chile, the rest forms an Argentine ter. (cap. Ushuaia) with an area of 8299 sq. m. and a pop. of 4900. Punta Arenas is cap. of the Chilean portion, Magallanes Ter. Large tracts of the Chilean is. are devoted to sheep-farming, largely by Brit. subjects. See M. Mielche, *Journey to World's End* (trans.) 1945, and E. Lucas Bridges, *Uttermost Part of the Earth*, 1948.

Tiers Etat, see THIRD ESTATE.

Tiffin, city and co. seat of Seneca co., Ohio, U.S.A., on the Sandusky R. It is the seat of Heidelberg Univ. (Reformed Church). Pop. 18,000.

Tiflis, or Thilisi, cap. of the Georgian S.S.R., on the Kura, 180 m. from Batumi. It was the cap. of the Georgian kingdom in the fifth century, and old T. contains many ant. buildings, including a sixteenth-century cathedral. Since 1917 T. has been extensively modernised: it is now an administrative centre, and the seat of Georgian heavy industry. Pop. 519,200.

Tiger (*Felis tigris*), huge and powerful carnivore, peculiar to Asia, though absent from Ceylon, Afghanistan, Baluchistan, and Tibet. The Indian T. rarely exceeds

10 ft. in length, and the female averages about 8 ft. 6 in. Fine males weigh from 400 to 500 lb. Young animals, which are characterised by their canine teeth being hollow throughout, are handsomer than older ones, the tawny orange colour being richer and the stripes darker and

TIGER

closer together. Ts. are monogamous, though there is no reason to suppose that they pair for life. The period of gestation is fourteen or fifteen weeks, and from two to five cubs are born, though more than two are seldom reared. Ts. will eat carrion, but generally kill for themselves. Their food consists principally of deer, antelopes, and smaller animals, but occasionally powerful ones are attacked, and they sometimes kill the wild boar. Man-eaters are not, as is the case with lions, old and worn out, and many are in splendid coat when killed after a meal on human flesh. The taste is generally acquired during a hunt from which the animal escapes after having mauled a man, but even man-eaters are known to hunt for other food. The T. has been crossed experimentally with the lion; the resulting hybrid, the *ligon*, is faintly striped: it is sterile.

Tiger Beetle, see CICINDELIDÆ.

Tiger-cat, see OCELOT.

Tiger Flower, see TIGRIDIA.

Tiger Lily, see LILY.

Tighina, see BENDER.

Tighnabruach, tn. of Argyllshire, Scotland. It is a popular holiday resort, situated on the Kyles of Bute. Pop. 1000.

Tiglath-Pileser, name of sev. ant. Assyrian kings (see ASSYRIA), of whom the third of that name is mentioned in the Bible. He ascended the throne in 745 B.C. The revolution in the N. kingdom of Israel, which set Pekah on the throne of Samaria, appears to have coincided with a confederacy being formed against Assyria; the refusal of Ahaz to join it was the occasion of the determined assault made on the kingdom of Judah by Pekah and Rezin which led to the appeal to T. by Ahaz. In this campaign

T. besieged Damascus, and, apparently masking it, he proceeded to the conquest of Gilead and Galilee, deporting the inhabitants.

Tigranes, or **Dikran**, name of sev. kings of anct. Armenia, one of whom flourished as early as 550 B.C. and was a friend of Cyrus the Great, helping to overthrow the Median empire. The best-known bearer of the name (c. 121-55 B.C.) was the son-in-law of Mithridates the Great. He was king of Armenia (c. 96-55 B.C.), and master of the Syrian monarchy from the Euphrates to the sea (83), founding the city of Tigranocerta. T. at first supported Mithridates against the Romans. (76), but was defeated by Lucullus (69-68) and by Pompey (66).

Tigridia, or **Tiger Flower**, genus of bulbous plants (family Iridaceae), natives tropical America. They are grown in the cool greenhouse and also in warm borders, where the bulbs must be protected in winter.

Tigris, riv. of Asiatic Turkey rising in sev. branches, the chief being the Schat, Dije, or Dikla, in the frontier mts. of Armenia and Kurdistan, near Kharput and Bitlis. The chief headwater flows E., passing S. of Lake Gelik, S.E. and S. to Diarbekir, and E. to Tul, where it receives the Bolhan Su or Chal, which rises about 20 m. S. of Van and flows W. to this point. The stream then flows S., entering the plains at Jezire, and then S.E. to Kurna, where it unites with the Euphrates at Garinat Ali (70 m. from the Persian Gulf) to form the Schat-el-Arab. The chief tributaries are the Great and Lesser Zab and the Djala or Shurwan, all coming from the E. On the banks are Mosul, Tokrit, and Bagdad, and the ruins of Nineveh, Seleucia, Ctesiphon, the ancient Mesopotamia lying between it and the Euphrates. Length 1150 m., navigable by steamers to Bagdad. The construction of the first railway-bridge over the riv., at Bagdad, was begun in 1949.

Victory of the Tigris (Oct. 23-30, 1918).—This was the last battle fought in the First World War by a Turkish army. The Turkish army on the Tigris, numbering 10,000 rifles and fifty-nine guns, under the command of Ismail Hakki, surrendered on Oct. 30, 1918, to Lieut. General Sir W. R. Marshall, this victory opening the road to Mosul and leaving the greater part of Mesopotamia in the hands of the Brit.

Tihwa, **Tihwafu** (called by the Russians **Urumschi**), cap. of the Chinese prov. of Sinkiang. The mts around T. are full of unexploited metals. Irrigation is good, but the only export of importance, as at 1943, was wool, substantial quantities of which were used to clothe the Soviet Red Army.

Tilburg, tn. of N. Brabant prov., Holland. It is a great industrial centre, manufacturing cloth, woollens, soap, leather, etc. There is an economic univ. (1800 students). Pop. about 115,800.

Tilbury Fort and Docks, fortification in Essex, England, on the Thames opposite Gravesend, enclosed by a moat. Origin-

nally built by Henry VIII., it was enlarged by Charles II. The troops raised in anticipation of a Sp. invasion were reviewed here (1588). The docks (507 ac.) which lie 1200 ft. above Tilbury Ness, opposite Gravesend, 26 m. below London Bridge and about the same distance from the Nore, were opened in 1886, and formerly belonged to the London and India Dock Company, but are now under the control of the Port of London Authority. The great development of trade since 1886 has rendered frequent changes necessary. The latest extensions were begun in 1917, when the Port of London Authority extended the main dock 1450 ft. Those extensions, which were completed in 1928-29 at a cost of £2,500,000, enable London to compete for the large ocean-liner traffic. They comprise a new entrance dock, 1000 ft. by 110 ft. with a depth of 45½ ft. below T. H. W. at centre of sill a floating structure, a dry dock 750 ft. by 110 ft., and a passenger landing stage 1132 ft. in length, at which vessels can be dealt with at any state of the tide, day and night. The dry dock is so constructed that it can be extended when necessary, without interference with its use, to a total length of 1000 ft. There are over 35 miles of railways in the Tilbury Docks.

Tilden, **William Tatem**, (b. 1893), Amer. tennis champion and author, b. at Germantown, Pa. Educated at Germantown Academy and the Univ. of Pennsylvania he was world's champion of lawn tennis in 1920, 1921, and again in 1930, and with F. T. Hunter won the men's doubles at Wimbledon in 1927. He was for ten years a member of the U.S. Davis Cup team. In 1931 he became a professional player and was Amer. professional champion.

Tile, thin plate of various materials, such as baked clay, porcelain, earthenware, marble, glass, etc., used for roofing, flooring, walls, fireplaces, etc. Whether glazed or unglazed, flat or curved, simple or decorated, the manufacturing processes are essentially the same as those for brick-making. Ts. are often embossed or painted with a design, painted Ts. being known as encaustic Ts. Roofing Ts. of marble-coloured clay were known in anct. Greece and Rome, and coloured glazed roofing Ts. were used in old China and Japan. Ts. of baked clay in anct. times were used for preserving written records, especially in Assyria and Babylonia. Roofing Ts. are sometimes made with a concave (pantiles) or ridged surface. Flooring Ts. of medieval Europe were generally mosaic in type. Elaborate wall Ts. were known to the anct. Egyptians and were later introduced into Rome and Persia. Old Moorish Ts. were noted for their metallic lustre. Wall Ts. to-day are made in a considerable variety of shades. Flooring Ts. to-day, being generally machine-pressed, are hard and vitrified.

The manuf. of building T. was a widespread and important industry in Rom. Britain, and tile-makers adhered more closely to Rom. ways than did the

potters. An imperial tile-works is known: the legions frequently made their own T., and municipal as well as private factories were in being. They are located by their tile-maker's stamps. From a stamped tile found in London, the existence of a financial office has been deduced. In S.E. England, T. stamped *Classis Britannica*, the Brit. Channel Fleet, are known. Most fascinating, however, are the messages, epithets, and idle scribbles made on the wet T. and preserved by firing. Medieval T., which are of costume, heraldic, and artistic interest, are a study in themselves. The Rutland Collection in the Brit. Museum has more than 7000 examples ranging in date from the thirteenth to the sixteenth centuries and including some 4000 different forms and designs. There is a complete tile floor from a fifteenth-century secular house at Bristol, and sev. portions of floors from monastic houses.

Till, see BOULDER CLAY.

Tillage, see CULTIVATION.

Tillamook Language, see under NORTH AMERICAN INDIAN LANGUAGES, *Pacific areas*.

Tillandsia, or Spanish Moss, or Old Man's Beard, named by Linnaeus after Tillands, a Finnish prof., is a genus of Bromeliaceae (q.v.). *T. usneoides* hangs down from trees in tropical America like long dry beards. It is used for stuffing birds. *T. utriculata*, or wild pine of Jamaica, also a parasite, has large leaves, with expanded bases, which retain rain water as if in a bottle. Species cultivated in Britain as perennials are *T. circinnata* with lilac bracts and *T. duvaliana*, with yellow and green bracts.

Tillett, Benjamin (1860-1943), Brit. Labour leader and politician; b. in Bristol and began his career in a brickworks, later joining the R.N. Subsequently he organised the Dockers' Union, of which he became general secretary. T. largely organised the dock strike of 1889. He shared responsibility for the developments which placed the general labour unions in an equal position with the organisations of skilled craftsmen inside the Trade Union Congress. He was M.P. (Lab.) for N. Salford (1917-24) and president of the T.U.C. 1929. T. pub. a short hist. of the Dockers' Union in 1910, and his *Memories and Reflections* in 1931.

Tillcultry, tn. of Clackmannan, 5 m. from Alloa. It is situated on the R. Devon and is noted for plaids and tartans. Pop. 4500.

Tillotson, John Robert (1630-94), Archbishop of Canterbury, b. at Ilalifax, of a Calvinist family; educated at Cambridge. He was at first a Presbyterian and accepted the Act of Uniformity. At the Restoration he became chaplain to Charles II. (1666). In 1672 he became Dean of Canterbury, in 1675 Canon of St. Paul's, in 1689 Dean of St. Paul's, and in 1691 Archbishop of Canterbury. He was a strong anti-Catholic, and pub. *Rule of Faith* (1666), four lectures on the Socinian controversy. His sermons are famous for their prose style and are among the best examples of the pulpit oratory of his

times. See selections ed. by G. W. Weldon, 1886, and by J. Moffat, 1926.

Tilly, Johann Tzerclaes, Count von (1559-1632), Ger. soldier, b. in Tilly in Brabant and brought up by Jesuits. He served in the Sp. army in the Netherlands. Later, he left the Sp. service for Austria, and in 1607 became gen. of the Bavarian army and Catholic League, greatly distinguishing himself during the Thirty Years' war. He won the great battle of the White Mt., near Prague, in 1620, and was also victorious at Wimpfen, Stadtlohn, Wiesloch, and Kockst. In 1630, T. was appointed commander-in-chief of the imperial forces, and besieged and took Magdeburg, after a fierce struggle. Four months later, however, he was defeated by Gustavus Adolphus at Breitenfeld, and shortly after, again on the banks of the Lech, where he was mortally wounded, and d. at Ingolstadt the following day. See Count Villermont, *Tilly ou la guerre de trente ans*, 1859; O. Klopp, *Tilly im 30-jährigen Kriege*, 1861, 1891-6; Keym-Marcour, *Johann Tzerclaes Graf von Tilly*, 1884; life by G. Gilardone, 1932.

Tilman, Harold William, Brit. mountaineer (b. 1898), advocate of the small mobile Himalayan party, and leader of the 1938 Everest expedition. He had a distinguished record in the First and Second World Wars, has explored many mt. dists. in Africa and Asia, and led the first ascent of Nanda Devi in 1936. He has written *Ascent of Nanda Devi* (1937); *Snow on the Equator* (1938); *Mount Everest* (1938); *When Men and Mountains Meet* (1947); and *Two Mountains and a River* (1949).

Tilsit (or **Sovietsky**), tn. of the R.S.F.S.R., formerly of E. Prussia, on the Memel (Niemen), 65 m. N.E. of Königsberg (Kaliningrad). There are iron foundries, glass, cloth, and machinery manuf., cellulose is produced, and there is trade in grain, coal, cattle, etc. Here, Napoleon I. concluded treaties with Russia and Prussia in July 1807 by which Prussia lost her possessions west of the Elbe, and Westphalia was formed out of W. Prussia and Hanover. Prussian Poland was assigned to Russia and Saxony; and the Czar Alexander I. was to join an alliance with Napoleon against England. In 1945, when E. Prussia was overrun by the Russians, T. was joined to the Soviet Union. Pop. 57,700.

Timæus (c. 352-c. 256 B.C.), Gk. historian, was the son of Andromachus, tyrant of Tauromenium in Sicily. He was banished from Sicily by Agathocles, and passed his exile at Athens, where he had lived fifty years at the time when he wrote the thirty-fourth book of his History. This, his greatest work, was a hist. of Sicily from the earliest times to 264 B.C. See J. B. Bury, *The Ancient Greek Historians*, 1909.

Timæus of Locri, Pythagorean philosopher contemporary with Plato. To him is usually ascribed the work *περί τῆς ψυχῆς* ('Concerning the Soul of the Universe'), written in the Doric dialect. It deals with the same subjects as Plato's dialogue *Timæus*.

Timaru, seaport and city of S. Is., New Zealand, on the E. coast between Christchurch and Dunedin, cap. of S. Canterbury dist. The climate is equable, with little rain, and there are some 400 ac. of scenic and recreational reserves. It was the first N. Zealand tn. to operate a tn. planning scheme. Industries include the manuf. of woollen goods, footwear, pottery, furniture, flour, and allied products, agrico. implements, and engineering products and the frozen meat industry is carried on nearby. There is an airport, and a good harbour, the area of which was doubled during the Second World War. It became a city in Nov. 1948. Pop. 21,100.

Timber is loosely classified as hardwood from Dicotyledonous trees and softwood from Gymnosperms. Owing to the great variations in hardness, even in wood of the same species of tree, this classification is misleading. The *grain* of T. is determined by the direction and arrangement of the tissues and the width of the annual rings. The *texture* is close or open, according to the diameter of the wood vessels. Experts can frequently classify T. by noticing the colour, hardness, weight, annual rings, or their absence, and the size and distribution of the wood vessels. Microscopic examination may be needed to supplement macroscopic observations. Felled T. trees should be removed immediately to the sawmills or to storage sheds. The freshly-felled tree contains moisture which must be removed before the wood can be converted into useful T. This removal of moisture is the process of seasoning, a long, slow, natural process that can be greatly expedited artificially. Natural seasoning is accomplished by storing the T. in a shed free from draught, provided with air circulation, and sheltered from the sun. Whole logs seasoned in this way remain wet in the middle and when sawn into pieces warp, owing to shrinkage, and split.

In the earlier part of the nineteenth century, smoke kilns were used in France for artificial seasoning, and steam and smoke passed through holes in the floor of the kiln and escaped through flues. Subsequently various kilns have been invented, and the most modern types provide for thermal circulation of air and the condensation of moisture by cold pipes or sprays. T. of different thicknesses can be dried in different compartments, each provided with separate controls of air circulation, temperature, and humidity. Seasoning increases the durability of wood, since decay cannot take place in the absence of moisture. Air also favours decay, and, in consequence, deeply buried or submerged wood is protected by the absence of air, while the parts of telegraph and other poles, of fences, and of wooden piles just above the surface of the soil, or of the water, decay most rapidly. T. exposed to conditions favouring decay, to attacks of insect-borers, and of ship-worms, to the growth of fungi, to mechanical abrasions, and to fire, should be preserved. Softwoods are liable to 'brown rot,' a fungal

decay which affects the cellulose and associated carbohydrates. Decay in hardwoods occurs from 'white rot,' in which all the constituents of wood are attacked. 'Dry rot' has a specialised meaning, as caused by one or two fungi such as *Merulius lacrymans*. The Gks. and Roms. killed superficial wood pests by charring to a depth of one-eighth to one-half an in. This decreases the strength of the T. Recent preservative measures lie in thoroughly brushing the surface with special paint, kalsomine, or other preservative. More effective is the method of dipping the wood into a bath of the preservative and making it penetrate deeply into the tissues. Creosote oil is one of the best general preservatives. Oak is suitable for use indoor and out; walnut, maple, sycamore, and beech only in dry places. Ash, one of the best tough, pliable woods, is extensively used in aircraft, and in sports apparatus.

Felled timber is cut and made into planks in the sawmill, which may be water- or power-driven. The saws used are either circular saws, frame saws, or bandsaws. See *Saws*.

See W. S. Jones, *Timbers: Their Structure and Identification*, 1924; S. Record and R. Hess, *Timbers of the World*, 1943, and H. T. Eyres, *Introducing Wood: Facts for all who handle it*, 1950.

Timber (in Law). In real property T. means oak, ash, and elm by general custom, and various other trees by local custom. It becomes important to consider what T. denotes when construing the powers of a tenant-for-life under a settlement (*q.v.*). A tenant-for-life, unless expressly authorised, is liable for *Waste*, and felling T. is an act of *Voluntary Waste*. Neither T. nor *germins* (*i.e.* T. trees under twenty years) may be cut by a tenant-for-life, except that he may cut germins for necessary thinning of overgrown plantations and, on recognised 'T. estates,' he may periodically cut so much T. as by local usage is regarded as annual fruits of the land so cultivated. By the Settled Land Act, 1925, the tenant-for-life, even though impeachable for waste, may with the consent of the court, cut and sell T. ripe and fit for cutting, most of the proceeds of which must go to 'capital money' for the benefit of the inheritance, and the residue as rents, and profits to himself; if not impeachable, he takes all the proceeds. A tenant for life, unimpeachable for waste, is entitled to the proceeds of sale of ornamental T., properly cut to preserve adjacent T.

Timbrel, or **Tobret**, Heb. musical instrument, like the modern tambourine.

Timbuctoo (Timbuktu, Timbuekto, or Tomboustou), tn. of the colony of Fr. Sudan, near the Sahara, 9 m. N. of the main stream of the Niger. Its position makes it a focus of caravan routes between Algeria, Morocco, and Tuab, and of traffic on the Niger, and it thus has considerable importance as a trade centre. It exports ostrich feathers, gums, salt (from Taudeni), and kola-nuts to Senegal, the Guinea Coast, and Morocco. Most of the houses are of straw and earth, but

there are a few brick buildings, some mosques and schools including a Moslem superior school, called a *médessa* (official), and a citadel and forts. René Caillé (q.v.) in 1824 approached the Niger at T. where his life was in constant danger. He was, however, not the first white man to discover T.: an Englishman, Maj. Laing, setting out from Tripoli, had reached this mysterious city of caravans and had been murdered there. In 1863 Faidherbe (q.v.), having routed his formidable adversary, El Hadj-Omar, lord of a vast region, concluded an agreement with the masters of T. But it was not until 1895 that Commandant Joffre (q.v.) seized the city and built a string of forts around it which have since then secured Fr. domination of this region. In 1904 it combined with Zinder-Chad to form the military ter. of the Niger. In 1920 it was formed into a military ter. incorporated in Upper Senegal-Niger, but in 1923 was converted into a civilian ter., under a lieutenant-governor. See P. Marty, *La région de Tombouctou*, 1920 Pop. 6500.

Time and Time Measurement may be determined by reference to some regular occurrence of any natural phenomenon. Thus the day is determined by the rotation of the earth on its axis, and the year by the apparent revolution of the sun round the earth, actually that of the earth round the sun. *Sidereal T.* is employed only in astronomical work, for definition of the *sidereal day*, which, unlike the solar day, is of constant length (see below). *Apparent T.* is taken from the revolution of the sun, the mean solar day being the interval between two consecutive southings of the mean sun. The mean solar T. in any instant is the mean sun's hour angle, which can be converted into time by taking 15° as one hour, $15'$ as one min., and $15''$ as one sec. T. can easily be determined by travellers by observing the transits of known stars across known vertical circles. At sea different methods can be used. A simple method is to observe the altitude of the sun or a well-known star whose spherical co-ordinates are given in the *Nautical Almanac*. Then, the latitude of the place being known and also the Greenwich Mean Time (given by a chronometer or time signals), the local time can be computed. Local T. varies with the longitude, it being one hour in advance of or behind the true Greenwich T. for every 15° to the E. or W. of Greenwich respectively. Owing to the confusion from the various local Ts., a standard T. has been introduced, the Greenwich T. being taken as the standard. This is known as *Greenwich Mean Time*, *Greenwich Civil Time*, or often as *Universal Time*.

Time Measurement.—The ultimate standard to which all systems of T. measurement are referred is *sidereal T.* The *sidereal day* is defined as the duration of a complete rotation of the earth on its axis relative to the stars. The sidereal day begins at a given place when the *First Point of Aries* (q.v.) is on the meridian. One of the duties of the Astronomer-Royal is to provide the nation, and, as we

shall see, the civilised world, with a T. scale. A very accurate clock, known as the *sidereal clock*, is checked daily by astronomical observation of the instants when certain stars, known as *block stars*, cross the meridian. In actual practice, time is measured by the length of the *mean solar day*. A solar day is the duration of a complete rotation of the earth on its axis relative to the sun. The length of a solar day varies because the earth's orbit round the sun is elliptical and because the earth's axis is not perpendicular to the ecliptic (q.v.) or the plane of its orbit. For time measurement clocks are referred to the *mean solar day*, which is divided into twenty-four mean solar hours. The length of the mean solar day is constant and it refers to the duration of one complete rotation of the earth on its axis relative to an imaginary body, the mean sun. The zero of this time measurement is the instant when the mean sun crosses the meridian at a given place. In England this place is chosen as Greenwich, and whereas the zero of T. measurement was formerly referred to the instant at which the mean sun crossed the meridian in the cap. of a given country, it is now the implicit common practice to refer all T. measurements to Greenwich. What is known as *Greenwich Mean T.* (G.M.T.) is T. measured from the zero of the Greenwich mean solar day. Formerly this day began at noon, but from Jan. 1, 1923, astronomers adopted a day of twenty-four hours beginning at midnight.

The checking of G.M.T. from sidereal T. is a matter of astronomical computation (vide *Whitaker's Almanack*). The advent of radio had simplified the regulation of clocks by means of the Greenwich standard clocks, since T. signal are broadcast.

Standard Times.—Since 1883 the system of Standard Time by zones has been gradually accepted and now almost throughout the world a Standard Time which differs from that of Greenwich by an integral number of hrs., either fast or slow, is used. A list of times in various regions of the world at 12 noon Greenwich Mean Time is given in the *Nautical Almanac* (ann.) and displayed in diagrammatic form in most good atlases. It is to be noted however, that changes in standard times are often made without long previous notice, also that in the *Nautical Almanac* no account is taken of Summer Time in any country. Zone times have been adopted in various large countries. In Canada and the U.S.A. five standard times are used, the zones being bounded by meridians of long. 15° —the equivalent of 1 hour apart. Within each zone the mean time for the meridian midway between each of the meridians $15'$ apart kept. In the U.S.S.R. hourly zones from 3 hrs. to 13 hrs. fast on Greenwich time are used.

See also EQUATION OF TIME, HOROLOGY; For Summer Time see DAYLIGHT SAVING. INTERNATIONAL DATE LINE; SUNDIALS. For T. in relation to space see RELATIVITY; SPACE AND TIME.

Timentel, Eleonora, see FONSECA, MARCELA DE.

'Times, The.' This daily newspaper was founded in 1785, under the title of *The Daily Universal Register*, by John Walter, mainly in order to prove the advantages of the 'logographic' process of setting up type by units consisting of whole words or groups of letters as well as by single letters. The process failed and was quickly discarded; but the newspaper succeeded, especially after Jan. 1, 1788, when it took the title *The Times*. In 1802 he was succeeded as editor, and in 1803 as sole manager, by his younger son, John Walter II., under whom the paper maintained, through many struggles, its complete independence and immensely increased its circulation and power. Through the Napoleonic wars it frequently pub. news before the Gov. had received it; and its staff of writers, which included a young clergyman, Peter Frazer, Edward Sterling, and John Stoddart, made the leading articles a political force respected both at home and abroad. Stoddart was appointed editor of the paper. He was succeeded in 1817 by Thomas Barnes, who held the chair till 1841 and brought the paper to the height of its reputation and power.

He died in harness, and was succeeded by John Thaddeus Delane, then only 23. Being independent of party ties, John Delane took his own political line. In 1846 he practically forced upon the hesitating gov. the repeal of the Corn Laws. John Walter II., having died in 1847, his son, John Walter III., succeeded him as chief proprietor, and did much to foster the mechanical side in which as of old, *The T.* was a pioneer. During the Crimean war, having organised its war correspondence on a scale never before attempted, it ruthlessly exposed, chiefly through the pen of W. Howard Russell, the faults in the conduct of the fighting and the equipment of the troops; and it was mainly through Russell's articles that Florence Nightingale was moved to go upon her mission, in which she was assisted by a large fund raised by *The T.*

In 1848 came the first rotary printing-press, invented by Applegath, and in 1866 the famous Walter press, which remained in use for nearly 30 years; and in 1879 (not long after Delane's retirement) Kastenheim, working in *The T.* office, perfected the first type-setting machine. Delane was succeeded by Thomas Chennor, who held office till his death in 1884, to be followed by G. E. Buckle, then twenty-nine years of age. The outstanding feature of Buckle's reign was the vigorous and successful opposition of the paper to Gladstone's proposals for Home Rule. The articles on 'Parnellism and Crime' contributed by a brilliant Irish writer, John Wolfe Flanagan, were the chief occasion of the Parnell Commission, which was appointed to examine the attacks made by *The T.* on Irish leaders and to investigate the truth about a letter attributed to Parnell. The letter was found to be a forgery, but most of the charges made by *The T.* were pronounced true. In 1889 C. F. Moberly Bell was appointed manager of *The T.* In spite

of the increased circulation of cheaper journals, the paper was still, contrary to general opinion, extremely prosperous; but the costs of the Parnell Commission had been enormous; the resources of the paper were being wasted; and after the death of John Walter III., in 1894, a system of ownership by which the printing business and the newspaper were held separately made efficient organisation difficult.

In July 1907, after 122 years, *The T.* was for sale. The controlling interest was bought, through Moberly Bell's negotiation, by Lord Northcliffe, who, with Moberly Bell as manager, immediately began to equip the printing office with the newest machinery and to make certain changes in organisation and detail. *The T.* had resumed its old position in the van of newspaper progress when in 1911 Moberly Bell died at his desk. In 1912 Buckle retired, a few weeks before the 40,000th number of *The T.* was pub. In his reign the jour. proper had been reinforced by the Literary Supplement (1902), the Educational Supplement (1910) and the Engineering Supplement (1905). He was succeeded by Geoffrey Dawson (q.v.). In May 1913, the price of *The T.* was reduced from 3d. to 2d.; and in March 1914, to 1d. In one night the circulation was for a time trebled; and it was with a daily circulation of 150,000 that it faced the outbreak of the First World War. During the War the paper did more than maintain the reputation of its news service; and it could point to a long list of suggestions first made in its columns which the Gov. adopted. Among the many subsidiary pub. of *The T.* issued in connection with the war may be mentioned its War Atlas, *The T.* History and Encyclopedia of the War, and *The T.* Broadsheets—passages of Eng. literature printed on single sheets of paper and distributed by millions among the troops. In 1919 Dawson resigned and was succeeded for a time as editor by Wickham Steed. In 1921 *The T.* raised more than £170,000 for the preservation of Westminster Abbey.

In Aug. 1922 Lord Northcliffe d. In Oct. the ownership of *The T.* was bought by John Walter (fourth of the name, and great-grandson of the founder) and Major the Hon. John Jacob Astor, who became Chairman of The Times Publishing Company; and in Jan. 1923 Geoffrey Dawson returned to the editorial chair. In 1925 *The T.* raised more than £250,000 for the preservation of St. Paul's Cathedral. In May 1926 *The T.* was the only one of the London daily newspapers which produced a number every day throughout the General Strike. Geoffrey Dawson d. in 1941 being succeeded by R. McE. Barrington-Ward, under whom the paper, pre-eminently the Brit. journal of opinion and therefore the paper most quoted abroad, became much more aware of the real current of opinion in Britain than it ever was in the days of his predecessor. The present editor (1950) is W. F. Casey who joined the staff of *The T.* in 1913 and became deputy editor in 1941.

The financial control of *The T.* is governed by a trust deed which prevents the sale of shares except with the assent of a body of trustees consisting of the Lord Chief Justice, the President of the Royal Society, the Governor of the Bank of England, the President of the Institute of Chartered Accountants, and the Warden of All Souls College, Oxford. See *The History of The Times*, vol. 1; *The Thunderer in the Making*, 1935, vol. 2; *The Tradition Established*, 1939, vol. 3; *The Twentieth Century Test*, 1947.

Times Literary Supplement, Brit. Jour. pub. weekly by the Times Publishing Co. Ltd. It was founded in 1902, and is the leading jour. in the field of literary criticism, noted for its independent and reasoned judgment. It offers, besides book reviews, articles of interest to authors, publishers, and, above all, readers, on literary and allied subjects. In recent years it has contributed largely to the growth of public interest in literary and historical biography.

'Time and Tide', independent, non-party weekly review (price 6d.), founded in 1920 by Viscountess Rhonda. Regular features include editorial comment and background articles on current politics, book reviews, financial notes, and criticism of theatre, films, music, and art. In the weekly *Notes on the Way*, to which well known personalities of the day are invited to contribute, writers are allowed a free pen to discuss any subject they choose. Strongly anti-totalitarian, both in home affairs and foreign policy, *Time and Tide* has been banned in most Communist-ruled countries.

Timgad, decayed city of Algeria in the prov. of Constantine, 64 m. S.W. of the tn. of Constantine. It was founded by Trajan about A.D. 100. Extensive Rom. remains have been discovered.

Timisoara, see TEMESVAR.

Timmins, tn. of Ontario, Canada, 268 m. N. of North Bay on the Temiskaming and N. Ontario Railway, and about 460 m. N. of Toronto. It is the centre of the Porcupine gold-mining area of N. Ontario. About twenty years ago it was only a rough frontier mining vil. but to-day it is a flourishing tn. with all the facilities and amenities of a long-settled city. It has an additional source of future prosperity in the adjoining great clay belt of fertile agric. land estimated at 23,000 sq. m., where settlement has only begun. A feature of the tn. is its large public park created in an area formerly occupied by unsightly mine-dumpings. Besides the large gold mines, there are saw and flour factories, saw mills and planing mills. Pop. 30,000.

Timoleon (c. 411-337 B.C.). Gk. democrat, b. of the noblest families of Corinth. His whole life was spent in a ceaseless struggle for liberty, and in his youth this led him to the murder of his own brother Timophanes, who was trying to make himself tyrant of Corinth. In 44 B.C. the Gk. cities of Sicily applied to Corinth for aid against the Carthaginians, and T. was sent with a small force. He took possession of Syracuse, and set about

the estab. of democratic gov. in all the Sicilian colonies. Meanwhile the Carthaginians landed at Lilybeum (339). T. was not able to collect more than 12,000 men, but with these he marched against the Carthaginian troops and totally defeated them. A treaty was concluded in the next year, and T. continued his work. The flourishing state of Sicily at the time of his death shows how beneficial was his influence. See Holden's ed. of Plutarch's *Life of Timoleon* (1889).

Timor, or **Timur**, is. of the Malay Archipelago, largest and most easterly of the Lesser Sunda group. In 1859 a treaty divided the is. between Portugal and Holland, the boundaries being finally arranged by arbitration in 1914. Portuguese T. includes the N.E. of the is. with the Oecussi enclave, and the is. of Pulo Kambing, Dilly (Deli) being the cap. and chief port. Area 7450 sq. m. Dutch T. comprises most of the S.W., including the is. Roti, Peman, Savi, Sumba, Allor, and E. Flores, with Kupang as the cap. Area 26,410 sq. m. The soil is dry and not very fertile, and the country mountainous, Mt. Atlas (12,000 ft.) and Mt. Kabalaki (10,000 ft.) being the culminating peaks. Among the chief exports are coffee, cocoa, copra, sandalwood, bêche-de-meur, and cattle. A noted breed of ponies is reared here. Pearls have been found off the S.W. coast. The staple article of food is sago. Pop. (1930), 1,657,000. See H.M. Stationery Office, *Peace Handbook*, No. 80, *Portuguese Timor*, and No. 86, *Dutch Timor*, 1920. Early in 1942 T. was bombed by Jap. raiders, particularly the airfields at Koepang. Later, when the Jap. landed, there was guerrilla warfare. The enemy's move on T. (and Bali) put their bombers within 400 m. of Australia's N. coast, but Australian bombing in 1943-44 averted the danger.

Timor-Laut, collection of is. belong to the Malay Archipelago, 265 m. E.N.E. of Timor, belonging to the Dutch. The chief is. are Yandena, Selaru, and Larat. Chief industries are agriculture, cattle-raising, and trepang-fishing. Area of group 2060 sq. m. Pop. 31,800.

Timoshenko, **Semion Konstantinovich**, (b. 1895) Russian marshal b. of peasant stock in the vil. of Furmanka, on the old Russo-Rumanian frontier. After leaving school, where he had but an indifferent education, he worked on the land for twelve years. Called up for military service in 1915 he fought in the First World War. Early in 1918 he was with the Black Sea Partisan detachment, a cavalry force, fighting in the Crimea and against Kaledin's Don Cossacks. He later joined Ladyenny's First Cavalry Army and became a skilful leader of night attacks, and rose in this army to the rank of general. In 1920 he was in the Russo-Polish campaign and after the defeat near Warsaw he returned to the Crimea where, at Percepo, he was defeated by Gen. Wrangel's troops and severely wounded for the fourth time. He now entered on his real career as a military leader, for at the Frunze Military Academy,

which he entered in 1922, he qualified for high command after long and intensive study both there and at the Military and Political Academy for commanders and commissars which he joined in 1930. T. became military representative at Kiev and Kharkov, stages in his career which had an important bearing on his achievements in the Second World War. It was T. who retrieved the Russian military position in the Russo-Finnish war of 1939-40. When the Gers. invaded Russia, T., who, as Defence Commissar, had reorganised the Red Army and introduced reforms without which successful resistance to the Ger. armies would have been impossible, was entrusted by Stalin with the defence of Moscow. After he had repulsed the Gers., Stalin sent him to stem the enemy's advance in the Ukraine in Nov., 1941. The re-conquest of Rostov on Nov. 26 of that year was due to his masterly tactics and strategy. Despite Russian failures in succeeding months Stalin's confidence in T. never wavered and it was to him he left the command of the general offensive against the Gers.

Timotheus of Miletus (c. 446-357 B.C.), Gk. dithyrambic poet and musician. He added an eleventh string to the lyre (or cithara) and thus incurred the displeasure of Athens and Sparta. His poems, on mythological and historical subjects, are daring in treatment and style. His fragments are printed in Bergk's *Poete lyrici graeci*.

Timothy (d. 97), young friend and fellow-labourer of St. Paul. He was a native of Lystra, his mother Eunice being a Jewess and his father a Gk. He accompanied St. Paul on the second missionary journey, and the lives of the two are henceforward closely connected. He was left as the apostle's representative at Ephesus, where he received two epistles from him. Eusebius says that he met his death there in a popular riot, after denouncing the worship of Diana.

Timothy, Epistles to, form with the Epistle to Titus the group known as the Pastoral Epistles, which consist of elaborate instructions for the appointment of officers and the pastoral care of the Christian churches. They show many points of contact with one another and with the other Pauline epistles, but there are numerous departures from the latter both in diction and subject-matter. They are private letters of an official nature. One of the most disputed questions is their authorship. In spite, however, of many attempts to disprove the Pauline authorship, the balance of probability still rests decidedly with the traditional view. The only considerable objection is the difficulty of finding a time and place for these epistles in the recorded life of St. Paul, and it is now usual, therefore, to place them somewhere in the unrecorded portion. The second epistle is, accordingly, placed during a second imprisonment of Paul, of which no record has remained. The pastorals are strongly doctrinal. The Christian life must show no incongruity between creed and practice, and Christianity must be translated into ethical and

spiritual terms. The Christian is to fight a good fight and expect suffering, and his swan song will be a song of victory. Other points are the unity of God; the inspiration of Scripture; and the danger of riches. The modern critical study of the Pastorals began in the early years of the nineteenth century with Schleiermacher, who denied Pauline authorship to 1 Tim. See B. S. Easton, *The Pastoral Epistles*, 1948.

Timothy Grass, see CAT'S-TAIL GRASS.

Timūr Beg, or **Tamerlane** (1335-1405), sultan of Samarkand, b. at Kesh, of Mongol origin, a direct descendant of Genghis Khan. He assisted and then attacked Huscin, Khan of Northern Khorasan and Jagatai, finally supplanting him in 1369. He made Samarkand his cap. and rapidly made himself master of the whole of Turkestan and part of Siberia. He next attacked N.E. Persia. After a series of bloody and cruel conflicts, the whole of Persia, Georgia, Armenia, and the neighbouring states accepted him as suzerain. Timūr then turned his arms towards the N. and overran Kiptshak. He then declared war against India, and in 1398 defeated the Indian army near Delhi. He later came into conflict with Europeans, when he attacked and took Smyrna, the property of the Knights of St. John. He died at Otrā on the Jaxartes as he was marching to attack China. His name Tamerlane is a European corruption of Timūr-lenk (Timur the Lame). He figures as the hero of Marlowe's (*the*) great drama, *Tamburlaine*.

Tin, symbol Sn, atomic number 50, atomic weight 118.7, one of the seven metals of the ancients, occurs as the oxide—tinstone or cassiterite (SnO_2)—and is found in Cornwall, Austria, and New S. Wales, but the prin. deposits are in Malaya, the Dutch E. Indies, Bolivia, and Mexico. The metal is prepared from the ore (see CASSITERITE) by roasting to remove arsenic and sulphur, followed by heating in a reverberatory furnace with anthracite. The T. so formed is re-melted and poles of green wood stirred in it. By this means impurities are carried to the surface in the form of a scum. T. is white and lustrous (sp. gr. 7.2), and melts at 232° C. It is crystalline in structure and when bent emits a curious crackling sound called the 'cry of tin.' T. is not acted upon by the air and is therefore used for tinning iron (see TINPLATE). T. readily dissolves in hydrochloric acid with evolution of hydrogen and the formation of stannous chloride (SnCl_2). It is not acted upon by dilute sulphuric acid but dissolves in the concentrated acid. Stannic oxide is formed in the hydrated condition (as in stannic acid ($\text{SnO}_2 \cdot \text{H}_2\text{O}$)) by the action of nitric acid on the metal, while aqua regia acting on the metal forms the tetrachloride (SnCl_4). T. forms two series of salts, the stannous, in which it is bivalent, and the stannic salts, in which it is quadrivalent. The stannic salts correspond with similar compounds of carbon and silicon, the oxide (SnO_2) is acidic, and the chloride is a fuming liquid. The stannous salts are strong reducing agents. The

oxide (SnO) is basic but also acts as an acid-forming oxide towards strong bases. The alloys of T. are of great value, comprising gun metal (Cu and 8-14 per cent. Sn), bronze (copper and tin), phosphor bronze (1 per cent. phosphorus), pewter (Sn 80, Pb 20), solder, bell metal, as well as a large number of alloys with other metals such as gold, iron, bismuth, etc. One of the best-known compounds of T. is pink salt, $\text{SnCl}_2 \cdot 2\text{NH}_4\text{Cl}$, which is used as a mordant in dyeing.

Tinchebrai, tn. in the dept. of Orne, N.W. France. T. was the scene of a battle between Robert of Normandy and his brother, Henry I. of England, in 1106, after which Normandy was annexed to the Brit. crown. Pop. 3300.

Tincture, in heraldry, the colour of the field and charges of an escutcheon. See HERALDRY.

Tindal, Matthew (c. 1656-1733), Eng. deist, b. at Bere Ferrers, Devon, and educated at Lincoln College, Oxford, becoming fellow of All Souls (1678). After having joined the Church of Rome (1685), he returned to the Church of England (1688), and later wrote controversial pamphlets, which all met with vehement opposition from the High Church party. He aroused fierce controversy in 1796 with the pub. *The Rights of The Christian Church Against all Romish and Other Priests* (1706). But his famous work was his *Christianity as Old as the Creation* (1730), popularly known as 'The Deist's Bible,' which had for its purpose the 'stripping of religion of the additions which policy, mistakes and the circumstances of the times have made to it.' See E. Curll's *Memoirs*, 1734; J. Hunt, *Religious Thought in England*, ii, 431 (1896).

Tindale, William, see TYNDALE.

Tinfoil, see FOIL.

Tinned Meat, see under CANNING.

Tinneveli, chief tn. of the dist. of the same name, Madras, India. Headquarters of Protestant missions, and is famous for its temple to Siva. Area of dist. 4342 sq. m. Pop. 2,250,000. Pop of tn. 60,700.

Tin-plates and Sheets, basis of low-carbon unalloyed mild-steel coated by hot-dipping or electro-deposition with pure tin. It is used chiefly for the manuf. of cans and boxes.

Tintagel, coastal vil. 4½ m. from Camel-ford and 20 m. from Launceston in Cornwall, England. It is a popular holiday resort and has sev. good bathing beaches, and golf courses. Near by is T. Head, a promontory 300 ft. high, on the Atlantic Coast, with the ruins of a castle famous in the Arthurian Romances. Some affirm that King Arthur was born here. In other versions, it is the impregnable and inaccessible retreat of King Mark. That a castle did exist here in pre-Saxon times seems certain, though the present ruins are mostly of a later, Norman structure. Pop. 1400.

Tinta Wine, see under MADEIRA WINE.

Tintern Abbey, famous ruins of Tintern wll. in the co. of Monmouthshire, Eng., beautifully situated on the Wyfe, 5 m. N of Chepstow. They date from 1131, when

Walter de Clare founded a Cistercian house which became one of the wealthiest foundations in England. The magnificent building was mainly erected between 1269-87 by Roger Bigod, earl of Norfolk. The chief remains are the ruins of the magnificent cruciform church, the chapter house, and refectory. In 1900 the duke of Beaufort, whose family had long held the property, presented it to the nation; since when extensive repairs have been effected.

Tintoretto, Jacopo Robusti (1512-94), chief painter of the later Venetian school, b. at Venice. He studied under Titian, and was considerably influenced by Michelangelo. His paintings show never-failing imagination, broad and dramatic composition, fine draughtsmanship, and a superb use of colour. T. was an untiring worker, and his great output was probably responsible for some strangely uneven work. Among his numerous works are 'St. George Destroying the Dragon,' 'Christ Washing the Feet of the Disciples' (both in the National Gallery), 'The Miracle of St. Mark,' 'The Crucifixion,' and 'The Marriage at Cana.' Perhaps no writer has shown better appreciation of T. than Ruskin, who rescued him from obscurity (*Stones of Venice*, etc.). See also lives and studies by F. P. Stearns, 1901; E. M. Phillips, 1911; L. Coletti, 1914; and H. Tietze, 1919.

Tipperah, dist. of E. Bengal, Pakistan, on the edge of the Ganges delta. Area 2499 sq. m. It exports large quantities of rice and jute. Cap. Comilla. Pop. 3,860,000.

Tipperary: (1) Inland co. in the prov. of Munster, Eire, bounded by Galway and Offaly (King's co.) in the N., Cork and Waterford to the S., Leix (Queen's co.) and Kilkenny to the E., and Clare and Limerick on the W. To the N. and W. lies a mountainous region with Keeper Hill (2278 ft.) and in the S. are the Galtee Mts., with Galtymore (3015 ft.), the Knockmealdown Mts., and farther E. the Slieveardagh Hills. The Bog of Allen adjoins Kilkenny, while in the S.W. lies the Golden Vale, one of the most fertile regions in all Ireland. The prin. rivs. are the Shannon in the N.W. with Little Brosn., and Nenagh, the Suir and the Nore in the centre, and S. Lough Derg, the N.W. boundary, is the only lake of any size. Agriculture is the chief industry, barley and oats are the main crops, potatoes and turnips also grown; a considerable area is under pasture, and cattle are reared in large numbers. Dairy farming flourishes and there are a number of butter factories. There are also flour and meal mills. Coal, copper, lead, and zinc are found, also slate and limestone, but mining is very little carried on. The co. is divided into a N. and S. riding, and returns seven members to the Dail Eireann. There are interesting remains of castles and eccles. buildings in various parts of the county, notably at Cashel, where there is a round tower, at Ardinnan, at Athassel (an Augustinian priory), at Holycross (Cistercian abbey), and at Felthard and Roscrea (abbey). The co.

is one of those supposed to have been made by King John in 1210. It was granted to the earls of Ormonde in 1328, and was the last of the Irish palatine cos. In 1848 it was the scene of the Young Ireland rising, an abortive rebellion. The co. tn. is Clonmel (8889), other tns. are Tipperary, Carrick-on-Suir, Nenagh, Thurles, and Cashel. The area is 1659 sq. in. Pop. 137,000, decreased through emigration. (2) Mkt. tn., co. Tipperary, Eire, 23 m. S.E. of Limerick, at the foot of the Shevenamuck Hills. In the fertile plain known as the Golden Vale, it is famous for its butter making, and there is also a condensed milk factory. Four m. from the tn. is the Glen of Aherlow, and just outside the tn. is New Tipperary, the vil. built by Wm. O'Brien in 1890, for the Smith-Barry tenants who had to give up their holdings on account of the boycott. Pop. 5300.

Tippoo Sahib, see TIPU.

Tipstaff, officer of the High Court whose function it is to arrest within the precincts of the Court and take to prison any person committed by the Court. The name is often extended to any constable, sheriff's officer, and court crier or usher, and is connected with the staff tipped with metal or a small crown which was formerly his badge of office.

Tipton, tn. of Staffordshire. It is engaged in light and heavy engineering, iron founding, and the manu. of motor-car parts, grates, furniture, glassware, hollow-ware, clothing, light metal goods, electrical equipment, machine tools, etc. Its par. registers, beginning in 1513, are the oldest in England. Pop. 39,300.

Tiptree, vil. in Essex, England, 16 m. from London on a light railway running from Kelvedon. It is noted for fruit and seed growing, and for its jam factory.

Tipu, or **Tippoo Sahib** (1749-99), son of Hyder Ali, succeeded his father as Sultan of Mysore in 1782. He had previously distinguished himself in the Mahratta war, 1775-79, and in the first Mysore war had defeated Brathwaite in 1782. As sultan he concluded a treaty with the Brit. in 1784, but in spite of this invaded (1789) the protected state of Travancore. War followed, and in 1792 he was obliged to resign half of his dominions. But nothing daunted, he continued his intrigues, urging the Fr. to stir up war with England, the result of which was the storming of his cap. Seringapatam, by the Eng., during which T. himself was killed. See L. B. Bowring, *Hydar Ali and Tipu Sultan*, 1893.

Tipulidæ, see CRANE FLY.

Tirana, cap. of Albania, 20 m. inland above the Rushka valley. It dates from the seventeenth century and is noted for its mosques. The tn. was much damaged during the Second World War. It gives its name to a prefecture with a pop. of 57,800. Pop. 31,000.

Tiree, or **Tyree**, is of the inner Hebrides, Argyllshire, Scotland. Hlynish in the S. has a watch tower built for signalling to men on duty at Skerryvore lighthouse. The is. is very flat, and has been used as a landing ground for aircraft. Pop. 1700.

Tiridates, name of a dynasty of Parthian or Armenian kings, five of whom are remembered. The two most important are Tiridates I. and II. *Tiridates I.* conquered his kingdom with the assistance of his brother, Vologesius. But the Rom. gen., Corbulo, from whom he had taken it, forced him to turn to Nero for assistance, whose suzerainty and paramount authority Tiridates was compelled to acknowledge. *Tiridates II.*, who was the son of Kosron, was educated at Rome, and won the friendship of the Roms. by his military qualities. At the request of Lichinus, Diocletian restored him to the throne of Armenia in 286. He was welcomed with enthusiasm by his people, anxious to be freed from the yoke of the Persians. Fortune, however, did not favour Tiridates long, for the Persians soon robbed him again of some of his richest prov. In 296, however, the Roms. replaced him on his throne. He embraced the Christian faith before his death in 314.

Tirlemont, see TIRKEN.

Tirnova, see TRNOVA.

Tiro, Marcus Tullius, freedman of Cicero, and his amanuensis and assistant in literary labours. He was himself an author of no mean reputation, and notices of his works have been preserved by anc. writers. He was the first recorded person to invent a system of lat. shorthand.

Tirol, see TYROL.

Tirpitz, Alfred Peter Friedrich von (1849-1930), Ger. grand-admiral; b. at Küstrin, son of one 'Gross-Justiz-Rat' T., of a Prussian landowning family. Attended the Realschule at Frankfurt-on-the-Main. Passed into the Prussian Navy in 1865, and for thirty years was almost continuously at sea. In the eighteen-seventies, T., a lieutenant-commander, prepared memoranda on torpedoes, which led to the estab. of a torpedo-section in 1885. In 1892 he was appointed to the naval staff at Berlin. Rear-admiral, 1895. In 1896, he was appointed to command the Asiatic Cruiser Squadron; under his direction Tsingtau became a Ger. naval base. On returning home in 1897 he became secretary of state for the navy. In 1898 he presented to the Reichstag his first Navy Bill, the beginning of the serious growth of the Ger. Navy. Vice-admiral, 1899. His second Bill was brought in in 1900; it definitely started the naval-arms-race. Admiral, 1903. Grand-admiral, 1911. At the beginning of the First World War he was still secretary of state for the navy; but he was on bad terms with his two naval colleagues, and did not succeed in his purpose of making full use of the navy from the beginning. He resigned March 15, 1916, and was Nationalist member of the Reichstag from 1924 to 1928, and then retired to private life. He wrote *My Memoirs* (1919); also *Der Aufbau der deutschen Weltmacht* (1924).

'Tirpitz', Ger. battleship, see under NAVAL OPERATIONS IN SECOND WORLD WAR, *Naval Operations*, 1944.

Tirso de Molina (alias Gabriel Tellez) (1585-1648), Sp. dramatist, b. in Madrid

educated at the Univ. of Alcalá de Hénarés. When he had taken his degree he left for Madrid, in order to take up the life of a dramatist. Molina, or Tellez, as he is more generally known, was a very prolific writer, and wrote three hundred comedies, which, taking into consideration the length of his creative period, works out at the rate of two plays a month. Tellez ended his life as a member of a religious order, and became prior of the monastery of Soria, where he died at the age of sixty-three. Among his best-known plays is *Don Juan*, to which Molière was indebted. See life by A. H. Bu-see, 1939.

Tirupati, tn. of Madras, India, in the dist. of N Arcot, 72 m. N.W. of Madras. It is celebrated as a place of pilgrimage, and has a wonderful hill-temple. Pop. 19,500.

Tiryns, anct. tn. in Argolis, said to have been founded by Proetus, who built the massive walls of the city with the help of the Cyclopes. Proetus was succeeded by Perseus, and it was here that Hercules was brought up. The remains of the city including the ruins of two palaces dating from about 1600 B.C. are some of the most interesting in all Greece.

Tischendorf, Lobegott Friedrich Konstantin von (1815-71) Ger. biblical scholar, b. at Legenfeld in Saxony. He made a special study of N. T. criticism at the Univ. of Leipzig, and in 1845 became prof. there. He discovered the fourth-century Smaitic Codex (see *SINAITICUS*, CODEX), at the monastery on Mt. Sinai. His works include: eds. of the Smaitic Codex (1862-63); *Editio VIII.* of the New Testament (1864-72); the *Monumenta Sacra Inedita* (1846-71); and *Reise in den Orient* (1846); *Aus dem Heiligen Lande* (1862), which describe his journeys.

Tishri, seventh month of the anct. Biblical (the name T. is post-biblical) calendar, and first month of the Jewish post-exilic calendar, corresponding to Sept.-Oct. On the first day is the feast of the New Year (Rosh Hashanah, *q.v.*); on the 10th the Day of Atonement (Yom ha-Kippurim, *q.v.*); on the 15th the harvest festival or feast of Tabernacles.

Tisio da Garofalo, see *BENVENUTO*.

Tisiphone, see under *ERUMINENTES*.

Tisserand, François-Félix (1845-96), Fr. astronomer, was appointed as *astronome adjoint* to the Paris Observatory in 1863 and as director in 1892. In addition to his observational work he conducted important researches in mathematical astronomy, many of the results of which appeared in *Comptes Rendus*. In *Bulletin Astronomique* (1899), he dealt with the theory of the capture of comets by the larger planets and pub. his well-known *Criterion* for establishing the identity of a periodic comet, in spite of its perturbations by the planets. This also appeared in his chief work, *Traité de Mécanique céleste* and is expressed as follows:

$$\frac{1}{a} + 2\sqrt{a(1-e^2)} \cos i$$
 is constant, where a is the semi-major axis of the ellipse in which the comet moves, e its eccentricity

and i the inclination of its orbit to the plane of the ecliptic.

Tissue and Tissue Culture. **T.** (Lat. *texere*, to weave) in general usage denotes either an interwoven fabric, or a connected series of statements, circumstances, or events. Biologically, a T. consists of associated cells having in common either form, function, both form and function, or other characteristics. In animals there is frequently dead, non-cellular matrix deposited between the cells, as for instance in bone and cartilage. The study of T.s is *histology*. T.s. may be named severally according to the types of cells composing them, e.g. muscular and nervous T.s. of animals, and parenchymatous, prosenchymatous, and sclerenchymatous T.s. of plants; or according to their function, e.g. connective T.s. of animals, vascular and storage T.s. of plants; or according to their position, e.g. epithelial tissue of animals and dermal T.s., such as cork and bark, of plants. See further under *AMERBA*; *CELL*; *EMBRYOLOGY*; *EPITHELIUM*; *EXPERIMENTAL EMBRYOLOGY*; *HISTOLOGY*; *LYMPH* and *LYMPHATICS*.

Tisza of Boros-Jenő and Szeged, István (Stephan) Emmerich Ludwig Paul, Count (1861-1918), Hungarian statesman; b. April 22, at Budapest; son of Kálmán Tisza. He entered the Hungarian Chamber, 1886. He was Prime Minister from 1903 to 1905 and had himself elected President of the Chamber in 1912, forcing the Army Bill through. On June 15, 1913, T. again became Premier. He was adamant in his attitude to minority peoples within the territory of the Dual Monarchy, so that he hopelessly estranged Rumanian feeling. On the death of the Emperor Francis-Joseph, 1916, T.'s influence began to wane. The Emperor Charles favoured a thorough review of the problem of the Slav, pops., and also a democratisation of the franchise. T. objected to both these reforms, resigned May 1917, and was assassinated in the following year. On his policy, especially during the closing months of his life, see E. von Glaise-Horstenau, *The Collapse of the Austro-Hungarian Empire*, 1930. See also life by F. Herczeg, 1926; O. Jászai, *The Dissolution of the Hapsburg Monarchy*, 1921, and L. Lanyi, *Le comte Étienne Tisza et la Guerre de 1914-1918*, 1946.

Tisza, see *TREISS*.

Tit, or **Titmouse**, names given to members of the passerine family Paridae. Five species, all great insect-eaters, are common in Britain, and two occur in a few districts: one of these is the bearded T. or reed pheasant (*Parus biarmicus*), which is found only in Norfolk and Yorkshire; the male is about 6 in. long, and has a thin tuft of black feathers on each side of the chin; the general colour is light red. The crested T. (*Parus cristatus*) occurs only in parts of Scotland, though it sometimes visits England. The blue T. (*P. ceruleus*) is the commonest of these birds; its prevailing colour is blue, with green above, and a black throat. The coal T. (*P. ater*) has a black head, with a white patch on the nape. The great T. (*P. major*) is about 6 in. long and is yellow on the back,

breast, and sides, with grey wings and tail, and black head and throat. The marsh T. (*P. palustris*) resembles the coal T. except for the latter's white nape and white spots on the wings. The long-tailed T. (*Acridula caudata*) is about 5½ in. long, and has the black tail feathers prolonged and graduated. The black-cap T. or chickadee (*a.v.*) (*Parus atricapillus*) is a N. Amer. native.

Titan, satellite of Saturn. Mean distance from primary 759,500 m., periodic time, 15 days, 22 hrs., 4 min. Stellar magnitude at mean opposition distance, 8.3.

Titania, satellite of Uranus. Mean distance from primary 272,500 m. Its period of sidereal revolution is 8 days, 16 hrs., 56 min. Stellar magnitude at mean opposite distance, 14.

Titania, see MAB. QUEEN.

Titanic 'Disaster' was caused by the White Star liner *Titanic* colliding with an iceberg on the night of April 14, 1912. In all, close on 1,500 persons were drowned, among them being Colonel J. J. Astor, Jacques Futelle, the Amer. novelist and dramatist, F. D. Millet, the artist, William T. Stead, editor and journalist, and Harry Widener, millionaire book-collector. Out of 2201 passengers, only 711 were saved, being picked up by the *Carthage* after a wireless message from the *T.* The *T.*, then the largest vessel afloat (tonnage about 45,000), was on its maiden voyage to New York, and shortly before midnight of the third day of the trip, when in lat. 41° 26' N., and long. 50° 14' W., struck an enormous iceberg a glancing blow, stripping off her bulge practically from end to end. Less than three hours from the impact the liner sank. After an enquiry the Mersey Report was issued as a result of which improvements were introduced in life-saving equipment, and boat-drill for passengers became a necessary routine. See L. H. Bessley, *The Sinking of the Titanic*, 1912; and Commodore Sir A. Rostron, *Home from the Sea*, 1931.

Titanium, metallic chemical element, symbol Ti, atomic weight 47.9, atomic number 22. It occurs in nature as the oxide which exists as the polymorphic varieties, anatase, rutile, and brookite. The metal is white and lustrous (sp. gr. 4.5), and is obtained by the electrolysis of a solution of the oxide in calcium chloride, or, better, by heating titanium tetrachloride with metallic sodium in the absence of air. T. unites directly with nitrogen to form a nitride having a metallic lustre. Like silicon dioxide, T. dioxide is the anhydride of a weak acid, but it also exhibits feebly basic properties. In its halogen compounds T. is quadrivalent and hexavalent. Though T. is a comparatively abundant element, few uses have been discovered for it or its compounds. T. is employed in the manu. of various alloys; T. tetrachloride is used in making smoke-screens for naval purposes, and other compounds are used as pigments, chemical reagents, etc. T. chloride finds some use in volumetric analysis.

Titans, sons and daughters of Uranus (Heaven) and Gaea (Earth). They were

twelve in number, six sons and six daughters. It is said that Uranus, the first ruler of the world, threw his sons into Tartarus. Gaea, indignant at this, persuaded the Titans to rise against their father. The Titans then deposed Uranus, liberated their brothers who had been cast into Tartarus, and raised Cronus to the throne. It having been foretold to him by Gaea and Uranus that he should be dethroned by one of his own children, he swallowed his children successively. Rhea, therefore, went to Crete, and gave birth to Zeus in the Dictæan Cave. When Zeus had grown up he availed himself of the assistance of Thetis, who gave to Cronus a potion which caused him to bring up the children he had swallowed. United with his brothers and sisters, Zeus now began the contest against Cronus and the ruling Titans. This contest lasted ten years, till at length Gaea promised victory to Zeus if he would deliver the Cyclopes and Hecatoncheires from Tartarus. Zeus accordingly slew Campe, who guarded the Cyclopes, and the latter furnished him with thunder and lightning. The Titans were then overcome, and hurled down into a cavity below Tartarus.

Titchener, Edward Bradford (1867-1927), Eng. experimental psychologist, was b. at Chichester. Graduating from Oxford Univ., he then went to Leipzig for his Ph.D. degree. He graduated in 1892, and was at once called to Cornell Univ. in the U.S.A., where one of the first experimental psychological laboratories in America had been founded. He remained there for the rest of his life, and became one of the recognised world authorities on his subject. His big two-volume work *Experimental Psychology, a Manual of Laboratory Practice* (1927), is the masterpiece on the subject so far as Eng.-reading people are concerned. In this exhaustive treatise he considered both qualitative and quantitative experimental work.

Tithe. Ts. were 'the tenth part of the increase yearly arising from the profits of lands, stocks upon lands, and the industry of the parishioners, payable for the maintenance of the par. priest, by everyone who has things fitheable, if he cannot show a special exemption' (Thomas Wood's *Institute of the Laws of England*). Ts. were payable before the Christian era (see Gen. xiv. 20), but in the Christian Church Ts. were first given by the faithful as spontaneous offerings, at the solicitations of the clergy. Such voluntary offerings were given in kind, e.g. wool, corn, or other agric. or farm produce. Canon law (*g.v.*) later enjoined payment as a legal obligation in accordance with the divine law of the O.T. (see TENSORS). Ts. were either *predial*, *personal*, or *mixed*: *predial* being the produce of the soil (e.g. corn, wood); *personal*, the produce of labour and industry; and *mixed*, the produce of animals, also including eggs. Prior to the decrees of the Lateran Council (1215), it was a common practice to pay T. to monasteries, but the Council restricted tithe-payers to payment to the parsons of pars. In consequence most Ts.

belonged as of common right to the par. incumbents, though sometimes laymen could show a right to a portion of Ts., based upon a prior voluntary grant to some spiritual corporation. Again, rec-torial Ts., after the dissolution of the monasteries, frequently found their way into lay hands (see *IMPROPRIATION*). The only lands exempt from Ts were barren heath, waste forest or glebe, old monastic lands held prior to the dissolution exempt from Ts., crown lands or lands held by a spiritual corporation, which had never been known to pay Ts., and lands in respect of which was payable a modus or composition real: it was an agreement between parson ordinary and landowners and patron, whereby the landowners agreed to pay a perpetual sum in lieu of T.). The Tithe Commutation Act, 1836, and amending Acts commuted all the Ts. of England and Wales into T. rentcharge and fixed the total amount of the rent-charge for which the Ts. of each par. were to be commuted.

Provision was made by the Tithe Act, 1813, for the compulsory redemption of rent charges exceeding 20s., the consideration money for redemption being the amount agreed between the owners of the land and of the rentcharge. Provision for apportionment of annuities created by the redemption of T. rentcharge was made by an Act passed in 1921. The Tithe Act, 1925, still further amended the law on T. rentcharges, rents, etc., in lieu of T., and the payment of rates on rentcharge, etc. By this Act any T. rentcharge which before March 31, 1927, was attached to a benefice or to an eccles. corporation was transferred to be vested in the Governors of Queen Anne's Bounty and held in trust for the incumbent or corporation.

Notwithstanding much legislation rent-charge gave rise to agitation and remained a vexed question which was only settled by another Act, the T. Act of 1936, which at last ended a system containing ineradicable difficulties. This Act extinguishes both rentcharge and extraordinary rent-charge, and makes provision through a Tithe Redemption Commission for compulsory redemption and for the compensation of persons interested, by the issue of 'redemption stock' charged on the Consolidated Fund. In other words, the rent-charge, which was previously payable to the Church, the Eccles. Commissioners, Queen Anne's Bounty, and some lay owners, is replaced by 'redemption annuities' payable to the Crown, and the Crown issued gov. stock to the tithe-owners. Thus for the first time in its long hist. T. was divorced from the Church. The annuities will be payable until 1996 when they should cease and all T. (with a few minor exceptions such as corn rent) will be abolished. A capital loss estimated at £17,750,000 resulted to the Church of England from the Act of 1936, a situation which called for every possible adjustment by the Eccles. Commissioners and Queen Anne's Bounty (now amalgamated as the Church Commissioners). See P. W. Millard, *Tithes and Variable Rentcharges: Some Aspects*

of their History and Development, 1934, and *Law Relating to Tithes and Payments in lieu of Tithe* (3rd ed.), 1938.

Tithing: (1) In A.-S. police arrangements, associations of ten men (in the N. of England called the *tenmannetale*: elsewhere *frithborh* or *frankpledge*) who, dwelling near each other, were sureties or free pledges to the king for each other's good behaviour. The name and div. of T. itself still remains in parts of the country. (2) Levying a tax on or to the amount of a tenth. See *TITHES*.

Titian, or **Tiziano Vecelli** (c. 1477-1576), It. painter of the Venetian school, *b.* at Pieve, in Cadore, a mountainous dist. of the Venetian Alps. Having shown a taste for art, he was sent to Venice to learn painting, and first studied under Zuccati, a mosaicist, afterwards becoming the pupil of Bellini and Giorgione. He seems first to have been employed in the decoration of houses, but he also produced works on canvas, notably the allegorical picture 'Sacred and Profane Love,' 'Doge Marcello' (at the Vatican), and 'Christ and the Pharisee—Tribute Money,' of the Dresden Gallery, spoken of by Vasari as something stupendous and miraculous. In 1516 he was made official painter to the council in Venice. In the same year he went to Ferrara, and executed amongst other works the 'Bacchus and Ariadne,' now in the National Gallery. In 1533 he became acquainted with the Emperor Charles V., who sat to T. for his portrait, rewarding him by making him a Count Palatine and a Knight of the Golden Spur. Returning from Bologna to Venice (1537) he executed his magnificent 'Battle of Cadore,' which unfortunately perished by fire in 1577, but he was again with the emperor at Milan in 1541, and in 1545 accepted the pope's invitation to Rome, where he painted portraits, as well as 'Danaë,' now in the Naples Museum. In 1548 he undertook a journey across the Alps to join Charles V. at Augsburg, and painted the well-known portraits of Philip of Spain. From this time he was chiefly occupied in working at Venice, until in 1576 he died of the plague. T.'s works are remarkable for their magnificent colouring and technical skill. He painted religious pictures as well as mythological, poetical, and allegorical subjects, and as a portrait painter he occupies the first rank. See J. A. Crowe and G. B. Cavalcoressi, *Life and Times of Titian*, 1887; C. Phillips, *Titian: a Study of his Life and Work*, 1898; C. Huetts, *Titian*, 1910; D. von Haden, *The Drawings of Titian*, 1927; R. F. Heath, *Titian*, 1930.

Titicaca Lake, mt. lake in the Andes, on the frontier of Bolivia and Peru in S. America, between the main Andean range and the Cordillera Real. It is 120 m. long, has an average width of 30 m., and lies 12,545 ft. above the sea. Its area is 3200 sq. m., and its maximum depth is about 700 ft. The water is fresh but unpleasant.

Tit-lark, see *PITR*.

Titles, additions to a person's name, indicative of some honour, office, or

dignity, e.g. emperor, prince, chancellor, primate, duke, mayor. Some T. are held *virtute officii*, as for instance 'king'; others, like the T. of the five orders of nobility, and baronets in Britain, are hereditary, and some, like that of knight, are conferred for life. See also ADDRESS, FORMS OF; NAMES; NOBILITY.

Titmouse, see BLACK-CAPPED TOMTIT.

Titto, Broz Josip (b. 1890), Yugoslav soldier and statesman, b. at Kumrovec nr. Zagreb. He came of peasant stock, and worked as a farm-labourer for a time. After the First World War he became a Communist, paying frequent visits to Moscow for training periods there and adjustment to the ever-changing Party line. He married a Russian intellectual, who later disappeared in a Moscow purge of Trotskyists. In the winter of 1928-29 he was arrested in Zagreb. After a short time in the Zagreb prison T. returned to Moscow and attended the Lenin school for two years. In 1934 he became a member of the Yugoslav Politburo and here he began his secret struggle to oust Stalin's satellite, Milan Gorkić who had been sent

Communist leaders of Europe who remained safely in Moscow during the war, T. was in his own country organising resistance to the Nazis. His fight was fraught with the greatest difficulties for his antagonists included, besides the Nazis, the Mihailovich (q.v.) partisans and the N.K.V.D. observers in his own Politburo. By welding the peasants into a victorious guerilla partisan army he felt he had contributed not only a new Communist experience, but something novel in Stalinist doctrine. When the Cominform (q.v.) headquarters were estab. in his cap., Belgrade, T. had a valuable opportunity both to receive regular reports from Moscow on the latest developments in the Russian party, and also to pass on his interpretation of such reports to those delegates he wanted to influence. He now no longer stopped at sparring with Russian supervisors in Belgrade in order to keep control of the Yugoslav Party, but actively intervened in the Party struggle in Moscow and, as a consequence, he came into a life-or-death struggle with Andrei Zhdanov (q.v.). In mid-1948 the Cominform expelled T. and urged the Yugoslav people to turn him out of office if he did not change his policy. Yet a year later T. was still in power in spite of all that the Cominform had been able to do, though there can be no doubt that the quarrel with Soviet Russia had by that time made serious political and economical difficulties for Yugoslavia; but equally there seems to be no doubt that T. was still genuinely popular with supporters from all classes of the people and all parts of the country, for the idea that Moscow should try to control Yugoslav internal affairs, or limit her industrial expansion roused their national pride and rallied them round T. As a consequence of this quarrel the Cominform countries decided to impose economic sanctions and therefore stopped sending to Yugoslavia any cap. equipment, hoping that unemployment and food shortage would eventually bring about wholesale collapse of Yugoslav economy; but T., adhering to his five-year-plan, made trade treaties with over a score of countries, many of them in W. Europe. See also EASTERN FRONT IN SECOND WORLD WAR.—*New Russian Attacks in Rumania, etc.*; YUGOSLAVIA. See G. Bilainkin. *Titto*, 1949.

Titograd, see PODGORITZA.

Titration, method in quantitative chemical analysis. The weight of a substance in a definite volume of solution is determined by causing it to react with a solution of another reagent of known strength. This reagent is contained in a burette and run out into the other solution till reaction is complete, as shown by change of colour of an indicator such as litmus, methyl-orange, phenolphthalein, or by cessation of effervescence, etc. The volume used is noted and the weight of reagent contained is thus known. From the chemical equation and the atomic weights, the weight of the other solute can then be calculated. T. methods are quick and, under suitable conditions, are susceptible of great accuracy; they have

Yugoslav Embassy

MARSHAL TITO

to Belgrade in 1928 to bind the Yugoslav Party to the Soviet general secretariat. After three years of conspiracy T. achieved his first success; Gorkić paid the usual price of failure, was called to Moscow in 1937, and executed. Installed with unlimited power, as the general secretary of the Yugoslav Party T. dissolved it and ordered a re-registration. Surrounded by loyal adherents T. now began to aspire to higher things. Unlike most of the other

therefore largely displaced the older gravimetric methods, though these are still employed when even greater accuracy is required. T. was introduced by Gay-Lussac (q.v.) early in the nineteenth century.

Titulescu, Nicolas (1883-1941), Rumanian lawyer and statesman, became prof. of law at Jassy Univ. (1905) and at Bucharest Univ. (1909). He entered Parliament in 1912 as a supporter of Také Jonescu (q.v.) and as a recognised authority on finance. In the First World War he was finance minister from 1916 until the treaty of Bucharest, when he resigned. In his term of office he supported the scheme of land reform involving div. of the large estates, whereby he probably saved his country from Bolshevism. He took a prominent part in negotiating the agreements with Czechoslovakia and Yugoslavia which constituted the Little Entente (q.v.). His policy of a Balkan bloc led to the signing of the Balkan Pact of Feb. 1934. His foreign policy envisaged friendship with France, accommodation with Russia, and regional pacts in the Balkans, the objective always being the integrity of Greater Rumania. In 1936 he was ousted from the gov.

Titus, friend and companion of St. Paul, not named in the Acts. All we know of him is learned from the letters of the apostle. He was left by the latter as bishop of Crete, and there he received the epistle which bears his name. Eusebius says that he remained unmarried and d. in old age. See B. S. Easton, *The Pastoral Epistles*, 1948.

Titus (T. Flavius Sabinus Vespasianus) (A.D. 40-81), Rom. emperor, son of Vespasian. He won early distinction as military tribune in Britain and Germany, and helped to crush a Jewish insurrection (67), besieging and storming Jerusalem (69-70). T. was associated with Vespasian in the gov. (71), and succeeded him (79), proving a wise and kind ruler.

Under T. began the campaigns of Agricola in Britain. Two heavy calamities fell upon Italy during his reign: the eruption of Vesuvius, burying Pompeii, Herculaneum, and Stabiae (24 Aug., 79), and, a few months later a great fire in Rome. See Suetonius, *Titus*; Tacitus, *Hist.*; Josephus, *History of the Jewish War*; C. E. Boulé, *Titus et sa Dynastie*, 1872.

Titus (Τίτιος), giant of Euboea, son of Gaea, or of Zeus and Elara. For offering violence to Artemis (or in other accounts to Leto) he was killed by Zeus or Apollo and then cast into Tartarus, where two vultures perpetually devoured his liver as he lay outstretched on the ground.

Timen, or **Tyumen**, tn. in the Omsk Region of the R.S.F.S.R., 125 m. S.W. of Tobolsk. Rivercraft are built here for the Ob-Irtysk transport system of Russia. It has tanneries, silk mills, iron foundries, machine works, etc. Pop. 75,500.

Tiverton, municipal bor. of Devonshire, England, on the Exe, 14 m. N.N.E. of Exeter. The chief building of interest is the church of St. Peter. Textile manuf. is the chief industry. Blundell's

School was originally built at T. in 1604; the present buildings were erected outside the tn. in 1882. Pop. 11,200.

Tivoli (anct. *Tibur*), anct. tn. 25 m. by railway E.N.E. of Rome, on the Teverone (anct. *Anio*), in Italy. Before Rome was built the Lat. city of *Tibur fl.* In Horace's day it was the favourite summer resort of wealthy Romans, and ruins of Hadrian's and Maecenas's villas, besides mausolea, aqueducts, and a circular temple, are still to be seen. Its situation at an altitude of nearly 800 ft. in the Sabine Hills makes it both picturesque and healthy. Apart from classical remains, the Renaissance garden of the Villa d'Este (begun in 1549) excites much interest. Beautiful falls on the riv. supply Rome with electric power. In the battles of 1941, the fine buildings of T. sustained considerable damage, especially the churches, though the cathedral lost only its window glass. A direct hit badly damaged the Chiesa del Gesù. S. Filippo was completely destroyed. A direct hit demolished the whole upper storey of the Villa d'Este, on one side of the courtyard, but the hanging gardens with their famous fountains were relatively undamaged. Pop. 16,000.

Tlacolula, tn. in the State of Oaxaca, Mexico, dating from about 1250 and an important mkt. centre. Its sixteenth-century church has a beautiful chapel decorated in the baroque style of Santo Domingo in the city of Oaxaca (q.v.). Pop. 12,000.

Tlaxcala, inland state of Mexico and its cap. The State, which has an area of 1555 sq. m., lies on the Mexican plateau, average height 7000 ft., rising in Malinche to 13,454 ft. In the days of the great Aztec empire, T. maintained a sturdy independence within her mt. fastnesses till, in 1519, she became the ally of the Spaniards under Cortés. The cap. lies 18 m. N. of Puebla. Pop. state 224,000; tn. 3000.

Tlemcen, tn. in the dept. of Oran, Algeria. The Rom. *Pomaria*, it was later the Moorish cap. It fell to the Fr. in 1842. It has synagogues, mosques, and a museum of antiquities. It exports blankets, olive oil, and alfa, and manufs. leather work and native carpets. Rashgun, which has a lighthouse, is its port. Pop. 54,300.

Toad, the name usually applied to members of the large genus *Bufo* of batrachians. They differ from frogs chiefly by the total absence of teeth, and in certain anatomical features, such as the shoulder girdle and the sacral vertebra. In Brit. Ts. a large poison-secreting gland, called the *parotid*, occurs, but this is absent from the frogs. It appears to be necessary for the poison to come into contact with the blood through an abrasion or other means to be noxious. The skin of the T. is drier and more warty than that of the frog. The two Brit. Ts. are the natterjack (*Bufo calamita*) and the common T. (*Bufo vulgaris*), which is generally distributed over Great Britain, though absent from Ireland. It has longer hind limbs than the other and is

able to hop. Its eyes are more lateral and the irises reddish-copper colour. The females are usually larger than the males. The natterjack, which is local in England, cannot hop, as the hind limbs are too short, but it is able to run and is often called the running T. Its eyes are more prominent and the irises greenish-yellow; a thin yellow line runs along the middle of the back. During the breeding season the males croak very loudly. The value of Ts. to the farmer and gardener cannot be exaggerated, as they feed entirely on insects, millipedes, woodlice, slugs, and snails. They are quite harmless to man.

Toadflax, or *Linaria*, genus of plants and sub-shrubs (family Scrophulariaceae), with a spurred corolla. A number of species grow wild in Britain, but some of them are not indigenous, including the ivy-leaved T. (*L. cymbalaria*), a widely distributed wall and rock plant, which reproduces itself readily from seed and by means of its long rooting stems. The yellow T. (*L. vulgaris*) is a handsome and common hedgerow plant, with terminal racemes and large yellow flowers. Several species are grown in gardens.

Toadstool, see FUNGI.

Tobacco, plant of the genus *Nicotiana* (family Solanaceae) from which is manufactured smoking and chewing T., cigarettes, cigars, and snuff. There are over fifty varieties of the plant, many of which are cultivated in gardens, but only a few varieties are used for smoking purposes. The varieties of most importance to smokers are *Nicotiana Tabacum* and *Nicotiana Rustica*. The former, a native of the W. Indies, bears pink or rose-coloured flowers and grows from two to nine ft. high. The bulk of T. used in the trade of most countries of the world is produced from this variety. The latter, a native of Mexico, bears greenish yellow flowers, and is a much smaller plant than *Nicotiana Tabacum*. *Nicotiana Rustica* was cultivated by the anc. Mexicans and by the N. Amer. Indians, but early in the seventeenth century it was largely superseded by *Nicotiana Tabacum*.

Growth and Cultivation. T. seedlings are grown in sheltered level ground containing loamy, mellow soil, which is burnt to a depth of three in. to kill all weeds, insects, etc., and deposit the essential potash. Sowing takes place in the early spring. The seed is minute, one ounce containing 300,000 to 400,000 seeds, and a tablespoonful being sufficient to sow a bed covering 100 sq. yds. The seed is usually mixed with ash or flour which are white, so that the sower can see where it falls and thus ensure even distribution. After sowing the bed is covered with cheese cloth or grass to protect the plant in the early stages of growth. When the plants are 5 to 6 in. high they are transplanted by hand into fields which have been thoroughly broken up by repeated harrowings. In land that does not drain easily they are usually set in ridges. About 4200 plants are set to the ac. Very careful cultivation is essential. 'Topping,' the cutting away of the stalk carrying the top leaves and the flower bud, is necessary

to prevent seeding and to put more strength in the remaining leaves, usually 10 to 16 in number. Harvesting takes place in the hottest part of the year. Leaves may be picked individually as they ripen (known as 'priming'), or by the whole plant method, after which they are conveyed to barns for curing.

Curing. Curing is an operation requiring skill and experience. There are four methods: flue-curing; firing; air-curing; and sun-curing. Flue-curing barns are heated by iron flues and the leaves are hung above the flues. No smoke comes into contact with the T. Flue curing is done in three stages: yellowing the leaf; fixing the colour; and drying out the stem; and the whole operation takes four to five days. In fire-curing the T. is hung in the barns over wood fires lit in trenches in the floors and the smoke comes into direct contact with the T. The length of the process varies from a week or ten days to six weeks. Generally speaking, the longer and more gradual the process, the better the result. For air-curing the T. is hung in the barns, protected from the rain, but exposed to the passage of air, and the curing is a natural process extending over about two months. Sun-curing is a similar process, except that in the early stages the leaf is exposed in the open to the sun's rays.

Production and Types of Tobacco. The production of T. is world-wide, extending as far N. as Sweden and as far S. as New Zealand. In some countries, China for example, the production is almost entirely for domestic use, and in others, England for example, because of unsuitable climatic conditions, only tobacco of low yield and poor smoking quality can be produced commercially. The prin. types of T. and the main exporting countries are as follows:—(1) *Flue-cured tobaccos, Brights and Semi-brights.* U.S.A. (N. and S. Carolina, Georgia, Virginia); E. Canada; Nyasaland; Rhodesia; some parts of India; and Brazil. This is the type of T. most used in the United Kingdom, where most cigarettes are made from it, and it is also extensively used in pipe T. It is grown on light, sandy soil and obtains its nourishment from applications of chemical fertilisers. It has a characteristic bright colour. (2) *Burley Tobacco and other Air-cured tobaccos.* U.S.A. (Kentucky; Tennessee; Maryland); E. Canada; parts of India; and Nyasaland. This type is used in very large quantities in the U.S.A. both for cigarettes and pipe Ts. It is used to a lesser extent in the United Kingdom for pipe Ts. only. It is grown from distinctive kinds of seeds and its reddish-brown colour is obtained by air-curing. (3) *Dark Fired Tobacco.* U.S.A. (Kentucky, Tennessee, Virginia); E. Canada; Nyasaland; and S. Rhodesia. This type of T. is used for the manuf. of roll and shag T. and produces a strong smoke. It is a large heavy type of leaf grown on richer soil than the flue-cured variety. (4) *Latakia and Latakia type tobacco.* Syria (dist. of Latakia) and Cyprus. Latakia T., has a flavour

peculiar to itself and is used in the United Kingdom entirely in pipe smoking mixtures. It is the smallest of all the tobacco plants and its leaves are barely two in. in length. The whole plant is cured by heavy firing, which gives the characteristic black appearance and distinctive flavour. (5) *Oriental Tobacco*. Turkey; Greece; Bulgaria; and the borders of the Black Sea. Oriental has a highly distinctive aromatic flavour. It is used in Oriental and 'blended' brands of cigarettes. The Oriental T. plant is of small growth, producing a delicate type of leaf. (6) *Cigar Tobacco*, see CIGAR.

History. The use of T. dates from remote antiquity amongst the natives of the Amer. Continent. It is mentioned in the observations (1497) of Romano Pane, a friar who accompanied Columbus on his second voyage, as being used medicinally and in religious ceremonies by the tribes of the Antilles. Gonzalo Fernandez de Oviedo in 1526 described the plant and the native custom of inhaling smoke from the burning leaf through a hollow forked cane held to the nostrils. This cane was called tobacco by the natives, and the name was applied by the Spaniards to the primitive cigar and to the plant itself. T. was introduced into Europe in 1559 by Francisco Hernandez de Toledo, a physician who had been sent by Philip II of Spain to investigate the products of Mexico. Jean Nicot, the Fr. ambas. to Portugal, learned of T. in Lisbon and introduced it to the Fr. court in 1560. His association with the plant is commemorated by the botanical name *Nicotiana* and the word nicotine. On its first introduction to Europe T. was valued for its medicinal properties, and it was considered 'a panacea for all the ills that the flesh is heir to.' Sailors returning from the Americas first introduced smoking to England about 1565. Sir Walter Raleigh brought the practice to Court circles. By the end of the seventeenth century, despite attempts to exterminate the practice by means of stringent laws, heavy punishment, and even excommunication from the church, T. was in general use in most parts of the world. The introduction of cigarettes and the two World Wars popularised smoking among women, although women smoked in earlier times, particularly in some E. countries, where it was and still is customary. Smoking by children and the sale of tobacco to them is now forbidden by law in many countries, including Great Britain.

The rate of tobacco duty in the United Kingdom increased from 3s. per lb. in 1900 to 3s. 8d. in 1914, to 9s. 6d. at the beginning of 1939 and to 58s. 2d. per lb. in 1948. From 1900 to 1949 the United Kingdom Gov.'s revenue from the T. duties increased from nearly £11,000,000 a year to £602,000,000 a year, and in 1948 and 1949, except for Income Tax, the T. duties were the Gov.'s largest single source of revenue. A committee appointed by the Treasury in 1923 recommended against gov. financial support of T. growing in England, on the grounds of unsuitable climatic conditions. The

growing of T. in the United Kingdom is subject to Excise regulations and the payment of duty, but in 1948 the gov. announced that although not prepared to repeal the Excise duty on home grown T., they would not for the time being interfere with private individuals growing T. for their own personal consumption.

Bibliography. A. E. Tanner, *Tobacco* 1912, 1945; G. L. Apperson, *The Social History of Smoking*, 1914; C. M. MacInnes, *The Early English Tobacco Trade*, 1926; Count Corti, *A History of Smoking*, 1931; and W. W. Garner, *The Production of Tobacco*, 1946.

Tobago, is. of the Brit. W. Indies, in lat. 11° 9' N. and long. 60° 12' W., about 75 m. S.E. of Grenada and 22 m. N.E. of Trinidad. The is. is 26 m. long and 7½ m. wide and has an area of 116 sq. m. T. is mountainous in the centre and at the N.E. end, and undulating and flat in the S. and W. The highest peak is 2100 ft. Deep fertile valleys run down from either side of the main ridge. The prin. riv. is the Courland named after the viking duke who in the seventeenth century ruled the is. almost as a sovereign. Scarborough (pop. 1250) formerly called Port Louis, is the cap. The only other tn. is Roxborough (pop. 1000). Sugar was once the staple industry but it was runned by the foreign sugar bounties. Cacao, coco-nuts, and limes have taken its place. The climate is most agreeable; the mean temp. is 80° F., but owing to the long seaboard the heat is generally tempered by a cool sea breeze. In the central and Windward dists. the rainfall varies from 85 to 95 in. and in the N. may exceed 100 in. There is a civil airfield at Crown Point, the S.W. tip of T.; also a gov. wireless station and telephone system. At a distance of 1½ m. from the N.E. end of T. off the vil. of Spoysside (25 m. from Scarborough), is the is. of Little T. The rocks between it and T. are known collectively as Goat Is.

T. is known to many people by its nickname, Robinson Crusoe's Island. For though the actual story of Crusoe's life on his is. of Juan Fernandez was based largely on Alexander Selkirk's adventure there, there can be no doubt that Defoe, in describing his mythical is., had T. in mind.

Columbus discovered T. in 1498 and named it 'Tabago,' from a notion that it resembled in shape the Carib tobacco pipe. Sir Robert Dudley, natural son of the earl of Leicester, is believed to have visited T. and hoisted the Eng. flag in 1580. Nearly thirty-six years later Eng. colonists from Barbados effected the first settlement but no successful settlement was made for nearly a century and a half after the discovery of the is. For the ensuing forty years the is.'s hist. was a ding-dong struggle between Dutch colonists and some Baltic settlers from Courland, varied by Fr. and Eng. invasions. After that and for the next twenty years the is. was declared neutral but, nonetheless, alternated between Fr. and Eng. possession until, in 1814, it was finally ceded to England. By an Act of

1855 T. was given an executive committee or Privy Council, that being its nearest approach to self-gov. In 1898, after a long period as part of Windwards, T. became a ward of the United Colony of Trinidad and Tobago administered by a commissioner. Pop. 27,000. See H. I. Woodcock, *History of Tobago*, 1867; E. C. Digby, *Guide to Trinidad and Tobago* (2nd ed.), 1936-37; Bowman and Bowman, *Crusoe's Island in the Caribbean*, 1939; C. Reis, *The Government of Trinidad and Tobago* (3rd ed.), 1947.

Tobermory, seaport and burgh of Argyll, on a bay of the same name, 30 m. from Oban. It has a good harbour. Fishing is the chief activity. In 1588, following the scattering of the Sp. Armada, a Sp. galleon sank in T. bay with, it was believed, a great deal of treasure. In 1912 Col. Foss recovered some coins and silver goblets. A further search was made in 1950. Pop. 770.

Tobit, Book of, one of the books of the Apocrypha, which, however, is included in the Vulgate. It is a Haggadic romance based on an old tradition, embodying in historical form a series of moral and religious lessons. Its date is given by Ewald as about 350 B.C., but Litzig places it in the reign of Trajan.

Tobogganing (from an Indian word, *tobankan*, meaning sledge), practice of sliding down natural or artificial slopes of snow or ice. The Canadian toboggan consists of a flat surface curled up backwards and in front. It is about 5 ft. long by 2 ft. broad. T. in its advanced form takes place really only on the Cresta, a valley behind St. Moritz, Switzerland. The sports was started in 1885 by Eng. visitors and took the form of an ann. race between those at St. Moritz and those at Davos, the race being fought out alternately at Davos on a course from Klosters and at St. Moritz on the Cresta. The former is now closed but the Cresta continues. From being a snow run it is now an enclosed track of solid ice three-quarters of a m. long dropping at an average slope of 1:7. There are sev. well-known corners, known as banks, such as the Battledore and Shuttlecock. Down this run, a steel chassis is employed with two steel runners rounded in the front, about 3 ft. long and about 13 m. apart. On this chassis is a sliding seat. The back parts of the runners are grooved. The method of riding is to lie prone with the body on the sliding seat forward, and on coming to a corner the rider pushes his body back upon the seat so that the weight is on the back part of the runners where are the grooves. Steering is effected by pushing the nose of the toboggan round, mechanical forms of steering being allowed. Great skill and judgment are required for fast riding. Racing is done against time, taken by the breaking of two electric contacts, at the start and the finish. A running start from 10 ft. behind the line is allowed; this requires much skill and agility. Finishing speeds are over 80 m.p.h.

Riding the Cresta is recognised as an Olympic event and races were held in the last Olympic Games of 1936 and 1948

under the winter sports category. The two great races are: (1) the Curzon Cup, consisting of six courses from about two-thirds of the length of the course, starting from what is called Junction, and (2) the Grand National, the complete course from the top. These events take place annually, when the track is built: the Curzon Cup is held about Jan. 20, and the Grand National is at the beginning of Feb.

Bobsleighing is to be distinguished from T. The bobsleigh is formed of a frame carried on two sleighs fitted with steel runners. Steering is effected by swinging the front runners; this is done by cords or a steering wheel. Under rules at present in force, riders sit facing the direction they are going. At one time the position was prone with heads first but this practice has now been banned. There are many famous places where this sport is popular, notably at St. Moritz in Switzerland and at Lake Placid in America. 'Bobs' vary in size, there being races for those carrying two people and a bigger type carrying five people. The track is usually of beaten-down snow and the banks are usually iced. International races take place and 'bobsleighing' has been included among the Olympic Winter Sports sections.

Tobolsk, tn. of the Omsk Region of the U.S.S.R., once cap. of a gov. of the same name. (1) The gov., which had an area of 535,739 sq. m., stretched from Sempalatinsk in the S. to the Arctic Ocean in the N. (2) The tn. is a well-built city on the Irtysh, near its junction with the Tobol, 305 m. E.N.E. of Sverdlovsk (Ekaterinburg). It was once the cap. of W. Siberia and, like Omsk and Yakutsk, a fortified trading post on the Siberian rly. portages, and is a centre for trade between European Russia and Siberia. Shipbuilding, tanning, and the manuf. of soap and tallow are carried on. Here Nicholas II. was imprisoned after the revolution, and it was the scene of considerable strife in 1919. Pop. 25,000.

Tobruk, or **Mersa-Tobruk**, port in the prov. of Cyrenaica, Libya. It has an excellent harbour, and was occupied by Italy in 1912. It was the scene of much fighting in the Libyan campaign of the Second World War. See further under AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN.

Tocantins, riv. of Brazil, rising in the state of Goyaz and flowing N. into the Atlantic Ocean through the Rio Para. Its largest trib. is the Araguaia. Its course, which is much interrupted by rapids, is navigable only in some parts. Length 1500 m.

Toccata (from It. *toccare* = lit. to touch, figuratively to play). Originally, in the seventeenth century, simply 'a thing to play,' as distinct from *cantata*, 'a thing to sing.' But it soon acquired a sense of touching an instrument, for the purpose of trying or testing it, which meant that it usually contained scales, shakes and other brilliant figuration, often interspersed with slow choral passages. Modern Ts. usually lay stress on brilliance and rapid execution alone, and are often

more or less uniform in figuration throughout; there is in fact little or nothing to distinguish them from concert studies.

Toc H, organisation formed to bring together into Christian fellowship men of every class and opinion for the purpose of social service of all kinds. The name, **Toc H**, comes from the army signallers' designation of the initials, T.H., which stood for Talbot House, opened in Dec. 1915 at Poperinghe in Flanders as a chapel and club for soldiers. It was a memorial to Gilbert Talbot, who was killed in July 1915, and was founded by his brother, Neville Talbot, later Bishop of Pretoria, and the Rev. P. B. ('Tubby') Clayton. In 1920 Clayton formed a small **Toc H** group in London, and in 1922 an auxiliary body, the League of Women Helpers, was organised on the same lines. In the same year **Toc H** was incorporated by Royal Charter. The movement, which unites all Christian denominations, has grown, and there are now many groups and branches throughout the world. **Toc H**, church, All Hallows by the Tower, largely destroyed in the Second World War, was afterwards rebuilt. The war-time hist. of **Toc H** is dealt with in two books by Clayton, *Tales of Talbot House* (1919) and *Plain Tales from Flanders* (1929); its subsequent development and aims are described in current literature issued at headquarters (47 Francis Street, London, S.W.1.). The *Toc H Journal* is pub. monthly.

Tocqueville, Charles Alexis Henri Maurice Clérès de (1805-59), Fr. historian, b. at Verneuil, Seine-et-Oise, accompanied Gustave de Beaumont to America to study prisons in 1831, and took the opportunity to collect materials for his *De la Démocratie en Amérique* (1835), a work of peculiar interest as the first reasoned and more or less unbiased exposition of popular gov. in that country. An orthodox Liberal in politics, he was elected vice-president of the Assembly in 1849, as dismissed when Louis Napoleon became emperor, and met with an enthusiastic reception from John Stuart Mill and other great Whigs when he visited England. He pub. *Ancien Régime et la Révolution* (1856). His *Œuvres complètes* were written in 1850-51, first pub. in 1893, and ed. and trans. with an introduction, by J. P. Mayer in 1948. See studies by E. d'Eichthel, 1897; R. P. Marce, 1910; and H. Goring, 1928. See also R. Sottan, *French Political Thought in the Nineteenth Century*, 1931.

Todas, The, pastoral tribe 'dwelling in isolated hamlets ('mand') on the slopes of the Nilgiri Hills, S. India.

Todd, Ruthven (b. 1914), Brit. poet, essayist and novelist, b. in Edinburgh, and educated at Fettes College and the College of Art, Edinburgh. A leading authority on William Blake. He ed. the Everyman's Library ed. of Gilchrist's *Life of Blake*. A collection of essays entitled *Tracks in the Snow* (1946), deals with the mythology of the eighteenth century in its effects upon Blake, John Martin, and Henry Fuseli, and with the influence of science upon the artists and writers of the period. He has pub. four books of poems,

including *The Planet in My Hand* (1947), and *In Other Worlds* (1950). His first novel, *Over the Mountain* (1939), an allegorical fantasy, was followed by *The Lost Traveller* (1942), and *The Ruins of Time* (1950).

Todhunter, Isaac (1820-84), Eng. mathematician, graduate of London and Cambridge. At St. John's College at Cambridge he was a scholar, fellow, and lecturer in turn, heading the degree list as senior wrangler, and gaining the mathematical blue ribbon, Smith's Prize. He was a member of the council of the Royal Society. His text-books on algebra, euclid, trigonometry, and calculus attained a world-wide circulation, and he made original contributions to the calculus of variations and the theory of probability.

Todi (anc. **Tuder**), city of Italy, in the prov. of Perugia, 21 m. S. of Perugia. There are remains from the time of the Romans and Etruscans, and a Renaissance church. Pop. 17,000.

Todi, Jacopone da, see JACOPONE DA Todi

Todmorden, municipal bor. in the W. Riding of Yorkshire, England, 19 m. N.N.E. of Manchester. It has cotton weaving and spinning factories, foundries, and machine shops; and there are coal mines in the area. Pop. 19,100.

Todt, Fritz (1891-1942), Ger. engineer, b. at Baden famous as the constructor of the Ger. W. Wall (q.v.), and the *Autobahnen* (motor roads) in Germany. He became Inspector-General of Reich Roads in 1933 and visited Britain in 1937 to study Brit. traffic problems. He was made major-general in 1939 in recognition of his work in the W. anti-aircraft defensive zone, and was appointed Reich Minister of Arms and Munitions in March 1940.

The construction of the Ger. W. Wall had to be carried out at great speed because of the tense political situation, and for this purpose T. created his 'Todt Organisation' by the aid of which the task was completed with almost incredible speed.

Toga, prin. outer garment of the anc. Romans, made of woollen material, usually white. It was a large semicircular piece of cloth, the straight side 4 or 5 yds. long, the largest width about 2 yds. It was worn with half the straight side hanging over the left shoulder in front, the other half brought round under the right and over the left shoulder. The 'toga praetexta,' worn by children, magistrates, and priests, had a purple border. At the age of seventeen the youth assumed the 'toga virilis.' The 'toga picta' (embroidered) was worn by generals in their triumph. The emperors wore a purple toga. Mourners and persons unpurged wore a 'toga pulla' of a dark colour, while those seeking office wore a white one, whence the name 'candidatus.' The garment was not allowed to be worn by foreigners or slaves.

Toggenburg, upper valley of the R. Thur, canton of St. Gall, Switzerland. It extends for about 30 m. The chief vills. are Lichtensteig, Kirchberg, and Wattwill.

Dairy-farming, fruit-growing, and agriculture are carried on. Pop. 58,300.

Togoland, W. African ter. administered under United Nations trusteeship by Britain and France, was a Ger. colony from 1884 to 1914. In Aug. of that year it was surrendered unconditionally to the Eng. and Fr. forces. France administers 21,893 sq. m. (this area including all the coastline) between the Gold Coast Colony on the W., and Fr. Dahomey on the E. The ter. is represented in the National Assembly by three deputies, in the Assembly of the Fr. Union by one delegate, and in the Council of the Republic by two councillors. Britain administers 13,041 sq. m., attached to the Gold Coast Colony and N. Ters. Upper Volta bounds it on the N., the Gulf of Guinea on the S. A chain of highlands runs from S.W. to N.E., the highest point being Mt. Atiakuse (3248 ft.). The chief rvs. are the Volta, which formerly separated T. from the Gold Coast, its trib. the Oti, the Mono, and the Shio, and the Haho which empty into Togo Lagoon. The climate is unhealthy. Palm kernels, maize, rubber, timber, kapok, palm-oil, copra, cocoa, ground-nuts, kola nuts, and raw cotton are exported, and cocoa, tapioca, coffee, coconuts, and oil palms and bananas, etc., are cultivated on fertile tracts which lie between arid plains, whilst dye woods and caoutchouc grow in the forests. The dist. is rich in iron, which is smelted by the natives. Some cattle are reared. The cap. and chief port Lome (29,300 natives and 760 Europeans) is connected by rail with Aneho, the second port, and Palime for Misahohe, and Atakpame, all in Fr. territory. In Brit. T., of which Yendi is the chief tn., there are no rlys. A trade school has been estab. at Yendi. Straw-plaiting, weaving, wood cutting, smith-work, and the making of earthenware are the chief industrial occupations of the coloured peoples, who, in the S., are of Bantu stock. They speak thirty different languages, of which Ewe is the chief. The inhab. of the N. are of Hamitic descent and speak sixteen languages. The pop. of Fr. T. is 738,000 natives and 1,100 Europeans. The pop. of the Brit. area is 391,400 natives and about 45 Europeans.

Terms of the trusteeship for Brit. T. under the United Nations Charter were approved in 1946 (Cmd. 6863, H.M.S.O.). In 1948 an Anglo-Fr. standing consultative commission was formed, which agreed on co-ordination of medical and educational services, on economic exchanges, and on freedom of movement across the boundaries. See General Maroix, *Le Togo*, 1938; and *Report on the Administration of Togoland for the year 1947*, H.M.S.O., 1948.

Tojo, Hideki (1884-1948), Jap. statesman and general, b. in Tokyo, came into office with the expansionist elements in the army and navy and, in 1940, when Prince Konoe founded his new National Party, T., as war minister, was one of the two leading figures in the Cabinet formed by Konoe, whom he succeeded as Prime Minister. In 1941 T. sent

Kurusu, ex-ambas. to Germany, to Washington with instructions to keep meaningless conversations alive until such time as military and naval preparations in Japan had been sufficiently advanced for Japan's purposes. It was T. who ordered soon afterwards the treacherous attack on Pearl Harbour. During the easily-won victories in 1941-42 before the Allies could deploy their strength, T. assured his position at home in 1942 by dissolving the Diet and appointing a National Service Political Council to control the Diet in the interests of the gov. But in 1944 T. began to realise that the war was closing in on the heart of Japan, and he therefore reorganised the High Command by combining, and himself taking, the posts of war minister and army chief of staff and combining the posts of navy minister and navy chief of staff. He also speeded up shipbuilding and gave priority to aircraft production. But despite these measures the tide of allied victory rolled on, and when Saipan fell, T. resigned and was succeeded by Gen. Koiso. After the Jap. collapse T. was tried in Tokyo (1947-48) and hanged on Dec. 23, 1948.

Tokay, or Tokaj, tn. of Zemplén co., Hungary, at the confluence of the Bodrog and the Theiss, 148 m. E.N.E. of Budapest. It is famous for the wine to which, it gives its name, *Tokay*. The vine grows on a plateau among the Hegyalja Mts. Pop. 5800.

Tokelau, see UNION ISLANDS.

Token (Money), coin of higher nominal than intrinsic value but exchangeable for full-standard money at the higher rate; or a stamped piece of metal issued as a limited medium of exchange, as for bus fares, and at a nominal value much greater than its commodity value; or anything of only nominal value similarly used, as a piece of paper currency.

Tokharian Language, see INDO-EUROPEAN LANGUAGES.

Tokitaro, Ando, see HIROSHIGE.

Tokyo, or Tokai ('Eastern Capital'), cap. of Japan, situated on the S.E. side of the is. of Honshu in the Bay of Tokyo, on the delta of the Sumida R., which separates the city proper on the W. from Honjo on the E. It was founded in the sixteenth century, and until 1868 was known as Jedo, Jeddo, or Yedo ('Estuary Gate'); it received its present name when the court moved thither from Kyôto. The tn. was opened to foreigners in 1869. The magnificent palace, in Jap. European style, stands in the park Fukiage, not far from the anct. castle. To the E. of the palace lies the commercial and industrial part of the city, while the N. div. is mainly educational, containing the Imperial Univ., the Law School, First Higher Middle School, and numerous beautiful temples. In the W. and S.W. (before the Second World War) were the foreign embassies and legations. The port of entry, Yokohama, is 17 m. distant.

T. has suffered frequently from fire, so many of the houses being built of wood, as well as from storms, earthquakes, and epidemics. The gov. buildings had to be

rebuilt after the fire of 1891. In Sept. 1923 great portions of the city were destroyed by a disastrous earthquake and a fire that followed after. Yokohama suffered even more severely. Nearly 70,000 people were killed in T., and the number that migrated after the disaster brought the decrease in pop. to nearly a million. Reconstruction work was begun at once and by Mar. 1930 was completed. The more important buildings were made both quake and fire proof; three large parks and 51 smaller ones were laid out to serve as refuges; and wherever possible improvements in the planning of the city were carried out. It is lit by electricity, and served by electric tramways.

T. was frequently and heavily bombed by Amer. aircraft, especially by Superfortress aircraft in 1945. Official estimates said that more than 80 per cent of the houses in T. were completely destroyed. The pop. (Feb. 1946) was then still about 3,000,000; in 1940 it was 6,779,000.

See A. Akiyama, *A Complete Guide to Tokyo*, 1937, and N. Nouet, *Tokio: ville ancienne, capitale moderne*, 1937.

Tokyo Trials, see JAPANESE (WAR CRIMINALS) TRIALS.

Tolbooth, term originally used in Scotland for a booth at a fair in which dues or tolls were collected and offenders against fair regulations were detained—whence it came to mean a prison. The most famous T. was the one in Edinburgh mentioned in *The Heart of Midlothian*. It stood near St. Giles cathedral and was pulled down in 1817.

Tolbukhin, Fyodor Ivanovich (b. 1884), see under EASTERN FRONT in SECOND WORLD WAR. *Dnieper 'Rend' battles*.

Toledo: 1. Prov. of the Tagus valley, Central Spain, 5925 sq. m. in area, formed (1833) from part of New Castile. It is bounded N. by Avila and Madrid E. by Cuenca, S. by Ciudad Real, W. by Caceres, and is mountainous except in the Tagus valley itself. Various minerals are found but not much worked. Sheep, asses, goats, and fighting bulls are reared, bees and silkworms are also kept. Some textiles, earthenware, wine, spirit (aguardiente), oil, and chocolates are manufactured. Pop. 516,300. 2. Cap. of above, on the Tagus, 50 m. S.S.W. of Madrid, and once cap. of all Spain. It has a fine Gothic cathedral (1227-1493), the seat of an archbishop, and interesting Moorish and Mudjar remains. The great square or 'Zocodover' was once the scene of bull-fights and the burning of heretics. The fine old Alcazar was partially burnt in 1887. Toledan sword-blades were famous in Rom. times, and fine steel cutlery is still manufactured near by, along with textiles and church vestments. Pop. 27,400. See I. Marin, *Recuerdos de Toledo*, 1893; A. F. Calvert, *Toledo*, 1907; H. Lynch, *Toledo* (Med. Town Series); M. Gonzalez Simancas, *Toledo*, 1929. 3. Co. tn. and port of entry of Lucas co., Ohio, U.S.A., on Maumee Bay, at the W. end of Lake Erie, about 92 m. from Cleveland. Manufact. include flour, motor vehicles, glass, bicycles, sugar, and electrical appli-

ances. Its trade is carried on by means of the Great Lakes, canals, and numerous railways. It has a univ. Pop. 278,000.

Tolerance, or **Limit Gauging**, permissible range of dimension of a finished article, provided in order to cover unavoidable imperfections of workmanship in the case of pieces intended to fit together, and calculated by fixing the largest and smallest clearances needed upon the working surfaces. As an example, if a metal bar is to be turned down .5 in.; the limits of the finished bar must be .0001 over to .0001 under; therefore the bar may be .5 + .0001 or .5 - .0001. The difference between the two, .0002, is the T. On the drawing the T. would be represented as .5 ± .0001.

Toleration, doctrine that a citizen may adopt or discard any religion without state interference. T. became practically universal during the nineteenth century, but the rise of Fascism and Communism tended to restrict it in many countries, though most govts. still claim to support it. T. is not a direct offspring of the Reformation, which accepted the principle 'Cuius regio, eius religio,' a man should follow the religion of his king. In effect, however, this principle implied a theoretical equality of religions and so paved the way for T. Modern indifference to religion also contributed to the development of T. Where it exists, it extends only to matters of doctrine; the State still exercises certain rights as a guardian of morality. See W. K. Jordan, *Development of Religious Toleration*, 1932-38; and T. Lyon, *Theory of Religious Liberty*, 1603-39, 1937.

Toleration, Act of, see under ACT.

Tolima, dept. of Colombia, lying between the Central and E. Cordilleras. The volcano Tolima rises to 18,425 ft., the highest peak in Colombia. Silver, gold, lead, copper, and sulphur are found, and there is agriculture and stock-raising. Cap. Ibagué. Area 8874 sq. m. Pop. 691,400.

Tolls, tax imposed in consideration of some privilege. In the feudal system it meant the right to tollage one's vassals. Later it became the distinguishing mark of a turnpike road, i.e. a road having toll-gates or bars on it, called 'turns.' These 'turns' appear to have been first constructed about the middle of the eighteenth century, when certain interested persons subscribed among themselves for the repair of various roads, and exacted a T. for the privilege of using the roads so repaired. The popular resistance to these exactions led to the passing of Acts to regulate T. These turnpike roads are now extinct. Where a claim to demand T. is made, there is a distinction between a *toll thorough* (through) and a *toll traverse* (across); the former being granted in consideration of the performance of a continuing beneficial service, such as the repair of a road or the maintenance of a bridge or ferry; the latter if permitting the general public to pass over the land of the grantee of the toll. Military vehicles are exempt from payment. Other kinds of T. are *port-tolls*, or charges on goods carried into a port

turn tolls, or charges on cattle driven to market and returned unsold, and T. levied by railway companies, as a statutory authority, upon merchandise carried on their lines. For the *Ferries Committee's* proposals (*Ferries in Great Britain*, H.M.S.O., 1948), see under *FERRY*.

Tolly, Michael Andreas Barclay de, see BARCLAY.

Tollocan, see TOLUCA.

Tolosa, see TOULOUSE.

Tolpuddle Martyrs, six farm labourers of Tolpuddle, 7 m. from Dorchester, who in 1834 were transported to Australia for forming a trade union which at that time was held to be a conspiracy in restraint of trade. Following a nation-wide agitation they were pardoned two years later. The centenary of the Tolpuddle episode was marked by the pub. of *The Book of the Martyrs of Tolpuddle, 1834-1934*, by the general council of the T.U.C. and of *The Tolpuddle Martyrs* by M. M. Firth and A. W. Hopkinson; and also by a gift to the public of a plot of land including a memorial to the T.M.

Tolstoy, Alexeyev, Count (1817-75). Russian author, b. at St. Petersburg, son of Count Konstantin Petrovich T. Brought up on an uncle's estate near Tchernigov, which he later inherited, he was educated in Moscow, served in the diplomatic service, and fought in the Crimean War. He wrote ballads and lyrics, set to music by Tchaikovsky. His novels *Prince Sevebrenni* and *The Terrible Tsar* have appeared in Eng. trans. He also wrote a dramatic poem *Don Juan*, but is chiefly famous for his dramatic trilogy, *Death of Ivan the Terrible* (1866); *Tsar Fiodor* (1868); and *Tsar Boris* (1870). See study by A. Lironotelle, 1913.

Tolstoy, Alexei Nikolaevich (1883-1945). Russian novelist, dramatist, and patriot, b. at Nikolaievsk, a relative of Leo T. After the Revolution he lived abroad, but the life of an *émigré* did not suit him and he returned to Russia to work on a trilogy, trans. into Eng. as *The Road to Calvary*, which won the Stalin Prize in 1942. As the war developed T. took an ever more active part in sustaining the spirit of his compatriots and became a member of the Supreme Soviet of the U.S.S.R. Until a few days before his death he was at work on the third part of his famous *Peter the Great*, the story of Russia at a previous period of transformation. If he was overshadowed by a greater writer of the same name, he at least made an unchallenged place for himself as a writer of distinction. His play, *Ivan the Terrible*, was produced in 1944.

Tolstoy, Count, Leo Nikolaevich (1828-1910). Russian novelist, poet, and social reformer, of noble family, b. at Yasnaya Polyana. Being left an orphan at the age of nine, he was brought up by an aunt, and with his brothers studied under a Fr. tutor until 1843, when he was sent to the univ. of Kazan. He did not distinguish himself scholastically, and on leaving college gave himself up to pleasure for some years. In 1851 he joined the Russian

artillery in the Caucasus, and on the outbreak of the Crimean war took command under Prince Gortchakov and fought at Silistria (1854), and at Sebastopol (1855). During these stirring times he wrote a series of brilliant war sketches entitled *Tales from Sebastopol* which made him famous. He had previously contributed to the Russian *Contemporary*. On his return to St. Petersburg after the war he was welcomed into the gayest social circles and the most exclusive literary cliques, and he won the admiration of

COUNT LEO TOLSTOY

Turgenev, but the respect they had for each other did not grow into anything warmer on account of their differences of opinion. T. freed the serfs on his estate and he was revolutionary in his educational schemes for the peasants, but, always individualistic, he stood outside the progressive Socialistic movement, then growing in Russia. In 1862 he married Sophia Behrs, and he now began his two great masterpieces, *War and Peace*, completed in 1866, and *Anna Karenina*, completed in 1877, and in 1880 he pub. his religious experience in *My Confession*. His later works were written with a conscious didactic and mystical intention, and include *The Cossacks* (1878), *Ivan Ilyitch* (1887), *Childhood* (1888), *Kreutzer Sonata* (1890-1900), *The Kingdom of God is Within You* (1894); and *What is Religion?* (1902). Later in life he gave himself up to studying and supplying the needs of the poor; he renounced his property in favour of his wife and children and endeavoured to introduce a peasant's manner of life into his own household. Estranged from his wife, he found his home embittered and left it secretly, dying ten days later, on Nov. 8, 1910, at Astapovo.

T.'s views cannot be ignored in any

discussion on the nature of art, the philosophies of hist. His diaries give evidence of his struggles of will and spirit at every stage of his long quest for a meaning in life. T. rejected the teaching which followers of various kinds have propounded in his name. His was too solitary and proud a spirit to be lost in that of a teacher, still less of a doctrinaire. Through all his insistence upon the simple moral truths of the Gospels there emanates much of his visionary aloofness. In the last resort, confronting the mystery of death, he stood remote from his own doctrine of salvation, and that is the aspect of T. which Gorky understood so well in his reminiscences of T. Tiring of mere dissipation, his constant note is dissatisfaction with his manner of life and renewed resolution to discover in himself greater strength of will, a clearer perception of God's will. Between the obligations of marriage and of his soul's salvation there could be no reconciliation. To be a wife to a seer and a saint was a hard fate for the passionately alive and intelligent Sophie Andreyevna. The fact is, perhaps, that T.'s was an all-consuming egotism, as the most discerning of his Russian critics have always recognised. He would not identify himself with the Russian literature of his own times, but stood aloof. By his repudiation of the State and of the institution of private property, T. proved a great revolutionizing force though he himself disapproved of the revolutionaries. In Russia to-day he is admired as a writer, even though his teaching is held to be injurious. His one outstanding disciple outside Russia was Gandhi. If not a great teacher he exerted great moral influence and remains one of the world's supreme artists.

His *Works* were translated into Eng. by N. H. Dole (19 vols 1889-90); the Oxford Centenary Ed., being the authorised trans. by Aylmer Maude, was begun in 1928 and ten of the 21 vols. have been issued (1932). The Moscow Ed. of all T.'s writings in the original 100 vols. is in preparation. See lives by Bruckoff 1905, 1906; Aylmer Maude, 1908, 1931; R. Rolland (Eng. trans.), 1911; E. Gar-nett, 1914; S. Zweig, 1929, 1949; E. J. Dillon, 1934; G. Abraham, 1935; D. Leon, 1946; and E. J. Simmons, 1948. See also M. Gorky, *Reminiscences of Tolstoy*, 1920; *Tolstoy's Love Letters*, trans. by S. S. Kotliarsky and Virginia Woolf, 1923; J. Lavrin, *Tolstoy; a Psycho-Critical Study*, 1924; A. Maude, *Tolstoy on Art*, 1925, and *Family Views of Tolstoy*, 1925; Leo Tolstoy, Jr., *The Truth about my Father*, 1927; *The Private Diary of Leo Tolstoy* (1853-57), trans. by L. and A. Maude, 1927; Countess A. Tolstoy, *The Tragedy of Tolstoy*, 1933; T. Palmer, *Tolstoy and his Wife* (Eng. trans. 1946).

Toltecs, semi-legendary people of Mexico and Central America, to whom the Aztecs and Mayas ascribed many cities, monuments, and arts. Though their certain origin is not known, they were the reputed conquerors of the Mayas. They are said to have migrated southward along the Mexican plateau from the N. In the

basin of Mexico they subdued the tribes already settled on the land and founded their own cap., calling the land Anáhuac, 'edge of the water,' on account of its many lakes. They reached the zenith of their power between A.D. 700-1100, conquering many neighbouring tribes, and in time the confines of their empire extended as far N. as the Tropic of Cancer and as far S. as the S. border of Guatemala. The legendary Toltec leader, Quetzalcoatl ('Feathered Serpent'), who is said to have died in A.D. 895, forced the Maya city states to cease their internecine warfare and accept his rule, but when the power of the T. declined the Mazas resumed their mutual strife, which resulted in their abandonment of the tns of N.W. Yucatan. The legendary hist. of Quetzalcoatl is found in *Historia de Colhuacán y de México* (see Selser's *Commentary* (Eng. trans. by A. H. Keane), 1901-02). See also P. James, *Latin America*, 1942.

Tolu, see under BALSAM.

Toluca, or **Tolocoacan**, tn. of Mexico, cap. of the state of Mexico, 45 m. S.W. of the city of Mexico. It is a summer resort and the centre of an agric. and stock-farming region. The Nevado de Toluca, an extinct volcano (14,950 ft.), lies S.W. of the tn. To reach T. from Mexico City, a distance of only 40 m. by road, it is necessary to climb above 10,000 ft. over the intervening mt. range. The centre of the region known as the basin of T. is swampy; maize, wheat, beans, and alfalfa are grown. Included in this dist. of concentrated settlement is the old mining community of El Oro. There are flour and textile mills and a power plant. Pop. 43,500.

Toluene, **Methyl Benzene**, or **Phenyl-methane** ($C_6H_5CH_3$), a mobile liquid (boiling-point $110^\circ C.$) which resembles benzene in most respects. It is prepared from the 90 per cent. benzol obtained from coal-tar, and is used in the preparation of aniline dyes, explosives, and many other compounds.

Toluidine. The Ts. or amido-toluenes ($C_6H_4(CH_3)NH_2$) are prepared from the corresponding ortho-, meta- and para-nitrotoluenes by reduction. Ortho- and meta-T are oils boiling at 197° and $199^\circ C.$ respectively. Para-toluidine is crystalline, melts at 45° and boils at $198^\circ C.$ The Ts. resemble aniline in their reactions and the ortho- and para-compounds are employed in the manuf. of aniline dyes.

Tomahawk, war-hatchet of the N. Amer. Indians. Originally it was composed of a stone head tied to a wooden handle by leather thongs. One end of the stone was sharpened and the other hollowed into a pipe bowl, to which the hollow handle acted as stem. Subsequently steel and iron heads were introduced by Europeans.

Tomaso de Vio, see CAJETAN, JACOPO.

Tomato, or *Lycopersicon esculentum*, annual plant (family Solanaceae), bearing globose red or yellow fruit, formerly known as 'love apples,' was introduced into England in 1596, but only since 1900 has it come into immense popularity in Britain, its production chiefly under

glass, now being a large and important industry. Its production is world-wide. Except in sheltered and especially favoured situations, and when the season is sunny, the culture of the fruit out of doors is unsatisfactory. The plants are raised from seed early in the year in warmth. They are confined to a single stem, shoots at the axils of the leaves being regularly pinched out. Liberal watering and manuring are necessary while the fruit is setting. Late fruit may be ripened in the dark in a temp. of 50° F.

Tomb (Gk. *τύμβος*), properly signifies a mass of masonry or stonework raised over a grave or vault used for interment; but it is applied, in a wider sense, to any sepulchral structure. Of primitive sepulchre there are two classes, one subterranean, the other of raised mounds or tumuli. Monuments of the first kind are numerous in Egypt; the Pyramids had no doubt a common origin with the tumulus. At some places in Etruria the Ts. are hewn out on the sides of rocks and hills, and their entrances present an architectural facade. Sepulchral edifices are numerous throughout Latium and Magna Græcia; many are remarkable for the architectural decoration bestowed on them. The Ts. of the Middle Ages are within buildings (churches, chantries, cloisters, etc.), and exhibit a variety of form and enrichment, from the primitive stone coffin to the lavishly decorated canopied monuments. Another class consists of *Altar* or *Table Tombs*. The next in order is the *Effigy Tomb*, first introduced in the thirteenth century, with a recumbent figure of the deceased upon it, extended, with the hands slightly raised and joined in the attitude of prayer. Altar and effigy Ts. were usually placed between the piers of an arch, or within a recess in a wall, and the whole T. was frequently covered by an arch forming a sort of canopy over it; of which kind is that of Aymer de Valence in Westminster Abbey. See also BURIAL CUSTOMS.

Tombigee, riv. of U.S.A. rises in Prentissco, Mississippi, and flows S. to unite with the Alabama R. to form the Mobile R. Length 500 m.

Tombouctou, see TIMBUCTOO.

Tomi (later **Tomiswar**, or **Jegni Pangola**: modern **Kustendje**, or **Constanta**), tn. of Thrace (later *Moesia*) on W. shore of the Euxine. It was once cap. of Scythia Minor, and is famous as the place to which Ovid was banished. T. was colonised from Miletus (c. 600 B.C.).

Tomlinson, Henry Major (b. 1873), Eng. writer, b. in London. He served in London shipping for many years. Some stories and sketches which he contributed to the *Morning Leader* later led to an appointment on the editorial staff of that newspaper. T.'s first experience at sea was in 1904 with the trawlers over the Dogger Bank. Since then he has sailed in Brit. warships, and in liners and cargo ships under many flags, to all parts of the world. He was in France during the First World War as an official correspondent, after which he was for six years (1917-23) literary editor of *The Nation*

and *Athenæum* under H. W. Massingham's editorship. His first book, *The Sea and the Jungle*, was pub. in 1912, followed by *Old Junk* in 1918; his first novel, *Gallion's Reach*, which won the *Femina-Vie Heureuse Prize*, appeared in 1927. More recently he has pub., *The Wind is Rising* (1941), *The Turn of the Tide* (1945), and *Morning Light* (1946).

Tommasini, Vincenzo (b. 1880). It. composer, b. in Rome. He studied violin and composition in Rome and later, under Max Bruch, in Germany. Among his operas are *Medea* (1906), *Uguale fortuna* (1913) and *Le Donne di buon umore* (*The Good-Humoured Ladies*), a one-act comedy on motifs of Domenico Scarlatti written for Diaghilev's Russian Ballet (1919). He has also composed various orchestral works, among which are *Chiari di luna*, successfully performed at the Augusteo and elsewhere, and instrumental and chamber music.

Tommaso di Stefano, see GIOTTINO.

Tommy Atkins, slang name for the Brit. private soldier; more shortly 'Tommy' as in the opening poem of Kipling's *Barrack Room Ballads* (1892).

'**Tommy Gun**,' see under SUBMACHINE GUN.

Tomsk: 1. Region of the R.S.F.S.R. 2. Former cap. of above. A branch line connects it with the great Siberian railway at Taiga, and there is steamer communication with Barnaul and Bisk and up to the Urals. It declined as a centre in the old trade route from the E. when the railroad was constructed to the S., taking traffic through Omsk and Krasnoyarsk instead of through T. and Yeniseisk. Plans have been made to build another railroad from T. to Tobolsk. There are flour-mills and aero engine works, metallurgical, and leather tanning factories in the tn. Pop. 141,200. Cultural centre of Siberia, the univ. dates from 1888. See SIBERIA.

Ton Thumb, see under DWARF.

Tonlit, see TIT.

Ton, or **Tun**. Ton is now always used for the measure of *weight*. 1 T. = 20 hundredweight, therefore in Eng. 2240 lb.; but in the U.S.A. also (especially for goods sent by sea) 2000 lb. Hence the terms 'long' and 'short' T. (See TONNAGE). The spelling tun is now restricted to the old measure of *capacity* from which the weight is probably derived, since a tun of water weighs approximately a ton. The metric ton is 2,204.6 lb.

Tonalite, type of quartz diorite found in the Adamello Alps. Plagioclase quartz, hornblende, and biotite are dominant minerals, with magnetite, zircon, etc., as accessories. The granite-diorites of the U.S.A. are of this type, which is also found among the Scottish plutonic rocks.

Tonality, synonym for key, in music, but also meaning, more specifically, the feeling of a definite key suggested by a composition or passage. In modern musical terminology two antithetical derivatives of the word have appeared, *atonality* (q.v.), and *polytonality* (q.v.).

Tonbridge, or **Tunbridge**, tn. of Kent, England, on the Medway, 27 m. S.E. of

London. Printing, cricket-ball making, tanning, tar-distilling, and the manuf. of plastic goods are the chief industries. Remains of T. Castle, founded soon after the Norman Conquest, are in existence. Tonbridge School was founded in 1553 by Sir Andrew Judd, but little of the sixteenth-century building remains. New additions were completed in 1894. (See hist. by D. C. Somervell, 1947). Pop. 20,000.

Tone, term used in Eng. for pure musical notes not charged with harmonics, each harmonic being itself a T.; also for the quality of a musical sound, especially with reference to performance. The word T. does not imply pitch; but in America it is often used confusingly as synonymous with 'note,' doubtless under the influence of the Ger. *Ton*. See also RESULTANT TONES.

Tones, Partial, see HARMONICS.

Tone, Theobald Wolfe (1763-98), Irish patriot, b. in Dublin and educated at Trinity College there. He was called to the Irish Bar in 1789, but devoted himself to politics, and printed articles attacking the gov. and agitating against it. In 1790 he founded the society of United Irishmen, hoping to unite Catholic and Protestant in the cause of Irish independence. He went to the U.S.A. in 1795, and in the following year to Paris, where he tried to promote an invasion of Ireland. He was given a command under Hoche, whose expedition did not effect a landing. He was captured in 1798 on a vessel in Hardy's squadron, and was tried by court-martial, and sentenced to death for treason, escaping execution by suicide. His *Autobiography* was pub. in 1893. See lives by A. de Blacm, 1935, and G. F. MacDermot, 1939.

Tonga bean, see under COUMAROUNA ODORATA.

Tonga Islands, or **Friendly Islands**, kingdom under Brit. protection situated in the W. Pacific to the E.S.E. of Fiji between 18° and 22° S. lat., with an area of 269 sq. in. The group consists of about 150, mostly small is., thirty-six of which are inhabited. They were discovered by Tasman in 1643, and visited in 1777 by Cook, who, on account of the disposition of the natives, called them the Friendly Is. Most of the is. are of coral formation, though some (Tofua, Kao, and Niunfoou or Good Hope Is.) are volcanic. There are two volcanoes, and the is. are subject to frequent hurricanes. The Tongans are Polynesians, closely allied to the Maoris and Samoans. Tonga is a self-governing protectorate under the protection of Great Britain, estab. by a treaty of friendship and protection signed in 1900. The is. are ruled by Queen Salote, who succeeded her father, King George Tubou II. in 1918. The kingdom mainly consists of three is., Tongatabu, Ha'apai and Vava'u. The inhab. are mostly converted to Christianity, the first Wesleyan missionaries having landed in Tonga in 1826. The Wesleyan Free Church of Tonga and its offshoots have 34,000 adherents; Rom. Catholic, 6000; Latter Day Saints, 2000.

There are both gov. and mission primary schools, primary education being compulsory between the ages of 6 and 14. There are secondary schools, with 1340 boys and girls. There are three public hospitals, the main one being at Nuku'alofa (the cap.). The soil is very fertile, and the chief exports are copra and bananas; other exports are kava, green fruit, and candle-nuts. All copra is now shipped to the United Kingdom and bananas to New Zealand. The imports include drapery, flour, sugar, fish

E.N.A

TONGA ISLANDS BOY

timber, and hardware. Exports were valued at £748,109 in 1917 and imports at £391,240. There is no public debt and the amount of accumulated balances (June 30, 1916) was £216,000. The main source of revenue is customs duties. There is a monthly steamship service from New Zealand via Fiji, and vessels call at frequent intervals to load copra for the United Kingdom. There is an excellent aerodrome on Tongatabu, and seaplane facilities at Nuku'alofa harbour. There are five wireless stations in the group and a telephone service in Nuku'alofa. The constitution provides for a gov. consisting of the Sovereign, a privy council and cabinet, a legislative assembly and the judiciary. The Sovereign presides over the privy council which consists of the premier, the ministers (at present three Tongans and one European, who are also heads of gov. depts.) and the governors of Vava'u and Ha'apai. The constitution of the cabinet is similar, except that the premier presides. The legislative assembly consists of the premier, and ministers of the Crown (including the two governors), seven representatives of the nobles elected by the nobles themselves and seven rep-

representatives of the people elected by popular franchise. The courts consist of a supreme court, a magistrate's court and a land court. Pop. (1947) 43,300 Tongans, 212 Europeans, and 950 others.

History.—The first Europeans to visit any part of the T.I. were the Dutchmen Cornelis Schouten and Jacob le Maire in 1616. After Tasman, the next arrival was the first Englishman to land in Tonga, Capt. Wallis, who, in 1767, gave the name of Keppel to the N. is. of Niutobutabu and exchanged some iron nails with the natives for food. A few years later these nails were shown by the natives to Cook, who paid sev. visits to the group between 1773–77 and gave a full account of the is. and people on his return home. After Cook's time the T. I. began to be torn by civil wars between sev. contemporary dynasties, from which it was rescued, after long and heavy fighting, by a member of the 19th Tu Kanokubulu (or third dynasty), Taufa'ahau Tubou, an able warrior and administrator who had been converted to Christianity in 1831, when he and his wife, at their baptism, took the names of George and Salote (Polynesian for Charlotte) in honour of George III. and his consort, and these names have persisted in the Tubou dynasty to this day. By 1845 King George I. Tubou had brought the whole of Tonga under his rule and when he *d.* in 1893, at the age of 96, he had united the kingdom, given the people a land system, a constitution, and the beginnings of parl. gov. in a modern Christian state. The results of Brit. protection, however, has been to sustain and strengthen the Tongan's independence and national characteristics. The Tongans have their own currency notes and postage stamps, and the language of the gov. or the departments is Tongan. Foreign affairs are transacted through the Brit. agent and consul, who represents in Tonga the high commissioner for the W. Pacific. His consent is necessary for the appointment of Europeans to the Tongan gov. service. In other respects the country is completely autonomous. See Sir H. Luke, *Britain and the South Seas*, 1945.

Tongaland, see AMATONGALAND.

Tongariro, volcanic mts. in the N. part of the N. Is. of New Zealand, Wellington prov., 20 m. S.S.W. of Lake Taupo. The N. plateau, to which the name is confined, has eight craters. To the S. is Ngauruhoe (7515 ft.), which was in eruption in March 1909. The Red Crater and Te Mari are also still active.

Tongeren (Fr. Tongres), city of Limbourg, Belgium, 12 m. S.E. of Hasselt, generally considered to be the oldest tn. of Belgium. It is the anct. Atuatica, cap. of the Eburons, which became Civita Tongrorum under the Romans. Part of the defensive wall, built in this last period, has been laid bare recently. T. has an important cattle mkt. Pop. 13,500.

Tong-king, Tonkin, or Tonquin: (1) prov. of the republic of Viet-Nam within the Fr. Federation of Indo-China. It is bounded N. by the Chinese provs. Kwang-

tung, Kwangsi, and Yunnan; W. by Laos; S. by Annam; E. by the gulf of Tong-king. The Song Koi or Red R. flows from N.W. to S.E. The mountainous, plateau, and forest land lies chiefly N. and W.; there is flat, low-lying, fertile land to the S.E. Area 40,530 sq. m. There are a number of small is. off the coast. Gold, silver (at Ngan-son), antimony, tin, and coal (at Hongai) are found, and there are rich limestone quarries and calamine mines. Teak, ebony, and sandalwood are the most valuable woods produced. Round the deltas of the Red R. and the Thajbinh rice is extensively grown, and forms the chief crop. In other parts are plantations of coffee, tobacco, maize, arrowroot, tea, ramie, cotton, jute, sugar-cane, and mulberry and some other fruits. Vegetables, betel-palms, areca-nuts, bamboos, hemp, indigo, gamboge, pepper, and cinnamon are also produced. A large quantity of rare silk is produced; some of it is exported, and the greater part is woven by the natives. The litchi (lichee or leechie) tree is a native of T. The chief imports are tools and machinery, beverages, yarn, and tissues and the prin. exports are iron, coal, castor and lac oils, essences for perfumery, rice, maize, and animal products. Haiphong is the chief port and Hanoi the cap. Hanoi replaced Saigon as cap. of Fr. Indo-China (1902), and is connected by rail with Haiphong and with Vinh. It has various mills, foundries, distilleries, and breweries, and a school of medicine for natives (opened 1902). In 1917 the univ. of Indo-China was opened with ten faculties. T. formed part of the kingdom of Annam until the Fr. residency was created in 1884, and it became part of Fr. Indo-China. In 1941 a Federal Council was estab. as a measure of political reform, and to this T. sent six members. At this time T. and other parts of Indo-China had come to have strategic importance to the Jap., and this was recognised by the agreement signed on July 23, 1941, between Japan and the Vichy Gov. of France. Jap. penetration increased until in March 1945 the Jap. took over the control of industrial plants in Hanoi and elsewhere. An Annamese declaration of independence was sponsored by Japan, and on June 30 a separate state of Viet-Nam, comprising T. and Annam, was proclaimed under Jap. auspices. With the defeat of Japan Fr. forces were engaged in re-establishing Fr. authority in Indo-China. On March 6, 1946, the Viet-Nam Republic was formally recognised, but this did not prevent the continuation of sporadic fighting between the Fr. and the guerrilla forces of the extreme nationalists in T. and Annam. Pop. (1942) 9,920,000. See J. Dupuis, *Le Tong-kin*, 1898; De Lajonquière, *Ethnographie du Tong-king Septentrional*, 1906; A. Guisman, *L'Œuvre de la France au Tonkin*, 1906; C. Madrolle, *Indo-Chine du Nord: Tonkin*, etc., 1925; A. H. Brodriek, *Little China; The Annamese Lands of Indo-China*, 1942. See INDO-CHINA, FRANCE, and VIET-NAM. (2) Gulf of, an arm of the China Sea, of average

breadth 150 m., receiving the Songkoi. It is bordered by T., Kwangtung, and Hainan Is.

Tongue, movable muscular organ attached to the floor of the mouth, and concerned in the operations of mastication, deglutition, speaking, and tasting. The T. consists of a mass of muscle symmetrically arranged about a middle line from tip to roof. The base is attached to the hyoid bone; the upper surface, or dorsum, is free; the edges and the anterior portion of the lower surface are free. A fold of the investing mucous membrane is situated in the middle line of the under surface; this is the *frænum linguæ*, or 'bridle' of the T. The substance of the T. is striped muscle. It is supplied by branches of the lingual artery, whose origin is the external carotid. The nerves of the T. are the gustatory, for touch and taste sensations, the glossopharyngeal, supplying the posterior third, and the hypoglossal, which conveys motor stimuli. The surface of the T. is covered with numerous papillæ (see TASTE). The T. is liable to many morbid changes. By easily-recognised phenomena of furring, etc., the existence of disease of the alimentary canal is indicated. Acute inflammation is caused by wounds, and may lead to the formation of abscesses. Chronic inflammation is due to prolonged irritation, as by a broken tooth or excessive smoking. It may be followed by excessive growth of the surface cells leading to the formation of a cancer. Cancer of the T. is painful and dangerous, the only hopeful treatment being early removal by surgical operation.

Tongres, see TONGEREN.

Tonic, in medicine, an agent which tends to re-establish the proper performance of the functions of the body in general, or of some particular organ.

Tonic, in music, the fundamental key-note of a scale. See MUSIC.

Tonic Sol-fa, see under SOLMISATION.

Tonic Sol-fa College, see under CURWEN, JOHN.

Tonk, chief tn. of the State of Tonk, Rajasthan, India, near the Banas R., 60 m. S. of Jaipur. Pop. 39,700. The State has an area of 2553 sq. m., including sev. detached regions. Pop. 353,700.

Tonlé-Sap, see TAILÉ-SAP.

Tonnage of a ship is the measure of its cubical or carrying capacity expressed in tons. There are now in use four methods of expressing the T. of a ship, known respectively as the gross T., the net register T., the dead-weight T., and displacement T. Before 1836 (1812 for warships) there was in use a much rougher and more inadequate measure, the 'builders old measurement' (B.O.M.), which, however, is still sometimes referred to. In calculating the gross T., the whole interior capacity of the ship below the T. deck is found, together with that of all covered-in spaces on deck used for stowage, and the result in cubic feet is divided by 100. Tonnage Deck is the upper deck in all ships which have fewer than three complete decks; and is the

second deck from below in all other ships. A 'register' ton is a measurement of space calculated from the average bulk of light freight. The net register T. is the gross T. minus all those spaces used for the working parts of the ship or for the accommodation of crew or instruments. It is on this T. that dues are almost invariably paid. The dead-weight T. is the measure of the exact amount of cargo, bunkers, stores, etc., that a ship can carry when floating at her load draught. The displacement T. is that in use since 1872 for all ships of war throughout Europe. The amount of water displaced by a ship is, of course, equal in weight to the ship and all that it contains. Since 35 cub. ft. of water weigh one ton, the displacement T. is found by dividing by 35 the number of cubic feet of water displaced when the ship is immersed to its draught- or load-line.

Tonnage and Poundage. Tonnage, a tax from 1s. 6d. to 3s. levied on each tun of wine or liquor imported into or exported from the United Kingdom, and poundage, a similar tax of 6d. to 1s. on every pound of dry goods, were first levied in 1371. James I. asserted his right to alter the rates of levy as he chose by means of additions called *impositions*, and secured a decision in his favour on the legality of such additions against the merchant Bate. Parliament never ceased to protest against this denial of its claim to control taxation, and the resistance of Hampden to the collection of the tax expressed the widespread discontent over the question which contributed much to the outbreak of the Civil war. In 1660 it was granted to Charles II. made perpetual under Anne, and abolished, on the reorganisation of customs and excise in 1787.

Tonnage Dues. Rates levied on the tonnage of ships entering ports or navigable public waters. Such rates are imposed by local Acts; and the mode of computing tonnage for the purposes of the dues may be that set out in the particular local Act, or may, with the consent of the Ministry of Transport, be on the registered tonnage as ascertained according to the rules made under the Merchant Shipping Act, 1894. The dues are devoted to the upkeep of harbours, wharves, etc., and the maintenance of buoys, lighthouses and light vessels. Pilotage dues are often paid on tonnage and all ships passing through the Suez, Panama and other canals pay tonnage dues. By the constitution of the U.S.A. no State may impose T.D. without the consent of Congress; but a municipal corporation may levy a wharfage rate on the owners of unused steamboats mooring at a wharf.

Tonquin, see TONG-KING.

Tonsils, pair of almond-shaped bodies situated in the fossa between the pillars of the fauces in the pharyngeal cavity. Each consists of a mass of lymphoid tissue plentifully supplied with blood vessels, and is covered with mucous membrane which dips into depressions called crypts. The T. secrete a viscous fluid which acts as a lubricant to the respiratory passages and they also function as lymph glands.

Inflammation of the tonsils, *tonsillitis*, is caused by the introduction of septic organisms through the mouth, or by way of the blood. It usually commences with slight rigors, and the characteristic swelling soon makes its appearance. The swelling is accompanied by pain, and swallowing and even breathing may be rendered difficult. The temp. rises and usually a certain amount of suppuration takes place. A yellowish secretion appears on the surface of the T., which may be brushed away or removed by gargling. Hot poultices should be applied to the neck, and if suppuration has taken place the T. should be stabbed to release the pus, though this operation requires care, on account of the proximity of the T. to large blood vessels. The inhaling of steam mixed with antiseptic vapours is useful in relieving the condition. In *chronic tonsillitis* there often occurs a permanent overgrowth of the substance of the T., usually associated with adenoids, and causing difficulty in breathing, which is best dealt with surgically.

Tonsure, the cutting of the hair in a certain form as a symbol of self-dedication to the monastic life. The custom first appears at the end of the fourth or beginning of the fifth century. In the auct. Celtic Church all the front of the head was shaved in front of a line drawn from ear to ear. In the Oriental churches the whole head is shaved. In the Rom. Church the 'coronal of St. Peter' has always been used. In this T. the crown of the head is shaved to leave a fringe of hair all round.

Tontine, form of mutual life insurance in which a number of people invest a sum of money in the purchase of a property. They share the income, and as each dies the shares become proportionately larger per survivor, until all the property eventually devolves on one. It owes its name to an It. banker, Lorenzo Tonti, whose idea it was. In France and in Great Britain, in the eighteenth century, the State raised money by this means.

Tools, Machine. The most important machine for producing finished work with Ts. is the *lathe* (q.v.). Since the invention of the slide-rest during the last century it has been possible to turn out very accurate work, since this affords a rigid support for the T. being used and can traverse it parallel to the piece that is being worked. The *planing machine*, invented by Clement about 1825, is used for producing a truly level surface. In these machines the work moves under stationary Ts. on a rolling bed. The weight of certain objects which require planing, such as armour for battleships, demands that the energy for reversing the mass be much greater than that required for the actual cut, hence for such work the machines often have a fixed bed and movable Ts. But to-day planing is being gradually superseded by *milling*, where a rod or disc has a serrated and sharp edge, shaped to the cut required. This milling-cutter is kept revolving at a high speed and quickly removes the surface presented to it; whereas a planer

can only remove at the outside limit a piece of material $\frac{1}{8}$ in. wide for each tool which seldom exceed four in number. Other Ts. which help to make the complicated mechanical productions of modern life are the drilling machine, the slotting machine, the shaping machine, and the boring machine. *Drilling machines* on certain occasions are of the multiple variety, i.e. sev. spindles are worked at once, if it is necessary to drill a great many holes in a plate, such as a boiler firebox or the like. Adaptors are also made nowadays for fitting taps into small drilling machines so that it is possible to tap small holes by this machine, instead of having to use hand labour. *Shaping machines* are really planers on a small scale with moving Ts.; the mechanism employed is of the steam engine type, i.e. the T. is moved by means of a crank and connecting rod; it is used on light work for facing up cottars and the like. *Boring mills* may be either horizontal or vertical; they are largely used for cylinders and guns, and the like. Cylinders 12 ft. in diameter may be bored on these machines, while holes 15 or 16 in. in diameter can be bored for some 60 ft. in length, e.g. on such work as guns and propeller shafts. In addition to these machines, the wood-worker is now provided with a universal wood-working machine that will cut holes of any shape, etc.; so much so that a high percentage of furniture is machine-made to-day.

See E. Pull and F. J. Taylor, *Workshop Practice*, 1935; W. H. Atherton, *Workshop Practice*, 1942; P. Gates, *Jugs, Tools, and Fixtures*, 1944.

Toothwort (*Lathræa*), genus of plants (family Orobanchaceæ), partly parasitic and partly saprophytic. *L. squamaria*, the only Brit. species, has a fleshy branched rhizome clothed with tooth-like scales and bearing a raceme of drooping dull red flowers.

Tooting, dist. of the bor. of Wandsworth, S.W. London, until 1945 a parl. div. It is largely residential, and there are industries. Pop. 38,200.

Toowoomba, tn. of Queensland, Australia, 101 m. W. of Brisbane, is situated in a pastoral and agric. dist. It has condensed milk, bacon, and butter factories, foundries, and railway workshops. Pop. 34,000.

Toparé, see POLONNARUWA.

Topaz, mineral crystallising in the orthorhombic system, with cleavage parallel to basal face. A fluosilicate of aluminium ($Al_2F_2O_4SiO_2$). The colour range includes colourless, yellow (pale to brown), blue, pale green. Hardness, 8, sp. gr. 3.5. The pink T. seen in jewellery is produced by heating brownish-yellow stones which change colour on cooling. On heating or rubbing, T. becomes electrified (pyro-electric). Abundantly found in Brazil, Siberia, and Ceylon. In the Brit. Isles T. has been found in the Cairngorm Mts. in Scotland, Mourne Mts. in Ireland, and in Cornwall. The true T. should not be confused with the yellow quartz known as citrine (Hardness, 7., sp. gr. 2.65). There is also the yellow

sapphire, sometimes sold as Oriental T.

Tope (Hind. *tōp*, prob. from Pall *thūpo*, Sanskrit *sthūpa*, a mound), common name for a kind of Buddhist monument erected by monks to enshrine relics of Buddha or his disciples. Most Ts. take the form of a tumulus of masonry, shaped like a dome or tower, and often surrounded by an elaborately-carved stone railing with lofty gates far higher than the railings. When the purpose of the Ts. is for the preservation of relics, it is called a *dagoba*, and when its purpose is merely to commemorate some event, the usual name is *stupa*, the word T. only connoting the external shape.

Topeka, cap. of Kansas, U.S.A., and co. seat of Shawnee co., on the Kansas R., 58 m. W. of Kansas City. It is a large manufacturing centre, and has railway work-shops, and in the vicinity are quarries and coal mines. Pop. 67,800.

Tophane, see CONSTANTINOPLÉ.

Tophet ('the place of burning'), high place in the valley of Hinnom, where sacrifices were offered to Moloch.

Topiary, training and clipping of trees and shrubs into ornamental shapes. The art was most greatly developed in Tudor times, and was a definite feature of old-world gardens: some of the more ambitious examples still exist at Elvaston Castle, Derby, and Leven's Hall, Westmorland. Evergreens are most popular for T. work, though hawthorn stands up to clipping well and is often used. The two best species, being long-lived and able to withstand severe and constant clipping, are yew (*Taxus baccata*) and box (*Buxus sempervirens*). Holly (*Ilex aquifolium* and its variegated varieties) and evergreen oak (*Quercus ilex*) are often used, and the larger-leaved sweet bay (*Laurus nobilis*) and Portugal laurel (*Prunus lusitanica*) may be trained in simple, formal shapes.

Toplitz, see TEPLITZ.

Toplady, Augustus Montague (1777-78), Anglican divine and hymn-writer, b. at Farnham, Surrey, and educated at Westminster and Trinity College, Dublin. He entered the Church in 1762, and became vicar of Harford (1766) and Broad Hembury (1768). In 1775 he became minister at the Fr. Calvinist Chapel in London. He is remembered for his hymn, 'Rock of Ages.' See life by T. Wright, 1811.

Topographic Surveying, see under SURVEYING and LEVELLING.

Topography, see MAPS; MAP READING.

Topolias, see COPAIS.

Topolino Stato, see TRIESTE.

Topsail, see SAILS and RIGGING.

Torbanite, see BOGHEAD COAL.

Tor Bay, on the S. of Devonshire, England, was the landing place of William of Orange (1688). On its shores are the tns. of Torquay, Paignton, and Brixham.

Torch-thistle, see CERUFA.

Tordesillas y Herrera, Antonio de, see HERRERA.

Tore, see under PYGMIES.

Torgau, tn. of Saxony-Anhalt, Germany, on the Elbe, 30 m. N.E. of Leipzig. The battle of T. was fought in the vicinity,

Nov. 3, 1760, when Frederick the Great defeated the Austrians under Daun. Its fortifications were levelled in 1889. Glass, pottery, and gloves are made. It was the scene of the first allied link-up in the Second World War, when Amer. patrols met units of the 58th Russian Guards Div. on April 25, 1945. Pop. 13,550.

Torhout (Fr. *Thourhout*), city in the prov. of W. Flanders, Belgium, 12 m. S.S.W. of Bruges, 2 m. N.W. of T. lies the beautiful castle of Wijncendale, built in the eleventh century. In 1940 King Leopold III. had his H.Q. and capitulated here on May 28. T. is considered to be the oldest place in Flanders and once was the most important cloth-market of the country. Manufs. include linen, drainage pipes, and weighing-machines. It is an important horse-market. Pop. 12,200.

Torino, see TURIN.

Tormentil (*Potentilla erecta*), perennial herb (family Rosaceae), found in the Azores, W. Siberia and Europe. The leaves are divided into three, sometimes five leaflets; the flowers, which are yellow have four, sometimes five petals. The rootstock is used in tanning, having an astringent quality.

Tornado, cyclonic disturbance of the atmosphere, most common in U.S.A. E. of 100°W. long., but particularly in Kansas and Illinois. Usually it arises suddenly on a sultry summer afternoon in the transition zone between tropical maritime air from the gulf of Mexico and polar air that has become hot and dry over deserts. It is of small diameter, a few hundred yards, but of relatively great vertical height. The upper portion is marked by a swirling funnel-shaped cloud which sways and rises and falls and may reach the ground in the centre of the T. Local surface conditions give rise to rapid heating of a column of moist air by the sun, and sudden expansion takes place; it rises and condensing moisture adds to its temp. As it spreads out rain falls, which evaporates into surrounding dry air, cooling it and increasing the instability of the transition zone, causing, in its turn, more intense convection—a self-generating process.

The pressure in the centre falls and as the air is sucked in, it is whirled vortex-like in a cyclonic (anti-clockwise) rotation with stronger and stronger winds, sometimes reaching 200 m.p.h. The force developed cuts a clean path through tn. or country; trees are uprooted and whirled outside the track; houses are 'burst' by their own internal pressure as the low pressure passes; the damage to houses often leads to escape of gas and disastrous fires. The track extends usually for about 30 m., and the energy is dissipated in about an hr., although sev. have been observed at the same time. They also occur in W. Africa, where they are known by the same name, in India where they are sometimes known as 'Nor'westers,' and in Australia where the name is 'Willy-willy.' A very destructive T. visited S. Wales in Oct. 1913, springing up near Merthyr-Tydfil and dissipating in Cheshire. A T. in Oklahoma on April

9, 1947, killed 167 people and caused damage to property of nearly \$10,000,000. From 1916 to 1947 the average yearly number of Amer. Ts. was 141, the average loss of life 235 and the average loss to property \$12,300,000. The waterspout (q.v.) at sea is a similar phenomenon.

Toronto, cap. of the prov. of Ontario, Canada, is in York Co., 1800 m. W. of the Atlantic Ocean on a bay on the N. shore of Lake Ontario, 330 m. N.W. of New York City, 333 m. S.W. of Montreal, and 238 m. E. of Detroit. The cross-roads of trade since Indian times, T.'s strategic position was fought for by Fr., Amer.,

the Customs Ports of Toronto in 1947 amounted to \$441,103,801: exports, \$8,603,767 (*Trade of Canada*, Vol. 1, Dominion Bureau of Statistics). In volume of trading T. Stock Exchange is the second largest in the world.

T. is served by municipally-owned water works, hydro-electric power supplied by Niagara Falls, gas works, electric street railways, trolley buses, and motor coaches, and has an airport. One of the world's great sports cities, it has four race tracks, a large baseball stadium, and one of the world's largest indoor sports arenas, Maple Leaf Gardens, in winter the T.

TORONTO: A VIEW FROM CENTRE ISLAND

and Eng. Its well-sheltered harbour, the finest on the Great Lakes, handled 4,310,900 short tons of water-borne trade in 1948. Co-ordinated water, rail, highway, and air transit services include two of the world's greatest railway systems, Canadian National and Canadian Pacific, buses, steamships, and Trans Canada and Amer. Airways air service to all parts of the world. A great commercial centre, it has the largest livestock mkt. in Canada, 3869 manufacturing estab. with gross value of products of \$1,188,751,064 (Dominion Bureau of Statistics, 1946), including meat-packing, electrical equipment, agric. implements, bakery products, clothing, furniture, automobile supplies, pianos, foundries, brewing, and distilling works. T. is the leading Canadian city in wages and salary payroll, bank clearings, postal revenue, telephone installations, and car loadings. Imports cleared through

home of Canada's national sport, hockey. The Canadian National Exhibition, largest ann. exposition in world, occupies in Aug. and Sept. a 350 ac., municipally-owned park on the shore of Lake Ontario, where the Royal Agric. Winter Fair, one of the three major livestock shows on the continent, is also held annually. A new rapid transit system to provide increased, speedy transportation in the form of modern subways, began in 1949 with the building of Yonge St. subway.

The Univ. of Toronto, founded in 1827, had 16,190 students (1948-1949), in Faculties of Arts, Science, Medicine, Music, etc., the chief colleges being Univ., Victoria (United Church), Trinity (Anglican), St. Michael's (Rom. Catholic), with federated theological colleges, Knox (Presbyterian), Wycliffe (Anglican), Emmanuel (United Church), and St. Michael's, with which is affiliated St. Michael's

Pontifical Institute of Medieval Studies, the only Institute in N. America empowered to grant Pontifical Degrees. T.'s School of Medicine has developed the Connaught Laboratories, and the Banting and Best Institute, named after the late Sir Frederick Banting and Dr. Charles H. Best, who discovered insulin in one of the most accurately planned scientific developments ever known, at the physiology laboratories at the Univ. of T. in 1921. T. hospitals include T. General, Sick Children's, and Sunnybrook, largest and most modern Canadian military hospital. T. is also the centre of Dominion Meteorological services. The Royal Ontario Museum, largest in the Brit. Commonwealth outside London, is famous for its Chinese collection. The Conservatory of Music, incorporated in 1886, passed under the trusteeship of the univ. in 1921 and was granted the title of Royal T. Conservatory of Music in 1946 on the occasion of its diamond jubilee. It is the dominant force in musical education in Canada. T. had its first full-size symphony orchestra in 1894, and now supports two symphony organisations, the T. Symphony Orchestra and the T. Philharmonic Orchestra. T. Art Gallery contains the second largest collection of Canadian paintings in the world. Other interesting buildings include the Prov. Legislative buildings, City Hall, Casa Loma, Bank of Commerce Building (tallest in the Brit. Commonwealth), Univ. Law, Legislative libraries, T. Public Library, with 17 branches and total circulation of 3,990,029 vols. (1948); St. James (Anglican) and St. Michael's (Roman Catholic) cathedrals, Metropolitan (United) Church, with its famous 52-bell carillon, the first tuned to the chromatic scale. 105 parks and playgrounds cover 2035 acs. of land and 159 acs. of water, including Exhibition, High, Riverdale, Queen's, Sunnybrook, Sunnyside, and T.'s island parks.

The site of the present city of T. was chosen by Lord Dorchester, governor of Canada, as the seat of gov. for the newly created prov. of Upper Canada in May, 1793. Sir John Graves Simcoe, first lieutenant-governor, named the new tn. York. It was occupied by United States forces in 1813, when legislative buildings and archives were burned and the mace carried away, to be returned by President Roosevelt at the centennial celebrations in 1934. Self-gov. was granted to the tn. of York in 1817; and it was incorporated as a city under the name of T. in 1834, with William Lyon Mackenzie as its first mayor. Its name, of Huron Indian origin, means 'a place of meeting.' Pop. 670,000: Greater T. including suburbs 1,030,000. See J. C. Dunt, *Toronto: Past and Present*, 1884; *University of Toronto History* (1925); *Toronto Municipal Handbook*, 1949.

Torpedo, or **Electric Ray**, genus of fishes, one of species of which (*T. hebelians*) is occasionally found off the coast of England. Ts. are characterised by the possession of an electric organ which is present between the head and the pectoral fin of each side. The shock which it is

capable of administering can disable a man.

Torpedo. In the days before the advent of the locomotive T., all submarine explosive devices, whether stationary or mobile, were referred to as Ts. These early Ts. were of many different forms: one type was towed across the bows of enemy vessels by small torpedo-boats (*q.v.*), another was the 'spar' T., which was carried on the end of a spar at the bows of a launch. The spar was arranged to lower the T. below the water-line just before striking, later models being fired electrically. As the result of equipping battleships with additional small guns and the installation of searchlights, the use of the above kinds of T. became a practical impossibility, and efforts were concentrated upon the development of a type which could drive itself. *Whitehead's* T. was constructed to ideas of Captain Luppiss of the Austrian Navy but was first practically evolved in 1866 by Whitehead, whose practical mechanical skill completely altered the original ideas. The first type was too uncertain in vertical direction, but the introduction of the 'balance chamber' in 1868 obviated the troubles of skimming and diving. The secret was purchased by the Brit. Gov. after successful trials, and in 1876 the servo-motor was added by Whitehead. Improvement continued, and to-day every navy uses the Whitehead T. in a highly-developed form, though there are many patterns.

The shape of the modern T. resembles a cigar with a rounded or blunt nose, upwards of 20 ft. long by as many inches in diameter and constructed of special steel. It is divided into a number of compartments: the explosive head, compressed-air chamber, balance chamber, engine room, and buoyancy chamber. In wartime about 500 lbs. of high explosive are stored in the head and are fired on contact with the target by means of an arrangement called a pistol, located in the extreme nose. The blow need not be directly head-on to detonate the charge, there being other side-projections capable of causing the explosion in the event of an oblique strike. To render the T. safe whilst being handled and until it is clear of the ship, there are three safety devices fitted, viz. a safety-pin which is first withdrawn; small vanes, so set that the rush of the T. through the water causes them to rotate and unscrew until they fall off; and lastly, the force of impact against the target must be sufficient to shear through another pin before finally the point of the striker fires the charge. For peace-time practice, special heads are fitted containing water and cork. The head is bolted on to the compressed-air chamber, which is forged from high-tensile steel and contains air at a pressure of over one ton per sq. in. supplied from air compressors on board the warship. Next follows the balance chamber containing the mechanism for controlling the depth the T. will run at, as well as, in the later types, vessels containing fuel, water, and a special heater apparatus. Depth control is effected by

a swinging weight or pendulum which, being affected by any alteration in tilt, sets in motion a servo-motor, contained in the engine room, which provides the necessary power to actuate the horizontal rudders which correct the vertical deflection of the T. from its proper depth. A hydrostatic valve is fitted to ensure that the T. attains the correct depth. The engines, placed about the balance chamber, are of the four-cylinder, single-acting, Brotherhood type and are marvels of ingenuity. Normally they are driven by compressed air, though in latest types fuel and air are burnt in a special generator and form steam which is led to the engines. The exhaust is allowed to escape and rises to the surface in the form of bubbles, making a track which can be clearly seen from the bridge of the ship attacked. Next comes the buoyancy chamber, whose primary purpose is to give the necessary buoyancy to the T. Herein is situated the gyroscope, which rotates at high speed, is delicately suspended in gimbals, and is connected to the vertical rudders. The gyroscope tends always to maintain the direction of its spinning axis, and thus is used in conjunction with a servo-motor to actuate the vertical rudders and correct any deflection as soon as it occurs. At the tail are situated the vertical and horizontal rudders which keep the T. on its course and prevent it from sinking or jumping out of the water. Behind the rudders are situated two four-bladed propellers, driven by the engines, which rotate in opposite directions, thus preventing the T. from any heeling due to the torque reaction which would occur if only one screw were fitted. Exact details of the latest types are secret, but figures which have been pub. show that ranges exceeding 15,000 yds. and speeds of over 45 knots have been obtained. Efforts are being made to control them by radio.

T. tubes from which T.s are ejected are either submerged, as in submarines, or above water, as fitted in light cruisers and destroyers, and the firing impulse is given by compressed air or explosive. Another method of discharging them is by means of special dropping-gear from aircraft. The submerged tube has the advantages that the T. cannot be damaged by shell-fire when within the tube prior to discharge and that the moment of release cannot be detected by the enemy. In this type of tube the orifice can be closed by a watertight door, when a rear door may be opened to allow the T. to be placed in position. To fire, the rear door is closed, the outer door opened, and a blast of compressed air blows the T. out of the tube.

Modern battleships rely upon 'blisters' for protection against T.s. These are really an outer skin fitted below the water-line on the hull, and the space inside is utilised for carrying fuel oil. The T. explodes on striking the skin of the 'blister,' but no damage is sustained by the hull proper.

Torpedo Boat and Torpedo Gunboat. Both these types of craft are obsolete in modern navies having been replaced by

the destroyer (*q.v.*), and Motor Torpedo Boat. The earliest type of torpedo boat was merely a launch fitted with spar torpedoes; later the method adopted was to tow the torpedo across the bows of the enemy vessel. The first T. B. was built by Messrs. Thornycroft for the Norwegian Gov. in 1873, for the 'towing' type of torpedo. In 1879 the Brit. Admiralty had built the torpedo boat, *Lightning*, of 27 tons, 19 knots speed, and fitted with a bow torpedo tube for launching a locomotive torpedo of the Whitehead type. As time went on this class of vessel grew in size, speed, and armament and became a grave source of danger to battleships, necessitating other means of countering them than quick-firing guns and torpedo nets, particularly as torpedoes were fitted with net cutters. A special class of vessels, termed 'torpedo gunboats' or 'torpedo catchers,' was introduced to destroy the T. Bs. They were armed with 4-in. and 3-pounder quick-firing guns and, later, torpedo tubes, but were never successful, owing primarily to their lack of speed, and were entirely superseded by the torpedo boat destroyer, which was able to combine effectively the functions of torpedo boat and catcher.

Torpedo Boat Destroyer, see DESTROYER, TORPEDO BOAT.

Torpedo Ejector, or Torpedo Tube, see under TORPEDO.

Torquatus, name of a patrician family of the gens Manlia. *Titus Manlius Imperiosus* fought against the Gauls (361 B.C.), winning his name T. by taking the necklace (*torques*) from the body of a mighty Gaul slain by him in single combat. He was dictator 353 and 349, and consul 347, 344, and 340. With P. Decius Mus he defeated the Latins at the foot of Vesuvius. (See Livy, iv. 5, viii. 3-12; Cicero, *De Officiis*, iii. 31.) *Lucius Manlius* was a consul with Cotta (65 B.C.), and helped to suppress Catiline's conspiracy (63), and supported Cicero in his exile (58). *Lucius Manlius*, his son, was praetor 49 B.C., and opposed Caesar on the outbreak of civil war. Obligated to surrender Oricum, he was taken prisoner (48), but released. He fought again in Africa, but was captured and slain (46), on the defeat of the Pompeians.

Torquay, municipal bor., seaport and holiday resort of S. Devonshire, England, on Tor Bay, 26 m. S. of Exeter and 1994 m. by rail from Paddington (London). Its picturesque scenery and mild climate make it a favourite health resort. Terra cotta, clay, and marble are found in the neighbourhood of the tn. The Domesday survey identifies part of the site of T. with the Norman period, recording that William I. gave the manor of *Cockintone* (now Cockington) to a follower, Hostarius. But by far the earliest link with the past is Kent's Cavern, in the Ilsham valley, a cave which is earlier than any other known. A fine collection of the remains of extinct animals, which once frequented the cave and of the implements made by the men of the Old Stone Age, forms part of the exhibits at the Museum of the T. Natural

Hist. Society. In 1196 the Premonstratensian Order of White Canons founded Torre Abbey, the ruins of which together with the restored Monastic Barn and the Mansion House dating in some parts from about the fifteenth century are a conspicuous feature to-day on the sea-front. The development of T. as a modern seaside resort dates back to the end of the eighteenth century, when 'Tor Kay' or 'Tor Key' was no more than a cluster of fishermen's huts on the shore with the vil. of Tor (or Torre) about a m. inland. To deal with the threat of invasion by Napoleon, ships of the Fleet constantly used Torbay as an anchorage and houses were built on the shores of the bay for the accommodation of the wives and families of the officers. Of T.'s total acreage (6244) over one thousand ac. are occupied by parks, pleasure grounds and public gardens, with tennis courts, bowling greens, etc. Torbay, which is notable for its regattas, provides one of the best yachting courses in Great Britain and has been the scene of America Cup trials; the yachting events of the 1948 Olympic Games were contested in the bay. In the tn. hall there is a tablet in honour of Prof. Oliver Heaviside (q.v.), who lived here for a period of his life. Babacombe (q.v.), 2 m. N. of central T., on Babacombe Bay, is now part of the bor. of T. Cockington, an old-world thatched vil. $\frac{1}{2}$ m. from T. railway station, has for long been part of the bor. Its little church, in its present form, is of the Norman period. In the neighbourhood of T. are traces both of Rom. and Saxon occupation. Pop. (estimated) 50,390.

Torque Amplifier and Torque Converter. It is often necessary for an operator to be able to rotate massive pieces of mechanism such as a rudder of a liner or the guns of a ship. The operator can only exert a feeble twist or torque on the controlling device fixed in his observation post, so that some intermediate mechanism is required to magnify or amplify this torque in order to perform the required operations. This intermediate mechanism is called a *torque amplifier* and the principle of its action is as follows. The operator applies a feeble torque to a control-shaft that causes friction bands to engage with two drums rotating in opposite directions. The bands also engage with a shaft connected to the mechanism to be rotated, and the magnitude of the torque applied to this shaft depends on the friction between the bands and the rotating drums. Hence the feeble torque provided by the operator controls the extent to which the bands are brought into contact with the drum, while the final torque applied to the mechanism depends on the speed of rotation of the drums.

The *torque converter* acts as an infinitely variable gear, usually with varying efficiency.

Torquemada, Tomás de (1420-98), Dominican friar b. at Valladolid, who in 1483 was entrusted by Queen Isabella with the estab. of the Sp. Inquisition. Ascetic in his private life, he was severe to the point of cruelty towards suspec-

ted or convicted heretics. Of 100,000 said to have been accused, 1000 were put to death, others fined and penanced. He was one of the leading instigators of the conquest of Granada and of the expulsion of the Jews. See W. T. Walsh, *Isabella of Spain*, 1937; E. Lucka, *Torquemada und die spanische Inquisition*, 1926; life by H. G. de Saint Amant, 1910.

Torre, Duque de la, see SERRANO Y DOMINGUEZ.

Torre del Greco, seaside resort and fishing tn. of Italy, in the prov. of Naples, situated at the foot of Vesuvius, which has often damaged the tn. by eruptions. It has shipbuilding yards, and exports cameos, worked coral, lava, etc. Pop. 61,000.

Torrans, Lake, large salt lake of S. Australia, discovered in 1840 by Eyre, 35 m. N. of Port Augusta. It is 40 m. N. of Spencer Gulf, in the N. part of the Great Valley and 80 ft. above sea level. Its average breadth is 20 m., length 130 m. It becomes a marsh in dry weather.

Torreon, tn. of Mexico, in the state of Coahuila, and standing 3800 ft. above sea level, 500 m. N.W. of Mexico City. It is an important railway junction, lines radiating to Chihuahua, Durango, Zacatecas, Fresnillo, and Monterrey. Its industries include cotton mills, smelting works, and flour mills, and there are coal and other mines in the dist. Pop. (including the nearby tns. of Ciudad Lerdo and Gomez Palacio), 87,800.

Torres, Alioto Alcalá Zamora y, see ZAMORA Y TORRES.

Torres Strait, in the S. Pacific Ocean, between New Guinea and Australia, from 80 to 90 m. broad. It contains sev. is., the chief of which are Clarence and Prince of Wales Is. Reefs and shoals abound, rendering navigation difficult.

Torres Vedras, tn. with a Moorish citadel, on the Sizandro, Portugal, 40 m. by rail from Lisbon. It was here that Wellington constructed the famous field-works known as the 'Lines of Torres Vedras' when he withdrew his forces in face of Masséna's invasion of Portugal, for the winter of 1810. Wellington's triple lines of fortifications, stretching to the Tagus, consisted of one hundred forts, joined together by entrenchments and inundations, and he successfully defended them until he was able to advance against Masséna and drive the Fr. back into Spain. T. V. is the centre of a vine-growing dist. and has sulphur baths. Pop. 8700.

Torricelli, Evangelista (1608-47), It. physicist, b. at Faenza. He acted as Galileo's secretary, and was prompted to many of his discoveries by the study of that scientist's works. Besides making a barometer—an invention commemorated in the names of Torricellian tube and Torricellian vacuum—he solved the problem of the quadrature of the cycloid. *Opera Geometrica* (1644) is his prin. work. **Torridon**, hamlet at the head of Loch T., on the W. coast of Scotland, in Ross and Cromarty. There is a deer forest nearby.

Torrington: 1. Bor. on the Naugatuck R., in Litchfield co., Connecticut, U.S.A. Textiles, engines, and hardware are produced. Pop. 27,000. 2. Or Great T., a mkt. tn. and mun. bor., on the Torridge, in Devonshire, England. Its Saxon name was Tortitone. The bluecoat school was estab. in 1671. There is a milk-canning factory, and gloves are made. Pop. 7500.

Torrington, Viscount, see BYNG, GEORGE.

Torsion, strain produced by a twisting motion, that is, by a couple acting in a plane at right angles to the axis of a prism. The distortion produced is a type of shearing stress. In the case of a cylinder the outer layers slide over the inner layers in the direction of the twist, so that, while the axis remains the same, the exterior takes on a screw-like appearance. Resistance to T. determines the rigidity of the bar, and resistance to permanent distortion depends upon its elasticity. The amount of 'torque' or twist required to produce T. in cylindrical bars of the same material varies as the fourth power of their diameters. In bars of section other than circular the rigidity is lessened, so that in practical application cylindrical bars are best adapted to resist a twisting strain.

Tort, (Lat. *tortus*, twisted), act or omission giving rise to a remedy by action for damages which is not an action for contract, e.g. trespass (q.v.), slander, libel, detinue (q.v.), negligence and nuisance (q.v.), and assault. A T. has some of the characteristics of a criminal offence, but is to be distinguished therefrom, though many crimes necessarily include a T. (e.g. a public nuisance causing special damage to an individual; rape), but every T. does not amount to a crime (e.g. slander and seduction are merely T.s.) nor does every crime amount to a T. (e.g. blasphemy and treason). Where the T. is punishable summarily and the magistrates dismiss the case, no further proceedings, criminal or civil, can be taken. A cause of action in contract may co-exist with a T., i.e. the same facts may give A a remedy in contract against B and also a remedy in T. against C, e.g. where A is injured in alighting on a defective wharf belonging to B shipping company, from a ship belonging to C shipping company which enjoys unloading rights on B's wharf (see Sir F. Pollock, *Law of Torts*, 1887); conversely there may be two causes of action, one in T. and one in contract with a common defendant; and generally, when a contract inevitably gives rise to duties independently of the contract itself, the breach of them often amounts to a T., e.g. where A purchases goods on credit from B, and B resells before A makes default in payment, A can sue B for conversion. Sir F. Pollock, *Law of Torts* (14th ed. by P. A. Landon), 1939; Sir J. W. Salmond, *Law of Torts* (10th ed. by W. T. S. Stallibrass), 1945; P. H. Winfield, *Cases on Law of Torts* (3rd ed.), 1945; and G. F. Clerk and W. H. Lindell, *Law of Torts* (10th ed.), 1947.

Torticollis, see STIFF NECK.

Tortoise, name for all the land Chelonians, and often applied to all members of

the family Chelonia with the exception of the marine Chelonians or turtles. All members of the order are cold-blooded, four-footed reptiles, without teeth, and are protected by a shell, or leathery case. All lay eggs, but otherwise there is wide diversity in their habits. They are of great geological age, and their tenacity of life has enabled them to survive where more recent animals of higher types have become extinct. The most familiar example of the land Ts. (*Testudines*) is the common or Gk. T. (*Testudo graeca*) which occurs around the Mediterranean and is much kept as a pet. It is entirely vegetarian in its diet, though frequently sold as an insect killer. Another T. which is sometimes offered for sale is the riv. T. (*Emys europaea*); this is a type of the riv. and marsh Ts. (*Emydes*) and is distinguished by its small yellow spots; this eats insects, worms, etc. Among the mud or soft Ts. (*Trionycides*) are various Amer. and Indian species which are frequently killed for food, the flesh being well flavoured. The most important of the turtles (*Cheloniades*) are the edible green turtle (*Chelonia mydas*) and the hawksbill turtle (*C. imbricata*), from which tortoiseshell is derived. Among the most interesting kinds of T. are the Gigantic Ts. formerly found in great numbers in the Galapagos and Mascarene Is. When discovered these is. were uninhabited; the Ts. therefore enjoyed perfect security, and this, as well as their ordinary longevity, accounts for their great sizes (as much as 5 ft. in length) and numbers.

Tortoise Plant, see TESTUDINARIA.

Tortoise-shell, in commerce, is the horny plates of the hawksbill turtle (*Chelonia imbricata*). The largest of these plates are about 18 in. long by 6 in. broad, and rarely exceed one-eighth of an in. in thickness. T. is semi-transparent, and mottled with various shades of yellow and brownish-red. Its value depends on the brightness and form of the markings, and, if taken from the animal after death and decomposition, the colour of the shell becomes clouded and milky. Hence great cruelty has been exercised in removing the plates from living turtles, but the finest T. is derived from shells immersed in boiling water immediately after the death of the animal. Numerous imitations and substitutes are made. T. is used for making combs, snuff-boxes, and a number of fancy articles, as a material for inlaying ornamental furniture, as a veneer, and as a ground substance in which the precious metals and mother-of-pearl are inlaid.

Tortola, see VIRGIN ISLANDS.

Torture. The application of bodily pain in order to extort evidence from witnesses or confessions from accused persons has been a feature of almost every judicial system of the world. In England the practice was virtually abolished in 1640. T. was abolished in France at the Revolution (1789); in Scotland by an Act passed in 1709. It was unknown in the Ger. municipalities until the end of the fourteenth century, but once introduced it remained lawful (though only intermittently resorted to after 1750) in

Hanover, Bavaria, and some of the smaller Ger. states until the first decade of the nineteenth century, while in Austria, Prussia, and Saxony it virtually ceased in 1750, and in Russia was finally abolished in 1801. Ingenious forms of T. were used by the Jap. and Gers. in the Second World War, in occupied countries and against resistance movements. The customary modes of T. were the rack, wheel, and thumb-screw, although in England in earlier times it was inflicted by the boot, by fire or water, and by *peine forte et dure*, i.e. by piling weights on the prostrate body of the victim.

Toru Dutt, see DUTT, TORU OR TARULATA.

Torula, see YEAST.

Torun, or **Thorn**, tn. on the Vistula, 6 m. E.S.E. of Bydgoszcz in the prov. of Pomorze, Poland, formerly in E. Prussia, Germany. Pop. 54,000.

Tory, synonym, though historically inappropriate, for a Conservative. The word T. is Irish, and signified, during the time of the wars in Ireland in the reign of Elizabeth, a kind of robber who, being attached to neither army, preyed generally upon the country without distinction of Eng. or Spaniard. They were especially prominent in the Protestant massacres of 1611. From this the term came to be applied to a body of men who, in 1680, appear to have ridiculed the Popish Plot and yet encouraged the Papists to revive it. Their political object was to banish the duke of Monmouth and recall the duke of York, and to further their end they endeavoured to thwart the Bill of Exclusion (from their abhorrence to which they were called 'abhorers' and their opponents the 'petitioners'). Ultimately the 'abhorers' and 'petitioners' became identified with the terms Tories and Whigs respectively. See *Edinburgh Review*, vol. 1, 1830. See further under CONSERVATIVE PARTY; PARTY GOVERNMENT.

Toscanini, Arturo, (b. 1867). It. conductor. b. at Parma. He studied at the Parma Conservatory, where he gained his diploma in cello and composition in 1885, and began his career as a conductor in 1886 at Rio de Janeiro. His reputation rapidly gained ground. In Turin, where he remained for sev. years, he directed the first performance in 1886 of Catalini's *Edmea*. In 1898 he was appointed to La Scala, Milan, and in 1907 nominated conductor of the Metropolitan, New York. He returned to La Scala in 1921. He was conductor of the Philharmonic Symphony Society of New York, 1926-36. His chief centres of activity have been the oper. houses and concert halls of Milan and New York, but he has been guest conductor at Vienna, Salzburg, Paris, and elsewhere. He conducted at Covent Garden during the Coronation celebrations of George VI., 1937. In 1946 he returned to La Scala. The concerts conducted by him in the Augustus in Rome have become memorable. Many new It. operas were presented by T. See lives by G. M. Ciampelli, 1933; T. Nicotra, 1929; P. Stefan, 1936; S. Zweig, 1937; and L. Gilman, 1938.

Press Portrait Bureau

ARTURO TOSCANINI

Tosti, Sir Francesco Paolo (1846-1916). It. composer, b. in the Abruzzi. He came to London when about thirty years old and held the position of singing teacher at the R.A.M. In 1885 he was knighted by Queen Victoria, with whom he was a favourite composer. His early work recalls the folk-songs of his native Abruzzo. He was singing-master to the Queen of Italy and later to the Brit. Royal Family, and settled permanently in London. He composed hundreds of songs, 'Goodbye' being probably the favourite in a mass of work which achieved great popularity.

Tostig (d. 1066), earl of Northumbria, was the son of Karl Godwin. In 1065, he was banished from his realm because of his cruel, repressive measures. The following year he returned with Hardrada, king of Norway, and was slain at Stamford Bridge by King Harold.

Totalisator, machine, or apparatus, set up on race-courses for recording bets and payment of winnings on the principle that all money staked is pooled and shared (subject to a percentage deduction) by those who have backed winners. This system, known as the *pari-mutuel*, was invented in France by M. Oller in 1872. The first machine used to operate this system was set up at Christchurch, N.Z., in 1880, and the first T. in Europe was operated at Longchamps, near Paris, in 1925. Ts. were introduced into Britain in the same year, and by the end of 1930 ninety-two race-courses were provided with T. facilities. They were also in the same year installed at many greyhound tracks. A mechanized *pari-mutuel* system was operated in Maryland, U.S.A., in 1930.

In Great Britain Ts. are operated on horse-racing courses by the Racecourse-

Betting Control Board, constituted under the Racecourse Betting Act, 1928, with a view to benefiting, by the legislation and estab. of Ts. on race-courses in Great Britain, the horse-breeding industry, the sport of horse-racing, and charities. Under the Betting and Lotteries Act, 1934, veterinary science also benefits. The Board's income is derived by a deduction of ten per cent from the moneys staked, and these earnings are paid into a 'T. fund.'

On a fully mechanised installation, at the time of the issue of the tickets, each 2s. unit is automatically added and recorded on a miniature indicator in the control room and simultaneously indicated to the public on the main indicators. The prices of tickets on a race-course are 2s., 10s., £1, £5, and on some race-courses, £10 and £100. Facilities also exist for 'off-the-course' betting. T. betting represents only a small proportion of off-course betting on horse-racing, whereas it represents a larger proportion of on-course betting. The amount staked with the T. on horse-racing between 1929 and 1949 was £165,753,635, the average over the last four years being £22,000,000 a year, the peak year being 1948 with £26,252,615. Two representatives each of the secretary of state for the Home Dept. and the National Hunt Committee, three from the Jockey Club and one representative each of the secretary of state for Scotland, the chancellor of the exchequer, 'Tattersall's' Committee, the minister of agriculture and fisheries, and the Race-course Association, Ltd., form the Race-course Betting Control Board. As regards greyhound racing about sixty per cent, or over 300 tracks are equipped with Ts. The average amount staked per year during 1945-48 was £142,000,000, the peak year being 1946 with £199,000,000. For discussion of T. and *pari-mutuel* systems, see under BETTING.

Totalitarian Government, see under GOVERNMENT.

Totemism, belief prevailing among primitive peoples of blood-kinship with or descent from an animal or plant. The word is derived from the Algonquin Indian *otem*, a totem or guardian spirit, or rather from that form of it, *totem*, signifying 'my otem' or guardian spirit (pronounced *odavm* and *todaim*). T. is at the root of nearly every mythology, and accounts for such mythological phenomena as the animal-headed gods of Egypt, which were merely anthropomorphic totems in a state of high evolution. The system was certainly in vogue among the anc. Britons, Hebs., Gks., and many other European and Asiatic peoples, and still is so among, notably, the N. Amer. Indians and Australian aborigines. In sev. Indian 'nations' each individual of a tribe possesses a personal totem which he receives in a dream induced by drugs or hunger at the age of puberty. The idea of blood-kinship among the members of a totem tribe renders it incestuous for its members to intermarry, so that they are compelled to find spouses from another community. Hence also it is regarded as

being wrong to kill a blood-brother. Indeed the results and vestiges of T. may be remarked as still existent among our modern institutions. See E. B. Tylor, *Primitive Culture*, 1871; A. Lang, *Secret of the Totem*, 1905; Sir J. G. Frazer, *Totemism and Exogamy*, 1910; Lord Avebury, *Marriage, Totemism and Religion*, 1911; S. Freud, *Totem and Tabu*, 1913; W. Schmidt, *Origin and Growth of Religion*, 1930.

Totila (d. 552), king of the Ostrogoths in Italy, was proclaimed in 541. He at once commenced the restoration of the kingdom of Italy and gained a victory over the Romans near Faenza. Continuing his victorious march towards Rome, he besieged that city in 546, and captured it the same year. In 547 Belisarius recovered possession and repulsed three assaults of T., who did not succeed in retaking the city till 549. Owing to T.'s continued successes the Emperor Justinian sent a large army against him, led by the eunuch Narses, who encountered T. at Taginae, defeated, and slew him. See F. Dahn, *Könige der Germanen*, 1861-1911; and L. M. Hartmann, *Geschichte Italiens im Mittelalter*, vol. 1, 2nd ed. 1923.

Totnes (the *Totenais* of Saxon times), anc. mkt. tn., with cider breweries, a milk factory, sawmills, and timber-yards, on the Dart, in Devonshire, England. The grammar school was founded in 1551. There is a Norman castle, and the Guildhall dates from 1555. Pop. 5700.

Tottenham, bor. of Middlesex, forming part of Greater London, an industrial and residential dist. The area is 3014 acs., and the pop. (estim. 1916) 129,000. See W. Robinson, *History of Tottenham*, 2nd. ed., 1840.

Tottington, urb. dist. of Lancashire, England, 2½ m. N.W. of Bury. Its industries are cotton-spinning and production of rayon silk. Pop. 6000.

Toucans, popular name of any bird of the genus *Ramphastos*, often applied to the whole family *Ramphastidae*. They are all natives of tropical America and are characterised by their enormous bill and by their habit of bringing up their food after swallowing it in order to masticate it. In confinement they are almost omnivorous, but in a wild state they live chiefly on fruit. In the true Ts. the ground colour of the plumage is generally black; the throat, breast, and rump adorned with yellow, red, and white; the body is short and thick; tail rounded or even and capable of being turned up over the back when the bird goes to roost.

Touch, sensation due to the stimuli of pressure and contact acting on the body. There are two components of this sensation, one of simple pressure, and the other of the locality or region of application of the pressure. Sensitivity to pressure may be estimated by the ability to perceive the pressure due to small weights, from two to fifteen milligrams, on various parts of the body. Results show that the sensitivity of these parts varies considerably, parts of the face being most sensitive. Ability to perceive locality is measured by the

minimum distance separating the two slightly blunt points of dividers when they can be felt as two separate points. In parts of the back, forearm, and thigh, the two points are felt as one, even when they are 2 in. apart. The tip of the tongue is most sensitive to locality, points 1 millimetre apart being distinguished separately. The peripheral nerves supplying the skin terminate either on or between epithelial cells, or in special corpuscles. Certain of these have long been regarded as tactile organs, but there is conflicting evidence with regard to this view. Although careful experiment has failed definitely to establish the connection between the corpuscles and the sensation of T., results seem to indicate that T. must be due to special nerve endings probably associated with the corpuscles. Like all other sensations, that of T. is perceived by the brain, and is conveyed to it by afferent nerves or fibres which travel in special tracts of the spinal cord, distinct from those conveying impulses of pain. Consequently in *symplo-myelia*, when the sensation of pain is lost, that of T. is unimpaired. (See NERVOUS SYSTEM.)

Touch-Me-Not, see under BALSAM.

Touchstone, mineral (schist or jasper) used for testing the purity of gold and gold alloys, which gave characteristic streaks when rubbed over it. The test is probably over 2000 years old, and is still used. T. is also known as basanite and Lydian stone.

'Tough School', see under HEMINGWAY, ERNEST.

Toul, fort tn. in the dept. of Meurthe-et-Moselle, France, on the Moselle, in a plain almost surrounded by mts. Its fine old cathedral (now the church of St. Etienne) was begun about 965 and took five centuries to build. It capitulated to the Gers. during the Franco-Ger. war of 1870. In the Second World War T. suffered much damage. Pop. 12,700.

Toulon (anc. *Telo Martius*), naval and military port and fortress of the dept. of Var, France, on a bay of the Mediterranean. Next to Brest in Finistère it is the chief naval station and arsenal of France. The commercial port and tn. are on the N.E. side of the inner harbour. T. contains a medieval cathedral, a torpedo station, a naval hospital and schools, extensive docks and arsenal, the Musée Bibliothèque, and a convict prison. Trade is not important, but wine, brandy, oil, and fruits are exported. Since 1912 T. has replaced Marseilles as the port of call for the Orient Steam Navigation Co.'s steamers to Egypt, Colombo, and Australia. Its original dockyards and arsenal were begun by Vauban in the seventeenth century, but destroyed by the Brit. to whom T. was yielded (Aug. 1793), being retaken by the Fr. republicans (Dec. 1793). Napoleon first won military fame during this memorable siege. In 1911 the Fr. battleship *Liberté* caught fire and was blown up in T. harbour; many ships near by were damaged and about 200 people perished.

In 1942 the bulk of the Fr. fleet was

scuttled in T. harbour to prevent it falling into Ger. hands. Subsequent Allied bombing almost completely destroyed the harbour and installations. T. was liberated by Fr. troops in Aug. 1945. Pop. 125,800.

See G. Lambert, *Histoire de Toulon*, 1886-92, and J. H. Rose, *Lord Hood and the Defence of Toulon*, 1922.

Toulouse, Count of, see RAYMOND.

Toulouse, cap. of the dept. of Haute-Garonne, France, lies on the Garonne. The riv. is spanned by the beautiful Pont-Neuf (1545-1626), which connects the city with St. Cyprien, its suburb. The Canal du Midi makes broad curves on the N. and E. The church of St. Saturnin is a splendid Romanesque basilica. The cathedral, a structure of many periods, contains the tombs of the counts of T. Noteworthy are the historic Capitole, the thirteenth-century brick church of the Jacobins, the Hôtel Bernuy, and the Musée with its unique collection of antiquities. The city is an archbishopric and the seat of a univ. (8000 students), founded in 1230. Besides a brisk commerce in corn, wine, and horses, all kinds of commodities, from steam engines to truffle pies, are manufactured. The national tobacco factory is here. In Rom. times the tn. was called Tolosa, and it was ruled by counts from 778 to 1271. At T. was fought the last action of the Peninsular War, on April 10, 1814, the battle being fought, and a somewhat doubtful Brit. victory gained, without knowledge that Napoleon's abdication had already taken place. Pop. 264,400. See J. de Lahoudès, *Les Monuments de Toulouse*, 1924.

Toulouse-Lautrec-Monfa, Count Henri Marie Raymond de (1864-1901), Fr. painter, b. at Albi. He travelled widely, but most of his life was given up to the bohemian and artistic society of Paris which he depicted in his paintings, representing the behaviour of both the aristocracy and the *demi-monde*. 'La Goulue et sa Sœur', 'Messalina', 'Femme au Chien', and 'À la Mie' are among his best works, which included drawings, posters, etchings, and lithographs as well as oils.

Touraco, or **Touracou**, beautiful African bird of the genus *Corythae* of the family *Muscophagidae* or plantain-eaters. The T. has a small high bill, notched and serrated mandibles, short rounded wings, and a long rounded tail. It has an erectile crest on the head. The plumage is green, with purple on the wings and tail. The Ts. comprise over a dozen species, including the *T. persa*, with purple wing coverts, found on the Guinea Coast, and *T. albicristatus* or white crested T. of Cape Colony.

Touraine, prov. of anc. France, corresponding in the main to the present dept. of Indre-et-Loire. Its cap. was Tours, and it was named from the Gallic tribe of the Turones, who settled here. It was ruled by the counts of T., being joined with Anjou in the seventeenth century. At the Revolution it became the dept. Indre-et-Loire and part of Vienne. See A. Macdonnell, *Touraine and its*

Story, 1906; and A. H. Brodrick (ed.), *Touraine, with Anjou and Maine*, 1948.

Tourcoing, tn. in the dept. of Nord, France, 9 m. N.E. of Lille. It has been an important textile manufacturing centre since the twelfth century. Other manufs. include carpets, hosiery, and machinery. T. was the scene of a Fr. victory over the Austrians in 1794. Pop. 76,000.

Tourism, the organisation of sightseeing (q.v.), the emphasis being on travel and accommodation, and from this side only do the profits of tourist agencies accrue. See next article.

Tourist and Holidays Board, British, non-governmental organisation set up by the gov. in Jan. 1947, to foster and develop the tourist, catering, and holiday services. After adverse criticism by the Catering Wages Commission and the House of Commons Select Committee on Expenditure, the Board and the Brit. Travel Association were merged as the Brit. Travel and Holidays Association.

Tourmaline, mineral of variable composition, containing silica, aluminium, sodium, iron, magnesium, boron, etc. It crystallises in the hexagonal system, and has a rhombohedral cleavage. It also occurs massive and compact and in radiate fibrous masses. In colour it is generally black, more rarely green, blue, and red, and, still more rarely, colourless. The black variety is termed schorl (q.v.). The mineral is dioic, brittle, and pyroelectric. On account of its hardness (hardness 7-5; sp. gr. 3) it is sometimes cut as a gem. Varieties of T. are rubellite (red or pink), indicolite (indigo blue), Brazilian sapphire (Berlin blue and transparent), Brazilian emerald (green), and peridot of Ceylon (yellow). T. occurs in granite, gneiss, mica, and chlorite slates and granular limestones; it is found in Cornwall and Devon, Bavaria, and Switzerland. The rubellite variety, used as gems, is found in Ceylon, Siberia, and Ava. The clear transparent varieties are used for making polariscopes and polarimeters, e.g. the 'T. pincette'.

Tournal (Flemish *Doornik*), Belgian city and important railway junction, situated on the Scheldt, in the prov. of Hainaut, 27 m. W.N.W. of Mons. Of all the Belgian tns. T. suffered most during the Second World War. Many houses, medieval churches, and municipal buildings, and the valuable library were destroyed. The fine Romanesque and Gothic cathedral, built from the eleventh to the fourteenth century, however, and the Belfry, the oldest in the country, were hardly damaged. There are quarries of freestone and limestone, and the chief manufs. are Brussels carpets, pottery, and woollen and cotton goods. Pop. 32,200.

Tournament, **Tourney**, or **Joust**, form of martial sport very popular in the Middle Ages. Combats took place on horseback between men of noble rank, and a prize was given by the lady of the T. to the knight who had displayed the greatest prowess. The invention of this particular form of military display was ascribed by Ruxner to Henry the Fowler (d. 936) and by others to Geoffroi de Prouilly

(d. 1066). The custom was introduced into England from France during the eleventh century. Ts. were regulated by definite rules and by very strict etiquette. The weapons used, spears, lances, swords, or daggers, had to be blunted. Each joust was attended by his squire, who acted as his second and could alone touch him if he fell. In spite of precautions, however, accidents and rough dealings were not infrequent. See Froissart's *Chronicles*, Scott's *Ivanhoe*, and F. H. Cripps-Day, *History of the Tournament*, 1918.

Tournesfort, **Joseph Pitton de** (1656-1708), Fr. botanist, b. at Aix, Provence. Was appointed prof. of Botany at the Jardin des Plantes in 1683. His *Éléments de Botanique* (1694), embodies a systematic arrangement of some 8000 species of plants, classified, mainly, according to the corolla, a system for long adopted on the Continent. But his chief work was his *Institutiones Rei Herbariae* (3 vols. 1700), which certainly prepared the way for Linnaeus, whose system of classification eventually superseded that of T.

Tourneur, **Cyril** (1575-1626), Eng. dramatist, b. and educated at Westminster, and Trinity College, Dublin. He spent much of his life soldiering (1600-07, 1613-26), being engaged in 1625 by the Low Countries which he served as secretary of the War council. He accompanied Sir Edward Cecil's expedition to Cadiz, and died on his return at Kinsale, Ireland. In the six years which he devoted to literature T. was a prolific writer. He wrote the *Atheist's Tragedy*, 1611, *Transformed Metamorphosis* which was discovered only in 1872, and a lost play, *The Nobleman*. T.'s masterpiece is the *Revenger's Tragedy*, 1607. If it is true that T., unlike Shakespeare, was concerned rather with the technique of horror, physical, and mental, than with psychological issues, it must be emphasised that, like Shakespeare, he sought to 'hold the mirror up to nature'; and he was perhaps the first Eng. writer to display the 'indifference' exemplified by Tolstoy and his view that 'Man will become better only when you make him see what he is like.' Eng. drama owes much to T. for the admirable construction of his work, free from mannerism and bombast. His works were ed. by J. C. Collins in 1878; his two chief plays are reprinted in the Mermaid series and the *Revenger's Tragedy* in the Temple Dramatists. There is an ed. of his complete works by A. Nicholl (1930). See A. C. Swinburne in *The Age of Shakespeare*, 1908; T. S. Eliot in *Elizabethan Essays*, 1934; and U. M. Ellis-Fermor. *The Jacobean Drama*, 1936.

Tourniquet, instrument for preventing hemorrhage by compressing the main artery of a limb. The usual form consists of two metallic plates, united by a thumb-screw, and a strap provided with a pad. The instrument is applied so that the pad is opposite the artery to be compressed, while the strap encircles the limb. By turning the thumb-screw the two metallic plates are gradually separated, so that the strap is drawn more tightly round the

limb. A simple form of T. for first-aid purposes may be contrived by tying a triangular bandage about the part, introducing a stick between limb and bandage, and twisting until the required compression is obtained.

Tours, cap. of the dept. of Indre-et-Loire, France, 146 m. S.W. of Paris by rail. There are printing works, and silk (the industry was estab. by Charles VII.), stained glass, sweet, and automobile factories, etc., besides a considerable traffic in wine and brandy. A great agric. fair and exhibition is held here annually. T. is the seat of an archbishop, and boasts an historic cathedral of St. Gatien, the apostle of the Gauls, in which the gradual progress of architecture from 1170 till 1547 may be traced. A fifth of the tn. was destroyed or gravely damaged in the Second World War, the cathedral being partly destroyed. The *Cesaronum* and later the *Civitas Turonorum* of the Romans, it was the scene of the ministrations of St. Martin and St. Gregory (q.v.), the cap. of Touraine, and the bp. of Balzac. See A. H. Brodriel (ed.), *Touraine—with Anjou and Maine*, 1948. Pop. (tn.) 80,000 (arron.) 218,000.

Tours, Battle of, see CHARLES MARTEL. **Tourville, Anne Hilarion de Contetin, Comte, de** (1642-1701). Fr. admiral and marshal of France, b. in Normandy, distinguished himself in the battle of Palermo against the combined fleets of the Dutch and Spaniards (1676). But his most famous victory was won in 1690 off Beachy Head against the Dutch and Eng.

Toussaint, Anna Louisa Geertruida, see BOSBOOM.

Toussaint L'Ouverture, Pierre Dominique (1746-1803). Negro liberator of Haiti, b. in Haiti, son of a chieftain of Guiaou-Guiauou W. Africa, whom slave-traders captured and brought to Haiti. He was baptised and learned to read. He read and was markedly influenced by the Abbé Raynal's *Philosophical and Political History of the European Establishments and Commerce in the Two Indies*, where it was emphasised that the slaves were treated worse than dogs. Having joined the rebels, he soon acquired a magnetic hold over the negroes; his literacy lent him prestige, his knowledge of plants the reputation of a witch doctor, his dignity of bearing commanded their respect, and by 1791 he was their leader. T. and his army, then 6000 strong, allied themselves with Spain and carried out a lightning campaign.

In France, with the progress of the revolution of equality, came a change of heart towards Haiti and three delegates from the ls. now took their seats in the Fr. National Assembly (1793), while slavery was declared abolished. Thus T. was now able to lead his fellow negroes under the banner of the Fr. Republic against both the Sp. and the Eng., the latter having intervened on behalf of the white planters. Though without military allies, and alone he fought the Eng., who sustained their worst defeat for many years and soon had to yield all the posi-

tions they had won. T. entered Port-au-Prince in triumph.

In France reaction now set in. Vau-bianc, in the Convention, demanded that help be given to the whites against the aggression of the negroes, but T. defeated both the mulattoes under Rigaud and the Sp. During 1801-02 T. was the ruler of the whole ls., and began to reorganise the administration in the Sp. colony, as he had done in Haiti.

At this point, however, Napoleon intervened in an attempt to recover the slaves to their former bondage and T. then took up arms against his former Fr. allies. T. refused to negotiate with Napoleon's commissioner, and stipulated that he himself should be made governor of Haiti for life. Napoleon retorted by making extensive preparations for war. Following the Pledge of Amiens (1802), Napoleon openly announced an expedition against Haiti, whose slaves had 'flouted France's authority.' In the end T. could not rely on his general staff, and had no choice but to accept peace. He was inveigled into pourparlers with the Fr. leaders and at once put on board a frigate for France. There he was confined in the castle of Joux. Through the studied neglect of his jailers he died there in less than a year.

See S. Alexis, *Black Liberator: The Life of Toussaint L'Ouverture* (trans. by W. Stirling), 1949.

Tout, Thomas Frederick (1855-1929), Eng. historian, b. in London. Educated St. Olave's School, Southwark, and Balliol College, Oxford, he became prof. of hist. at St. David's College, Lampeter, 1881-90, and at Manchester Univ., 1890-1925. He was president of the Royal Historical Society, 1925. His works include booklets on medieval subjects, and many articles in *Dictionary of National Biography*. See also his *Collected Papers* (1932-34). See memoir by F. M. Powicke, 1931.

Tovey, Donald Francis (1875-1910), Eng. composer, pianist, and conductor, b. at Eton. From early childhood he was associated with Joachim (q.v.), who took a great interest in his musical education. T. entered Balliol College, Oxford, in 1894, as the first Lewis Nettlehip Scholar, and studied composition under Sir Walter Parratt and Sir Hubert Parry. In 1900 he gave concerts in London, Berlin, and Vienna, and from 1914 was Reid Prof. of Music at Edinburgh Univ. being then the youngest prof. of Music in any Brit. univ. His work as a conductor, which was often marred by eccentricity, was in connection with the Reid Orchestra, Edinburgh, founded in 1924. T.'s music is distinguished by high and serious aims with much regard for classic form and style, and as a pianist he was for some time in the front rank, his interpretations of Bach, Beethoven, and Brahms being of value. As a teacher of music he was regarded with the greatest esteem. He wrote forty articles for the eleventh ed. of the *Encyc. Brit.*, and others, on Brahms and Haydn, in *Cobbett's Cyclopaedic Survey of Chamber Music*; *A Companion to Beethoven's piano sonatas* (1931), and *A Companion to Bach's Art of Fugue*

(1931), and studies of Schubert (1927), and Gluck (1934), in H. Foss's *Heritage of Music*. His *Essays in Musical Analysis* (6 vols., 1935-38), were notes for performances by the Reid orchestra. See also his *Essays and Lectures on Music* (ed. by H. Foss), 1950.

Towcester, mkt. tn. of Northamptonshire, England, 8 m. S.S.W. of Northampton. The chief industry is brewing and there is also an agric. trade. T. is on Watling Street and was known to the Romans as *Lactodorum*. It has an anct. par. church at which Archdeacon Wm. Sponne (d. 1449) was rector for twenty-eight years, during which time he founded the grammar school and a chantry which are still in existence. Sponne bought an old hostelry, then known as the 'Tabard inn,' together with its lands, and devoted the revenues from the property to the needs of the par. In the seventeenth century the name of the inn was changed to the 'Talbot hotel' on account of its associations with the earls of Shrewsbury. Pop. 3000.

Tower Bridge, The, only bridge over the Thames below London Bridge, built in 1886-94. It was designed by Sir Horace Jones and Sir J. Wolfe Barry and it cost the city corporation £1,500,000. It has two high Gothic towers 200 ft. apart and is connected with either bank by single-span suspension bridges. The span between the towers in the centre of the river consists of a pair of drawbridges, or bascules, which can be raised in 14 min., each half pulling up against its tower to permit the passage of vessels, whilst high up near the top of the towers there is a permanent suspension-bridge for pedestrians, which, however, is no longer open.

Tower and Extending Ladders. A ladder is a set of steps or rungs between supports, usually made of wood, but sometimes of metal or rope. Ladders were originally used in the anct. world e.g. for embarking or disembarking from the stern of a ship, or, fixed to a wheeled platform, as an *escalade* for siege work. A simple form of E. L. is the scaling-ladder (q.v.) which consists of two or more loose sections, each of which fits into the other. Other types of ladder are the wheeled tower ladder for (e.g.) inspection of street lamps, and the self-supporting steelback ladder for use when the surface of a building is not to be touched. For fire 'escapes' and turntable ladders, see under FIRE BRIGADES AND FIRE FIGHTING.

Construction.—The construction of a telescopic extending ladder, which is typical, is here described. The stiles of a ladder are of two kinds: deal sides cut from deals, or pole sides, formed by cutting straight fir-pole in half and using one half for each side. Douglas fir is also used for stiles at the present time; oak and ash are employed for the rungs or rounds. Stile-lengths, having been brought to the correct size are 'paired-up,' so that stiles with the same grain tendencies are matched together. Stiles are then mortised for fitting with oblong rungs or drilled for round rungs, and are next grooved to take a wire reinforcement.

Stiles and rungs are then glued or wedged together. To rebate the wire into the grooves the ladder is bent at the centre with weights and a tautened rope, the wire is fixed to one end of the stile and held away from the groove by draw-arms; the rope and weights are released at the centre and the wire allowed to fall into the grooves.

Tower Hamlets, before 1918, a parl. bor. of E. London, returning seven members. The divs. were Bow and Bromley, Limehouse, Mile End, Poplar, St. George Stepney, and Whitechapel.

Tower of London. The official title of the Governor as 'Constable of the Royal Palace and Fortress of London' emphasises the fact that the Tower is the Castle of London. Since the time of its earliest building on Thames-side by William the Conqueror to protect as well as control the city it has served as a Royal Palace (until the reign of James I.); a prison; a fortress, though it has never had a major siege; and at various times it has served as the Royal Mint, the Royal Observatory, the Royal Menagerie, and as a repository for State Documents. At the present day it still serves as an occasional prison for those convicted of treason, but it is chiefly important as a national 'sight,' and as the home of the Crown Regalia in the Jewel House of the Wakefield Tower. It is also a military barracks.

The original building stood within the Rom. city, and it was extended beyond the Wall in the twelfth century. A piece of the Rom. Wall may still be seen close to the White Tower. The T. of L. consists of three parts, as did most castles of importance. The Great Keep, or White Tower, has very thick walls, 15 ft. at the base, and is rectangular in plan. It was commenced about 1078 by Gundulph, a famous military architect, afterwards bishop of Rochester, and contains the Chapel of St. John built of Caen stone in a very severe style with little ornamentation. The W. T. contains a magnificent armoury, well displayed. The Inner Wall had a strong curtain-wall within defensive towers, twelve of which (Bell, Beauchamp, Devereux, Flint, Bowyer, Brick, Martin, Constable, Broad Arrow, Salt, Lanthorn, and Wakefield Towers) still survive. The Outer Ward has lofty defence walls provided with towers and casemates. Traitors' Gate is the chief riv.-gate; above it is St. Thomas's Tower, built in 1242. As an outer defence, there was a wide moat (now dry), but formerly kept filled by the Thames. The whole building is of great interest and has unrivalled historic associations. The Wakefield Tower, built by Henry III., saw the trial of Anne Boleyn. In the Bloody Tower were murdered the duke of Clarence, and allegedly the boy King Edward V. and his brother the duke of York. Many prisoners in the Beauchamp Tower, built in 1300, have left carvings on the walls, many of them well-executed. Among famous prisoners were Thomas More, Cranmer, Latimer, Penn, and Ridley; Anne Boleyn, Katharine Howard, Jane Grey; Walter Raleigh,

Sidney and Russell; and among royalty, David II. and James I. of Scotland, and Queen (then Princess) Elizabeth.

For details of architecture, reference must be made to the official pamphlet of the Anct. Monuments Dept. of the Ministry of Works, 1947, or to a standard work such as Lord Gower's *The Tower of London* (1902), or Sir J. Younghusband's *A Short History of the Tower of London* (1926).

Tower Mills, see under WINDMILLS.

Town Council, in England the governing body of a mun. bor. or co. bor. (see BOROUGH). Where the particular tn. is included in the co. area the co. council has overriding administrative powers in certain matters; but in the case of co. bors. the T. C. is practically independent of all other local governing authorities (see LOCAL GOVERNMENT). The T. C. consists of the mayor (*q.v.*), aldermen and councillors. The qualifications for membership are either the ownership of freehold or leasehold property within the area of the authority or registration as a local gov. elector for the area or residence within the area during twelve months preceding the election. In addition qualified persons must be Brit. subjects, and at least twenty-one years of age. There are certain disqualifications contained in the Local Gov. Act, 1933. The term of office is three years, one-third of the whole number of councillors of the bor., or of each ward thereof where the bor. is divided into wards (being those with the longest term of membership without re-election) retire in May every year and are eligible for re-election. Persons entitled to vote at an election of councillors are those who appear as local gov. electors on the register of electors for the area. The number of aldermen is one-third the number of councillors and they are elected by the councillors from the members of the council or persons qualified to be councillors of the bor. The ordinary election of aldermen is held in every third year at the ann. meeting of the council in May, and takes place immediately after the election of the mayor. The mayor is elected annually by the council as the first business of the ann. meeting from persons who are, or who are qualified to be, members of the council. He is the civic head of the bor. and presides over the T. C. The provisions of the Local Government Act, 1933, govern the constitution and meetings of T. Cs. A T. C. must hold an ann. meeting and at least three other meetings yearly which are to be as near as may be at regular intervals. Business cannot be transacted at meetings unless at least one-third of the whole number of members are present. Acts of the Council and all questions coming before the council are decided by a majority of such members as are present and vote. Thus, if there are thirty-six members of the council and twelve only are present, nine of them could pass an effective resolution. Bor. councils usually meet monthly. The council can make standing orders for the regulation of their proceedings which may supplement statutory rules but not be at

variance with them. Except in the case of business required by law to be transacted at the ann. meeting no business can be transacted at a meeting of the council other than that specified in the summons relating thereto.

Town and Country Planning. What is now known as tn. and country planning is not new. An examination of anct. tns., and cities shows that they were constructed to a plan designed to give protection to the inhab. against attack. There was a central area used as a meeting or mkt. place. The siting of tns. and cities indicated that planning considerations had been borne in mind, i.e. communications and water supply, and, as a result, they were usually sited near to ports or rivers. The Romans developed communications by road to a high degree, and their tns. and cities were sited strategically for purposes of control and defence. With the growth of pop. in many tns., the growth of cities ceased to proceed according to any plan. There were, however, some exceptions, where a ruler took an interest in beautifying his cap. or wished to facilitate his domination of it, or where, as in the eighteenth and nineteenth centuries in Britain, large estates were laid out by landowners for speculative building purposes, as in the W. end of London and Bloomsbury, in Bath and Edinburgh, and in seaside tns. such as Hove and Eastbourne.

The enclosures of land and the Industrial Revolution encouraged an exodus from the country into the tns., and in the absence of planning and public health control small insanitary dwellings were erected in narrow streets near the factories. Public health legislation was soon enacted empowering local authorities to control the type and method of construction of houses, the width of streets, etc., but not the siting. Consequently, residential and industrial buildings could be erected side by side without thought as to amenity, traffic routes, etc. No thought was given to relation of agric. urb. life. The problems thus created and the lessons taught were left to the twentieth century to solve.

Aims of Planning.—The basic aim is the promotion of human welfare, health, safety, amenity, and convenience. To ensure healthy living conditions a community must have satisfactory systems of water supply, drainage, and sewage disposal, buildings planned with sufficient space about them to permit of access of light and air, and areas for recreation. Safety requirements are concerned not only with the type of construction but with the provision of access to buildings so designed as to avoid congestion and danger from traffic and from fire. Amenity necessitates the siting and design of buildings and the preservation of natural features to create a harmonious whole. Convenience requires attention to communications, the grouping or zoning of buildings so as to enable the community to function economically and efficiently, and preservation of balance between the distribution of industries and pop., and the conservation of agric. land.

Early Planning Legislation.—The first general Act of Parliament dealing specifically with planning was the Housing, Town Planning, etc., Act, 1909; the planning provisions (which constituted Part II. of the Act) enabled local authorities to prepare tn. planning schemes in relation to land in course of development or likely to be so used. The object was to 'ensure by means of schemes prepared by local authorities or landowners that land in the vicinity of tns. should be so developed as to secure proper sanitary conditions, amenity and convenience in connection with the laying out of the land itself.' The Public Health Acts, byelaws, and regulations relating to sanitary matters, etc., had regulated the development of individual plots in the interests of public health, but had done little to ensure amenity and convenience, and, therefore, the first planning Act represented a significant advance in the control of development in the interests of the community.

Under the 1909 Act a scheme could only refer to land in course of, or likely to be developed; the prior consent of the Local Gov. Board (now the Ministry of Health) had to be obtained to the preparation of the scheme and subsequently the scheme had to be approved by the Board after having been laid before Parliament. The system was cumbersome, and it was timidly administered, and after the First World War the Housing, Town Planning, etc., Act, 1919, removed the necessity of obtaining consent to prepare a scheme and of laying it before Parliament. The Act also introduced the method of interim development control whereby development between the passing of a resolution to prepare a scheme and the actual preparation of the scheme was subject to such conditions as would ensure that the development would not conflict with the contents of the scheme, or if the conditions were not complied with, then the non-conforming development could, when the scheme came into operation, be made to comply with the provisions of the scheme without payment of compensation by the local authority; alternatively, development carried out in accordance with the conditions would attract compensation if subsequently it had to be altered to comply with the provisions of the scheme. Furthermore, the Act rendered it obligatory for local authorities with a pop. of 20,000 and over to prepare and submit planning schemes within a specified period.

In 1925, planning was separated from housing legislation and consolidated in the Town Planning Act, 1925. Co. councils had no active part in the preparation of schemes but the Local Gov. Act, 1929, which considerably increased the powers of co. councils as highway authorities, also empowered them to prepare schemes in default of co. dist. councils, to join with other local authorities in preparing schemes and by agreement to take over the planning powers of co. dist. councils.

The Town and Country Planning Act,

1932, repeated the previous planning provisions and re-enacted the law in a consolidated form with certain important changes, the most important being 'the extension of planning to any land whether there are or are not buildings thereon.' The planning authorities remained the same, i.e. co. bor. and co. dist. councils, who could, however, act together by means of a joint committee. It was necessary for the local authority to pass a resolution to prepare a scheme; the resolution had to be approved by the minister of health, and when approved it brought into operation interim development control. The Act was defective in that it left the initiative for carrying out schemes with the owners of the land, and local authorities were frightened by the compensation provisions which enabled a landowner to claim compensation for injurious affection where he claimed to have suffered damage from the restrictions imposed by a scheme which had come into operation. Consequently, the preparation of schemes proceeded slowly. The Restriction of Ribbon Development Act, 1935, was passed with the object of arresting development in ribbon formation along the edges of arterial and trunk roads. (See RIBBON DEVELOPMENT).

Commissions of Enquiry into Town and Country Planning.—The Report of the Barlow Commission (Cmd. 6153) was issued in 1940. The Commission inquired into the causes and probable future trend of the drift of industries and workers to the larger tns. and the social, economic, and strategic disadvantages arising therefrom, and recommended action to re-develop congested urb. areas by decentralisation of pop. and dispersal of industries from them to garden cities, satellite tns. and existing small tns. The Commission were concerned that a check should be made on the concentration of pop. in the S. Midlands, the S.E., particularly London, and that the industrial areas in the N. and S. Wales should be revived.

The Scott Commission was appointed in 1941 to consider the conditions which should govern buildings and other constructional development in country areas consistently with the maintenance of agric., and in particular the factors affecting the location of industry, etc. While recognising that the location of many heavy industries was determined by immutable physical conditions and that other industries though theoretically 'mobile' were in practice tied to a limited choice of locality, the Commission recommended (July 1942) that where the latter were brought into rural areas they should be located in existing or new small tns. rather than in vills. or open country and that wherever possible new tns., housing estates, garden cities, and suburbs should be sited away from the better agric. land.

The Uthwatt Committee was appointed to consider and report upon compensation and betterment arising in connection with land development. Its first interim report (Cmd. 6291, 1941) advocated the setting up of a central planning authority

to lay down a national policy for agriculture, industrial development and transport, and the fixing of compensation for the public acquisition of land at pre-war values, i.e. value as at 31st March 1939. The final report (Cmd. 6381, 1942) confirmed the earlier recommendations and put forward an elaborate scheme for dealing with compensation and betterment in connection with planning control, a distinction being made between developed and undeveloped land.

Subsequent Legislation on Town and Country Planning.—In 1944, the gov. pledged itself to secure a balanced industrial development in areas which had in the past been unduly vulnerable to unemployment. These areas have subsequently become known as 'development areas'. Shortly after a White Paper was issued on the Control of Land Use based largely on the recommendations of the Uthwatt Committee but not making any differentiation between developed and undeveloped land and proposing that all land be subject to a 'betterment' charge where the value was increased by planning operations.

The Minister of T. and C. P. Act, 1943, provided for the appointment of a minister of T. and C. P. to take over the planning functions of the Ministry of Health, and also for the estab. of statutory commissions for the purpose of exercising such functions in relation to the use and development of land in England and Wales as might be subsequently decided, e.g. the National Parks Commission. The T. and C. P. (Interim Development) Act, 1943, extended interim development control to those areas where the responsible authority had not passed a resolution under the 1932 Act to prepare a scheme. The Act also enabled interim development authorities to take positive action for the purpose of making developers apply for permission to develop or change the use of the land and to bring development contravening a conditional permission into conformity with that permission. Also, the minister could take over, by direction, development applications for decision by himself in the light of national policy. The T. and C. P. Act, 1944, gave positive powers for the re-planning and rebuilding of areas of 'extensive war damage' and of 'bad lay-out and obsolete development.' The New Towns Act, 1946 provided for the making of Orders by the minister for the construction of new towns on sites selected by the minister and the appointment of Development Corporations to be responsible for the lay-out and construction of such new towns.

Prior to 1947 the planning system contained a number of defects. In the main it was based on the 1932 Act, which required the preparation of a scheme, which when prepared had the effect of law and was comparatively static, as it could only be altered by a long and cumbersome procedure. Planning was in the hands of urb. and rural dists., boroughs, and co. bors., which tended to plan their areas in isolation from their neighbours.

There was no time limit within which a scheme had to be prepared and because of the difficult compensation and betterment provisions of the Act many local authorities preferred to continue under interim development control. The system was negative, only controlling development proposed to be carried out and not itself bringing about development. It was hoped that these defects should be removed by the T. and C. P. Act, 1947.

This Act entirely changed the position of town planning and contained revolutionary provisions. Co. councils and co. bor. councils were made the planning authorities, though the detailed working of the plans might be delegated to dist. councils. The planning scheme was replaced by a development plan which had to be prepared within three years and thereafter reviewed at five-yearly intervals. The idea was that preparation of the plan would be preceded by a survey and an attempt made to secure a proper balance between competing demands for land so that all land should be used to the best advantage in the interests of the community as a whole.

The plan requires the approval of the minister of T. and C. P. and landowners, and others are given an opportunity of inspecting the plan and making representations thereon, both to the local planning authority and to the minister. Planning permission will be required for all development (which includes change of use of land as well as the construction or alteration of buildings, roads, etc.) other than the limited and small exceptions contained in the Act and the regulations made thereunder. The Act enables local authorities to buy land compulsorily, even for leasing to a private person for development in accordance with the plan. Thus plans need no longer be rendered abortive because an owner of land required for a purpose in accordance with the plan refuses to sell. Land likely to be required within ten years for development by gov. depts., local authorities, and others can be designated on the plan as 'subject to compulsory purchase.' The Act also contains provisions for the control of advertisements, the preservation of buildings of special architectural or historic interest, and of trees and woodlands. Interim development control is provided for by the T. and C. P. (General Development) Order, 1948.

The most revolutionary provisions of the Act are those relating to the imposition of a development charge assessed on the difference between the value of the land for its existing use and its value for some other use for which planning permission is given. Thus all increases in the value of land arising out of building or the change of use of existing buildings development are vested in the State. These provisions have already caused protest (1950) and sev. authorities have suggested that they are unnecessarily stringent. The Act does not recognise any right to compensation on the part of landowners for the loss of development value but to cover cases of hardship a

sum of £300,000,000 was provided and landowners were given an opportunity up to July 1, 1949 of claiming on this sum.

An obligation is placed upon developers to pay or to give security for the payment of the development charge assessed by the Central Land Board before any development or change of use is carried out. Broadly speaking, the effect of the development charge system will be that land bought for development will change hands at its existing value and the purchaser will have to take into account the charge he will have to pay to the Board in respect of the development proposed.

The Act aims at reducing the cost to local authorities of good planning by extinguishing development values as these have been taken out of private hands and therefore the planning authority will not have to pay heavy compensation. Certain exemptions from development charges are conferred on gov. depts., local authorities, charities, and areas developed as a whole by Development Corporations under the New Towns Act, 1946. Local authorities and Development Corporations will make payments in lieu of development charges of such amount as may be determined by the minister. The 1947 Act substitutes a revised grants scheme for that contained in the 1944 Act and includes in the scheme areas of bad lay-out, obsolete development and derelict land which require to be developed as a whole.

The enforcement of planning control is strengthened by enabling the planning authorities to secure the restoration of land to its former condition or compliance with conditions where development is carried out without permission or not subject to the conditions attached to the planning consent. Also, on payment of compensation, the planning authority can order the discontinuance of any existing building, if it is necessary on planning grounds. Where planning permission is refused or unacceptable conditions are imposed, the intending developer has a right to appeal to the minister. If as a result of refusal or the imposition of conditions, the land is incapable of reasonably beneficial use, an owner may require the local authority (co. dist. or co. bor council) to buy the land.

The Board of Trade exercises control over the location of industry, as the Act provides that an application for permission to develop will be of no effect in the case of an industrial building of an aggregate floor space exceeding 5000 sq. ft. unless accompanied by a certificate from the Board that the development in question can be carried out consistently with the proper distribution of industry.

Planning Associations, etc.—The Town and Country Planning Association is an association of individuals and bodies interested in the subject. The National Housing and Town Planning Council is an association of local authorities. The Univs. and the Architectural, Surveyors' and Engineers' professions lay great emphasis on a study of planning law and

methods and have specialised courses both in England, Scandinavia, and the U.S.A.

Town Planning in the U.S.A. and Europe.—The serious study and application of the principles of tn. and country planning have been practised in the U.S.A. since the nineteenth century. Examples of conscious planning can be seen in some of the lay-outs of the original colonial tns., especially in the S. and later planning examples are the geometric centres of New York, Chicago, etc. In recent years, the 'zoning' principle has been carried out in many new tns. Most new tns. in the U.S.A. are now planned on this principle. The idea of decentralisation by means of satellite tns. (q.v.), though widely supported in theory in the U.S.A., has not been consciously applied, as in Britain, on any large scale. In Europe, tn. planning has been practised especially in Sweden, Denmark, Italy, and Germany (under the Fascist régimes in the last two countries). In Germany, the building of satellite tns. was sponsored by the gov. between 1933 and 1939 and an extensive road network developed in relation to them. In France, the rebuilding of Paris's centre under Napoleon III. is an example of nineteenth-century planning; but generally France's contribution to tn. planning theory has not been great.

See T. H. Hughes, and E. A. G. Lamborn, *Towns and Town Planning, Ancient and Modern*, 1923; C. M. Purdom, *Town Theory and Practice*, 1921, and *The Building of Satellite Towns*, 1925, 1949; L. P. Abercrombie, *Town and Country Planning*, 1933, 1943; B. Schwan, *Town Planning and Housing Throughout the World* (trans.), 1934; T. Sharp, *Town Planning*, 1940; G. Gibbon, *Reconstruction and Town and Country Planning*, 1942; J. H. Forshaw, *The Greater London Plan*, 1944; L. Mumford, *City Development*, 1946; C. Le Corbusier, *Concerning Town Planning*, 1947; and T. Hill, *Town and Country Planning Act, 1947*, 1948.

Towneley Plays, The, or Wakefield Mysteries, are thirty-two in number, and are believed to have been compiled by the friars of Wakefield or Nostel in the fourteenth and rearranged in the fifteenth century. Like the York plays, etc., the various 'pageants' together dealt with the whole Bible story. The simple religious sentiment is by no means marred by the comic element, which never endangers the dignity of the whole. The cycle was ed. for the Surtees Society in 1836, and by G. England, and A. W. Pollard in 1897 for the Early Eng. Text Society. See E. F. Williams, *The Comic Element in the Wakefield Mysteries*, 1914; and M. Carey, *The Wakefield Group in the Towneley Cycle*, 1929.

Townsend, Meredith White (1831-1911). Eng. newspaper proprietor and man of letters, b. in London and educated at Queen Elizabeth's Grammar School Ipswich. At sixteen he became an usher in a small Scottish school but later went to Serampore, India, as asst. editor of *The Friend of India* of which in 1852 he

became editor and in 1853 proprietor. In 1859 he finally returned from India on account of health, and in 1861 he bought *The Spectator* (q.v.), which he edited in conjunction with R. H. Hutton (q.v.) until the latter's death in 1897. Their joint editorship is historical in journalism, and a later editor, J. St. Lee Strachey, said of T. that 'he was, in the matter of style, the greatest leader-writer who has ever appeared in the English Press.'

Townsend, Mrs. Stephen, see BURNETT, FRANCES ELIZA HOBGSON.

Townshend, Charles, second Viscount (1674-1738), Eng. statesman, b. at Raynham Hall, Norfolk, played a part in supporting the Hanoverian succession. He was one of the commissioners for the Union with Scotland, was joint plenipotentiary with Marlborough at the Hague, and negotiated with Holland the Barrier Treaty. Dismissed in 1712 on the formation of the Harley ministry, he kept up a correspondence with the court of Hanover, secured the confidence of George I., and on the latter's accession was appointed secretary of state of the N. Department. He lost favour with the king in 1716, and was sent to Ireland in 1717, but was soon dismissed. In 1720 he was President of the Council under Stanhope, and on Stanhope's death (1721) became again secretary of state, which office he held until 1730, and then retired into private life. He encouraged turnip growing and greatly improved the rotation of crops, being known as 'Turnip Townshend.'

Townshend, Sir Charles Vere Ferrers (1861-1924), Brit. soldier, b. at Raynham, Norfolk; entered the Marines in 1881. As

Lobcal Press

GENERAL TOWNSHEND

captain in the Indian army he led the march to Chitral, Jan. 1895, he commanded there during siege, and was made C.B. He saw service in Egypt and Africa. In April 1915, T. was appointed to command the 6th Div. in Mesopotamia. He proceeded from Basra over flooded

country, with barges, reaching Amara, June 1. He captured Kut in Sept. Fighting Nured-Din at Ctesiphon, Nov. 22, he had to fall back on Kut, was besieged there, and surrendered April 29, 1916. In 1920 he pub. *My Campaign in Mesopotamia*. He was Independent M.P. for Wrekin, 1920-22. See also KUT AL AMARA.

Township, or Vill, originally probably a group of allodial proprietors united by community of agric. interests, the chief officer of which was the tn-reeve. The T. is almost certainly one of the antecedents of the medieval bor. The term is not now in common use, but until recently meant legally a tn. containing more than one parishioner.

Townsville, port of Queensland, Australia, is situated on the E. coast. It is the seat of an Anglican bishop. The chief exports are sugar, meat, cattle, coal, silver-lead, and zinc concentrate. Pop. 35,000.

Towton, par. in the W. Riding of Yorkshire, England, midway between Leeds and York. The scene of the Yorkist victory of 1461. Pop. 80.

Towy, riv. of Wales, rising in the hills between Cardiganshire and Radnorshire. It flows on a southerly course, passing by Llandovery and Carmarthen, and enters Cardigan Bay at Llanstephan. Length 66 m.

Townyn, urban dist. and seaside resort of Merionethshire, Wales, situated on Cardigan Bay, 12 m. N. of Aberystwyth and 232 m. from London by the Western Region of British Railways. Its church of St. Cadvan is the largest and most interesting example of Norman architecture (1150-1200) in Merionethshire. Within it is preserved an inscribed stone dated by experts as c. 660 and accordingly considered to be probably the most ant. monument of the Welsh language. Pop. 3600.

Toxaemia, blood poisoning from the presence of toxins (poisons) in the blood (see PYAEMIA).

Toxicology, -science dealing with poisons. Its main branches deal with the chemical nature of poisons, their origin and preparation, their physiological action and the test, by means of which their presence may be detected; the pathological changes due to their presence and the recognition of them by post-mortem evidences; their chemical reactions with a view to the determination of antidote and the physiological action of the latter. Poisons may act on various organs and systems of the body. Acids and alkalis are corrosive to the alimentary tract; carbon monoxide reduces the oxygen capacity of the blood by combining with haemoglobin; digitalis affects the heart; strychnine the medulla and spinal cord. A tolerance is acquired to some substances such as opium, which can ultimately be taken in doses which would initially prove fatal. Certain poisons, such as salts of heavy metals, may accumulate slowly in the body and finally prove toxic in their action. Toxins are produced by pathogenic bacteria, and injections of such toxins, or of toxoids

prepared from them, are used in the production of immunity, e.g. to diphtheria. The number of poisons is very large; almost any substance may be dangerous if taken in sufficiently large amounts. See Sir S. Smith and F. S. Fiddles, *Forensic Medicine* (9th ed.), 1949; A. S. Taylor, *Principles and Practice of Medical Jurisprudence* (10th ed.), 1948. See also POISONS.

Toxophily, see ARCHERY.

Toy-dogs, diminutive breeds usually developed purely as pets. See GRUFFON BRUXELLOIS, KING CHARLES SPANIEL, MALTESE DOG; PAPILLON; PUG-DOG and YORKSHIRE TERRIER; see also under BLACK-AND-TAN TERRIER; and POMERANIAN.

Toynbee, Arnold (1852-83), Eng. economist and social reformer, b. in London. He was intended first for the army and then for the Bar, but ill health and literary activity prevented the following of either of these professions. He went to Oxford and finally gave himself up to the study of social and economic questions. He also did much practical work for the betterment of industrial conditions. In 1875 he went to Whitechapel, where he joined in work with Canon Barnett. T. wrote various articles which were pub. posthumously as *Industrial Revolution in England* (5th ed. with memoir by B. Jowett, 1906). See lives by F. C. Montague, 1889; and Viscount Milner, 1901; and L. L. Price, *Political Economy in England*, 1891, for a criticism of Toynbee as an economist.

Toynbee, Arnold (b. 1889), Brit. historian, b. in London, nephew of Arnold and Paget T. (q.v.). Educated at Winchester and Balliol College, Oxford, of which he became Fellow and tutor (1912-15). After attending the Peace Conference in Paris (1918) and serving for a short time as prof. of Byzantine and Modern Gk. at London Univ., he became in 1925 director of studies at the then newly-founded Institute of International Affairs (Chatham House). It is with this institution that his name is chiefly associated (see ROYAL INSTITUTE OF INTERNATIONAL AFFAIRS). There he has written contemporary hist. in the ann. *Survey of International Affairs* and *A Study of History* (1934-39), the latter a standard work on the evolution of civilisations revealing great erudition in the treatment of anc. and modern historical problems. In 1914 at the outbreak of the First World War he served in the Foreign Office and later as a member of the Brit. Delegation at the Paris peace conference. In the Second World War he again entered the Foreign Office, as director of a group of Chatham House and other scholars which developed into the Foreign Office Research Dept. In 1916 he was again a member of a Brit. delegation to a Paris peace conference. Other works by T. are *Western Question in Greece and Italy* (1922); *Greek Historical Thought* (1924); *Greek Civilisation and Character* (1924); *The World After the Peace Conference* (1925); *A Journey to China* (1931); *Christianity and Civilisation* (1940); and *Civilisation on Trial* (1948).

Toynbee, Joseph (1815-66), Brit. pioneer otologist (ear specialist). He studied particularly the pathology of the ear and pub. in 1860 his medical classic, *Diseases of the Ear*. He was appointed in 1857 aural surgeon to St. Mary's Hospital, London, which was the first general hospital to establish a special dept. for the ear. T. died as a result of an experiment in which he inhaled chloroform and prussic acid to test its effect on tinnitus (noises) of the ear. 'Toynbee Hall' (Whitechapel), the first Univ. Settlement, was named after his son, Arnold Toynbee.

Toynbee, Paget (1855-1932), Eng. philologist, b. at Wimbledon, educated at Hailybury and Balliol College, Oxford. He was a leading authority on Dante, having ed. *inter alia* critical texts of the *Divina Commedia* (1900) and of Dante's *Letters* (1912-17); also written *Life of Dante* (1900). He ed. books in connection with Horace Walpole (*Horace Walpole's Reminiscences*, 1924, etc.).

Toynbee Hall, Whitechapel, the first Univ. Settlement, founded by Canon Barnett, rector of St. Jude's, Whitechapel, and named after his friend and colleague Arnold Toynbee (q.v.). See under SOCIAL SETTLEMENTS.

Toys, implying, in a general sense, children's playthings. T. can be traced back to very remote periods. The top is mentioned in Virgil in the seventh book of the *Aeneid*, and was probably introduced into England by the Romans. The Gks. appear to have played with different kinds of ball: the little ball, the great ball, and the empty ball, which was blown out like the modern football. There is a fine collection of early Rom. dolls in the Musée du Louvre, Paris, of which a description is given in H. R. d'Allemagne's *Histoire de Jouets* (1903); and deals very fully with dolls of different periods.

Trabzon, Trebizond, or Trapezus, formerly **Trebizond**. (1) Prov. of Asiatic Turkey, on the S. coast of the Black Sea, heavily timbered and generally mountainous. Wheat and barley are grown and valuable timber produced. There are copper and zinc deposits. Area 16,671 sq. m. Pop. 396,700. (2) Cap. of the above, a port on the Black Sea, 108 m. N.W. of Erzerum, formerly of great importance as an emporium for the wares of Kurdistan and Persia, but has lost much of its transit trade since the Batum-Tiflis Railway was opened. The chief exports are hides, skins, eggs, opium, tobacco, and albert nuts. Its silk industry is declining. T. was founded in 600 B.C. by Gk. settlers from Sinope. In 1204 it was the cap. of Trebizond, an empire constituted by Alexius Comnenus. It became Turkish in 1462. In 1895 it was the scene of the Armenian atrocities. It was captured by the Russians in 1916, but in 1918 was retaken by the Turks. Pop. 50,000.

Tracery, in old architecture the ornamental stone framework over a Gothic window formed or traced by the mullions being continued, but diverging into circles, curves, and flowing lines embellished with foliations. The styles of T.

differed in different periods and countries, and were known as geometrical, flamboyant, flowing, etc. Geometrical T. assumed symmetrical forms such as trefoils, cinquefoils and circles, but later the designs became freer or flowing, while still later, in the fourteenth century, flowing T. was superseded by the more vertical bars of the Perpendicular period. With the Renaissance, T. disappeared.

Trachea, or **Windpipe**, air tube which leads from the larynx to the bronchi. It is about $4\frac{1}{2}$ in. long, and is made up of fibro-elastic membrane enclosing cartilaginous rings about $\frac{1}{2}$ in. in diameter. The interior consists of coatings of submucous tissue and ciliated epithelium. The T. begins at the larynx and proceeds downwards in front of the oesophagus until it bifurcates into the two bronchi. The T. is sometimes the seat of inflammation through the impaction of foreign bodies. In such cases the removal of the body is attended with a certain risk, but as the danger of respiratory obstruction is usually greater if the condition be allowed to persist, removal should be attempted with every preparation for the operation of tracheotomy.

Tracheotomy consists of cutting into the windpipe above or below the isthmus of the thyroid gland. A curved tube is inserted into the orifice, and by this means breathing is carried on. The operation is called for when the upper respiratory passages are obstructed by foreign bodies or morbid growths, as in diphtheria.

Trachoma, form of conjunctivitis in which small granular nodules form under the conjunctiva (q.v.). It is very infectious and very chronic, and the peasant races of middle and E. Europe are heavily affected with it. So much is this the case that emigrants seeking to enter the U.S.A. are excluded if they show signs of infection. The results of T. are often very serious: the sight may be seriously damaged, by injury to the cornea, and the eyelids may become deformed. Malnutrition is an important factor in T.

Trachonitis, dist. of anct. Palestine, corresponding to the modern Latakia. It lies S. of Damascus, E. of Aulantis and N. of Batanea, in Bashan. In A.D. 37 Herod I., king of Judea, received the tetrarchy of Batanea and T. from Caligula.

Trachyte, volcanic type of the sub-acid igneous rocks. Characteristic minerals are orthoclase and hornblende, the felspar occurring usually as sanidine (with Carlsbad twinning). The Ts. are named after their most conspicuous mineral, thus: sanidine T., hornblende T., etc. The leucitophyres and phonolites are trachytic rocks containing leucite and nepheline respectively. Trachytic rocks are found chiefly on the Continent, in Auvergne, Hungary, and Bohemia and in the vicinity of Rome. They are much less common in Britain, occurring in E. Lothian, Skye, and Cornwall. In America they are not much represented, but they occur in S. Dakota.

Track and Field Sports, term applied in the U.S.A. to athletic contests, including flat and hurdle racing on cinder track and

field events—long and high jumps, pole vault, throwing the discus, putting the weight, and throwing the javelin. The Inter-collegiate Association of Amateur Athletics, to which most Amer. colleges belong, arranges contests annually. Apart from the colleges, the largest body is the Amer. Amateur Athletic Association, but there are many other smaller ones. It is largely due to the keenness engendered by these organisations that Amer. athletes hold their present place in the world's records and in the Olympic Games. See **ATHLETICS**.

Trackways, term applied generally to prehistoric routes and particularly to pre-Roman ways in England. Their prin. purpose was the conveyance of goods, and they ran roughly in a straight line, being sited by such natural objects as stones, mounds, and ponds. It is probable that some of the Roman roads (e.g. Watling Street) followed at least in part those Ts.

Tractarianism, see **OXFORD MOVEMENT**.

Tractor, name given to a compact mobile power-unit, used primarily for agric. purposes and generally deriving its energy from a petrol, fuel-oil, or vapourising-oil engine, though steam-engined tractors have been used extensively in the past and are occasionally used to-day for heavier haulage and stationary belt-work. Certain countries, including Russia, are re-experimenting with the use of electricity as the motive power. In the early 1880's Brit. engineers had designed and built heavy

Harry Ferguson, Ltd., Coventry

The tractor has a 4-cylinder wet-sleeve petrol engine with maximum belt horse-power of 23.9. There is a power take-off shaft for belt and pulley work at the rear, and a hydraulic system of depth control for regulating the working depth of any rear-mounted implement.

steam traction-engines for farming work, but it was the Amers. who first conceived the then novel idea of powering the farm tractor by means of the internal combustion engine. In 1889, the Amer. Burger T. made its appearance in the Middle W. A massive and somewhat unwieldy machine of cumbersome proportions, its chassis was built to steam-engine specifications yet it was powered by a single cylinder Charter internal combustion engine. Though exposing the limitations

of its designers, the idea caught on and from then onwards the general use of steam Ts. gradually diminished. The influence of the steam-type chassis, however, was such that it was not until 1899 that a specific friction-driven chassis with a hopper-cooled petrol engine was manufactured in America. This was possibly the first real attempt to break away from the heavy steam engined type of chassis construction so favoured by the earlier engineers. The development of the many types of farming Ts. appearing during the period 1899-1914 was largely in the hands of the Amers., though it is only fair to add that by now many reasonably reliable Brit. machines were being manufactured. Designers were now turning their attention to the problem of affording some sort of weather-protection both to the operator himself and the various vital parts of the power-unit; the Amers. were the pioneers in a matter which had remained neglected for too long.

But it was the food crisis of 1916 which gave the real impetus to tractor design and production both in Britain and the U.S.A. The Brit. Gov. instructed its ministry of munitions to develop a utility T. and this, known as the 'M.O.M.', is generally reckoned as the forerunner of the lightweight internal combustion engined T. as we know it to-day. Since 1918 much progress has been made in T. design. Crawler types (track-layers) were developed to work under those heavy soil conditions in which a wheeled T. would be reduced to immobility. 'Wheelbarrow' Ts., suitable for the market gardener and horticulturist, have also been manufactured. Certain types of Ts. have been manufactured with regard to the farmer's requirements in the matter of row-crop work with its many variations of widths and adjustments. The T. is now no longer a mere haulage machine; in the main it is a highly specialised item of modern farming machinery. Another major development is the integration of the T. and implement as one co-ordinated unit, an idea originated and developed by an Ulsterman, Mr Harry Ferguson. The principle of the system is that the implement is no longer towed by the T. but is an integral part of it, being mounted directly on to the rear of the machine and hydraulically controlled by the tractor driver himself from his seat. The obvious advantages of the system (now widely used all over the world), lies in the more positive and accurate control over the implement concerned plus greater traction and the consequent reduction in labour costs since one operator only is needed.

With reference to the engines used to-day it may be said that whereas power-units were formerly of the heavy and slow-revolutionary type, the present trend is towards high-efficiency light weight to power-ratio engines developing high brake horse power and of sturdy endurance. Engines fuelled by vaporising-oil are enjoying great popularity in Britain and indeed throughout the world, while the fuel-oil compression-ignition type and the petrol engine are also used extensively.

Each type has its respective merits. To-day it is difficult to foresee the ultimate trend in T. design. On the farm there is little that the T. cannot do, not only in cultivation and haulage but also—by belt and pulley—it is able to drive such necessary accessories as the circular saw and the threshing machine, etc. But power farming is an established fact, and the driving force is the agric. T. See also PLOUGHS AND PLOUGHING. See H. J. Hines, *Tractors on the Farm*, 1942, and C. Culpin, *Farm Machinery*, 1946.

Tractory, or Tractrix, curve traced by a heavy particle dragged by an inelastic string attached to a point moving in a straight line. It is represented in the figure, where its evolute, the catenary, is also shown. Tangents intercepted between the curve and the x-axis are of equal length. If a point P be taken on the curve, its co-ordinates being x, y , then the arc $AP = a \log a/y$, area = $a^2 \csc^{1/2} y/a$. The curve is asymptotic to xx_1 , and a circle with radius equal to the tangent has an area equal to the total area included in the four branches of the curve symmetrically disposed to the axis.

Trade and Commerce. Trade or commerce is the exchange of commodities for money or other commodities, the term 'commerce' tending to be confined to large-scale exchange. The word 'trade' is related to 'tread'—a reminder that the beginnings of trade were associated with travel and the trodden way. The 'commerce' derives from 'merchandise' and involves the idea of bargaining. Throughout hist. wars have had a profound effect on trade. Early trading expeditions often combined trade and plunder, sea-traders mixing commerce and piracy. Land commerce followed the caravan routes of the anct. world, the Nile and the Euphrates being connected by the route leaving Egypt to pass along the coast of Palestine and by the mts. of Lebanon before turning E. to the basin of the Euphrates and Tigris, cradle of Babylonian and still older civilisations. Between Lebanon and the sea was the narrow land of the Phoenicians, a sea-faring people whose ships traded Mediterranean and Black Sea products as well as the tin of Cornwall and the precious caravan freight

of the E. Before the Phœnicians there was an active commerce across the E. Mediterranean between highly-civilised Cnossus (Crete) and Egypt. The Gks., sailing from is. to is. in the *Ægean* became great sailors in their turn, extending their colonies to Marseilles and beyond; rivalling and eventually surpassing their Phœnician tutors. The conquests of Alexander the Great, by bringing E. and W. into contact, gave an immense stimulus to commerce. Alexandria became a great city, a centre of manuf. and of trade with the Far E. through the Red Sea. The Gks. came into collision with the great Phœnician colony of Carthage, founded 800 B.C., which dominated the Mediterranean and its commerce; but it was a new power, Rome, that destroyed it (146 B.C.). The Romans were not a commercial people but their Empire, with its superb network of roads, its posts, and above all, its Pax Romana, provided a unique basis for settled trade.

The eventual fall of Rome (A.D. 476) thrust the provs. of the W. Empire back towards barbarism. Roads fell into disrepair. On the ruins of Roman civilisation trade collapsed. Based on manor and vil., life became localised and primitive. Before trade revived in Europe the rise of Mohammed in the seventh century had carried commerce as well as the sword from Bagdad through N. Africa to Spain; making Damascus, Cairo, Kairouan, Fez, Granada, Cordova, Seville, and Toledo, prosperous centres of industry and commerce. European revival came after A.D. 1000. Tns., new and old, were growing, and with fair and market continued to grow in spite of handicaps—bad roads, too little money and too many mints, multiplicity of regulations, tolls, duties, prohibitions, etc. Within the tns. trade came under the protection and restriction of the merchant and craft guilds (*see* TRADE UNIONS) and did not escape the regulation of the Church which forbade usury and frowned on profit. As the tns. developed and prospered they gained power which vied with that of lord and bishop. Tns. with common interests formed leagues. The Rhenish League in the thirteenth century soon embraced over ninety cities (Cologne, Strasburg, Frankfurt, etc.), with hundreds of vessels on the Rhine. It destroyed castles and swept away tolls. The Swabian League (Augsburg, Nuremberg, Ratibon, etc.) was based on the Danube and traded N. products with those of the E. through Venice and other cities. In N. Germany and the Baltic the powerful Hanseatic League (*q.v.*) grew rapidly from the thirteenth century, with depots at Bruges, Bergen, Novgorod and London (Steelyard). The League dominated the Baltic as did Venice the Adriatic; their ships meeting at Bruges exchanged the produce of N. and S. Venice and the League both had their part in the Crusades (1096–1272) which had a greater influence than the campaigns of Alexander in promoting commerce between E. and W. Venice was the gateway to trade with the Levant and the E.; along with Genoa and

Florence she enjoyed immense wealth and power until c. 1500, the discoveries of the Americas and the Cape route to India, altered the pattern of world trade. The Mediterranean ports declined in importance and trade went to Antwerp, London, and other ports well-placed for ocean commerce with the new and old worlds. The discoveries of new lands were matched in the realm of ideas by the Renaissance and the Reformation, reinforced by the new art of printing. These influences, with the advance of commerce, the invention of gunpowder and the standing army, which all favoured national power against tn. and league, were ending feudalism and the Middle Ages. The pope divided the non-Christian world between Spain and Portugal. The Sp. galleons, bringing the precious metals from the New World, helped both to stimulate European trade and to raise prices. Under the new Mercantilist policy pursued by the nation-states it was the general aim to secure an excess of exports over imports—a favourable balance of trade which would command gold or silver for currency or 'war chest' purposes. Portuguese ships monopolised trade with the E. Indies until they lost power and trade to the Dutch in the seventeenth century. The same century saw the wane of the Sp. power following wars with the Dutch and the growing power of England. In the second half of the century the Eng. were fighting the Dutch for maritime and commercial supremacy and by 1713, the treaty of Utrecht, following Marlborough's victories over the French, estab. the ascendancy of England, with France as her only rival. The treaty gave England the slave trade monopoly with the Sp. colonies. Colonial trade was conducted frankly in the interest of the mother country, and in the eighteenth century successes against the Fr. in America and India further extended Brit. colonial power and trade. Nevertheless, increasing trade with the U.S. after their secession (1776–1783) demonstrated the mutually advantageous character of the trade between Britain and her late colonies. Eng. commercial predominance had grown from small beginnings in the Middle Ages when her great export was raw wool. The Eng. Merchants of the Staple exported raw materials via (*e.g.*) Calais; but up to the time of the Tudors the export trade was mainly in the hands of foreigners. The Hanseatic League privileges were annulled by Elizabeth. By the fourteenth century less wool began to be exported in its raw state and more in the form of cloth. In 1660 wool export was forbidden. Huguenot refugees enriched England and other countries at the expense of France. Thanks to them the Eng. silk industry assumed importance in the early eighteenth century. The woollen and silk industries were protected against the competition of Indian cotton goods, a protection serving to foster the cotton industry that became a pillar of Eng. commerce.

At the close of the Middle Ages the

growth of national power favoured the rise of national commercial companies, recognised by Royal Charter; and formed, many of them, as their names indicate, to exploit the world as opened up by the voyages of discovery. Eng. companies included, besides the early Merchant Adventurers (1404 and 1505), the Muscovy Company (1553), the Eastland Company (1579), the Guinea Company (1588), the Levant Company (1592), the E. India Company (1600), the Hudson's Bay Company (1670), the Royal African Company (1672), and the S. Sea Company (1711) of 'Bubble' fame. Other famous companies were the Dutch E. India Company (1602) and the Dutch W. India Company (1621). The former broke the Portuguese power in the E.—and for two centuries earned an ann. average of 18 per cent: the latter, a corporation of privateers making armed attacks on the Sp. 'silver fleets,' often earned from 25 per cent to 100 per cent a year. Company trading was intended to secure regulation and control but failure in this respect and changing conditions reduced their number, few surviving the eighteenth century. One of the last Eng. companies to go was the E. India Company whose activities in India extended to gov. as well as trade. New ideas were stirring in the later eighteenth century. In England Adam Smith was advocating Free Trade; while the Industrial Revolution gathered momentum as invention followed invention. Machinery was being applied with increasing ingenuity to textile and other industries. Steam was harnessed to drive the machine and pump the mine. Coal was smelting the iron and becoming the main source of industrial power. By the turn of the century steam and machinery were playing a great part in this country's industrial and commercial predominance. A graph of United Kingdom exports for ten-year periods from 1701 to 1930 (E. Staley, *World Economic Development*) shows a steep rise in volume from 1781-90 to 1851-60, despite the Napoleonic wars; a less steep rise to 1881-90; and a rise to the decennium before the First World War at a lesser rate again. The graph does not cover invisible exports, an increasingly important part of Britain's foreign trade since 1851-60. The railway and the steamer, with good roads and canals, had come to reinforce the Industrial Revolution before 1851-60; and from then on there was the trade flip of the gold discoveries; and above all, Free Trade. Britain had an export surplus but used it in no Mercantilist spirit, investing abroad some £4,000,000,000 net by 1913—to her own and the world's great benefit. Free Trade made England the free entrepôt for world trade; brought cheap food to her people and cheap raw materials to keep her exports competitive. More than that it brought a new spirit to mankind with hopes of universal peace. The Brit. lead made a great impression throughout the civilised world. Tariffs were lowered and in 1860 there was a reciprocal reduction and abolition of

tariffs with France. But in the end the great nations retained and reinforced their protective systems. The United Kingdom retained Free Trade up to the First World War but, after the Great Slump and the Second World War, had abandoned *laissez faire* not only for protection but for a planned economy. Planned economies are a world feature—planning is on a world scale and the subject of European and World conference. In the shadow of two world wars and the threat of a third the achievement of general Free Trade seems remote. Increasing freedom in trade is, however, the great aim of the United Nations as of its most powerful member, the U.S.A., now outstandingly the world's greatest industrial and commercial nation. Predominant in manuf., the U.S. may be thought to have as little to fear from foreign competition as the United Kingdom a century earlier. The United Kingdom built her wealth on the exchange of manufactured goods for food and raw materials. The field for this essentially profitable trade is diminishing; but there will always be room for international trade on a large scale given a world of settled peace and freedom from unemployment—a world which dares to plan for maximum specialisation with rational hope of maximum reward.

World export values for 1919 are estimated as \$56,700,000,000, European countries exporting 22,700,000,000, and the U.S. and Canada 11,850,000,000; while volumes, compared with 1937, are 103 per cent, 87 per cent, and 189 per cent. These figures (United Nations, *Monthly Bulletin of Statistics*, May 1950) fail of course to reflect the internal commerce of e.g., the great Free Trade area of the U.S. It is in the smaller countries that trade bulks largest: Denmark, 68 per cent; New Zealand, 55 per cent; Norway, 52 per cent; Netherlands, 47 per cent; Sweden, 39 per cent; Canada, 37 per cent; Australia, 34 per cent; France, 30 per cent; United Kingdom, 24 per cent; Japan, 23 per cent; Germany, 14 per cent; U.S.A., 6 per cent. These are 1938 percentages (E. M. Patterson, *see below*) of foreign trade to national income. Estimated increases (Staley) in the average ann. vol of international trade: 3.02 per cent (1881-1894); 3.84 per cent (1894-1907); 4.52 per cent (1907-1913); and 4.85 per cent (1925-1929).

See CUSTOMS DUTIES, ECONOMICS, FREE TRADE, IMPORTS AND EXPORTS, MERCANTILE SYSTEM, PROTECTION. *See* W. C. Webster, *A General History of Commerce*, 1903; C. Day, *A History of Commerce*, 1914; J. R. Smith, *Industry and Commerce*, 1926; G. W. Southgate, *English Economic History*, 1936; J. B. Condliffe, *The Reconstruction of World Trade*, 1941; A. J. Brown, *Industrialisation and Trade*, 1943; E. Staley, *World Economic Development*, 1945; and E. M. Patterson, *An Introduction to World Economics*, 1947.

Trade, Board of, gov. dept. of the United Kingdom, formally a committee of the Privy Council. From 1622 onwards various committees to advise the Privy

Council on trade matters were appointed and dissolved. Its present form dates from 1786 when a permanent committee was constituted by an Order in Council, which is still in force and provides the constitutional basis of the present Board. The members of the Board included the Archbishop of Canterbury, the First Lords of the Treasury and of the Admiralty, the prin. secretaries of state, the holders of a number of other Crown offices, and sev. private persons; but by the end of the Napoleonic wars the president and vice-president were the only operative members. From 1786 until the middle of the nineteenth century, the Board's functions were mainly those of advising the gov. and other depts. (particularly the Foreign Office on commercial policy and treaties, and the Treasury on customs and excise matters) and of collecting information about trade and industry. During the second half of the nineteenth century the Board was allotted administrative functions under Acts of Parliament, notably responsibilities relating to the railways, trainways, mercantile marine, harbours, and electricity. As a result of increased gov. activity in industrial and trade matters during the First World War, new ministries were created to perform the Board's previous functions in respect of labour, railways, tramways, harbours, and electricity. During the Second World War its responsibilities for food, shipping, the gas industry, petroleum, and the coal mines were also transferred to other depts. The Dept. of Overseas Trade, which had been set up in 1918 as a joint responsibility of the Board and the Foreign Office to encourage exports, was wholly absorbed by the Board after the Second World War.

The president of the Board of Trade, who is now assisted by two parliamentary secretaries, is the cabinet minister responsible to Parliament for the work of the Board in its widest sense. At present the Board has general responsibility for guiding and encouraging industry and commerce in the United Kingdom although particular industries, such as agriculture and fisheries, building, engineering, food, fuel and power, transport, and merchant shipbuilding, are the concern of other depts. The Board has also certain powers and duties in relation to the following: insurance and company law; bankruptcy; patents; weights and measures; administration of enemy property; the distribution of industry; the allocation of scarce raw materials; general price policy; the production and price control of a wide range of materials and manufs.; commercial relations with overseas countries; the promotion of exports; the economic aspect of reparations; and the census of production and distribution. Besides having the general charge of commercial policy, it fosters the work of Brit. firms overseas, and arranges Brit. participation in trade exhibitions. At home, the Board's activities include the organisation of the Brit. Industries Fair; encouragement of tourist trade; and pub. of the *Board of Trade Journal*.

Trade Boards, statutory bodies estab. under the T. B. Acts of 1909 and 1918. They formed part of the negotiating machinery in the settlement of industrial disputes, especially wage claims, and arise out of the arbitration boards set up prior to 1909 to settle disputes where collective bargaining failed to produce agreement between employers and workers. By the Act of 1909 T. B. were instituted in four trades (wholesale tailoring, box manuf., lace manuf., and chairmaking). The Board of Trade had power, however, to apply the Act to other trades. The chief object of the T. B. was to prevent sweating, especially in home and factory work (see SWEATING SYSTEM), since the workers in the industries in question were not sufficiently organised to protect themselves from exploitation.

The T. B. Act of 1918 extended the operation of T. Bs. to any industry where wage rates were considered by the minister of labour to be low or where any other means of settling wage rates by collective bargaining were lacking. As a result of the Act, 37 new T. Bs. were set up, but after 1922 on account of trade depression there was little further extension of the system. Under the Wages Councils Act of 1945 the function of the T. B. were taken over by the Wages Councils (*q.v.*). A T. B. consisted of members representing employers and workers in equal numbers, together with a number of independent persons known as Appointed Members, one of whom acted as chairman. Members normally held office for two years. It was obligatory for a Trade Board to fix minimum rates for time work; it could also fix other minimum rates, such as general minimum piece rates, special minimum piece rates, guaranteed time rate, overtime rates, etc. The deliberations of a Trade Board upon a question of wages were regulated by the rate the trade itself could economically afford. Although limited in their functions, T. B. proved an efficient means of improving conditions in many depressed trades. Trade Cycle, term for the fluctuation of prices, profits, and employment over a period of sev. years.

Trade Diseases, see OCCUPATIONAL DISEASES.

Trade Disputes Acts. These Acts seek to define (1) what a trade dispute is in the legal sense; (2) the legal position of persons involved in the dispute; and (3) the degree of legal protection persons affected especially by consequent intimidation or coercion, may claim. Strikes are not illegal *per se* at common law, but such Acts as the Conspiracy and Protection of Property Act, 1875, imposed penalties on combinations, whether of masters or workmen, which resulted in depriving the public of such essentials as gas and water. Various other statutes were passed up to 1875, when the legal position was consolidated under the

Combination Act of that year. It was not, however, until the Trades Disputes Act of 1906 that complete statutory immunity from civil and criminal liability was provided with respect to strike action. Other Acts followed, designed to clear the position regarding breach of contract consequent upon 'sympathetic' strikes, and in 1927, following the General Strike of 1926, new restrictions upon strike action, picketing, and sympathetic strikes were embodied in the Trades Disputes and Trade Unions Act (1927). The Act provided that any 'strike having any object other than, or in addition to, the furtherance of a trade dispute within the trade or industry in which the strikers are engaged is to be unlawful, if it is designed and calculated to coerce the gov., either directly or by inflicting hardship upon the community.' The Act also provided that a lock-out was illegal if it came under the same category. The Act further provided that picketing was to be deemed unlawful if the picket attended in such numbers or such manner as to intimidate any person. It will be seen that the Act possessed very wide powers, aimed at preventing a recurrence of a strike of similar magnitude to that of 1926. Since the General Strike, the Labour Party had placed the removal of this Act from the Statute Book in the forefront of the Party programme; and the presentation of the repeal Bill on Jan. 23, 1946, initiated an acrimonious conflict between the Labour gov. and the Conservative opposition. The second reading of the Bill was carried by 369 to 194 votes and the Royal Assent was signified in May, 1947.

Trade Facilities Acts. The economic and industrial depression of 1921 involved producers in great difficulty in finding sufficient capital either for the extension of business or for new ventures. In order to assist those who were unable to borrow capital in the ordinary way, owing to the stringency of supplies of money, a Trade Facilities Act was passed in 1921 whereby the Treasury guaranteed such loans under certain conditions. A limit of £25,000,000 was made, but this sum was soon exhausted, with many *bona-fide* applicants still anxious to take advantage of the gov.'s offer. Accordingly in 1926 a further Act was passed raising the limit to £75,000,000, the operation of the Act to expire in 1927. Most of the money thus raised was employed in shipping and railroad schemes. The acute shortage of capital available for schemes of development overseas brought about a Trade Facilities Act in 1924 by which loans were guaranteed up to three-quarters of their amount for the purpose of extending public utility ventures and expansion. The Sudan, Western Australia, and Newfoundland were the prime areas to benefit.

Trade Mark (and Trade Names). The law relating to the registration of T. M. is now the Trade Marks Act, 1938, which replaces and largely re-enacts the Trade Marks Act, 1905, the Trade Marks Act, 1919, and the Trade Marks (Amendment) Act of 1937. This last mentioned Act introduced important amendments con-

cerning the definition of a T. M., severance of the mark from the goodwill, and licensing of T. Ms. The Merchandise Marks Acts also deal with offences as to T. Ms. and trade descriptions from a penal point of view. Part of the Patents and Designs Act, 1907, as amended in 1928, which, so far as it concerns T. Ms., substituted 6 for 4 months as the term within which priority may be asked for an application for registration based upon a prior application, remains in force.

Definition.—The Act of 1937 defines a T. M. as 'a mark used or proposed to be used in relation to goods for the purpose of indicating, or so as to indicate, a connection in the course of trade between the goods and some person having the right either as proprietor or as registered user to use the mark, whether with or without any indication of the identity of that person.' As in the Trade Marks Act of 1905 the later Act includes in the term 'mark' a device, brand, heading, label, ticket, name, signature, word, letter, numeral, or any combination of these. A T. M. thus denotes the *producer* of a thing, and not the *thing produced*, and in that respect differs from a 'trade name.' To be valid, the mark chosen need not have any meaning, but whatever it is it must be distinctive. 'Distinctive' is defined as meaning 'adapted in relation to the goods in respect of which a T. M. is registered or proposed to be registered, to distinguish goods with which the proprietor is or may be connected in the course of trade from goods, in the case of which no such connection subsists, either generally or, where the T. M. is registered subject to limitations, in relation to use within the extent of the registration.' The actual distinctiveness of any given T. M. does not depend on abstract consideration of the nature of the mark itself but on the extent to which it has actually become distinctive by its use.

Essential particulars.—No mark will be registered under Part A of the register (*see infra*), unless it contains at least one of the following 'essential particulars': (i) The name of a company, individual, or firm represented in a special or particular manner (called 'name marks'). A surname alone is not the name of an individual and therefore does not come within the category of essential particulars. But on the other hand it may have acquired such notoriety in connection with the goods as to be deemed distinctive and registrable. (ii) The signature of the applicant for registration or some predecessor in his business. (iii) An invented word or words (called 'word marks'). Laudatory epithets are generally rejected; as also mere phonetic renderings of ordinary words even with a meaningless suffix.

As to the use of a word or words as the name or description of an article, sect. 15 of the 1938 Act provides that the registration is not to be deemed to have become invalid by any such use unless it is proved either: (a) that there is an established use of the word or words as the name or description of the article by a person carrying on a trade therein not

being used by the proprietor or a registered owner; or (b) that the article was formerly manufactured under a patent (being a patent in force at or granted after 23 Dec. 1919), that a period of two years or more after the cesser of the patent has elapsed, and that the word or words is or are the only practicable name or description of the article. (iv) A word or words having no direct reference to the character or quality of the goods, and not being according to its ordinary signification a geographical name or surname. (v) Any other distinctive mark, but a name, signature, or word or words, other than such as fall within the descriptions in i, ii, iii, and iv (*supra*), shall not be registrable under the provisions of this paragraph (*i.e.*, sect. 9 (a) of the Act of 1938) except upon evidence of its distinctiveness. But any special or distinctive word, letters, etc., used as a T. M. by the applicant or his business-predecessors prior to Aug. 13, 1875, which has continued in use without substantial alteration down to the date of the application for registration was registered under the Act of 1905 (*i.e.* irrespective of its failing to satisfy any of the 'essential particulars' above noted). A thin red line woven into the margin of tracing cloth was held to be a good mark, having been used as such for 50 years.

Trade Marks which are not registrable.—Likely to deceive.—It is unlawful to register as a T. M. any matter the use of which would be likely to deceive or cause confusion or would be disentitled to protection in a court or would be contrary to law or morality or any scandalous design, nor can a T. M. be registered in respect of any goods or description of goods which is identical with a T. M. belonging to a different proprietor which is already on the register in respect of the same goods or which so nearly resembles such a T. M. as to be likely to deceive or cause confusion. But in the case of honest concurrent user or other special circumstances, the court may permit the registration of T. Ms. which are identical, subject to such conditions as the court thinks fit to impose.

There are various particulars which are not permitted by the Acts and Rules to appear as or as a part of any registrable T. M. These are representations of the King or Queen or of any member of the Royal Family; words such as 'Patent', 'Patented', 'Registered', 'Copyright', etc. The following may not be used unless the proprietor of the mark containing such arms, etc., can show a right, if any, to such use:—(a) representations of the Royal or of the Imperial armorial bearings; insignia or devices so nearly resembling them as to lead to mistake. (b) The Brit. Royal or Imperial Crown. (c) The Brit. Royal, Imperial, or National flags. (d) anchor devices of the Admiralty, the eagle device and the wings of the R.A.F. (e) The words 'Royal' or 'Imperial.' (f) Any such words (such as 'Empire', 'Dominion', or 'Crown'), letters, or devices used so as to lead persons to think that the applicant has Royal

or Imperial patronage or authorisation.

Concurrent user.—Where a mark is used by three or more independent parties, the mark has usually been held to be common to the trade and will not be registered.

Certification Trade Mark.—A mark adapted in relation to any goods to distinguish in the course of trade goods certified by any person in respect of origin, material, mode of manuf., goods not so certified, is registrable as a certification T. M. in Part A of the register in respect of those goods, in the name, as proprietors thereof, of that person. Such mark cannot be registered in the name of a person who carries on a trade in goods of the kind certified.

The Register, Part A and Part B.—The Act of 1905 continued the system of registration then in use. It was found that the provisions of the Act of 1905 as regards what could be registered did not appear to admit of the registration of marks which had no actual distinctiveness at the moment but might reasonably become distinctive in the future. The somewhat cumbrous method was therefore adopted of setting up a separate register B for these marks. Under the Act of 1919 they were subjected to the disability that they could not be registered under Part B until they had been used at least two years in this country. By the T. Ms. Act of 1938 this disability was removed. By section 10 of the 1938 Act, to be registrable in Part B, the mark must be 'capable of distinguishing' goods in the manner stated above (*see* **DISTINCTIVE under Definition**); and in determining whether a T. M. is 'capable of distinguishing' the court may have regard to the extent to which (a) the T. M. is inherently so capable and (b) by reason of the use of the T. M. or any other circumstances the T. M. is in fact so capable. A mark may be registered by the same proprietor in both parts. The rules as to registration in the 'A' class are stricter than for 'B' marks, and confer higher rights; for registration under 'A', if valid, gives exclusive rights to the mark; that under 'B' is merely *prima facie* evidence of such right, and proof that a rival mark is not such as to deceive is a good defence. T. Ms. must be affixed in some way to the articles sold and thus again differ from a 'trade name' (which must not be confused with a 'name mark'). The Registrar's address is: Patent Office, Trade Marks Branch, 25 Southampton Buildings, London.

Legal Remedies for infringement.—In case of infringement, the injured party may choose between damages or having an account taken of profits. Registration is a condition precedent to the right to sue. In regard to *trade names* the law merely recognises a person's right to prevent others from personating his business by using any such description as would lead customers to confuse his goods with those of a trade rival. Brit. law recognises that where a person has used a T. M. in connection with his goods, so that it has become generally recognised as distinguishing his goods from those of others,

he acquires a common law right in such a mark. This proposition may be extended to include the general 'get up' of goods. But a proposal or intention to use a mark can give no common law rights.

Ownership of T. Ms. with goodwill.—The Act of 1938 permits the assignment of a T. M. with or without the goodwill and, if with goodwill, then for all or *some only* of the goods for which the mark is registered. It is also permissible for a registered user to license the use of the mark (consult section 22 and 23 of the Act of 1938).

Registration with no intention to use the mark.—It was formerly held that where registration of a mark had been obtained by a person who had no intention of using it, such registration was invalid and was not made valid by subsequent assignment to another person who intended to use or had used the mark. This disability has been to some extent removed by the Act of 1938 if either a body corporate is about to be constituted and the applicant intends to assign the mark to the corporation, or if the application to register the mark is accompanied by an application for the registration of a person as registered user of the T. M. and the court is satisfied that such person will be registered as such immediately after the registration of the T. M.

Classification.—For the purpose of registration of T. Ms. in the United Kingdom goods are classified in the manner set out in rules made under the Act of 1938. The classification serves as a ready means for bringing together T. Ms. relating to the same or similar trades. In the case of an application for registration in respect of all the goods mentioned in a class, or of a large variety of goods, the Registrar may refuse to accept the application unless he is satisfied that the specification is justified by the use of the mark which the applicant has made or intends to make if and when it is registered.

Special legislation for protection of certain marks and for certain compulsory marks.—Special legislation exists for the protection of the Red Cross mark or the words 'Red Cross' (Geneva Convention Act, 1911), the word 'Anzac' (*q.v.*) (The Anzac (Restriction on Trade Use of Word) Act, 1916), and the words 'Port' and 'Madeira' (Anglo-Portuguese Commercial Treaty Acts, 1914 and 1916). The use of a T. M. is voluntary, but in certain cases the manufacturer is compelled to stamp on goods a specified distinctive mark. Of such goods, gold and silver plate has, from the fifteenth century, been the most familiar example, and the most recent are imported watch cases, under an Act of 1907. Others are anchors and chain cables; butter, cheeses, and margarine (under the Food and Drugs (Adulteration) Act, 1928); gun barrels, under an Act of 1868; and, gunpowder, under an Act of 1875. Buyers and sellers in good faith of marked goods are protected by various provisions in the Merchandise Acts, 1887 to 1926. (See also **MERCHANDISE MARKS**.) There are

special provisions relating to false marking of particular goods such as linen, cutlery, dyed goods, and metal buttons.

Registration of Business Names.—The Registration of Business Names Act, 1916, and the Business Names Rules, 1917 and 1926 (made under the Act), provide for the registration of firms and individuals who carry on trade under a name other than their true name. Associations incorporated by Royal Charter now receive protection for their names and uniforms by the provisions of the Chartered Associations (Protection of Names and Uniforms) Act, 1926. Such associations as Boy Scouts, Girl Guides, and the Order of St. John of Jerusalem also receive the benefit of this Act by Order in Council. See R. Haddan, *A Compendium of Trade Mark Law and Practice* 1931-1942; J. and J. E. S. Ricardo, *Handbook on trade marks and trade names* (2nd ed.), 1939; A. H. Cousins and H. E. Wadsworth, *Trade Names*, 1946; T. A. B. White, *Trade Marks and the Law of unfair competition*, 1947; and Sir D. M. Kerly, *Law of Trade Marks and Trade Names* (7th ed.), 1947.

Trade Organisation, see **CHAMBERS OF COMMERCE; COMMERCIAL INTELLIGENCE DEPARTMENT; OVERSEAS TRADE DEPARTMENT OF; COMMERCIAL TRAVELLER; also EXHIBITIONS.**

Trades Councils, local organisations in the Brit. trade union movement, consisting of representatives from the branches of the various trade unions in a tn. or dist. The T. C. first came into existence probably before 1850 but did not emerge as a wider organisation until ten years later. They were active in consolidating the labour movement and in 1868 were instrumental in the formation of the Trades Union Congress (*q.v.*). In 1865, however, they were excluded from the Congress in order to avoid dual representation of the affiliated trade unions. In Scotland they continued to be affiliated to the Scottish Trades Union Congress. In spite of their dis-affiliation in England they played an important although undefined part in the movement, and where they existed they have been prominent in all local affairs whenever a united labour front was desirable. They gradually came to be recognised as the local agents of the Trades Union Congress and are now the channel for conveying information and ideas between the Congress and local trade union branches. Their official connection is through the T. C. Joint Consultative Committee consisting of six representatives of the Congress and six of the T. C. The Committee also appoints a fraternal delegate to attend the Ann. Congress. The function of the T. C. is therefore mainly administrative and they are excluded from political activity. They co-ordinate the activities of local branches but do not take part in formulating policy. They are linked nationally through a series of federations. It was estimated (1949) that there are over twenty federations comprising approximately 500 individual T. C. See also **TRADE UNIONS**.

Tradescant Museum, see ASHMOLEAN.

Tradescantia (Zebrina), an extensive genus of plants of the family Commelynacæ, native of S. America and India and named after John Tradescant the elder. At least 30 species are cultivated in Brit. flower-gardens.

T. virginica, the common spider-wort, is the one most usually grown in Britain, and bears purple blue flowers. Other species, such as *Zebrina discolor*, and *T. zebrina*, leaves purple beneath and white-striped above, are grown in green-houses. The name *Zebrina* has now replaced *T.*

Tradesmen's Tokens, or Trade Tokens. The official small change of England from Saxon times was of silver, which was coined in the Middle Ages to a value as low as a farthing. By the time of Elizabeth, however, the smallest piece was the halfpenny, weighing only four grains, which was inconvenient and easily lost. Some change was essential and a more useful size and weight desired. In the reign of James I., the king delegated his prerogative of striking copper money to Lord Harrington, who was given a patent for striking farthings; similar patents were issued in the next reign, but were so grossly abused by the patentees, that, following a public outcry, the coins were suppressed by Parliament in 1644. On the death of Charles I. (1649) the exclusive royal prerogative of coining copper and brass ended, and tokens immediately began to be issued by tns., tradesmen, and, occasionally, by private persons. During the whole of the Commonwealth period no copper coinage was officially issued and tokens continued to be the small currency of the country. The tokens were usually struck in copper or brass, but lead was occasionally used.

A SEVENTEENTH-CENTURY TOKEN FROM BARNET, HERTFORDSHIRE

Left, obverse; right, reverse.

Their denominations were farthing, half-penny, and penny, though not many of the latter were minted. Generally speaking they were round in shape, but square, heart and diamond shaped and octagonal tokens were also made. The inscription on these tokens issued by tradesmen commonly consisted of the Christian and surname of the issuer, his trade and occupation and the tn. or vil. in which he resided. In addition they had the value, the initials of the issuer and a device. These designs were the arms of his trade guild, family arms, tavern- or shop-signs and a device indicating the issuer's handicraft or trade. A regal copper coinage

was started under Charles II. in 1672 and a Royal Proclamation announcing the new currency forbade the use of all others (i.e., tokens). In the eighteenth century industrialists were much exercised over the problem of obtaining small change in which to pay their employer's wages and Brit. industrial expansion during this period occurred at a time when the Royal Mint took a very restricted view of its duty to the public, so that tokens re-appeared in 1787-1801 and again in 1807-20, including later, silver and gold tokens. Legislation in 1817-23 finally stopped private minting.

Trades Union Congress, permanent central organisation of the Brit. trade union movement. It came into existence as the result of the Trade Union Conference which was held in Manchester in 1868 in order to secure the unity of the movement and to co-ordinate its activities. The following year the Congress appointed a Parl. Committee to further trade union interest in Parliament. The Parl. Labour Party itself owes its origin to a conference convened by the T.U.C. in 1900 to consider means of securing working-class representation in Parliament. In 1920 a General Council was created, which became the executive body, replacing the former Parl. Committee. It is elected by the Congress and holds office for one year. The Congress meets annually and is to-day representative of over 80 per cent. of the trade union membership. Any bona-fide trade union may apply for membership of the affiliation to the Congress, and delegates are appointed in the proportion of one to every 5000 members. The Congress has no authority to enforce its decisions upon any union, its recommendations operating upon the principle of counsel and consent.

There are eighteen groups of unions affiliated to the Congress, as follows, the number in parentheses indicating seats on the General Council: 1. Mining and Quarrying (3); 2. Railways (3); 3. Transport (3); 4. Shipbuilding (1); 5. Engineering (3); 6. Iron and Steel and Metal trades (2); 7. Building, Wood-working, Furnishing (2); 8. Printing and Paper (1); 9. Cotton (2); 10. Textiles (1); 11. Clothing (1); 12. Leather, Boot, and Shoe (1); 13. Glass, Pottery, Chemicals, Food, Drink, Tobacco, Brush-making, and Distribution (1); 14. Agriculture (1); 15. Public Employees (1); 16. Non-manual Workers (1); 17. General Workers (3); 18. Civil Service (1). The T.U.C. co-operates politically with the Parl. Labour Party, close contact being maintained through the National Council of Labour, on which the T.U.C., the Labour Party and the Co-operative Union are represented. The T.U.C. also forms with the Brit. Employers' Confederation a Joint Consultative Committee which advises the gov., and it has become customary for the gov. to consult the T.U.C. on major matters of industrial policy.

In international relations the T.U.C. supports the International Labour Organisation, being represented on its industrial Committee. In 1949 the T.U.C. with-

drew its membership from the World Federation of Trade Unions. Links between the T.U.C. and the trade union movement in other countries are preserved by representation on, *inter alia*, the Anglo-Fr. Trade Union Committee, and on Joint Committees of the two organisations in the U.S.A., the Amer. Federation of Labour and the Congress of Industrial Organisations.

The membership of the T.U.C. reached over a million by 1890. The Congress gained prestige during the First World War, and by 1920 its membership was 6,500,000. Following the General Strike of 1926 its members declined until by 1934 they had fallen to 3,295,000. Thereafter there has been a steady rise and in 1949 membership was 7,936,600.

The number of affiliated unions has decreased in recent years as a result of the fact that some smaller unions have dissolved and others have amalgamated. At the Eighty-first Ann. Congress held at Bridlington in Sept. 1949 there were 889 delegates from 187 affiliated unions. Trade union representation at this Congress is shown by the following table.

Trade Group	No of Unions	No. of Delegates	Membership
Mining and quarrying .	4	126	644,767
Railways	3	42	620,841
Transport (other than railways)	10	94	1,383,177
Shipbuilding	4	16	122,810
Engineering, founding, and vehicle building . .	27	54	1,250,034
Iron and steel and minor metal trades .	20	42	193,275
Building, woodwork-ing and furnishing . .	20	53	592,737
Printing and paper . .	14	52	251,991
Cotton	8	33	158,029
Textiles (other than cotton)	23	36	111,751
Clothing	5	23	172,473
Leather, boot and shoe .	6	18	115,898
Glass, pottery, food, chemicals, etc.	15	63	479,883
Agriculture	1	16	135,000
Public employees . . .	4	23	225,017
Civil service	7	56	429,211
Non-manual workers . .	12	45	225,740
General workers	4	62	823,963
TOTALS	187	889	7,936,600

The Scottish T.U.C. is a similar organisation incorporating the Scottish trade unions and the Scottish branches of larger unions already affiliated to the T.U.C. There are therefore strong links between the two organisations. It has a membership of over 600,000. In Ireland there are two organisations—the Congress of Irish Unions with a membership of about 80,000 drawn mostly from unions in Eire

and the Irish T.U.C., the parent body with some 120,000 members, divided between Eire and N. Ireland. For bibliography, see under TRADE UNIONS.

Trade Unions, associations of employed workers, formed primarily for the purpose of substituting collective for individual bargaining, though they act in many cases also as friendly societies, and take part in other activities related to their main purpose, such as politics and working-class education. T. U. existed in Great Britain long before the Industrial Revolution and were powerful and highly organised among the skilled crafts in the eighteenth century; but they owe their main social and economic importance to the rise of the modern factory system based on power-production. They exist in agriculture as well as in industry. There are T. U. in all modern industrial countries, and the movement attained importance in Japan and India, as well as in Europe and America. Usually, the most important T. U. in each country are joined together in a congress or federation, such as the Trades Union Congress (*q.v.*) in Great Britain, which acts as their spokesman on matters of general concern.

The primary purpose of T. U. is collective bargaining, based ultimately on the right to strike. But the strike is, in fact, usually invoked only as a last resort. T. U. greatly prefer to settle questions by means of negotiation, either with employers singly or, more often nowadays, with Employers' Associations or Federations, or direct with the State.

The T. U. movement is now practically world-wide. It has reached its greatest strength in the U.S.S.R. where for the first time T. U. were part of a uniformly nationalised economy, and with a membership of about 15,000,000 are a means of organising the labour force of the country in the interests of the State. These T. U., however, cannot be compared with those of W. Europe, since the Soviet system has no place for the principles of collective bargaining, etc., or of strike action as this would, in effect, be action against the State. Germany was with Great Britain one of the countries of Europe in which T. U. were most strongly organised before they were suppressed under the Nazi régime. During the period of the Weimar Republic membership reached about 6,500,000. After the Second World War the revival of T. U. was recognised under the Potsdam Agreement, and during the period of military occupation membership reached a total of about 7,000,000, of which more than half were in the Russian Zone of occupation. In Oct. 1949, 800 delegates representing sixteen T. U. in the Brit., Amer., and Fr. Zones met together in Munich for the purpose of forming a Ger. federation of all T. U. in the W. zones.

In France trade unionism grew in strength more slowly than in Great Britain or Germany, partly because there was more small-scale industry. Since the Second World War it has become a powerful force in the country, although

there is a political div. between the three largest groups, i.e. the *Confédération Générale du Travail*, which is mainly Communist in sympathy, the *Force Ouvrière*, which is Socialist, and the *Confédération Française des Travailleurs Chrétiens*, a Catholic group.

TRADE UNIONISM IN GREAT BRITAIN.—The movement achieved its legal emancipation first in Great Britain, where modern industrialism first developed on a large scale. Up to 1824 there were many statutes in existence forbidding working-class combination, either generally or in particular trades. The earliest general Act dates from the reign of Edward VI. General Acts prohibiting combination were passed in 1799 and 1800, when the Brit. governing class was in fear of popular movements following on the Fr. Revolution of 1789 (incidentally, the revolutionary gov. in France also prohibited T.U., under the *Loi Chapelier* of 1791, and T. U. only received legal recognition in France in any full sense in 1884). The Eng. Combination Acts were repealed in 1824, after an agitation engineered by Francis Place and the Radicals, but stringent restrictions on T. U. activity were re-imposed in 1825, and the T. U. only secured adequate legal recognition in 1871–75. Prohibitions and restrictions were, however, unsuccessful in preventing working-class combinations, though they sometimes drove them underground, and many leaders were imprisoned for taking part in the work of organisation or attempting to apply collective bargaining. The hist. of Brit. trade unionism falls, roughly, into seven periods. (1) During and before the eighteenth century trade unionism was for the most part confined to skilled craft-workers, organised in small local Trade Clubs which only linked up occasionally over a wider area. These clubs were sometimes powerful, as they had a monopoly of skilled labour. Their main functions were to negotiate with employers (mostly small employers) a. at wages and hrs., to enforce limitation of apprenticeship, and to act as friendly societies. Until 1813 the magistrates still had power under the Elizabethan Statute of Artificers to regulate wages, and until 1814 to regulate apprenticeship, and often the object of the T. U. was the enforcement of the Elizabethan statute. These provisions were repealed in 1813 and 1814 under the influence of the new doctrines of *laissez-faire*. (2) From 1799 to 1824 trade unionism was forbidden under the Combination Acts. It continued to exist, and in some trades to negotiate with the employers openly and without prosecution. But T. U. in the mining and textile trades were subject to severe repression, and unable to maintain a continuous existence, though new societies constantly sprang up in place of those which were dissolved. (3) The repeal of the Combination Acts in 1824 was followed by a great wave of T. U. activity, culminating in the formation of the Grand National Consolidated Trades Union, under Robert Owen's influence, in 1833. But this body was destroyed in

the following year after a series of strikes and lock-outs, and after the famous 'Dorchester Labourers,' who had formed an agric. branch, had been transported for the offence of administering unlawful oaths (see *TOLPUDDLE MARTYRS*). (4) After 1834 the work of organisation began anew on less ambitious lines. General unionism went out of fashion (though there was a revival of it in 1845–48), and attention was concentrated on building up stable unions in particular trades. The National Miners' Association (1841) came to grief, but from 1850 onwards powerful societies grew up, such as the Amalgamated Society of Engineers (1851), relying on high contributions and a mingling of industrial and friendly benefits to ensure stability of membership. This method was effective in organising skilled workers, but left unorganised the lower paid workers, who could not afford the high contributions exacted. Under the moderate leadership of the new Amalgamated Societies of skilled workers the T. U. at length secured legal recognition under the Trade Union Act of 1871. This was at first combined with repressive measures against coercion and intimidation, under the Criminal Law Amendment Act of 1871, but the T. U. strengthened by the Reform Act of 1867, which gave the urban workers the vote, got this Act replaced by the milder Conspiracy and Protection of Property Act of 1875. During the prosperous years between 1869 and 1874 trade unionism spread to the less skilled workers and, under Joseph Arch's leadership, to the agric. labourers. But in the middle 'seventies came a slump in trade, which largely destroyed the unions' power. They were reduced to quiescence, until the revival of 1888–89. (5) The Miners' Federation was formed in 1888; and in the following year the London Dockers' strike was the beginning of a big movement of agitation among the less-skilled workers. This period marks the revival of Socialist influence in the T. U., for the 'New Unionism' was largely organised and directed by Socialists. It was the beginning of the 'General' Unions, enrolling unskilled workers, which in power and influence came to supersede the earlier 'Craft' Unions. Under Socialist inspiration, the Unions not only began to supplement collective bargaining with demands for industrial legislation (already a familiar policy among the miners and textile workers), but also to consider taking political action as an independent working-class party. Under Keir Hardie's leadership, the Socialist Independent Labour Party (1893) undertook a vigorous campaign with the object of bringing the T. U. into politics, and in 1900 the Trades Union Congress was persuaded to launch, in partnership with the Socialist bodies, the Labour Representation Committee, which in 1906 adopted the name 'Labour Party.' (6) The progress of the L.R.C. was slow at first, but an important legal decision threatening the existence of trade unionism rallied the T. U. movement behind it. This was the Taff Vale decision (1902), by which it was laid down that

T. U. funds could be made liable for damage caused by a trade dispute. The agitation against this decision led to the winning of a large number of seats by the Labour Party in the General Election of 1906, and to the passing of the Trade Disputes Act (1906), which remedied the grievance. But immediately the T. U. suffered a further setback in the courts, the Osborne Judgment (1908) declaring political action by T. U. unlawful. Further agitation followed, until this grievance was in part remedied by the Trade Union Act of 1913. In the meantime, the failure of wages to rise with increasing prices and national wealth had led, in 1911 and the following years, to a great movement of unrest and strikes (transport workers 1911 and 1912, miners 1912), and to the emergence of new social theories such as Syndicalism and Guild Socialism, claiming a large share in the control of industry for the organised workers. This movement of unrest continued in being up to the outbreak of war in 1914. (7) The war, after an initial setback, greatly increased the membership and power of the T. U. owing to the high demand for labour and the necessity of constant negotiations as prices rose and industrial methods had to be modified in face of war conditions. The T. U. emerged from the war with doubled membership, into a period of acute unrest. There were many big strikes between 1919 and 1921, when the coming of the great post-war depression seriously limited the power of the unions. But politically the strength of the Labour Party continued to grow, and a minority Labour Gov. came into office for a brief period in 1924. The fall of this gov. was followed by a renewal of industrial strife, culminating in the miners' lock-out and the General Strike of 1926, when the Trades Union Congress organised a national strike movement in support of the miners' claim to a living wage. The defeat of the General Strike was followed by the Trade Disputes and T. U. Act of 1927, which not only declared general and sympathetic strikes to be illegal, but also withdrew many of the privileges gained by the T. U. under previous Acts, and left the law in a condition of dangerous ambiguity on many vital matters. A second Labour Gov. held office, in a minority, from 1929 to 1931, when it fell as a result of the financial crisis arising out of the world slump. Meanwhile, in the industrial field, the T. U. remained perforce on the defensive, owing to the general depression. Their membership had fallen heavily since the years of boom after the war; and their power was further menaced by the decline of the older industries, in which their strength mainly lay, and the rise of new mechanical trades operated more largely with unskilled labour. Numbers continued to decline until they fell below four and a half millions by 1933. After that year economic conditions slowly improved, and by the outbreak of war in 1939 membership was back to the six million mark, which had not been touched since 1921. An important development was that the right

of T. U. to negotiate on behalf of apprentices was recognised by employers. One feature of this period was the increasing use of advisory councils and committees in the relations between various T. U. The structure of trade unionism and the question of closer unity engaged the attention of the General Council of the Trades Union Congress, throughout the thirties. The ground was therefore well prepared in the thirties to make possible the important share which trade unionism had in the industrial effort of Great Britain during the Second World War. Trade unionism had by now become an instrument of gov. and was more intimately concerned than formerly with industrial policy. One of the first acts of the Labour Gov. which came to power in 1945 was to repeal the Trade Disputes and T. U. Act of 1927, and this was done on May 22, 1946. Thus the T. U. regained their full status as an integral part of the State. With the nationalisation of coal-mining, electricity, and other industries, provision was made for consultative councils consisting of representatives of the Boards of the nationalised industries and the staff concerned.

Organisation.—A union is usually a national body with branches distributed over the whole country. Its branch officers are industrial workers, giving only their spare time to union duties, but it maintains a head office staff of full-time officials, who manage its affairs under the direction of a part-time executive committee and an ann., biennial, or triennial congress or conference of delegates from the branches or dists. Naturally the precise form of organisation differs from union to union, but these are the common factors.

Types of T. U. fall into four main groups; first, the craft unions, the earliest form of trade unionism. Their membership is limited to skilled workers engaged in the same industrial employment or near allied employment. They tend to be small in size although there are a few craft unions among the largest, e.g. the Amalgamated Weavers' Association, the Electrical Trades Union, and the Amalgamated Engineering Union. The two last, however, take on some of the characteristics of the second group, the Industrial Unions. The industrial unions include both skilled and unskilled workers within a given industry. Important examples of industrial unions are the National Union of Mineworkers, the National Union of Railwaymen, and the Iron and Steel Trades Confederation. The third group, the Occupational Unions, are smaller T. U. consisting of those engaged in one particular class of work within the same industry, e.g. the Railway Clerks' Association. Finally, there are the General Unions, e.g. the two largest, the Transport and General Workers' Union and the National Union of General and Municipal Workers, which cater for both skilled and unskilled workers in a number of different classes of employment. Among non-manual workers, teachers, post-office workers, civil servants, municipal workers,

journalists are, among others, all strongly combined, and many of the unions of non-manual workers are linked up in the National Federation of Professional Workers, which maintains close relations with the T.U.C. In almost every tn. of importance there is a Trades Council, a federation of the local branches of the various T. U. See TRADES COUNCILS.

Almost all T. U. except those in the public services, provide benefits for their members in case of strikes or lock-outs. In many unions the expenses of management and negotiation, together with those of strike benefit, absorb nearly all the funds. Under Brit. law, payments for political purposes have to be made out of a separate fund, to which contribution is voluntary; and political payments account for only a very small part of total T. U. expenditure. Contributions to the General Funds of the T. U. are payable weekly, and range in most cases from 6d. to 2s. a week, with lower rates for women members, youths, and apprentices. In some T. U. in other countries (e.g. France) contributions are much lower than in Great Britain, and friendly benefits hardly exist. In America, on the other hand, contributions are substantially higher.

As regards political organisation, over seventy T. U. are affiliated to the Labour Party which has an affiliated trade union membership of two and a half millions, about eighty per cent of the total. T. U. are represented at the ann. conference of the Labour Party by delegates from the various affiliated organisations at the rate of one delegate per five thousand members. Local branches of T. U. may also affiliate with local branches of the Labour Party. Regional Councils of Labour have also been created by the Labour Party to serve as links between the National Executive and local affiliated organisations, such as T. U., at dist. level.

Educational Activities.—The provision of increased educational facilities for its members has been a recognised aim of trade unionism since the beginning of the movement. About 100,000 students are enrolled in the Workers' Educational Association, a section of which is devoted solely to the needs of members of T. U. See ADULT EDUCATION.

Statistics.—The number of T. U. in the United Kingdom is 730 (1948), including 24 with headquarters in N. Ireland. Of these 416 are registered with the Chief Registrar of Friendly Societies under the Trades Union Acts. Membership in the U.K. was 9,301,490. The largest are the Transport and General Workers Union, the National Union of General and Municipal Workers, the Amalgamated Engineering Union, the National Union of Mineworkers, the National Union of Railwaymen, the National Union of Distributive and Allied Workers, the Amalgamated Society of Woodworkers, the Electrical Trades Union, the National Union of Tailors and Garment Makers, and the National Union of Agric. Workers. The industrial distribution of T. U. membership (1948) is shown by the

table at the top of the following page.

The growth of trade unionism in the United Kingdom is shown by the following figures for selected years. At the height of the movement in the early part of the nineteenth century, T. U. membership is said to have risen to a million (1834), but this figure is open to doubt. There are no official figures before 1892, in which year total membership was 1,500,000. It reached 2,000,000 in 1906, 3,000,000 in 1911, 4,000,000 in 1913, 5,000,000 in 1917, 6,000,000 in 1918, 7,000,000 in 1919, and 8,000,000 in 1920. In 1921 it fell to 6,600,000 and further declined to under 5,000,000 in 1927. A small increase in 1927 was not maintained, and the lowest figure since 1915 was reached with 4,400,000 in 1933. Thereafter it rose to 5,000,000 in 1936, 6,000,000 in 1938, 7,000,000 in 1941, 8,000,000 in 1943. In 1945 there was a drop to 7,800,000 as a result of women leaving industry after the war, but the numbers again increased to their present total of over 9,000,000.

Trade Unionism in the U.S.A.—In the U.S.A. the beginnings of labour organisation date back to the days of Washington. Robert Owen carried his theories and practice to America when he set up a community at New Harmony in Indiana on the lines of the New Lanark experiment. By 1833 there were over a hundred T. U. in existence in Philadelphia, New York, Baltimore, and Boston. An attempt to form a national federation in 1834 was, however, short-lived. After the Civil war the growth of Amer. industrialism brought a parallel growth to the craft unions which were, however, heavily handicapped by the opposition of employers and the constant dilution of labour by immigration. In 1866 the National Labor Organisation was formed but lasted only six years, the difficulty being to unite local and national interests, immediate benefits and wider ideals. A second organisation, the Noble Order of the Knights of Labor, fl. for a few years, especially among unskilled workers, but it roused the opposition of the craft unions. It was not until 1886 that Amer. labour was put on a firmer national basis with the creation of the Amer. Federation of Labor. This was largely due to the energy and vision of Samuel Gompers (1850-1924) (q.v.), a member of the Cigar-makers Union, who succeeded in bringing together the leaders of the larger national unions, including the iron and steel workers. The first major conflict was the nation-wide railway strike of 1877, ended only by bringing the Federal troops into action against the strikers. Trade unionism was considered to be broken, but it continued its struggle towards more powerful organisation. A weapon used against the T. U. from time to time was the practice allowed to both state and federal courts of issuing a writ of injunction, forbidding the unions to take any action they proposed if held to be likely to cause damage. An injunction could therefore, and was, used as a strike-breaking instrument. Nevertheless, legis-

lation favourable to labour was introduced in a number of States, and in 1884 a Federal Bureau of Labor was set up, the forerunner of a State dept. Public opinion was on the whole against the severity with which a second railway strike was suppressed in 1886 also by armed force. T. U. slowly came to be recognised as an integral part of industrial life and employers were more and more urged to settle disputes with the T. U. by arbitration. In 1900 the Amer. Federation of Labor had a membership of only a little over half a million. By 1914 it was over two million. Women employees were also organised in a common effort towards obtaining better labour conditions, and the National Women's Trade Union League was formed in 1903. From the beginning of the First World War the wages and living conditions of Amer. workers began to improve considerably. The Amer. Federation carried on a long campaign against unrestricted immigration, especially of classes likely to lower the standard of labour. By 1927 it was successful in securing legislation limiting immigration to an ann. quota or proportion of any nationality already represented in the U.S.A. In July 1935 labour's position was further advanced by the creation of the National Labor Relations Board under an Act known as
